A successful effort has of late been made in Norwich to preserve a typical example of a city merchant's house of the fifteenth and sixteenth centuries. The Strangers' Hall, situated between the churches of St. John Maddermarket and St. Gregory, which for fifty years had been allowed to fall into a sad state of dilapidation, and was finally threatened with demolition, was purchased in 1899 by Mr. Leonard Bolingbroke, by whom, after a year devoted to its reparation, it was opened to the public, a small charge being made with the view of making the building self-supporting. The interest of the house, which represents a growth of nearly 500 years, and shows the changes which time has wrought in domestic customs and manners, has been greatly enhanced during the last three years by the collection within its walls of old household furniture and domestic appliances, so that it may more completely illustrate, even in the most homely details, the life of the past. Beneath the west end of the hall is a fine decorated crypt of three bays, to the east of which are passages and other cellars. These cellars were the crypts for the storage of valuables which usually existed beneath the timber-built houses of the fourteenth century, and they are probably the cellars of the house of Roger Herdegrey, burgess in Parliament in 1358 and bailiff of Norwich in 1360, which then stood upon this site. The kitchen and butteries, which are older than the rest of the building, may also have formed part of Herdegrey's house. The hall itself, with its groined entrance porch and oriel window, its kingpost roof and richly-moulded cornices and tiebeams, appears to have been built towards the close of the fifteenth century, when such halls were common enough in city mansions. It very soon came into the possession of Nicholas Sotherton, a grocer by trade and mayor of the city in 1539, whose merchant's mark is painted in two spandrels of the roof. The arrangement of the hall then was of the same nature as that of Haddon Hall, the screen crossing it at the eastern end, with a door in the south wall once leading into the garden, and two arched doorways in the east wall opening into the kitchen and butteries. A small portion of the original screen, which was painted bright red, is still in position under the south end of the present gallery. The parlour, containing a large open fireplace, is on the north side of the hall, and over it Sotherton may have had a bedchamber. But bedrooms in those days were a recent innovation, and doubtless the hall and parlour were used in part for sleeping. A century earlier a well-to-do merchant was well content that his house should consist of a large hall, a parlour, a kitchen and buttery. While the property was in the hands of the Sotherton family the settlement of Strangers, as the Dutch and Walloons were called, took place in Norwich, a settlement of which the Sothertons were the chief promoters. Early in the seventeenth century the building was sold to Alderman Francis Cock, also a grocer, and in 1627 mayor of the city, who built out a room into the garden and above it two other rooms, to give access to which he built in the hall the large oak bay-window and erected in it the beautiful Jacobean staircase and landing. It was not until a later date that this landing was extended across the end of the hall in a minstrels' gallery. The house, having passed through the hands of Charles George Cock, one of the Commissioners appointed in 1654 for the ejectment of ministers, came into the possession of Alderman Joseph Paine,

who was appointed mayor in 1660 and knighted by Charles II. Paine was a friend of Sir Thomas Browne's, and is frequently mentioned in Browne's correspondence with his son. It was then that the doorway was made at the west end of the hall, leading, by means of a narrow staircase of oak with twisted balusters and carved brackets, to the west tenement, which was thus made an integral portion of the house. This western part of the building dates from Tudor times, and in Paine's day the lower front room was a fine Tudor apartment with a richly-moulded oak ceiling. It is now panelled in the Georgian style, and the oak ceiling hidden from view by Georgian plaster, an alteration which may be attributed to the latter half of the eighteenth century, when the hall was in use as the Judge's lodgings. At the close of the eighteenth century the estate was acquired by the Roman Catholics, who used the hall as a presbytery; and during their occupation Mazotti, the Italian sculptor, had his studio here, and here for a time lived Thomas Deterville, who taught Borrow his French and Italian, and whom readers of "Lavengro" will recognise as "*exul sacerdos*, vone banished priest." It is thought that it is perhaps to its occupation by these men that the name of Strangers' Hall is due, for although in the sixteenth century the Dutch and Walloon "Strangers" resided in adjoining portions of the Sotherton's property, there is no evidence that they stayed in the house itself.

On the walls of several of the rooms is hung a large collection of etchings by Old Crome, J. S. Cotman, Daniell and others of the Norwich school, and there are also a few water-colours by Stark. Among the pieces which Mr. Bolingbroke has collected, and with which the house is furnished, are oak bedsteads with rush mattresses, settles, bureaux and ancient chairs and tables, while in the kitchen are to be found tinder-boxes, candle-moulds for making home-made candles, rushlights, smokers' tongs, sugar-breakers, Bellarmine jugs, pewter plates, old glass, old knives and forks, and many other things familiar to our forefathers, but long since disappeared from everyday use. There are also such curiosities as a watchman's tell-tale, a "perambulator" or surveying wheel, horn spectacles, a dandy-horse, and the Snap, or pasteboard dragon, formerly borne in the guild procession of the mock corporation of Pockthorpe, a hamlet of Norwich, the Snap of the real corporation being preserved in the Castle Museum. This year one of the rooms has been opened as a weaving-room, and contains a Norwich weaver's loom, identical in shape with that worked by Hogarth's industrious apprentice, a spinning-wheel, pattern-books of Norwich manufacturers of the past, water-colour designs for the once famous Norwich shawls, an old Suffolk lace pillow, needlework pictures, and bills and ballads relating to the now practically extinct Norwich weaving industry.

THE ARCHITECTURAL ASSOCIATION.

A PRELIMINARY meeting of the Association School of Design was held on Tuesday evening last, Mr. H. T. Hare, president, in the chair.

The PRESIDENT, in opening the proceedings, said the design classes were quite the most important in the course of work set out by the Association for students. The sole end and aim of an architect was to be able to design, and it was the most difficult part of his calling. All the other studies were subsidiary to that end, and the only way in which the architect could attain any facility in design was to constantly practice, and the young student therefore could not do too much of it. The large meeting was encouraging, and he hoped it meant the students of design would be numerous in the classes commencing. The committee found that although these classes began with a full attendance the numbers fell off towards the end of the session, and as a result few designs were submitted. The cause was not easily understood, because the subjects were not of such a nature as would call for a great sacrifice of time. He hoped the classes would be better attended in the present session, and that a large number of students would complete the course.

Mr. WALTER CAVE was asked to address the meeting. He said:—

I have been asked to say a few words to you to-night at the opening of the autumn work of the Architectural Association, and I find it no easy task to know how to begin or what to say. In the first place, the subjects to be dealt with this winter in the school of design will all be thoroughly discussed by the different visitors, and it would be impossible to enter into any of them this evening—within the few minutes at my disposal. In the second place, I feel, like all who work, a curious powerlessness to talk about what one is doing. I have often noticed that when an acknowledged expert on any technical subject attempts an explanation of his art or craft, he takes it for granted that either his audience knows nothing, or else as much as he does himself, and as a natural consequence either his explanations are extremely tedious, or else quite unin-

telligible to the ordinary listener. Now I cannot possibly claim to be an expert in any subject, but I am on the other side of the case, namely, that of the student who wish to learn, and so I am going to suggest some of the ordinary procedure and see what I can learn or suggest during that part of the autumn's work which has been entrusted to me, and in order to do this to our mutual advantage, I will indicate briefly this evening some of the points on which we may both benefit by special study. Tradition and experience are both very important words to the young and the old architect. Reverence for the first, tradition, is, I hope, to both, and experience is the fascinating goal to which we sometimes, alas! a bitter memory to the old. I have truly said that we can only learn by experience, but I can go further and say that it is only by paying for our experience (sometimes in actual cash) that our lesson is really learned. It is with some such object in view, *i.e.* of saving your memories in the future (if not your pockets also), that I offer a few hints on the work before you both in the school and in your after life. Let us first begin by reverence for tradition. You on your part will strive to make a use of it in working out your designs, carefully weighing its merits and seeing how it can help you in solving more difficult problems. And so by utilising intelligently the experience bought by practice of older and possibly wiser men, you will in your turn be adding another stepping-stone to the success for future generations. All really sound, fine, and successful architecture has been in the past built on the basis of what has gone before, and why should we not evolve from what has gone before, and why should we not have all the wealth of examples before us, ignore those lessons which tradition and experience alone can teach us? I, for my part, will endeavour to keep tradition in view when your designs come before me, not necessarily setting up a fixed and inflexible model on which I shall expect all your designs to be based, but seeing how far fresh views based on older ones can be fairly considered as improvements, and to which I will add intelligent and broad-minded study of the past can help in elucidating the problem in question.

Next I should like to say, Do not take anything for granted. You will find in every question which you have to solve, and every problem which you have to solve, both in your future practice, that at first sight certain elements appear inevitable. Do not trust these appearances without a very careful search and honest endeavour to prove that these things are inevitable. Certain methods, short cuts to success which you have seen used by others, personal predisposition for certain forms, will be apt to rise in your mind at the beginning of your work, but trust them without a severe mental cross-examination that they really are the best and most fitting solutions for the problem before you. Do not be content to do always exactly what you have done, even in the simplest matters, but endeavour to improve and advance. If you do this at the beginning of your work you will be saved the mortification of finding your drawings are approaching completion that with a little more thought at the start you might have produced a better design. You then may have to face the work of beginning over again or sending in a design which you know is not the best you could have done. I shall try to avoid any special arrangements when looking at your designs, and very possibly shall gain by admitting a different solution to the one which I had thought the most convenient. I shall avoid, on my part, the error of taking anything for granted. Avoid eccentricity. This is a warning which I know has been given, but it is of such importance that I must make an apology for saying it again. It is the besetting sin of many architectural students (and, indeed, of some architects). Originality and eccentricity are very closely related, and it requires an exceptionally strong character to adopt the first without the second. To the student who is of becoming eccentric in his desire to be original is one that I feel almost inclined to say, do not do it, but this would hamper all progress if followed literally. My earnest advice to you is not to strive for originality, but to grow naturally, as I have said before, from a careful study of the past, and be sure that your variations are improvements. A careful inspection of those designs which I have seen in my short experience of the Architectural Association which offend on the score of eccentricity, invariably show a large amount of imitation from some modern design. Work is labelled "original," and as a rule the points selected for imitation are the worst ones in the design, the unfortunate model selected. So I say again avoid eccentricity and any desire for originality for its own sake, and I may be saved from further learning the lesson of "what to avoid."

Next let your designs be suitable. This sounds very simple, but may not prove so simple as it appears. Think of the object for which you are striving, the uses to which the object will be put, and try and place yourselves in the position of the people who will use it. Do not think only of the

The Federal House of Representatives, sitting at Melbourne, by an exhaustive ballot has selected Tumut for the Federal capital. The contest lay between Bombala, in the south-east, Tumut, near the Murray, and Lyndhurst, one hundred miles from Sydney.

NOTES AND COMMENTS.

WHEN the means of technical education afforded to the Germans are discussed in this country, writers and speakers generally confine themselves only to the preliminary parts, which are to a large extent scholastic. We do not realise how much provision is available for those who have after leaving technical schools and colleges to take up some particular calling, and for whom it is well to suggest that instruction is not at an end. Let us take one instance. On last Monday evening the courses of lectures commenced in the Berlin Industrial (Kunstgewerbe) Museum. The first course by Dr. HERMAN LÜER is on bronze casting. It began with a description of antique processes in which wax was used as an auxiliary, and the successive improvements from age to age until the nineteenth century will be described and explained by examples. In the next course Dr. SWARZENSKI will describe the early Renaissance work in all departments of the Florentines. A third course will deal with lettering from the earliest times until the present. This is of more importance to the Germans than to us, for they still keep up the practice of using written or illuminated addresses in a vast number of cases, and the letter-painter or writer becomes a far more important craftsman than with us. Dr. GUSTAVE KÜHL will describe all the forms which are known to have existed, from those of the Chinese to those of WILLIAM MORRIS. In Germany there is now an endeavour to produce new forms, and the efforts of ECKMANN, SCHILLER, BEHRENS and the so called Vienna school will be explained. An interesting discussion is sure to arise about the effect of the form of lettering on the eyes of readers. Other courses will follow. In London similar lectures could only be heard at the Royal Institution, but in Berlin they are gratuitous. Their effect will be to conserve and deepen the impressions received by students when young, and to make them more gratified in being connected with industries which have such histories and from which art cannot be separated.

THE report of the Commissioners of His Majesty's Woods, Forests and Land Revenues refers, among other subjects, to the repairs of Tintern Abbey. The first work undertaken was the preservation of the beautiful arched openings between the sacristy and the cloisters, and the work, it is stated, has been carried out with the greatest care, without accident, and in such a manner as to preserve the old structure without any attempt to "restore" missing or decayed portions. The result is said to be very satisfactory, for it is difficult to see that anything more than superficial pointing has been done. At present attention has been directed to an even more dangerous portion of the abbey buildings—the groined entrance on the north side of the cloisters and the groining is now being covered with a layer of cement concrete, on which will be placed a coating of asphalt to completely exclude wet. The removal of the modern cottage built into the ruins on the north-west side of the abbey has opened out some most interesting remains of a former entrance. The removal of the modern buildings and obstructions to the west of the road, it is stated, is an immense gain, as a very fine and much extended view of the west front of the abbey is now obtained.

EDINBURGH University is unique in this country in having a lecturer on forestry. Colonel BAILEY, R.E., who holds the office, in his address at the opening of the session, spoke about the report issued by the committee on British Forestry. That committee, he said, found the conditions practically unchanged since 1885, when the last committee reported, though some scattered effort had been made to adopt methodical treatment and to organise instruction in forestry. There was a very large area available for profitable afforestation, which would give remunerative labour to an increased rural population. The world's supply of coniferous timber is approaching shortage, and afforestation has therefore become a matter of grave national concern. Timber of the kind and quality most largely imported could be grown in this country, and the preference of foreign timber was due to our neglect of sylvicultural principles. Additional facilities for instruction of owners and agents should be provided. The course

in Edinburgh should be carried considerably further. An area of from 100 to 200 acres should be provided for practical illustration by means of example plantations in accordance with the committee's recommendations. A State demonstration area of from 2,000 to 10,000 acres should be formed, as near Edinburgh as possible, the probable cost of 50,000/. As the benefit to landowners would be considerable they might co-operate by guaranteeing the interest of the purchase-money. Colonel BAILEY went on to describe the organisation and management of such an area, and to refer to the various recommendations of the committee for the propagation and preservation of timber.

THE possibility of Edwardes Square, Kensington, being used as a building site within a measurable period has excited alarm in various parts of the Metropolis. It has been made to induce the London County Council to regard certain squares as open spaces which are indispensable, but the prices are usually too high for the purpose. In some cases any change in the character of the ground would diminish the value of the surrounding houses, but as the leases may have several years to run there is temporary security that there will be no interference with the area enclosed by railings. The subject is, however, too important to be overlooked. Sooner or later it will have to be encountered, and it is wished to uphold such amenity as London possesses. The Council should organise themselves in order to discover what squares, which were so marked a characteristic of the city, can be preserved in their present condition.

ILLUSTRATIONS.

HOUSE, KINLEITH, NEAR EDINBURGH.

CHRIST CHURCH, HOLLOWAY, DERBYSHIRE.

THIS church was, with the exception of the tower, completed last year; it stands on a steep hill at a great height, overlooking the Derwent Valley. The walls are built of coarse millstone grit, quarried on the site, and the masons' work of Matlock stone. The roof is covered with Broseley tiles in mixed shades of colour. The nave roof is of pitch pine open to the ridge, and the chancel roof is ceiled with oak, with carved bosses supporting the Bromsgrove Guild. All the doors, seats, &c., are of oak, but beyond the seats the fittings are at present of iron, of a character. Advantage was taken of the slope of the hill to form a large parish-room under the west end. The contractor for the work was Mr. J. W. WILCOX, of Matlock, Mr. P. H. CURREY, of Derby, being architect.

VICARAGE HOUSE, HOLLOWAY, DERBYSHIRE.

THE vicarage is now being erected, from the plans of Mr. P. H. CURREY, on a site adjoining the church, and the slope of the land, rising very steeply on the east side, settled the general disposition of the plan. The elevations were kept very simple, both for reason of economy and to suit the coarse nature of the local materials. The contractors for the work are Messrs. FORD & Co., of Derby.

PAIR OF COTTAGES, DEVIL'S BRIDGE, CARDIFF.

THESE cottages were designed for Mr. F. J. JONES, a FOOT with a view to the accommodation of visitors. The walls are of local stone, quarried on the estate, and covered with cement rough cast above the eaves. The roofs are tiled. The architect is Mr. G. L. SUTCLIFFE, A.R.I.B.A., of the firm of Messrs SUTCLIFFE & SUTCLIFFE, 11 Argyll Place, London, W.

HOUSE NEAR BARNESLEY, YORKSHIRE.

THIS house, designed for Captain WALKER, is the work of G. L. SUTCLIFFE, A.R.I.B.A., 11 Argyll Place, London, W. It has not been built, as Lord WHARNCLEFFE is not disposed to sell the ground desired by Captain WALKER, and another site has not yet been obtained.

CATHEDRAL SERIES.—EXETER: SOUTH AISLE.

SUPERCOLUMNIATION.

The system of placing one range of columns above another is at variance with the practice of the Greeks, but it does follow that it is utterly absurd in its principle and ought to be discarded altogether. The temples and other public edifices of the Greeks did not allow a second range of columns, there being no upper storey within, as would have been thus indicated; there certainly is nothing contrary to architectural propriety in making the external appearance of a structure correspond with its internal disposition, and giving to each tier of columns into which it is divided a distinct order of columns to support the timbers that form the different floors. Still, although it would be nothing absurd in doing so, it remains to be considered how far such a mode of building is favourable to the eye, or the contrary. It is said, and said very justly, that two or more series of columns are employed the structure appears too much like so many distinct habitations placed one above the other. Undoubtedly it will; that is, it will appear as it really is, for nearly all modern buildings may be termed compared with the simple models antiquity has left us, very rarely consist of anything more than apartments, one on a level with the ground or raised on a moderate substructure. But the entablatures of the lower orders, it is again said, will, both by their depth and by exhibiting the same proportion of parts as that which denotes the external roof of the whole edifice, indicate more than an inner floor and a space between each storey—will, in fact, describe so many roofs successively constructed one over the other. Such indeed will to a certain extent be the case; yet something is to be conceded to the force of habit, and we are so accustomed to regard the entablature as essential to the column, even in situations where it is not so in fact, that any abridgment of it would appear as a mutilation, even should there be no particular propriety in retaining the whole. As a cornice exhibits the external rafters of a roof, if we must invariably find a meaning in everything, we ought to be offended with the appearance of a building wherever it is impossible that such roofing should exist. Nevertheless do tolerate, nay, affect cornices where they are merely ornamental adjuncts borrowed from the general effect of the fabric. The ancients themselves did this, and employed entablatures on a lesser scale to decorate the apertures of arches and windows, where being so much smaller and somewhat differently applied, they do not indeed recall the original effect so forcibly as either to remind us of it too strongly or to produce a monotonous rather than a harmonious repetition of the same form.

A continued entablature, however, upon the same or very nearly the same scale as what ought to be decidedly the principal one, is attended with a very different effect. In such cases we cannot help being impressed with the idea that the lower order is to all intents and purposes the same as the upper; whereas, in the other, we may consider the cornices to be as ornaments, &c., as ornamental ledges or shelves intended to protect the opening of the rain, rather attached to the external wall, and not forming a part of the framing of the aperture than the situation of any part within it. Another and still stronger objection is that an entablature above a first or lower order of columns will not only be actually larger than that above it, but will still more so by its being nearer the eye. This may, however, be in some degree remedied by varying the proportions of the orders, or less so as to accommodate them to particular circumstances. Some of the Italian architects have occasionally done this, placing on the summit of their façade a cornice, or rather a cornice, proportioned not to the order immediately beneath it, but to the entire elevation, which, although it may be deemed a license, can hardly be stigmatised as a solecism, and produces a very fine effect, at the same time that the departure from strict rule is justified by adherence to architectural principle. Had they never indulged in anything more capricious or fanciful they would not themselves need that licence from our toleration which they now require. Unless, however, the lower cornice or cornices be kept very subordinate to the upper one, they are apt to cut up a building too much, instead of appearing to shelter or protect it, seem to catch and collect the rain which would otherwise have no lodgment.

It is advisable, therefore, both on this account and for other reasons already assigned, to omit the cornice in the upper order, limiting the entablature either to an architrave and a plain fascia or frieze, or to an architrave and series of projecting mouldings, of which two divisions the lower would indicate the ceiling within, the other the thickness of the wall or above it.

Nevertheless, however, such a disposition is adapted only to columns or columns either engaged, or if entire, still placed intimately against the wall, and not to continued colonnades, perhaps at intervals or in some particular part. Two orders of insulated columns projecting from a building must inevitably have an unpleasant effect, appearing both insecure and insecure; and this air of weakness will be most conspicuous at the angles. When, instead of advancing from the wall, the columns are enclosed within the general plan

of the structure, as in the west front of St. Paul's, this disagreeable effect is considerably lessened, sometimes removed altogether.

If at any time two regular colonnades should be employed one above the other it would be desirable to adopt a pycnostyle system of intercolumniation, at least one approaching to it, since the closer the columns are and the nearer the quantity of the solids approaches to that of the voids, the firmer and more compact will the whole of such elevation appear. When on the contrary—as is the case in some Italian buildings—the distances between the columns are six or seven modules, or even more, the effect becomes particularly straggling and weak.

There is another disadvantage attending placing columns over columns, even when it is done with as little impropriety as possible, which is that the columns will appear minute both in proportion to the number of orders thus introduced and to the horizontal extent of the façade. This appearance will, moreover, generally be exaggerated even into incongruity by the windows to each order or storey being nearly as lofty as the columns themselves. In many examples of Italian design this takes place to such a degree that the columns or pilasters become little more than accessories to the windows themselves.

If to be tolerated at all, supercolumniation seems to be best adapted for narrow lofty fronts, and for structures partaking more or less of the character of a tower, because in such case the succession of storeys upwards assists the idea of altitude; whereas in façades whose length considerably exceeds their height, the separate orders will appear low in comparison with the horizontal extent of the different floors they decorate.

With regard to the succession of the orders above each other, it has been universally the practice to place the plainer and more robust ones beneath. Indeed, the bare mention of a reversed mode of supercolumniation would be scouted as a preposterous absurdity. But quite as much may be urged in favour of the latter as of the former. Would it not, then, be a gross solecism to place an order of stouter proportions above one that is less so? Certainly not; because the diameters of the upper columns will be less than those of the order beneath. Were the diameters the same, or those of the second order greater than in the first, then undoubtedly the effect would be contrary both to propriety and beauty. The fact, however, is that instead of being positively more bulky, the upper range of columns would be slenderer and shorter also than those below, which latter circumstance would in itself be rather an advantage than otherwise, because it will be better that the different orders or storeys should decrease in height as they ascend than otherwise. Now if we have three orders so arranged, supposing the respective heights of the columns to be ten, eight and six diameters, the columns of the second order will not be equal to eight diameters of the first, nor those of the third to six diameters of the second. The columns of the third order would in fact be only half the height of those of the first; this graduated diminution of the successive parts as they ascend in the elevation would also form a kind of artificial perspective, increasing the appearance of actual height. According to the usual mode, especially if the proportions of the columns vary not more than a diameter in each succeeding tier, there will be little variety as to the heights of the different parts of the elevation. Another circumstance in favour of the disposition here suggested is, that the richest order would be seen to more advantage, and even those who may consider such a mode of supercolumniation contrary to the rules of architectural grammar, must admit that there is something like propriety in placing the decorated Corinthian capital and cornice nearer to the eye than those of the plainer Doric. Still it may be alleged that it seems more natural to bestow a greater degree of embellishment on the upper than on the lower part of a building, and that this principle seems almost invariably to have been attended to by the architects of the Mediæval period, who frequently bestowed a profuse degree of embellishment on the summits of towers and other elevated parts, even where the rest of the building was not much distinguished by ornament. This must be admitted; nevertheless we ought at the same time to take into consideration the great difference between the two styles. The perforated parapets and enriched pinnacles of the one will not be rendered less distinct by their height above the eye, although they will certainly appear more delicate, but the carved mouldings of Grecian and Roman architecture would produce little if at all more effect than so many plain members—or rather, most of the smaller members would be entirely lost in such situations, particularly as we cannot enlarge them at pleasure so as to adapt them to particular distances, as may be done in Gothic architecture. When therefore several ranges of diminutive orders are piled up one above the other on the summits of steeples, as in the spire of St. Bride's Church, it becomes impossible to distinguish any difference of character.

The King will lay the foundation-stone of the King's Sanatorium for Consumptives at Lords Common, near Midhurst, on November 3.

CONVENTIONALISM IN PRIMITIVE ART.*

THERE is no more art in the mechanical figurations of primitive man and contemporary savages, or even of men who have advanced in barbarism—which is ever picturesque—and of semi-civilised and civilised men, than in the letters and numerals of their ordinary script; and most of the conventional “designs, so qualified, of savages are but meant to serve either as charms, or as crude hieroglyphs for the conveyance of information. Even the famous magical and religious symbols of Babylonia and Egypt, now known to have directly prompted so many of the artistic types of the Old World, cannot be said to be artistic in themselves, or, indeed, to have had any necessary or other than an accidental part in the assumed “evolution” of the beautiful types, “how beautiful beyond compare,” actually suggested by them. If the Greeks, who, as Goethe has said, “of all people dreamt the most enchanting dream of life,” had not copied their “palmette” and “honeysuckle” types from the religious symbols, conventionalised at first hand by the Egyptians and Assyrians from the palm-tree and the vine, and, again, from the lotus, they would themselves have devised these types direct from such natural forms of their own hills and plains and sea-shores as the honeysuckle, the cockle-shell and the cuttle-fish. The art of these consummate types has nothing to do with the stateliness of the palm-tree (“Odyssey,” vi. 165), or the splendour of the lotus, or the sweet, winsome, modest grace of the honeysuckle, or the refinement of the curves of the cockle-shell any more than with the abysmal monstrosity in form and texture and action of the loathly cuttle-fish. Their perfected loveliness is of “the vision beatific” that comes “like angel’s visits, few and far between,” only to exceptionally gifted men, who materialise the “spiritual body” of the absolute “archetypes” of all pulchritude and clothe them with a “natural body” of sensuous existence to be the world’s wonderment and joy for ever.

In brief, there is no such thing, certainly not in the narrow meaning of ethnological writers, as evolution in art. There is only individual, incalculable and miraculous inspiration; followed, alas! invariably by collective and continuous degradation of the ideals from time to time revealed to and realised by creative artists of the highest genius. A master soul founds a great school, and gradually this school of at first enthusiastic and disinterested, and at last sordid and perfunctory imitators, undermines the vital force of his work, and vulgarises it to the vilest uses, until, after generations, or it may be centuries, another master arises to revindicate and renew it. Alternate exaltation to the brightest heaven of invention, and abasement to the darkest Hades of mechanical mannerism, in some phase or other of “l’art nouveau”—this, in the patience of the all-disposing gods, has been the history of the arts in every country, including Greece and Italy, of Europe. There is overwhelming evidence in it of what ethnologists may be left to call “devolution”—“from top of honour to disgrace’s feet”—but never a tittle of “evolution.” Take the objects of Papuan art, illustrated in Professor Haddon’s monograph and those in Mr. Balfour’s scholarly handbook, surprised as we may be by the cunning of their contrivance and the manipulative skill expended on them, and prejudiced in their favour by the fact of their being for the most part of spiritual significance—the moving principle and distinctive note of all the greatest art—there is not one of them which is not frightful to look upon, and not only demoniac but demonic in its frightfulness. It is a profanation of the eyes to look upon them, and they have no association whatever with art, and their proper place is in the strictest seclusion of museums of ethnography.

The sense of art is universal among mankind. It is found in the earliest races of men, and, so far as the surviving proofs go, it was more developed in Palæolithic man, of both the “river drift” and “cave dwellings” periods, than in Neolithic man of either the “bronze” or the “stone” age, although the far more numerous remains of the bronze age show a very wide and familiar use of informative and symbolical, and, sometimes, of intentionally decorative conventional types of the mechanical order. The Esquimaux, who are believed to be a survival of Palæolithic man will, with a few scratches, figure a reindeer on a bone with all the truth to nature and all the artistic verve and flare of Landseer; while among all the remains of Palæolithic and Neolithic man there is not one that excites horror or that betrays a trace of those weird and convulsive contortions of line which characterise alike the decadent “art nouveau” of contemporary Europe and the assumed autochthonous “art,” so-called, of British Papua. I say assumed, for it may be reasonably presumed that all highly laboured ugliness, whether in informative, symbolical, or decorative types, indicates archaicism rather than true archaism, or primitivism, and a state, not of “evolution” in art, but of natural decay and degradation, or, in the language

of ethnologists, of “devolution.” My own suspicion is that the Papuan devices, depicted by Professor Haddon, are a depraved and sinister deformations of aboriginally Indian types, transmitted in the train of Buddhist mission, Mohammedan traders and Portuguese and Dutch navigators, filibusters, voyaging to and fro, through the centuries, between Southern India and Ceylon, and Farther India, the Indian Archipelago and China and Japan. The Portuguese, it may be added parenthetically, undoubtedly influenced, if they did not originally inspire, the fascinating, secular art—in flower-landscape painting—of Japan. It is quite distinct from ritualistic fruit and flower painting introduced, as I believe, into China and Japan by the Indian Buddhists. While, therefore, the æsthetic sense, using the phrase in its plain meaning (“aisthesis ton theon”), is latent in every race of men, and goes back beyond men to the animal kingdom, it is inherent in the very constitution of the “well-ordered” Cosmos, it is only in favoured races, and the most highly favoured individuals of these favoured races, that this sense instinctively self-moved—impelled—goaded on, to reproduce the true artist’s “passionate intuition” of his ideals in reality more or less closely answering to that “wonderous pattern” seen only of the inner eye—which, wheresoever it be—

Whether in earth, laid up in secret store,
Or else in heaven, that no man may it see
With sinful eyes, for fear it to deplore,
Is perfect beauty.

The Papuan devices figured by Professor Haddon are the most interesting to the student of art as suggestive of the prehistoric primitive, or, it may be archaic, origins of the historic decorative types of the Old World, which again would all have remained to this day dead, mechanical devices, even as the Papuan devices are, had not the quickening spirit breathed its healthful and elevating and refining life into them, and transformed their deformity into those exquisite creations of the pottery, jewellery, coins, engraved gems and architecture of the Greeks of the fifth century B.C., which continue to this day to be at once the inspiration and despair of the craftsman, the architects, the painters and the sculptors of the modern civilised, *i.e.* Hellenised, modern world.

But the Huichol designs for textile decoration are beautiful and embellishing, and alike in conception, in composition and in purpose, ornamental in the truest and best sense of the word. The types of the designs are taken direct from nature, from the local fruits and flowers, and with the objects they represent they are all prayers, the water-gourd and the water-lily and patterns derived from them being prayers for rain. This recalls the beautiful saying I am always quoting in the *Journal* attributed to “the Prophet of God” (Mohammed), “In the terrestrial Paradise, the Garden of God, every flower is an Alleluia,” and that other touching oriental thought in the reverse of the hymn of the Greek Church, translated by the *Journal*, “The Lord my Maker, forming me of clay,” of calling out the flowers of Eden to make intercession with God on behalf of Adam. There is not a flower in India—India of the Hindus—that is not thus sanctified by some moving association or by with one or other of the immemorial gods of the country. These Huichol designs are advanced far beyond the stage of charms, or religious symbols. In artistic quality of line and colour there is nothing to be compared with them in the whole range of the ritualistic devices of the Melanesians of Australia and the Xanthians of Farther India, the Indian Archipelago, China and Japan; and as conventional textile designs, at the very least, they could not be better inspired, planned or depicted. Compare, for example, the Huichol treatment of the “double-headed (Hittite) eagle” with that of the “frigate bird” of the Solomon Islanders, fig. 7, p. 462, of the *Journal*, April 27, 1901. The Huichol “Royal Eagle” is perfectly conventionalised, but is executed with something of the almost ferocious energy of the heraldic draughtsmanship of Germany as it is to be found in the *Münchener Kalender*, 1895-1903. The “double-headed eagle” of the Hittites, together with the “winged bull” and other seraph-beasts of the Assyrians, travelled into Southern India long before the modern rediscovery of that country by the Portuguese; and the type of the “Hittite Eagle” may have travelled westward on European coins in the proud train of the Spanish navigation, conquest and colonisation of the Americas. Mr. Carl Lumholtz expressly states that the crown on and between each of the heads of the Huichol eagle is of quite recent introduction from Europe, and the thoroughness of the assimilation of this detail, that is of its subordination to local “motifs,” models (isomorphs) and manipulations, more complete than that undergone in every instance by the ancient Assyrian types in Southern India—is of itself sufficient evidence of the natural force and independence of initiative and of the originality of the inborn and inbred artistic sense and technical skill of the Huichols.

Anyone familiar with the textile art of India will have

* From a paper by Sir George Birdwood, K.C.I.E., C.S.I., in the *Journal of the Society of Arts*.

by the remarkable resemblance, in their general artistic symmetry—dependent on similarity of material, patterning, and use—of the bags, cloths, ribbons, &c., of the cloths, as figured by Lumholtz, to the similar productions of the East. There is an extraordinary generic likeness between the Indian pouches, figured by Lumholtz, and the Assamese pouches, of which will be found in the chapter on "The Knop and the Tree of Life" and swastika patterns—"Industrial Arts of India" presented by me in 1902 to the Asiatic Society at Woking on the occasion of the opening of the cemetery there of the Wadia Mausoleum, and held in the hand of Assyrian kings, as they are represented on the "Nineveh marbles," worshipping before the "Tree of Life." This is of direct pertinence in the present connection, as it serves to accentuate the fact of the unrivalled position offered by India for the comparative study of the various decorative arts of the whole world. The country is the most varied structure, in more or less independent geographical areas, within the vast outstretched peninsula so long and so homogeneously defined by the Himalayas and the Indian Ocean. Its climates are of every degree of hot and cold, moist and dry, but all regulated by the force of the monsoon of the prevailing monsoons. Its inhabitants are of every race and nationality and religion, and in every stage of civilisation, but all more or less subdued to the physical, intellectual and moral type imposed on them by the ubiquitous and continuous operation, through 3,000 years, of the predominating system of the Code of Manu. Lying athwart the routes of ancient and modern overland and seaborne trade between the East and the West, and accessible to every power, in the course of this trade, from Central Asia and the Indian Ocean, it has been the arena of every form of commercial and political exploitation, gradually systematised, organised and rendered self-consistent by the long-continued operation throughout the Middle Ages of the easy-going supremacy of the Mohammedans, and the strenuous administration since the sixteenth century of the English. The result has been an extraordinary variety of local arts, each racy by its soil, but all one in the unity of the classical perfection imposed on them by the preponderating genius, as of "the irresistible air," of the great historical race of the classical Hindus.

I have written much on this point in the "Industrial Arts of India." But behind these classical arts of India—objects of the artists class as art—there are other manifestations of the aesthetic intuition of the people seldom observed by the classical artists, which should have a special interest for the study of art on a "biological basis." Such are the sectarian and aboriginally totemistic tattoos, largely reproduced in the "Industrial Arts of India" from Allen Moor's "Hindu Pantheon" and the symbolical marks tattooed on Hindu women, the so-called "drawings" (*kolam*, literally "beautiful," cf. *kalos*) traced with the fingers in sand, and coloured with ochre, on the almost daily occasions of public and private festivals, on the threshold or door sill of all Hindu houses. Henry Trueman Wood tells me that some twelve years ago, in passing one morning through the village of Knutsford, Cheshire, a decoration being treated in this manner on the doorstep of a house where a wedding breakfast was to be held. At such festivities in India a *toran*, i.e. cord or ribbon, decorated with leaves and flowers in rhythmical alternation, is draped across the lintel of every door, while before the doorway, as you approach it from without, the plank, or large stone, or the beaten and smooth earth which constitutes the threshold, is decorated with a variegation of symbolical designs in sand and coloured powders; the effect suggesting the origin of mosaic pavements and rugs and carpets of many kinds in some such practice of archaic antiquity. This mode of decoration in India is entirely a domestic art, hereditary in the families on the female side only, and the designs used are of a dateless tradition. I never saw any systematic or intelligible notice of these tattoo marks and domestic "drawings" until my young friend, Mr. B. A. Gupte, recently published in the "Indian Antiquary" his papers on "Female Designs in India" and on "Divali Folk-lore;" in the latter of which he reproduces a copy by Mrs. Gupte of the design with which she decorates the threshold of their house at the time of the annual celebration of the Divali (*dīpa*, "light," cf. "dips," and *avali*, a "row") the Hindu "Feast of Lights," held in the new moon of Kartik (corresponding to the present with October 28-30) in honour of *Lakshmi*, the goddess of Vishnu, and "Goddess of Good Luck and Prosperity."

The study of these tattoo marks and ritualistic devices led me to suggest at least two obvious conclusions. The first is that not only incoherent, almost amorphous, devices, but fully formed symbols, when bald and misproportioned, or badly and slipshod, or in any way unseemly, are all illustrations of artistic decadence; and the second, that a self-consistent, regularly designed symbol having once been created by a people, their natural tendency is to wrest the

familiar forms of nature about them to the canon of the established symbol, without any thought of endowing the later with the beauty of the former; just as Procrustes stretched out, or chopped down, his captives to the length of his murderous bed. Goethe has well said that the highest principle of art is significance, but he adds that the result of the right application of this principle is beauty; and this is achieved only through individual inspiration and technical mastery. As Pallas Athene sprang from the head of Zeus fully armed, so the work of every great artist passes out of his hands fashioned forth from the first to immortality, and without parentage of any "biological basis," or other pedigree than that of its divine descent. Lorenz Oken defined man as "the pantheistic animal." The phrase means more than the term Microcosm, when originally applied to man as the inexplicable compendium of the created universe, or Macrocosm. It means that man is not only the synthesis of the physical and spiritual creation, of all that is material and all that is individually spiritual (the *Karma*, —ego, of the Hindus), and therefore passing, but also of all that is divine and eternally abiding (*Atman* of Hindus—in Whom, not which, is the true *nirvana* of all created personality). In the physio-philosophy of the Zürich professor, therefore, art in its highest definition is the symbolical reflection of the design and ultimate purpose of creation as the probation of intellectual and moral beauty; and the artistic sense is the yearning latent in all men to realise, each for himself and for the world, the ideal which is the directing and operative "motive" of the visible universe. It is only in the noblest races that this sense becomes nascent; as, among the Hebrews, in their profound sense of holiness, among the Greeks of beauty, in the Romans of discipline and order, in the French of self-sacrifice for humanising ideals and of philanthropy in the English; and it is only among the most richly and rarely endowed men of these generous races that this transcendental artistic sense becomes expressive—in a Homer, a Plato, an Aristotle, a Phidias, a Julius Cæsar, a St. Augustine, a St. Francis, a Dante, a Fra Angelico—while for the inarticulate multitude of men and women there remains, as their privileged participation in divinity:—

The desire of the moth for the star,
Of the night for the morrow,
The devotion to something afar
From the sphere of our sorrow.

ENGLISH AND FOREIGN TRAMWAYS.

THE following report by Mr. R. H. Scotter on legislation in all countries relative to tramways and light railways was handed into the Departmental Committee on Highways:—

The study of the law with regard to tramways and light railways in various countries reveals the fact that although the general procedure is nearly the same in many parts of Europe, various obstacles are placed in the way by which the practical results are widely divergent.

After the perusal of some hundreds of letters, notes and reports which I had collated from all parts of the world, and also of the documents placed at my disposal by the International Union, I addressed a few questions on practical matters to practical men, hoping thereby to arrive at a better result than would be possible from a long perusal of the dry bones of laws and regulations.

The first list of questions which I prepared dealt mainly with the promotion of tramways and light railways, and from the answers I received I have prepared this preliminary report.

I may say that in my study I soon found that I was going over the same ground again and again, and I beg to state my opinion that the most profitable way of making use of this study of the law in different countries is to select a few points and collect the maxima and minima, the best and worst specimens, and to bring those prominently forward.

I asked myself the question, Of what use is this study? and I think I am correct in replying—(1) A complete collection of laws, acts, rules, regulations should be formed and deposited at the head office of the union. (2) Translations of the most useful and the most harmful points and clauses should be made as guide-posts for all of us. (3) An effort should be made by all of us to gradually standardise all regulations, especially those connected with electric traction.

Although we live in different lands, we are one in our aims and one in our methods. We have the improvement of the means by which humanity moves from place to place always before our minds, and therefore when any good rule is made in one country we should be ready, without jealousy, to help our brethren across the sea to adopt it. When a hardship presses on one of our group some others may be able to suggest a remedy. These actual facts would be immensely useful when, for instance, deputations wait upon a Minister to urge a change in the law.

This is the spirit in which I put before you the first instalment of a study which may, I hope, be spread over many years, but which at present has little to show for a great deal of work.

I appeal to members to help in every way this most important and interesting study.

Date of Laws.

In point of time England was the first of European countries to introduce the street railway system used in America. In 1860 Mr. Train put down the Birkenhead line, and I may add that this system has lately been electrified, and during the first year of its new system carried 6,000,000 passengers. But England has been the last to pass a law to facilitate the construction of tramways and light railways, I mean a law which brings her regulations in line with those of other European countries.

In 1870 an Act was passed recognising for the first time in English legislation the principle that rails may be laid on the public road. This Act simplified the process of obtaining power to construct a tramway by substituting the obtaining of a provisional order from the Board of Trade for the long and expensive process of promoting a Bill in Parliament. The Board of Trade afterwards embodies several of these orders in a Bill, which it passes through Parliament. The Tramways Act, 1870, contained one clause, however, which makes the veto of the local authority a *sine qua non* to obtaining an order. The result has been the local authorities have used this veto to effectively prevent the promotion of tramways unless they obtained very heavy compensation from the promoters. The consents of the local authorities or of the landowners "fronting" on the proposed line must also be obtained, and the refusal of one-third to agree to the scheme effectively wrecks it. A further clause limits the concession to twenty-one years, and then the local authorities can purchase practically at an "old iron" price. It is hardly to be wondered at that under these regulations the tramway enterprise in England did not flourish. In 1896 the Light Railways Act was passed to facilitate the promotion of light railways and to cheapen procedure and also construction. Hence for the first time England is brought in line with other countries in this matter. Bavaria has possessed her authority to construct light railways since 1855; Belgium since 1875 and 1885; and Italy in 1896 obtained her law respecting mechanical traction. But to Belgium must be granted the premier position so far as the successful carrying out of the law has been concerned.

Light Railway Authority.

We may all, I think, learn a great deal from the excellent system of *chemin de fer vicinaux* now working in Belgium. I am of opinion, from a practical point of view, this happy result is attained by the clever system of binding together three discordant elements, which separately are placing a great deal of hindrance in our way all over the world—I mean the Government, the local authorities and the public. Belgium has united these interests in such proportion that each one is alone relatively harmless. In my opinion no light railway or feeder line can be successfully worked unless these three interests are combined. Exactly in what proportions their help and influence are obtained is a matter for local arrangement.

I go further, and say that not one of these three elements alone can show good results as a light railway authority. Private enterprise represented by the investing public cannot see sufficient return for its capital from the districts which are most in want of light railways. There are many reasons why the State cannot single-handed supply money for the construction and working of these lines, because the beneficial results which will accrue are more local than national, and there are still greater reasons why local authorities—in England, county and district councils; in other countries, provinces and communes—should not embark in this enterprise. Their horizon is strictly limited, and their purses are as a whole already too heavily drained. But the principal reason is that our work needs the attention of an expert with world-wide experience of a life-long character, and where will you find such an one among the local authorities, and if you find him will he be able to sufficiently influence his colleagues?

In well-defined urban centres there are many arguments why the means of communication should be under municipal control. But this only applies to such passenger traffic as is confined to the municipal area. Once outside this artificial limit another authority claims to regulate the traffic. Hence the introduction of misunderstanding, jealousy and strife, and in the end the great work not done at all.

In England the battle between the advocates of municipal tramways versus private enterprise has become so acute that a deputation from the Institute of Electrical Engineers lately placed the grievances of private companies before the President of the Board of Trade, with the result that he has promised to bring in a Bill to curtail the reactionary uses made by local authorities of their very wide discretionary powers.

To conclude this point, I am of opinion that for inter-urban

and country districts the Belgium system of uniting the elements—the State, the local authorities and private enterprise—is decidedly the best.

In urban districts private enterprise certainly produces best results, because it secures the best and most economical management, and allows of that continuity in the carrying of the work which local authorities, subject as they are to periodical changes, cannot aspire to. But it is always best to accord to the local authority that equitable amount of consideration which will secure the most beneficial results to traffic facilities and payment for the concession. The traffic results can only be attained by linking up the whole of the country, and this is only possible where the whole is in the hands of one organisation. In France the railways are partly guaranteed lines, and partly lines worked by private enterprise. The former are, according to the lines which are most in need of assistance, as they are in the through poor districts. Their average expense for the year is 89 per cent.

General Regulations.

The general regulations with regard to light railways and tramways in all countries are so similar that I will not repeat them. One point in our English practice I have not mentioned in many other countries. Following the departmental plans and proposals, His Majesty's Light Railway Commissioners hold a local inquiry in the district proposed to be served by the line. This inquiry is an open court, and evidence of a formal and informal character is heard. All parties interested may attend and give evidence for or against the scheme. It is very surprising how good an effect this innovation has produced upon Englishmen. In many countries, and in England before 1896, the inquiry is held at the instance of Parliament, many miles away from the actual spot to be served by the line. Hence purely local circumstances are not so fully treated as they can on the spot.

Length of Time to obtain Concession.

A point which is of vital importance to all concerned is the actual length of time which it takes to obtain the concession for the line. In England the actual time varies from nine months to two years. Tramways, however, promoted under Parliamentary rules are dependent on the sanction of Parliament, and must be passed or rejected within nine months.

In Belgium two or three years is required to obtain a concession; in Turkey, with sufficient influence, two or three years; in Italy six to twelve months, and it is a matter of time and patience; German practice gives about one to one and a half years. Our American friends, with their proverbial swiftness, allow a franchise to pass "through" in thirty days.

Duration of Concession.

Upon the most important matter—the duration of a concession, the period of time granted for amortisation of capital—very wide divergence of practice is discovered. Naturally an important element in this consideration is dependent on the ultimate owner of the concession—that is, after the concession period has expired. This, again, entirely depends upon the ownership of the other means of communication in the country—whether they are State-owned or in the hands of private companies.

In England all the railways are private property, and at present there seems no immediate possibility of a change. Railway concessions are granted in perpetuity, but also tramway or light railway orders fix a limit of time upon the granting of any concession, as far as they relate to the promoters only. A local authority, on the other hand, grants a perpetual concession, and this naturally leads to the question of the ordinary commercial rules for providing for the depreciation of capital. Under the Tramways Act twenty-one years from the date of authorisation was fixed as the limit of time granted with each concession. At the end of that period the local authority has the right to purchase the undertaking at a price calculated on:—Cost at date of purchasing the undertaking, less of constructing a similar line, less an allowance for depreciation due to wear and tear or to neglect, plus an allowance actually paid for street widenings.

It was largely on account of the approach of the twenty-one years reckoning—the end of the twenty-one years—that tramway directors hesitated before adopting electric traction. Hence it is also that many electric tramways in England to-day are municipal undertakings. They were bought at a low price from the original promoters and converted by the local authorities. The new light railways bill gives thirty-three and forty-two years for the concession, and also directs that the ultimate purchaser shall acquire the line as a going concern. But even with this extension of time we are still behind other countries.

In Leipzig the period granted is forty years; in Italy forty and seventy, according to the character of the line, urban or suburban; in Brunswick and Bavaria nine years. Prussian law, too, differentiates between large thirty and

um size fifty to seventy-five, and for small towns
In Switzerland eighty years is allowed, and in
time limit is fixed, the concession is granted in per-

Gauge.

ge adopted for tramways and light railways varies
countries. Belgium used the metre gauge (3 feet
80 per cent. of its mileage. For the remainder
of the corresponding heavy railway is adopted.
elle also uses the metre gauge, which, with modifi-
ound in Italy, Brunswick and Turkey. Leipzig
is known as the ordinary or normal, 1'458 (4 feet
and no less than seven different gauges have been
ng adopted for light railways, namely, 1 foot
2 feet, 2 feet 6 inches, 3 feet, 3 feet 6 inches, 4 feet,
ches. At the present time, however, 80 per cent.
ge authorised for light railway construction is on

ys into one vast secondary system, I think we
up our minds on the subject and use our influence
legislation to obtain our wishes.

before us the lamentable failure of the Govern-
d light railways in Ireland, where about 300 miles
ne been laid down under six different gauges, with-
erence whatever to each other. The consequence
ange of rolling stock is possible, although in some
he is overcrowded while an adjacent system has
riages standing idle.

ois the waste in having separate workshops, stations,
lds, &c., for each system, and we recognise the
ue of standardisation in the matter of gauge.

Width of a Roadway.

enes of light railway or tramway are laid upon the
most important that some minimum width should be
elected. At the present time much diversity of
ists.

and 27 feet and 24 feet (8.3 m. and 7.50 m.) of
y is required for ordinary roads. In addition to
s most English roads possess one or more foot-

rtice is by no means uniform, as each road authority
tain such road widening as may be necessary at
of the light railway. Tramway promoters are
ave 9 feet 6 inches between the outer rail and the
e of the footpath. This means that the ordinary
rsed by a tramway should be about 24 feet wide.
his width is obtained, but under exceptional circum-
rule is relaxed. Indeed, in Cork a tramway
street only 16 feet wide.

Ultimate Owner of the Light Railway.

a point to which I wish to draw attention is, What
ultimately become the owner of all concessions?
ntroduction of electric traction many important
varisen which make this a most important considera-
have already mentioned, the ultimate possessor of
ys within municipal areas in England will be the
orporation, and this practice will be followed at
Athen, Brunswick and several other towns. Under
ays Act they are empowered to take over the
he "old iron" price. Under the Light Railways
several tramways have been promoted under this
just at least pay its market value. Light railways
try districts pass into the hands of the local
laid in only one local district, into the hands of
d local authorities, if they all agree to purchase, if
rlyway traverses more than one district.

recent enactments the County Councils (Provincial

is by far the best practice, but it needs a strong
to initiate it.

mind, light railways and tramways will prosper in
to the number of liberal facilities for promotion,
and working which are granted to their promoters.
it thrive if laid under such cast-iron fetters as are
heavy railways. Granting this proposition, it is
mulate such rules and regulations, such clauses and

sections in Acts of legislature, as will most effectively carry
these points in the actual working of the lines.

In conclusion, I wish to point out that the study of the law
is the most extensive of all other studies. It embraces all
others. It focuses all others in a point. We have only to
remember what an enormous influence the alteration of one
word in a law has to convince ourselves of this fact. But in
order to alter that one word we have to impress the Govern-
ment with many instances of its application.

Therefore I propose that a few subjects be selected, say,
the evils of municipal trading, uniformity of gauge, length of
time for concession, or any others, and that we obtain actual
examples of the working of the law for or against these, which
when tabulated and printed become the most effective means
we can possess of attacking the powers that be, in order to
obtain what we all strive for—the best and most economical
means of pursuing our most important profession, that of pro-
viding for the rapid transport of passengers and goods, by
means of a secondary system of tramways and light railways.

QUEEN'S COLLEGE, OXFORD.

DURING the long vacation important works have been in
progress, including the installation of the electric light
throughout Queen's College, Oxford, and the overhauling of a
part of the drainage. In introducing the electric light it was
convenient to pass a cable through the crypt underneath the
apse of the chapel which was erected in the north-east corner
of the great quadrangle in 1714. On opening the crypt it was
found to contain on a stone rest a leaden casket with the
remains of the founder, Robert Eglesfield, chaplain and con-
fessor to Philippa, Queen of Edward III, from whom the
college derives its name. Eglesfield died in 1349, aged 43,
and was buried in the college chapel. Cut deep in the lead on
the top of the casket are the words "Reliquiæ Fundatoris," a
peculiarity being that the letter "D" is turned backwards. No
date accompanies the inscription. In front were coffins of
Provosts Brown, Fothergill and Collinson; and in a recess to
the right on entering were the coffin of Provost Smith and the
remains of Provost Haltom. The latter was buried under the
old chapel in 1704, but his coffin was removed when the new
chapel was built a few years later.

There were also in the crypt some curious memorials which
had formerly been placed in the old chapel, and at its demoli-
tion were probably for safety transferred to this spot. One was
a broken stone, to which was attached a small brass represent-
ing a tun or barrel, with a musical note known as a "long"
upon it, with the capital letter "R." This is a rebus of the
name "Langton," Robert Langton having been a doctor of
laws and nephew of Bishop Langton, who at one time was pro-
vost of the college; Robert built the large antechapel to the old
chapel in the year 1518. The stone had also upon it a depres-
sion in which the head of the figure of Langton had rested. In
the muniment-room of the college was a brass which in the last
century was believed to be that of Robert Eglesfield, the
founder of the college, but archæologists described it as of later
date, and no doubt correctly so. The head of this brass fits
into the depression in the stone on which is the rebus, and it is
certainly that of Robert Langton.

Another interesting discovery was a brass representing the
figure of a man with an inscription below. The features and
the details of the inscription are all rubbed quite flat. This has
been identified as the memorial of Nicholas Hyenson, fellow of
the college in 1477. In addition there was found a stone with
an inscription of "Radulphus Hamisterley, Master of Uni-
versity College." Above the inscription in the depression of
the stone there was evidently originally a figure, but this has
disappeared. In the crypt were the three gravestones, which
formerly rested on the floor of the old chapel, of Provost Airay
(provost, 1599-1616), Provost Christopher Potter and Provost
Langbaine. Airay's stone has a brass plate with an inscription
upon it, and the other stones are engraved with the arms of the
provosts. In the identification of these memorials an engraving
by Burghers representing the ground plan of the old chapel
was found useful. This plan also facilitated the determination
of the position of the west front of the ante-chapel, which was
disclosed in the excavations made for drainage purposes in the
line of the path leading from the great gate of the college to
the chapel passage.

The drainage works also disclosed some feet below the
surface two passages, one in the front quadrangle and the other
in the back, the object of which at first seemed doubtful. It
was conjectured they might have belonged to an older building
occupying the site of the present college. Mr. James Parker
(president of the Oxford Architectural and Historical Society),
who was consulted, satisfied himself that the tooling on some
of the stones corresponded with the tooling of some of the
stones which were laid when the college was rebuilt. It is now
looked upon as certain that the passages were conduits leading

to large blind wells intended to receive the surface water from the college roofs and quadrangles, and that the conduits were made so large to hold the flood water in case of an exceptional rainfall.

The crypt has been closed, the leaden casket and coffins being left as they were found. The remains of Provost Haltom, from which the coffin had fallen, have been deposited in an oak casket and the gravestones have been placed in the ante-chapel. The brasses found in the crypt, with the stones to which they are attached, are fixed in the wall of the apse, together with two other brasses that have long been preserved in the muniment-room. They will form an additional feature of interest in the chapel, the foundation-stone of which was laid on February 6, 1714, the dedication taking place on All Saints Day five years later. The illuminated windows in the chapel by Van Ling (1635) are in good preservation, and were removed from the first chapel. They depict scenes in the life of Christ. The westernmost windows are earlier, and two of them bear the date (1518) of Robert Langton's ante-chapel. Some tiles of an ornamental character were discovered *in situ* near the western entrance of the old chapel, some of them adorned with the same rebus as is on the brass which formed part of Langton's memorial.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

AT a meeting of this Society held in Chetham's Hospital, Manchester, on the 9th inst., Mr. W. E. A. Axon delivered his presidential address. The address was, in effect, a survey of the history of antiquarian research in Lancashire and Cheshire. He mentioned that the Society was formed in 1883, under the presidency of Dr. Boyd Dawkins, and that the results of its labours are recorded in "Transactions," which now fill "a shelf of goodly volumes." It might be asked, he said, if the various societies which had been actively at work in the nineteenth century had left anything in the way of antiquarian enterprises for the twentieth century to accomplish. Those engaged in antiquarian study, at any rate, knew that there was still an almost unlimited field before them. Much, indeed, had perished for lack of observation. If, for instance, in the seventeenth century there had been a systematic examination of all that was then to be seen of Roman and Mediaeval Manchester, our knowledge of the city's past would have been infinitely greater. And the same thing might be said of every district in the two Palatinates. There was all the more reason therefore why in the present day they should carefully glean and garner what remained. There was great need for the systematic arrangement of the results of antiquarian research. A short paper was read by Mr. Ernest Axon on "Walter and Margaret Nugent," the founders of the Nugent Charity, which is "the oldest and almost the smallest of the numerous funds which go to make up the Lord Mayor's charities."

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

AT the annual meeting the president of the Association (Mr. Arthur Harrison) delivered his presidential address. He took as his subject the housing question, and dealt at some length with the construction of block dwellings. At the outset he alluded to the evils of overcrowding, and to the necessity, in the interests of health, of a clearance being effected as far as possible in insanitary areas. He explained various schemes which had been suggested for bringing about an improvement, and pointed out that a scheme which might be suitable for one town might be unsuitable for another. The flat system in Birmingham, for instance, seemed to be regarded with disfavour, but that was largely on account of its novelty. Still, the fear that the people would not take to flats no doubt influenced the Corporation when they produced the Milk Street tenements, as they were in the nature of a compromise. They were built on the principle of flats, but only two storeys high, and that he regarded as a mistake. Whether there was any prejudice against four-storey flats would soon be proved, because two schemes of block dwellings were being carried out in this city. He had inspected the buildings of many municipal and private enterprises, and had been disappointed with the block dwellings because better results might have been obtained for the money expended. The two schemes which were in progress in Birmingham, however, were different. He described in considerable detail the erection of these dwellings, explaining the improvements and conveniences which were secured in comparison with other dwellings, and said the tenements could be let at remarkably cheap rents to the poorest tenants, and still yield a return of 5 per cent. on the capital. Judging by the number of applications for the tenements, he did not think there was anything to fear from prejudice. As municipal cor-

porations had facilities for borrowing money at cheap rates, it would be possible for them to do much towards solving the housing problem and in bringing about an amelioration of the condition of the working classes, but most corporations had already borrowed up to the hilt. Moreover, it was probable that Corporation work was more costly than private enterprise. Still, whoever undertook the problem would have to be carried out. It was probable that the problem would be found ere long, and in the case of the work the architects would play a by no means unimportant part.

Mr. Harrison was cordially thanked for his address.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE first ordinary meeting of the fifty-sixth session of the Liverpool Architectural Society was held on the 11th inst. evening. The president, Mr. John Woolfall, delivered an interesting address, in the course of which he alluded to the great importance of impending architectural developments in the city, as shown in the proposed new offices for the Board, the new Cotton Exchange and the Cathedral. He mentioned the immense schemes in progress and contemplated by the City Council. Referring to existing buildings, he expressed the desire that St. George's Hall should be used as a people's hall, with exits on to the new terrace gardens adjoining, where music could be heard through, and that new law courts should be built on the same scale as a people's hall, with a removed into it, and where the enjoyment of the one would mar the business of the other. The opening-out of the Gardens and William Brown Street, in his opinion, enhanced the architectural impressiveness of the surrounding buildings. The Art Gallery was, however, only a poor example compared with those in continental cities which were so important as Liverpool, and it would no doubt have to be replaced by one much more pretentious and commodious. He said the Corporation would watch the streets which lead to the proposed cathedral, as opportunities might occur to lay up a grand thoroughfare from the centre of the city to the housing question, Mr. Woolfall said he thought the housing of the middle classes should command greater attention. The pitiful line of ugly streets, the everlasting want of grouping and planning was the main defect in the suburbs. There was a demand for more artistic surroundings. He also thought the importance of residential flat dwellings, the difficulty of erecting them under the present by-laws of the city were well worthy of discussion.

On the motion of Mr. Hartley, seconded by Mr. Willink, a hearty vote of thanks was tendered to the president for his address. Mr. Hartley expressed the opinion that the corner of the Old Haymarket and St. John's Lane was a very eligible site for a new council chamber.

TURTON TOWER.

THE approaching sale of the Horrobin estate at Appleton has lately had the effect of reviving the interest in Turton Tower, a building, says the *Bolton Courier*, which has so long and justly been held in high esteem by antiquarians of Lancashire as one of the most ancient in the United Kingdom. Few edifices in the county have been the subject of greater and more diligent research, and have carried the archaeological student further back into the past. Turton Tower is a link between the feudalism of the present age, and its possession has inspired the interest of ancient associations in the breasts of many men. The date of its erection is given in the annals of the county as 1101 (the second year of King Henry I.) when it was licensed for castellation. The exigencies of lawless age rendered necessary the construction of fortified buildings of its type, which were as much a necessity of defence for their owners and dependents as a source of utility. When predatory bands of Scots penetrated into the county of Lancashire and family feuds were kindled, events and more sanguinary than they are to-day, it was certainly a truism that an Englishman's home was his castle. There is authentic knowledge of Turton Tower in 1194-95, when, according to one of the records of the Society, "Richard, son of Robert (de Lathom), held the half carves of land, viz. three in Childwall, one in Turton, and a half fee in Brochels." In the thirteenth century the Tower, set in its forest environment, must have been regarded with great respect by the inhabitants of the

probably chiefly armed retainers or the class of serfs typified by the author of "Ivanhoe" in the chivalry and Wamba. Tournaments (there is a record of 1361), banquets and the excitements of the chase were the time of the Tower family and their dependents was not sterner business on hand. Since then, changing times and customs, the building has lingered a year of grace, when, still strong in its age, the only sound that falls upon it from the outside world is the noisy roar of an express as it carries the descendants of the marauding Scots through Lancashire on more legitimate errands.

According to the "Notes on Turton Tower" issued by the Rev. C. Scholes, the manor of Turton was held by Roger (de Holland), who was most likely brother to John, one of the twenty-five conservators for public highways by Magna Charta. At this time it became the property of Henry, Duke of Lancaster, from whose family it passed into the knightly family of Orrell, who owned Turton very early in the fifteenth century, and who came from the ancient family of that name at Orrell, near Warrington during the reign of Edward IV. (1461-83) the family claimed the manor of Turton, but Lord Derby's will on October 1, 1500, was in favour of Ralph Orrell, William of Turton, by his first wife Elizabeth, daughter of Robert, a family who, 150 years previously, held the office of a knight's fee in the ancient manor of Turton. The property remained in the Orrell family until the reign of James I.—(1628)—Turton Tower and lands were purchased by the last of the Orrells for 4,000*l.* by Humphrey, a Christian manufacturer, Clayton, near Manchester, to whom the estate was considerably mortgaged.

Chetham, as is well known, was a munificent benefactor. One of the Bolton parish church was in his possessions. A man of modest nature, and when commanded by James I. to proceed to London to accept the honour of knighthood, he declined, and was waited upon at Turton by the king's messengers to "compound with those for not appearing to the king's crowneation." He was told that "you are not to answer the contrary at your peril." With a fearful threat over him, it is to be presumed he was glad to escape with "the option of a fine." It is recorded that he was in 1634 appointed High Sheriff of Lancashire, "greatly to his annoyance." Humphrey died and the manor passed to his nephew, George, who was an Alderman and Sheriff of London. The property remained in the family through some generations. One of the Humphreys was noted for the peculiarly morose aspect in which he looked upon life. It is stated that his coffin by him, and pleasantly would discourse of his "bed" in his study (there his coffin stood). It was "improved" by a sermon of 40,000 words by the Rev. John Livesey.

With the death of Edward Chetham, a partition took place, and printed records of the names of the owners of the tower slightly differ. Families of Bland and Brierley appear to be intermingled. Ultimately a Mr. James Brierley came into possession, and relieved himself of the mortgage in the old parish church to Robert Knowles, a clergyman. He left five daughters, one of whom, born in 1700, married Mr. Edward Frere (father of the well-known Sir Edward Frere), whilst the second married Mr. John, of Kelsey Park, Kent, son of Sir Richard Hoare. The third fell to the lot of the eldest, the wife of Edward Frere, the husbands of Mr. Greene's daughters were at the disposal of Turton. Mr. Greene died in 1814. The Turton property was acquired by Mr. James Brierley, the only lord of the manor, the Tower being the occupation of Mr. Wm. Horrocks as tenant. A portion of the estate was sold to the Lancashire and Yorkshire Railway Company for their Bolton-Blackburn line, on June 13, 1848. Soon after the purchase of the property Mr. Kay took up his residence in the Tower, and on June 15, 1835, held his first court leet—a court of record, which preceded by two centuries the institution of the leet. All persons resident within the leet were to appear, and a day, and being above twelve years of age, knights, prelates, barons, people of religion, and all persons of the leet and were compellable to attend. The business was practically that now discharged by the magistrates. Mr. Kay was born at Edge Fold Farm, near Bolton, and his ancestors are stated to have settled down during the reign of Henry VIII., and it was said to have been his great-grandfather who became Lord of Turton. He was first attached to the Tower but afterwards became an inventive flax and cotton spinner. His death occurred in February 1857, and he was buried in Turton Church, the manor afterwards passing to his son, of whom he had six. The Tower was occupied by Robert and James, but probably on account of the incapacity to govern the property his brother James Brierley, the acknowledged Lord of Turton. It is recorded of him

that he "led the life of a country gentleman and was loved by his tenantry." He died in November 1876 at the Tower, and left his brother Robert and his own son James in possession. In February 1878 Robert died, and his nephew James was left in full possession. During the ownership of the Kays it was fully restored. In 1890 it entered into the possession of Miss Appleton, and has latterly been in the tenancy of Mr. W. R. Rigg.

Architecturally the chief interest of the building lies in the solid grim-looking tower, which is about 45 feet long and 28 feet wide. It is built square to the points of the compass. The lower portion of the Tower, including in height the present dining and drawing-rooms, is built of rough rubble stone with massive quoins at its main angles, and may be assigned (says Henry Taylor in his "Old Halls of Lancashire and Cheshire") to the first part of the Perpendicular period, or even to an earlier date. The tiny Mediaeval windows suit a building whose main purposes were those of defence. It was, in fact, like Radcliffe Tower and other houses in the district, practically a castle. Its walls are about five feet in thickness. The original fortress appears to have been three storeys in height with very low rooms, but at the end of the reign of Queen Elizabeth, William Orrell partially rebuilt the place, and one of his first proceedings must have been, acting in the spirit of that age, to endeavour to get loftier and better lighted rooms. He added to it another stage, built with the stiff and regular masonry of that period, and space was given for the insertion of the present large windows. In the Elizabethan or Jacobean recasting the bottom stage of the Tower became the great hall, with the usual passage through at its north end. It is entered by a spacious porch on the east side. The fine Jacobean staircase is to the north of the porch. The building contains many quaint apartments, with handsome oak wainscoting and fine plaster ceilings and friezes, which offer a special charm to the lover of antiquity. Near the tower, standing on Dove Hill, is a pedimental turret with doorway and arched window, which is said to have been an outlook in the time of Cromwell.

In these matter of fact times it is the practice to discount anything in the domain of the legendary, and it is unlikely that the prospective bidders for the ancient Tower at Turton will find in the catalogue of the sale any reference to the "invisible" effects of the place. Every self-respecting mansion with a pedigree stretching back into centuries has its own peculiar "something" about which its occupants speak with bated breath and awesome look, and it would be a pity to rob Turton Tower of its valuable supernatural asset. Tradition, that wrinkled old dame who hovers about these haunts of ancient days, has left a gossip record that "the Tower at Turton is haunted by a lady who can occasionally be heard passing along the lobbies and into the rooms as if dressed in very stiff rustling silk, but is never able to be seen. It is said that the sound is most distinct as she sweeps along the broad massive oaken staircase which leads from the hall into the upper rooms." Many traditions also prevail in the neighbourhood respecting the wealth and expenditure of Sir Humphrey Chetham during his residence at the Tower, and certainly they are quite justified by those portions of the structure which bear his name. Ben Brierley, the well known Lancashire writer, in his interesting "Journal," has associated the place with one of his quaint stories. There is also a very romantic legend dating back to the Norman epoch of a Lady Orrell who night after night maintained a lonely silent vigil in one of the upper chambers of the Tower, and kept a lamp burning in the lantern of the building to give light to her wandering son (who had fled the country with the Duke of Normandy), should he by any chance return at night. Her younger son Sigismund declared that the halls of Turton should never more resound with the clank of the heavy boots of Ralph, the heir, but his designs were frustrated by two stalwart Saxon retainers of the family. The missing Sir Ralph of course returned, and amid great rejoicings and banqueting to give a happy conventional end to the story, and his mother in her thankful heart bade "every Lady of Turton place a light in the Tower for her absent Lord"—an enjoinder which it is said was observed in honour of the Lady Orrell for many generations. There is no doubt that the ancient house has witnessed many strange scenes, and if its walls could give utterance they might many curious tales unfold. As to the aforementioned ghost, its appearances have ceased, and the only noise that is likely to disturb the sleeper is the rustling leaves near the old window casements. Whoever may be the future possessors of Turton Tower they will acquire an heritage which (to quote Mr. Scholes's "Notes") has been handed down from some of the most noble and opulent families in the country for more than 800 years, through times of terrible civil and national wars as well as through the brighter and more sunny days of peace and prosperity.

It may be incidentally mentioned in closing this article that there is a legend (which we give for what it may be worth, and which the curious will find noted in Harland and Wilkinson's "Lancashire Legends and Traditions") concerning the farm-

house situated a short distance from the Tower, known by the name of Timberbottom, or the Skull House. It is so-called from the circumstance that two skulls are or were kept here, one of which was much decayed, and the other appeared to have been cut through by a blow from some sharp instrument. Tradition says that these skulls must be kept in the house or the inmates will never cease to be disturbed. They are said to have been buried many times in the graveyard at Bradshaw Chapel, but they have always had to be exhumed and brought back to the farmhouse. They have even been thrown into the adjacent river, but to no purpose, for they had to be fished up and returned to their old quarters before the ghosts of their owners could once more rest in peace.

TESSERÆ.

Colours of the Ancients.

THAT the painters of the earliest period had not such abundant resources in this department of art as those of the later is quite consistent with experience, and does not require demonstration, but to suppose that they were confined to four pigments is quite a gratuitous supposition, and is opposed to both reason and evidence. Sir Humphry Davy analysed the colours of the so-called "Aldobrandini marriage," all the reds and yellows of which he discovered to be ochres; the blues and greens to be oxides of copper; the blacks all carbonaceous; the browns mixtures of ochres and black, and some containing oxide of manganese; the whites were all carbonates of lime. The reds discovered in an earthen vase containing a variety of colours were red oxide of lead (minium), and two iron ochres of different tints, a dull red, and a purplish red nearly of the same tint as prussiate of copper; they were all mixed with chalk or carbonate of lime. The yellows were pure ochres with carbonate of lime, and ochre mixed with minium and carbonate of lime. The blues were oxides of copper with carbonate of lime. Sir H. Davy discovered a frit made by means of soda and coloured with oxide of copper, approaching ultramarine in tint, which he supposed to be the frit of Alexandria; its composition, he says, was perfect—"that of embodying the colour in a composition resembling stone, so as to prevent the escape of elastic matter from it or the decomposing action of the elements; this is a species of artificial lapis lazuli, the colouring matter of which is naturally inherent in a hard siliceous stone." Of greens there were many shades, all, however, either carbonate or oxide of copper, mixed with carbonate of lime. The browns consisted of ochres calcined, and oxides of iron and of manganese and compounds of ochres and blacks. Sir H. Davy could not ascertain whether the lake which he discovered was of animal or of vegetable origin; if of animal, he supposed that it was very probably the Tyrian or marine purple. He discovered also a colour which he supposed to be black wad, or hydrated binocide of manganese; also a black colour composed of chalk, mixed with the ink of the sepia officinalis or cuttle-fish. The transparent blue glass of the ancients he found to be stained with oxide of cobalt, and the purple with oxide of manganese.

The Mediæval Contractor for Art.

Rude and uncouth descriptions of works of art during the Middle Ages, corresponding in character with those works, are to be found in some of the contracts respecting their execution contained in the histories of art of that period. Works of art were then bargained for and measured out, and, indeed, executed as mere pieces of furniture, and were so regarded, and, in fact, thus only did they deserve to be considered. In the 25th of Edward III., in the Rolls of the Exchequer, September 26, 1351, there is a charge to "William of Padyngton, for making twenty angels to stand in the tabernacles, by task-work at 6s. 8d. for each image, 6l. 13s. 4d." In the early ages of painting, and, indeed, as late as the time of Henry VIII., an artist of even first-rate powers in his day was looked upon as a mere mechanic. Works of art were bargained for and measured out like commercial articles; pictures were done by contract and paid for by the square yard. Very curious documents are now extant relative to agreements made for the execution of works of this description. In the fifteenth century we are informed of a contract which the Earl of Warwick made with his tailor for the painter's work to be displayed in the pageantry of his embassy to France. Among the items in this artist's bill is one "for a grete streamer for the ship of xi yerdes length, and viii yerdes of brede with a grete bere and gryfon holding a ragged staffe, pondred fule of ragged staves, and for a grete crosse of St. George: for the lynming and portraying 1l. 6s. 8d." This age, indeed, produced little beyond mere decorative painting; to this period, however, belongs a famous painting of the "Dance of Death," which was executed in the cloister of St. Paul's, and which is supposed to have furnished the prototype of Holbein's celebrated design.

The Society of Architects will hold its nineteenth annual general meeting on Thursday next, at St. James's Hall.

GENERAL.

The Board of Education have received a communication from the Foreign Office intimating that an International Art and Horticultural Exhibition is to be opened at London on May 1, 1904. A hope is expressed that England will contribute largely to this Exhibition.

The Authorities of King's College Hospital have approved of the proposal to remove the hospital to a new site in South London. Application will be made to the House of Lords against the recent judgment of the House of Commons for an Act to contain any powers necessary to effect the proposed removal of the hospital, and power to sell or otherwise dispose of the present site.

The Corporation of London have agreed to purchase the Bridge House Estates committee 50,000l. for the purpose of widening the road between Albion Place and Blomfield Street between Albion Place and Blomfield Street. The money will be paid from the consolidated fund.

The Metropolitan Public Gardens Association have decided, in view of its detrimental effect upon public health, to urge the Paddington Borough Council to appeal to the House of Lords against the recent judgment of the House of Commons in reference to St. Mary's Recreation Ground. It was decided that a public body holding public space has the same rights as a private owner has of putting up buildings to a reasonable distance from the boundary of public space, instead of building right up thereto, as is done in Paddington.

The Architectural Association will hold a convention at the Royal Institute of Painters in Water-Colours on Wednesday, October 28, at 8 o'clock.

M. Léon Benouville died suddenly in Paris last in his forty-third year. Although so young a man obtained high standing in the architectural profession as inspector of historic monuments, member of the Society of Fine Arts, vice-president of the Society of Artists. At the last Salon he exhibited furniture designed for his class dwellings.

The Late Mr. George Gilbert has bequeathed his colour drawings and oil-paintings by his brother, to John Gilbert, R.A., to the London Corporation for a gallery, and if declined to the Tate Gallery.

The Boring of the Simplon Tunnel, it is expected, will be finished next May, and the tunnel will be complete by the end of the year.

The Royal Society of British Artists elected the following members:—W. B. Lamond, Forbes Watson, E. Anderson, Paul Montford, Carruthers Gould, C. Fletcher Watson.

The First members' meeting of the Liverpool Art Society (56th session) will be held at the Public Rooms, William Brown Street, on Monday next, the 19th inst., at 6 P.M., to hear a paper by Mr. Peter Cowell, City Engineer, on "Venice," illustrated by lantern slides. Mr. John F.R.I.B.A., in the chair.

Mr. Henry Marc Brunel, whose death at the age of sixty-one occurred on the 7th inst., was the second son of I. K. Brunel, the engineer. He became a partner with Wolfe Barry, and was associated in the construction of the Dock, the railway bridge over the Thames at Blackfriars, the bridge recently erected at Connel Ferry, as also the Tower Bridge.

A Confectioner of Marseilles has brought an action against the municipality claiming 390,000 francs damages for loss of trade owing to the smell of the tar of the paving, which flavoured his stock.

The Excavations in connection with Glastonbury Village, which were commenced in 1892, are to be continued next year under the joint superintendence of Mr. Bulleid, F.S.A., and Mr. H. St. George Gray.

The Council of the Institution of Civil Engineers have decided, in addition to the medals and prizes given for competition, to discuss at the meetings of the Institution in the future the following awards in respect of other papers presented with in 1902-03:—A Telford gold medal to George J. (London); Crampton prizes to A. B. Brady (Brisbane); Maxwell Lawford (London); Telford premiums to T. O. Bourne (Tien-tsin), R. H. Rhind (London), H. (Marikuppam), G. A. Hobler (Cairns), A. J. Goldsmith (London), F. H. Frere (Derby), R. Appleyard (Leeds), Hamilton, B.Sc. (London). For students' papers the prizes are:—The "James Forrest" medal and a Millepied medal to Waude Thompson (Burton-on-Trent); the "James Joule" medal and a Miller prize to I. V. Robin (Hartlepool); Miller prizes to H. A. Bartlett (London), Morgan (Glasgow), H. S. Watson (London), J. V. (Gloucester), O. B. Rattenbury (Doncaster) and C. I. (Newcastle-on-Tyne).

Architect and Contract Reporter.

EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff **A VERY EMINENT BARRISTER**, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our **LEGAL ADVISER** will further answer any legal question that may be of interest to our readers. All letters must be addressed "**LEGAL ADVISER**," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London
a' the Provinces results of Competitions and Tenders
a' other particulars of Works in progress in which they
may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Readers are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

A great disappointment is frequently expressed at the non-appearance of Contractors Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

R. H. TON.—Nov. 9.—Designs are invited for a new
Premiums of 50%, 30%, and 20% will be paid to the
second and third premiated designs respectively. Par-
up to Sept. 29 on receipt of 1 guinea, which will be
on receipt of design. Mr. Leonard Holmes, hon.
Brighton and Hove Hospital for Women, 76 West
Brighton.

HARROGATE.—Oct. 26.—Competitive designs are invited for a new iron and glass pump-room and colonnade in the Victoria Gardens. Mr. F. Bagshaw, borough engineer, Municipal Engineer's Office, Harrogate.

LIVERPOOL.—The Liverpool Cotton Association, Ltd., invite Liverpool architects only to send in plans in connection for the proposed new Cotton Exchange. Mr. Peter J. W. Secretary, 50 Brown's Buildings.

LAND.—Nov 9.—Competitive plans for the erection of shops and workmen's dwelling-houses and belonging to the Corporation in Fore Street are Premiums of £15 15s, £10 10s and £5 5s. will be for the sets of plans and certificate which may be for the first, second and third respectively. Mr. W. Macdonald, town clerk, Kilmarnock.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100*l.*, 50*l.* and 25*l.* will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20*l.*, 10*l.* and 5*l.* will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WALES.—The Llwynypia Workmen's Institute invite tenders for the preparation of plans and specifications of a workmen's hall to seat 1,500. Secretary, Workmen's Institute, Llwynypia.

WALES.—Nov. 9.—Competitive designs are invited for a public library to be erected in Evelyn Road, the total expenditure, including fixtures, not to exceed £2,000. A premium of £10,10s will be paid for the approved design. Mr. Samuel Jones, clerk, Old Road, Skewen, Neath.

CONTRACTS OPEN.

ACTON.—Oct. 20.—For the erection of an engine-shed, &c., at Old Oak Common, Acton, Middlesex, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

ASHINGTON.—Oct. 21.—For additions to the bakery department, Ashington (Northumberland) Industrial Co-operative Society, Ltd. Mr. John Magin, secretary.

BATLEY.—Oct. 20.—For the erection of retaining and fence walls in Carlinghow Lane. Particulars may be obtained at the office of the Borough Surveyor, Branch Road, Batley.

WESTMINSTER.—Oct. 28.—For the reconstruction of slipper
baths at the Marshall Street establishment, including the pro-
vision and fixing of new baths, valves and supply pipes, also
new floor and sanitary work. Particulars may be obtained at
the Works Department, Westminster City Hall, Charing Cross
Road, W.C.

THE Wandsworth Council have under consideration a
scheme for providing bath-houses as distinct from swimming-
baths. Municipal baths invariably comprise one or more
swimming-baths and a number of slipper-baths. It is proposed
in Wandsworth to build a series of slipper-baths in a separate
building, and to erect these bath-houses in poor populous
quarters, available for the use of the inhabitants at moderate
charges. Twenty or more such bath-houses could be provided
for the cost of a single institution like the modern baths and
washhouses. Some time ago an architect, who has dis-
tinguished himself by the number and variety of municipal
baths and washhouses he has constructed, wrote in favour of
spreading out in sections throughout a district the various
things which are now grouped in huge buildings under the
general name of baths and washhouses. It remains to be seen
whether Wandsworth will begin to carry out the idea.

TRADE NOTES.

more fires speedily extinguished by the "Titan" in Yorkshire have just been reported to Messrs. Mills & Co, of Radcliffe, proprietors of the "Titan"

September 26 a fire was found to have broken out in on chamber at the Arkwright Mill, Hamer, Rochdale. has recently been fitted with the "Titan" sprinkler, as not until the sprinkler alarm gong sounded, owing el sprinklers having commenced to throw water on the hat anybody was conscious of the fire. The fire was to the cotton and was completely extinguished.

regret that in our notice of the opening of the new ough Theatre we omitted to mention that Messrs. F d & Co, of "Impermeable" Stone Works, Coopersale Homerton, manufacturers of impermeable concrete and artificial stone stairs, steps, cills, copings, &c., e manufacturers of the whole of the artificial stone es, and that Messrs. Diespeker, Ltd, of 57 and 60 i Viaduct, carried out all the beautiful mosaic work, ing been selected by the architect owing to its durable t, only the hardest marbles of their respective kinds ed in its construction.

B. and S. Folding Gate Company, of 19, 20 and er Street, Upper St. Martin's Lane, sole manufacturers e B. and S. patent folding gates, have recently secured owing contracts for the supply of their folding gates, doors and shutters, &c.:—*Pall Mall Gazette* building, Street, W., five B. and S. patent folding gates and inner-steel rolling shutters; Corporation of Leicester ing station, four Kinnear steel rolling doors; Corpora- Manchester, Stuart Street generating station, one r steel rolling door; the Underground Electric Rail- London, Ltd., generating station, Lots Road, Chelsea, inner doors; Corporation of Lowestoft, car sheds, one r steel rolling door in addition to those already fixed; eation of Pietermaritzburg, Natal, 13 Kinnear steel n doors; Corporation of Burnley, car sheds, twenty-two r steel rolling shutters; Corporation of Rochdale, old car shed, twenty Kinnear steel rolling doors; opation of Colchester, car sheds, six Kinnear steel rolling ts; Corporation of Derby, car sheds, nine Kinnear steel doors; Admiralty Buildings extension, Whitehall, eight S. patent folding gates. As an instance of the many

classes of work for which these shutters are used, the Company direct our attention to the fact that they recently supplied four of them to a coach and motor car house at a large range of private stables at Addlestone. They have also a contract in hand at the present time for nine shutters for the principal entrances and windows on the ground floor of a large private mansion in Ireland.

VARIETIES.

THE new Sunday school in connection with the Cheetham Hill Congregational church, which has been erected at a cost of 1,800*l.*, was opened on the 3rd inst.

AS a result of the recent heavy rains twelve of the arches of the massive stone viaduct, 40 feet high, which crosses the western valley of Monmouthshire at Risca have collapsed. It is feared that other arches over the river Ebbw will also give way.

ON the 8th inst. the Bishop of Leicester dedicated the restored south aisle of the church of Holy Trinity, Rothwell. This is the third section to be completed of the important work of restoration of the fine old church, and the event excited a large amount of local interest.

THE LONDON COUNTY COUNCIL have approved the estimate of 1,340,000*l.* for the construction of a tunnel under the Thames between Rotherhithe and Shadwell, and authorised the committee to prepare the specifications and plans and to take other steps for carrying out the work.

THE housing committee of the Marylebone Borough Council reported on Tuesday that they had prepared a scheme under the Housing of the Working Classes Act for submission to the London County Council. It is proposed to acquire, at an estimated cost of 23,000*l.*, an area in Devonshire Place, Devonshire Street and Salisbury Street, and erect thereon four blocks of dwellings to contain 360 rooms and eleven shops.

IN the Birmingham Architectural Association's annual report, just issued, it is stated that the question of registration had been much discussed, but, owing to opposition in the profession, the prospects of a Bill being passed are for the present remote. The report also states that an advisory committee has been appointed, the business of which is to consider and advise the Council on matters such as professional practice,

questions raised by the Master Builders' Association, and questions referred to it by the Council. A protest has been made against the licensing committee's new by-laws regulating the building of public-houses and alterations to existing ones.

THE new church for the populous district of Malvern Link known as Newtown was dedicated by the Bishop of Worcester on the 3rd inst. The Church of the Ascension is subject to the parish church of St. Matthias, which is situated but a short distance below the new church. The choir is 18 feet wide, 36 feet long and 36 feet high. In place of an east window there are paintings representing the Incarnation. The altar screen is composed of elaborately ornamental ironwork in black and gold, surmounted with a triptych representing the Crucifixion. There is a carved pulpit and a lectern. In lieu of aisles there is a stone arcade built in the walls on either side, at a height of 13 feet from the floor. There are sittings for 400. At the west end there is a small tower containing a baptistery, the font being ornamented with paintings and carved figures, an organ chamber, and the belfry in its three successive stages. The vestry is constructed underneath the choir.

A NEW town hall was opened at Oundle, Northants, on the 7th inst. The front of the building is of stone, with Weldon stone facings. On entering, a vestibule is reached by a few steps, and on either side are cloak-rooms, &c. From the vestibule a staircase leads to a gallery, which looks upon the main hall, but can easily be shut off by sliding glazed sashes. The main hall, a handsome room, is about 60 feet by 40 feet, and a convenient stage, 13 feet deep, is also provided. Beneath the stage is a dressing-room. The roof is of matchboarding, perforated for ornamentation and ventilation purposes. A system of hot-air heating has been arranged. The new hall promises to prove a convenient room in which to hold concerts, lectures, &c. It is in fact, a better room than the town has yet possessed; and it is hoped it will prove a great success. The original scheme, with furnishing, &c., was estimated to cost 2,500*l*, but it was afterwards somewhat modified, and two retiring-rooms from the stage and other minor matters were deferred, and the cost thus reduced by several hundreds of pounds. The contract for the present work was 1,523*l*.

At Hanley on Monday, October 12, a fire test of Uralite was carried out on ground adjoining the Grand hotel (by kind permission of the manager), in the presence of a number of members of the North Staffordshire Institute of Mining

and Mechanical Engineers, borough surveyors, architects and other gentlemen interested in fireproof building construction. The test consisted of an ordinary partition constructed of timber protected by Uralite slabs, against which a huge pile of wood soaked in petroleum was erected and set fire to. The temperature to which one side of this partition was subjected at times reached 1,850 degrees, whilst the other side of the partition remained at atmospheric temperature. In the middle of this raging fire was also placed a deed box constructed of timber and Uralite. Inside this box paraffin, wax, fusible metal and sulphur, also a bundle of papers, were placed. The fire was afterwards extinguished and the box opened; the contents were examined and found unharmed, and the inside of the box was not even warm to the hand. The spectators expressed great satisfaction at the result, and predicted a great future for Uralite in the pottery district, where a fire-resisting building material is greatly needed for a variety of purposes.

BUILDING AND BUILDERS.

MR RITCHIE, ex-Chancellor of the Exchequer, has suggested the 27th inst. as the date on which he should perform the opening ceremony of Pwllheli harbour works.

THE mayor of Deptford (Mr. Councillor Alexander Dickson) laid, on Wednesday afternoon, the foundation-stone of a new town hall for the borough, which is to be erected on a new site in the New Cross Road.

A SCHOOL to cost nearly 5,000*l*, and having over two hundred classrooms, is to be built by the King Cross West End Halifax; 116 ladies took part in the sod-cutting ceremony and each contributed a piece of gold.

THE corner-stone of the new church which is to be built at the Whaley Bridge end of the parish of Chapel-en-le-Frith was laid on the 3rd inst. The building, which will be named Christ Church, will be of a plain character, and is estimated to cost about 800*l*, and seat about 250 persons. A tower will be added when funds admit.

THE corner-stone has been laid of a new church in Whittaker Lane, Heaton Park, to be dedicated to St. Hilda. The church is to be built in a thinly-populated working-class district of the parish of Prestwich, and is to accommodate at first some 315 persons. The proposed site

HOUSE NEAR BARNESLEY, YORKSHIRE.

CATHEDRAL SERIES.—EXETER: SOUTH AISLE.

Later on it is intended to add a chancel to the new tower to be erected, at an additional cost of some 2,000*l*.

FACTORY progress is being made with the rebuilding of the bridge. A temporary footpath has been erected on the north side, while the demolition of the massive granite bridge has been completed, and the property necessary for the new bridge bought and cleared. The bridge now being constructed was opened in 1839, and itself took the place of one built by Queen Matilda, and which for generations has been the oldest stone bridge in the country.

St. James Urban District Council an offer of 97*½**l*. from the Corporation for repair of the main roads and footpaths was accepted. Messrs. Hill & Sons, engineers, Manchester, wrote that the work of constructing the new Stanley Moor bridge, which will cost 100,000*l*., would be shortly completed. Contracts were sealed with Messrs. G. & T. Earle for the supply of cement, with Messrs. Oates & Green for the supply of coal with the Staveley Coal and Iron Company for cast-iron.

SPECIAL meeting of the parishioners of St. Peter's Church, Burnley, has been held to consider alterations at the church. These include the taking out of the west gallery, which has now been done, the erection of a clergy vestry, the removal of the baptistry under the tower, the installation of the new organ, &c., estimated to cost about 4,000*l*. The Bishop of Exeter (Barnes) presided, and explained that there was a recommendation from the church officers to modify the scheme now proposed and to pull down the south gallery and extend the vestry to the west end of the church. This, he said, would mean a net loss of seventy-six sittings. The recommendation was adopted, and it was also decided to remove the organ from the north to the south side of the church.

THE new public baths which are to be built at a cost of 75,000*l*. by the Liverpool Corporation, if the City Council adopts the scheme, will be among the finest in the country. The accommodation consists of one swimming bath 150 feet by 50 feet, one 75 feet by 40 feet and one 60 feet by 40 feet, and one 60 feet by 30 feet (for ladies); 125 private slipper, spray and hydropathic baths; two suites of Turkish baths, one to accommodate fifty-six gentlemen and the other eighteen ladies, and two suites of Russian baths for ladies and gentlemen. Between 500 and 600 bathers will be accommodated at one time. Consideration of the scheme is postponed for a month in accordance with the City Council's standing order.

NEW CATALOGUE.

MESSRS. R. MELHUISE, SONS & CO., of Fetter Lane, have issued in very attractive form their new catalogue of ironmongery, electrical supplies, &c. This useful and compendious volume of upwards of 300 pages contains some thousands of illustrations of all kinds of useful furnishing and other ironmongery, bolts, nuts, door springs, draught excluders, turnery, lightning conductors, stable fittings, ventilators, chimney-pots, smoke cures, tallboys, cowls, &c., gas stoves, gas and electric fittings, electric batteries and numerous other goods of an equally diverse character.

A CREMATORIUM FOR THE CITY OF LONDON.

THE foundation-stone was laid on Wednesday of the first crematorium to be erected within any cemetery in the United Kingdom. The ceremony was performed by Mr. Robert W. Edwards, chairman of the sanitary committee of the Corporation of the City of London, and excited a large amount of interest. The site selected is within the area of the City of London Necropolis at Little Ilford, and the work is being carried out from the designs of Mr. D. J. Ross, the city engineer, by the sanitary committee of the Corporation, acting as the Burial Board for the City of London. The new building is in a somewhat secluded part of the cemetery, and the design provides for a hall 27 feet in length by 24 feet in width for the mourners to assemble in, with a waiting-room adjacent and leading from the hall. The catafalque upon which the coffins will rest will be placed in the centre of the hall, and an ante-chamber is provided for the attendants between the hall and the cremating chamber. The latter is at

ALSO AT LIVERPOOL, MANCHESTER, PARIS, AND CAPE TOWN.

the rear of the hall, and will be of sufficient size to admit of two cremating furnaces being erected, with an arrangement for the bodies being placed in either furnace by means of a traverse. At present it is intended to erect only one furnace, the flue of which will be carried up in the centre of an ornamental tower about 80 feet in height. A small auxiliary furnace will be placed at the base of the tower for the more perfect combustion of the gases arising from the cremating furnace, and a staircase is provided for access to the summit. There is to be a basement under the cremating chamber from which the furnace will be attended to, also stores for fuel, the entrance being at the rear of the structure. The building will be constructed principally of stone, the walls being faced with Kentish rag with Portland stone dressings, and the roof will be covered with Broseley tiles. The hall will have an open timber roof, and the interior will be faced with red pressed bricks with an ornamental tiled dado, the floor being paved with artistic tiles. The design is Gothic in style, and is intended to harmonise with the existing chapels and buildings in the cemetery. The cost of the work, including the furnace, will be about 7,000*l*.

A CANADIAN CANAL.

THE following description of a hydraulic lift lock on the Trent Valley Canal, near Peterborough, Ontario, Canada, has been furnished to the *Glasgow Herald* by a correspondent in Ottawa:—

This lock, which is now nearly completed, is said to be the largest of its kind in the world. It may be premised that the Trent Valley Canal is a waterway partly natural and partly artificial, which, when completed, will furnish a short route across the Ontario peninsula from Georgian Bay to Lake Ontario, effecting a saving of several hundred miles. This canal was commenced a number of years ago, but has progressed very slowly for some time past, as the Government was bending all its energies towards the completion of the main water route, *via* the Welland Canal and the St. Lawrence River system of canals. As the completion of this system has not by any means met the expectations of the Government in the direction of increased traffic, and the American routes to New York, both rail and water, are still holding what is thought here to be a disproportionate share of the traffic of the Great Lakes, especially when the saving in time by the Canadian routes is taken into considera-

tion, the authorities are beginning to take a renewed interest in the Trent Valley Canal. It is, in fact, evident that within a year or two, unless all the indications prove false, the shipments from the Canadian North-West will have immensely increased in volume as to tax every possible route to the seaboard, both rail and water. Consequently it will before long become a matter of absolute necessity to complete the Trent Valley Canal or build the Georgian Bay Canal, *via* Lake Nipissing and the Ottawa river to Montreal, more probably both will be found indispensable. Either of these routes would effect such a saving in the time from Arthur to Montreal, and consequently from Port Arthur to Europe, as would be sufficient to hold all the Canadian trade, and probably even to capture a percentage of the American traffic that now goes *via* rail or the Canal to New York.

Now, as to the new lock on the Trent Valley Canal are two watertight steel boxes or chambers, 33 feet in diameter by 140 feet in length, with 8 feet of water in the clear at each end, closed at the ends by means of gates hung on the lower rollers. Similar gates also close the ends of the reaches. The gates are carried by means of heavy trusses supported by a top of two rams, 7 feet 6 inches in diameter, which work on steel watertight presses, one under each chamber. The presses are connected with each other by a pipe 12 inches in diameter, in the centre of which a valve is placed for the purpose of regulating the motion of the chambers. For the purpose of making up for the small quantity of water lost in the working of the main presses an accumulator is installed in one of the side towers. This accumulator has a ram 20 inches in diameter, with a stroke of 30 feet 6 inches, working at a pressure slightly greater than that of the main presses. The pressure is also used to operate the gates, capstans and pumps. The junction between the ends of the reaches is made watertight by means of a continuous rubber hose placed on the sides of the ends and bottom of the gate of the reach. The hose is inflated with compressed air from a Taylor & Co. pressor installed in the main wall.

The mode of operating the lock is as follows:—Suppose both chambers are at a standstill, one up and the other down, both gates toward the reach open ready for the vessel to enter. When the chambers are thus the bottom of the upper chamber will be about 10 inches lower than the bottom of the lower, and has, say, 8 feet 10 inches of water on the sill.

After remarking that every case differed in many of its component factors, and that therefore the costs of motor transport, as compared with horse transport, or railway charges, could not be stated with mathematical accuracy, the author gave a table of costs, the figures given being the mean of those obtained in actual practice, the cases having either come under his own experience, or the figures having been afforded by the users themselves. Placing these costs in tabular form, the allowance for each item was shown separately for motor waggons capable of taking a paying load of 2, 3, 4, 5, 6, 7, 8, 9 and 10 tons. The ton mileage per day of 10 hours (proper allowance being made for the time usually consumed in loading and unloading) was also given, and the cost of doing the same work by horses. Those figures showed that if the loads were less than $5\frac{1}{2}$ tons the horse was the cheaper, but that above that the advantage lay with the motor.

SEND FOR CATALOGUES.

The author then urged the necessity for a better and stronger form of road wheel, to stand the strain of motor work, and also impressed on inventors the great future that lay before the internal combustion engine when it could be made to work with crude petroleum or residue.

He observed that the new regulations of the Local Government Board would be awaited with some anxiety, and suggested that whilst they should specify wider tyres and driving wheels of larger diameter, the speed of motor waggons should be left unrestricted, so that each size could be run at the speed that proved most economical and best suited to the traffic encountered.

The wear and tear produced on the roads was treated at some length, the conclusion being that if the roads were of a proper standard, there was less wear and tear from the use of motor vehicles than from any other form of transport.

The subject of the paper was then summarised from the point of view of various users, the author emphasising the importance of confining motors to hard roads. For contractors, he concludes that they are only of use in very limited circumstances, and that for gravel hauling, bricks, new roadwork or discharging barges, they can very seldom be used. In municipal work he considers they can seldom, if ever, be more economical than horse cartage, and for mineral water deliveries he considers the horse the cheapest. If the journeys are too short or the loads too light, he is of opinion they will only be used when economy is not the first consideration, but the ideal load he places at from five to ten tons for distances exceeding ten miles.

In conclusion, he pointed out that motor transport was essentially an expert engineer's business, and that the user of one or two motors would do better to put his work out to contract than to employ his own motors.

"SYMPATHETIC STRIKES."

THE advisory board of the Master Builders' Exchange of Philadelphia have fixed January 1, 1904, as the day on which systematic warfare by means of lock-outs against sympathetic strikes will begin. The advisory board represents the 300 members of the Master Builders' Exchange and 1,000 sub-contractors, whose signatures are on record. This means that on and after January 1 any sympathetic strikers will have to face a lock-out not only of the Employers' Association but of all of the leading individual employers.

This action is the most important ever undertaken in the structural trades in the city. The Philadelphia employes of this line did 30,000,000 dollars of business in the city alone in 1902. This is only a small part of the work controlled by them. The builders who are to participate in the lock-out plan have operations in every part of the United States and often in foreign lands.

The above-named sum represents the money involved in work for which permits are necessary in this municipality. The largest contract let last year, the State Capitol, was 4,000,000-dollar work under the supervision of a Philadelphia firm.

The sympathetic strike situation is not local, but has caused trouble and dissatisfaction all over the United States. The decision made on September 8, say the master builders, positively sounds the doom of the sympathetic strike, and will go far towards obliterating it wherever Philadelphia men are at work.

The subject has been pending since November 25, 1902. The advisory board was then created and was approved by the Master Builders' Exchange on April 24, 1903, by the presidents of the employers' associations. Since then the labour atmosphere, though clarified in some quarters, has again darkened, and the prospects are little or no work will be done in the coming year.

The text of the resolution adopted on September 8 follows:—

In pursuance of the authority given the advisory board of the Master Builders' Exchange by the resolution of the Exchange passed November 25, 1902, subscribed to by the employers' associations and by a number of individual employers, and further urged by a meeting of the presidents of said associations held April 24, 1903, at the Master Builders' Exchange, at which a resolution was adopted as follows:—

"Resolved, on and after a time to be fixed at the discretion of the advisory board of the Master Builders' Exchange, no workman shall be employed on any of our buildings in Philadelphia unless he is willing to agree not to engage in a sympathetic strike and to arbitrate any difference that may arise, work to continue meanwhile."

We have determined that on and after January 1, 1904, the above resolution shall be enforced.

Sympathetic strikes have demoralised the building trade. One trouble is no sooner adjusted than another branch of trade finds some cause for complaint, and all building operations are brought to a standstill again.

PLUMBERS' REGISTRATION BILL.

Plumbers' Company intend to press forward the Registration Bill in the next session, and hope to have better success. Mr. Long, when president of the Local Government Board, gave its proposals his warmest support. It is well known that considerable mortality and a vast amount of ill-health as domestic discomforts, are due to defective plumbing. The waste of water from the same cause is enormous. It was recently estimated by Dr. Mansel Howe that on alone the waste amounted to 26,000,000 gallons in Birmingham has recently been able to save 100 millions per day by renewing fittings and plumbers' work. Long ago as 1883 the subject of defective plumbing was discussed by the British Medical Association, which suggested technical instruction and registration of plumbers on grounds of public health. Other learned bodies have since taken the same view, and while the company has been quietly engaged in the work of education—there are now 12,000 registered plumbers—it has never allowed legislative action to be lost sight of. The Bill has been singularly unfortunate with the Bill, which was introduced for the first time in the session of 1892. It was passed in the session after session, and in 1897 was referred to a select committee by the standing committee on trade. It had the support of the Local Government Board in committee and on the floor, but as a private members' Bill failed to obtain a majority that session. They hope to be more successful in the next session.

BUILDING IN GLASGOW.

The Glasgow City Council has made his annual statement as to the building during the past year in Glasgow as follows:—The total valuation of the linings granted did not differ from that of the previous year, which constituted a record. The valuations of the linings are the next highest. For the previous year the valuation of the linings amounted to 2,549,698*l.*, while for the current year which has just been completed the valuations amounted to 2,609,773*l.* The number of linings granted was 1,260,773. The number of cases dealt with at each Court was 84, the highest number at one Court being 84. Of these 70 were for dwelling-houses and shops, 12 were for churches, 19 for churches, halls and schools, 134 were for alterations and additions, and 228 were for new streets, amounting to 11,683 yards,

or equal in length to between six and seven miles. In this latter respect it is a significant fact that there has been no falling off in comparison with the previous year in regard to the linings for streets, which proves that the city is more and more extending its boundaries, and that provision is being made for extensive building operations in the near future.

Of the dwelling-houses no less than 765 are of one apartment, being yet again an increase upon previous years, and these are mainly in the Eastern, St. Rollox and Maryhill districts; 2,117 are of two apartments, mainly in these districts also; but when you come to three-apartment houses and upwards, by far the greatest number are in the Queen's Park district. In fact, of the three-apartment houses and upwards nearly the half of the total valuations are in the Queen's Park district, again showing what a very large number of our better class population are moving towards that direction, induced no doubt by the modern character of the buildings, and by the facilities which are being given to that neighbourhood. Besides the ordinary applications for the erection and alteration of buildings, the Court has also had to consider fifty-one petitions at the instance of the Procurator-Fiscal. There have been in addition thirty special diets for debate, and the Court has made fourteen visitations and taken six proofs. With reference to the visitations, I may mention that these have been mainly in connection with applications for buildings in what are known as hollow squares, and I take this opportunity for stating that in a general way the feeling of the Court is greatly against the granting of linings for the erection of buildings in hollow squares except in exceptional cases. It seems in every way desirable that in the more thickly populated districts of the city in particular there should be the greatest possible amount of open space within the bounds of hollow squares, not only for sanitary reasons, but for the general well-being of the large population which is in many instances thronging the buildings on the four sides of the squares, and to whom light and air space must be of the greatest consideration. It is, therefore, most desirable that workshops and other buildings of a similar nature should not be erected within these squares.

In connection with the applications to the Court there has been nothing of a special nature to which I need refer, except, perhaps, in the case of the erection of stands upon the occasion of the visit of their Majesties the King and Queen to Glasgow in the month of May last. At that time forty stands were passed after inspection, and six were not permitted to be used, but even in the case of the majority of those stands which were

passed alterations had to be made to meet the requirements of the inspectors. This involved a large amount of careful work on the part of the master of works and his assistants at that time, especially as the erection of stands was carried out under considerable pressure owing to the time being limited; but it is satisfactory to record that in no single instance did any accident occur. In connection with the question of stands generally, I may remark that very great care has been exercised by the Court in passing plans for the erection of all stands which are intended for the occupation of the public. Not only have the plans for these stands been very carefully examined, but it is intended that, as far as possible, provision shall be made for their periodical inspection after their erection. You will no doubt recollect that on the occasion of the retrial of my predecessor some allusion was made to the alterations which were proposed in connection with the procedure of the Court, and it is satisfactory to know that such alterations as were adopted have been the means of facilitating the work of the Court, and have conduced to the prompt and methodical despatch of business.

CHELTENHAM WATER SUPPLY.

AN anxiety which lay heavily upon the mind of the local governing body with regard to the water supply of Cheltenham has been relieved by the sanction just received from the Local Government Board to a scheme for duplicating the main from the Severn at Tewkesbury to the town. The necessity for supplementing the present supply has been pressed upon the Town Council for some time. Up till some ten or twelve years ago, says the *Birmingham Daily Post*, Cheltenham was, so far as the public service was concerned, supplied exclusively from the gathering grounds of the high levels at Hewletts, Leckhampton and Dowdeswell. This hill service sufficed for some ten years only; a succession of dry seasons reduced the yield of the springs to an alarming extent, added to which the energetic action of the Health Department in closing a large number of shallow wells in the older parts of the town put a strain upon the diminished public supply which it was unable to bear, and resort had therefore to be had to other sources. Fortunately for the town, among the assets which it took over from the water company was the highly valuable right of abstracting from the river Severn just above the ancient borough of Tewkesbury no less than 4,000,000 gallons of water

a day, and spite of the opposition of several of the leading medical practitioners of the town, it was to the Severn that the local authority went for the water necessary to supplement the hill supply. Already the Corporation, as successors to the Tewkesbury company, were supplying the river water to the town of Tewkesbury; and it is a curious commentary on the agitation promoted against the introduction of the Severn service to Cheltenham that in after years, when an abnormal rainfall would fill the hill reservoirs and enable the Corporation to make some of this water to Tewkesbury from Cheltenham instead of receiving any part of the supply for the larger town from the river, the Tewkesburians would make complaint through their governing body, and thus emphasise their decided preference for a commodity which some of the medical profession would one time disposed to distrust. The Severn supply, such as it is at the Tewkesbury works to the most modern and efficient systems of filtration, is now universally admitted to be one of the best in the kingdom. The present proposal is not to go to the length of discarding the hill supply, though the fact duplication of the main will enable the authority, in the event of need, to dispense absolutely with the hill supply. It is somewhat difficult to understand why the Local Government Board should have hesitated about giving their approval to the scheme, which merely involves the laying of a second main alongside the first, and therefore on exactly the same principle. But, acting presumably on legal objection raised by the advisers, the Board at first declined to sanction a loan for the works. The Town Council did not, however, accept the refusal, but through both the late town clerk (Mr. E. T. L.) and their present legal adviser (Mr. Owen Seacombe) they insisted in their application, and have at last convinced the Board to this extent, that formal sanction is given to the proposed loan subject to the condition that the Town Council accept all legal responsibility. This condition the Council had already consented to undertake, and the way is therefore now clear for a commencement of the works, which will, it is little doubt, be completed before the need of the additional supply becomes urgent.

WM. E. PECK & CO

8, BRADFORD AVENUE,
LONDON, E.C.

Taden, engineer. The chief features of the new work the enlargement of the annexe and its conversion into an asylum for male patients, retaining the original female; the rearrangement of the stables, artisans' and boiler-house; stables for medical superintendents; cottages for the head attendant and engineer; the rearrangement of the boiler power and general rearrangement of the work, the installation of electric light and new stables.

Conditions at the male asylum comprise new blocks for sick and infirm, the enlargement of the east wing for acute patients, new workshops, mess and recreation-rooms, new bakery, photographic studio and alterations in the administrative offices. The wards for the epileptics and for the sick and infirm are on the new building, within easy access of the administrative offices and the medical officer's quarters. They are thoroughly planned for the acute wards, and are so planned as not to interfere with the outlook or working of the old western wing, which is reserved for working patients. The new blocks are arranged in buildings, and each comprise a self-contained ward for their respective classes. The day-rooms have uninterrupted outlooks, and they, together with the wards, are thoroughly lighted and ventilated. The arrangements are placed in spurs at the back of the building, which they are separated by cross ventilated inter-rooms. Staircases of artificial stone are built at the end of each block, thus affording two means of exit to the wards. The workshops comprise shops for upholsterers, shoemakers and tailors. They are arranged for supervision and access, have cheerful outlooks, and are so planned that after working hours they are off from the rest of the building. The mess and recreation-rooms for attendants are placed at the back of the main block, within easy access of the various wards. The kitchen contains two ovens, and a kneading machine driven by an electric motor, also flour store, &c. The alterations in the administrative offices comprise a new dispensary, and portions of the original building into quarters for the medical officer, offices for medical officer, head attendant, and visiting-room.

The boiler-house block, artisans' workshops and stables, which were more or less mixed up together, have been to a great extent rebuilt and rearranged, and are now

kept distinct from each other to admit of effectual working and supervision. The stabling comprises separate stables for the committee, visitors and asylum horses, coachhouse and carriage-shed. The workshops contain carpenter's, plumber's, painter's and glazier's shops, bricklayers' shed and store, artisans' mess-room and clerk of works' office and store. The engineers' department comprises a new boiler-house, pump-house, coal-bunkers, electric-plant room, engineers' shop, stores and office.

The superintendent's stables, which are situated off the back road to his house, comprise a stable for three horses, coachhouse, harness-room and washing-shed. The head attendant's cottage is built at the back of the new blocks, and contains on the ground-floor parlour, living room, scullery and the usual offices, and on the first floor three bedrooms and a bath-room. The cottage for the engineer has similar accommodation to that of the head attendant, and is situated off the old road to the annexe in close proximity to the boiler-house.

As it was necessary to provide additional boiler power for the male asylum for heating and hot-water supply, and as new boilers working at a higher pressure than the old ones were required for supplying steam to the electric-light engines, it was decided, instead of building a new boiler-house at the male asylum, to concentrate the whole of the steam supply in a new boiler-house at the main building. Three Lancashire boilers, each 28 feet long by 7 feet 6 inches in diameter, with a Green's economiser, have been provided. Two of these boilers are sufficient for raising the whole of the steam required for the electric lighting, pumping, cooking, laundry, hot-water supply and heating in both the male and female asylums. Originally there were thirteen boilers, which were placed in various parts of the building. The length of steam main from the boiler-house to the centre of the male asylum is 2,290 feet, and with the whole of the work on there is only a drop in pressure of from 1 to 2½ lbs. The extreme length to which steam is carried is 2,467 feet. The condensed water throughout is returned to the boiler-house. The whole of the hot-water supply in the main building which was previously heated by separate boilers in the different blocks, is now heated entirely by the exhaust steam from the electric-light engines, and circulated by means of pumps through mains to the various wards, &c. The hydrant system has been reconstructed and is now so arranged that pressure from the tank in the tower at the male asylum is always available for immediate service in the hydrant mains. On the alarm of fire being given the

pumps can at once be made to deliver direct into the hydrant main, giving an increased pressure sufficient to throw a jet over the tower at the male asylum. The cooking apparatus has been extended and rearranged to make provision for additional patients.

The generating plant consists of three of Messrs. Laurence, Scott & Co.'s (Norwich) steam dynamos, each having an output of 50 kilowatts, and three of Messrs. Reavell & Co.'s (Ipswich) high speed engines, each giving 100 indicator horsepower when running at 500 revolutions per minute, and supplied with steam pressure at 120 lbs. The engines are directly coupled to the dynamos, being fixed together on one bed-plate, and make a compact and efficient combination. The engines are compounded on a patented principle, owned by the makers, which enables the high economy of a compound engine to be obtained with considerable simplicity in construction. The working parts revolve in a bath of oil and water, which is splashed over the working parts by the cranks as they dip into this bath on each revolution, thus insuring perfect lubrication in an economical manner as the oil is continually used over and over again. The plant, besides generating current for the lighting of the buildings throughout, will supply power to the motor for driving the machinery in the laundry and to the motors driving sewage pumps, pumps at male asylum and kneading machine in bakery. A battery of accumulators of sufficient capacity for the night load and motor work is provided. The buildings are wired throughout on the two-wire system at a pressure of 200 volts.

The Local Government Board having requested the committee to provide some efficient means of treating the sewage, it was decided as there was no land available or suitable for the purification of sewage, to adopt the closed septic tank system followed by continuous filtration. The Local Government Board stipulated that twice the dry weather flow of sewage should be treated through the septic tanks from twice up to six times, the dry weather flow should discharge on to a storm-water filter, and that the volume of storm water, when it exceeded six times the dry weather flow, should discharge direct into the outfall drain. The sewage works which are now on the point of completion have been designed accordingly. The sewage from both asylums up to twice the dry weather flow is collected in a well, from which it is pumped by motor-driven pumps automatically controlled to the septic tanks. The tanks are in duplicate, and are properly ventilated to prevent the possibility of an explo-

sion. The effluent from the tanks discharges on to a continuous filter, which is composed of washed clinker and irregular material. The effluent is conveyed over the filter by means of Stoddart's distributing plates. These plates consist of a large number of small horizontal V-shaped gutters, the sides of which the liquid flows until it meets a series of vertical drip points, from which it falls on to the surface of the filter in a fine rain. In this way the sewage is made to fall on its course in a state of intimate admixture with air. The effluent, after gravitating through the filtering material at the bottom of the filter, is conveyed to collecting channels on either side the filter, from which it discharges into the outfall drain.

OILING ROADS.

DURING a part of this year and last year experiments have been conducted in Liverpool by Mr. J. A. Brodie, the engineer, in order to ascertain if there are advantages in the use of macadam roads.

The materials experimented with have been as follows: Creosote oil (hot), creosote oil (cold), creosote oil mixed with small proportion of pitch, creosote oil mixed with small proportion of resin, creosote oil mixed with small proportion of tallow, coal tar (hot), cheap waste oil from coal tar, crude petroleum, crude Texas petroleum.

The roads on which the experiments were made were portions of Prescott Road, Derby Lane, St. Oswald Road, Rathbone Road and Edge Lane.

The oil was in each case sprinkled by hand from a wheelbarrow, and it was found that 1 gallon covered an average of about 8 superficial yards without lying in pools on, or soaking into, the surface. As it was found that the oil took some time to soak in care was taken to sprinkle one side of each road at a time, the other side being left for use so that rubber-tired vehicles need not pass over the newly oiled surfaces. The cost of the material used, the smaller cost being that of the cheap oils, costing about 2½d. per gallon.

Some complaint was made as to the smell of the creosote oil, but as against this it was stated that as long as the smell remained flies had practically disappeared from premises adjoining the roads. One complaint was made as to the injury to rubber tyres and to coach var-

ce having the cleanest and whitest appearance was with the creosote oil mixed with resin, whilst that a creosote oil mixed with tallow had the least surface coated with ordinary petroleum was the dust, the next in order being the mixtures of with resin and tallow, and the hot creosote oil creosote oil mixed with pitch, the cold creosote oil and creosote oil mixed with a small quantity of pitch gave results, but the portions of the road coated with creosote had the worst appearance. The heavy black waste oil) lasted slightly longer than the creosote, of course, much cheaper. The crude Texas gave the most lasting results, and portions of the were heavily coated showed a somewhat glazed road of oil and dust. The coating of hot coal-tar rably situated, the dirt carried from adjoining road under repairs spoiling its value as an point of view of saving in street watering the unfavourable, as during the three weeks which the dust was again visible on the surface the water- it on four days only on the adjoining macadam h sweeping labour was, however, much reduced as with corresponding areas:—Thus, on 6,500 yards as reduced from a total of seven days to four days, material removed from the surface was reduced from five loads, the total reduction in cleansing and ing 13d. to 055d. per superficial yard over a period of days. Experiments showed that the dust was satisfactorily experience gained will probably enable future carried out more economically. From the point of e and tear of the road surface, the oiling was, on advantageous; the wear appearing to be less, the e road drying more quickly after rain, and the picked up were reduced; the combination of oil e the surface also appeared to form a somewhat rice. The first sprinkling kept the surface in good e weeks, at the end of which time it was thought re-cover the area. The second coating similarly a down for a period of about five weeks, and the ct of the oil on the surface had not entirely disap- end of that period. Experiments referred to in the foregoing state-

ment, some further oiling experiments have been carried out on two important macadam roads in Liverpool, which require a considerable amount of watering, and the results have proved satisfactory from an economical point of view as compared with watering.

The method of applying the oil was by means of ordinary syringes with fine roses at intervals of about three weeks, and as a result the surface of the roadway was kept in better condition than if watering had been adopted.

The area experimented upon was 12,847 superficial yards, and the total cost of oil sprinkling was 7l. 15s. 1d., or equal to a rate per superficial yard of 0 46d per single sprinkling, which kept the road surface free from dust for a period of three weeks.

These roads when treated by water were sprinkled three times per day, and the cost of this work over a period of three weeks amounted to 70d. per superficial yard, so that an ample margin is left for wet days, when no watering is required.

The reduction in the cost and quantity of materials removed in the cleansing operations was again noticeable, though the figures have not been separately kept.

The cost of oiling could no doubt be reduced if a larger area was spread and the oil purchased in larger quantities than was the case in the above-mentioned experiments.

Oiling experiments have also been carried out in connection with wood pavement in one of the principal carriage roads in the city. The work was done in the same manner as in the case of the macadam roads, and the dust was satisfactorily kept down—a result which in this case could not be obtained even by watering four times per day—and the surface of the road maintained in good condition during dry weather without gravelling, but the surface becomes somewhat slippery during the first part of a shower of rain, and in such cases it has been found necessary to sprinkle a little gravel.

SLAG ROADS.

In August of last year some very interesting object-lesson road work was carried out near Chester river, Queen Anne county, Maryland, which is a good illustration of the impetus which the Office of Public Road Inquiries of the Department of Agriculture is giving to road improvement throughout the United States. This piece of road near Chestertown, says the *Engineering Record*, was built from slag obtained from the iron

furnaces at Sparrows Point, this slag being transported down the Chesapeake in barges. The road was built under the direct supervision of Mr. A. N. Johnson, highway engineer of the Maryland Geological Survey, and no specifications were made for it, as the labour was for the most part contributed by farmers in the neighbourhood, while the county paid the cost of the material. The organising of the work was in charge of a committee of the local citizens, of which, Mr. W. I. Walker was chairman. The length of the road constructed at this time was 1,100 feet, and its width 15 feet.

The slag from which the road was built is the material run off from the furnace before the iron is drawn; it cools in a sponge-like form. Its chemical composition is complex, and varies with the different ores and fluxes used. It is composed for the most part of an anhydrous lime silicate with sulphur compounds to which its peculiar odour is due. The action of the weather on this slag is to harden it, and because of its cementing properties it readily compacts and becomes harder the longer it is down. The slag was put on the road 10 inches thick in the centre and 7 inches at the sides, measured loose. There were 458 tons of slag used, and about 45 tons of fine material or ladle scrapings were spread upon the surface. This fine material when wet becomes hard and cements the pieces of slag firmly together. The roller used on the work was a 3½-ton horse roller lent by the Good Roads Machinery Company, of Kennett Square, Pa. A heavier roller would have been better, but could not be easily obtained at that time.

Mr. Johnson considers that in preparing specifications for this kind of road, the subgrade should be prepared in the same manner as for a road built of broken stone. The experience gained from building this road and a sample one of the same material in Baltimore county five years ago, leads him to believe that it is unnecessary to be so particular as to the size of the pieces as in the case of a broken stone road. Care should be exercised that the occasional large lumps should be either thrown to one side or raked ahead and put in the foundation. The slag requires much less rolling than broken stone, but more water; in fact, Mr. Johnson considers that too much water cannot be used. After the material has been given a thorough drenching it should be allowed to stand for ten or twelve hours before rolling, and after the roller has passed over it once or twice it may then be watered again. Three trips over every part of the road with a 10-ton steam roller is considered sufficient to consolidate it.

An examination of this road early in March showed that,

although built on a soil which affords in wet weather about the worst possible foundation for a road, it nevertheless gave no signs of yielding or cutting through, and it should be noted that this past winter in eastern Maryland was especially severe one on the roads owing to almost constant freezing and thawing. The surface when inspected was covered with a thin layer of mud, evidently caused by softening of the coating of fine material with which the road was dressed, together with the mud which had been trapped to it. One of the most serious disadvantages of this layer of mud is the plainness with which all the wheel tracks show, causing horses to follow one another and leave slight ruts. This action would probably not have been so pronounced if a heavier roller had been used in construction. At a point where the travel had been forced to turn to one side, no ruts at all have appeared, and the surface appears to be firmer and harder than when the road was built. Mr. Johnson considers that a width of 12 feet would have been ample for this road. He believes that increased durability will make it in the end a cheaper construction than oyster shells, which is the only material that has been used hitherto in that part of Maryland. The accompanying table gives an estimate of the cost of such a road for the several counties on the eastern shore of the Chesapeake based on the actual cost of this road in Queen Anne's county. The price of the slag is that given by the steel company, which can be made as low as 41 cents per ton owing to the fact that the company would put in special arrangements for crushing and loading it, which would save entirely the cost of digging up, as was done in the work just described.

THE WEEK.

of the County Council on Tuesday relating to the improvement of the Strand is sufficient to make the view that the amenity of London is to be dispersed forth in Spring Gardens. The report of the committee concluded by saying:—"We have been convinced that by throwing open to view the views of the Law Courts buildings the architecture in the Strand would be considerably improved, whether this would be so or not, we feel that it would not be justified in incurring so large a sum as would be involved in securing a doubtful improvement of the architectural view in the Strand." But the Council in approving the report it is to be noted that there is a belief that the concealment of the Law Courts is an advantage. If one is rejected, its opposite has to be accepted. Mr. ROBERT's plan, however excellent, involved a cost of 360,000£, and on that account there was its rejection. But when the suggestion of the Institute of British Architects could be realised, the fact of that sum lovers of economy need not be annoyed. The County Council, however, considering the sum as exorbitant, and maintaining without any setting back the thoroughfare would provide for the traffic. A recommendation that the Council should be accompanied by an expression of opinion for financial reasons could not make a difference in the boundary proposed was rejected. We wonder some members of the Council would have seen that the church of St. Clement Danes was taken down, for its presence and awkward position under the new arrangements will always be a hindrance to their inability to realise one of the simplest and best planning.

Along the Holborn to Strand highway are not the facilities that was anticipated, and the subject of the last meeting of the County Council. The report of the corporate property committee, Mr. ROBERT, stated that speculators hesitated about accepting the architect's decision as final and the conditions were not more stringent than those of other buildings in London. The Ecclesiastical Commissioners, insisted on plans for new buildings by their own architect. Mr. WALTER EMDEN and the builders considered that the conditions were too stringent, and they did not distrust the architect they did the Council. He suggested that the Council should see if they could not bring their clauses in accordance with those of other large estates in the Strand. Mr. MULLINS promised to bring the matter before the property committee. It is easy for the Council to impose conditions on buyers are exaggerated and the conditions are sufficiently satisfactory. If so, it is to be noted that there are misgivings of some kind about the future action. Speculators would hardly be so easily gained because they are indifferent to the architectural standard.

Mr. HORSLEY, a useful and honourable career, died at his house in the Strand on Sunday last. As a painter he was known for his illustrations of simple incidents in rural life, and his pictures which recalled Puritanism in its most simple forms. They were always bright in colour, and in an unaffected style. Seen in foreign exhibitions they were accepted not only as true English life in past and present times, but as English art, which never attempted more than to be true. When a young man of twenty six Mr. HORSLEY received the call which was made by the Committee for the Decoration of the Houses of Parliament, and he painted the fresco, *St. Augustine Preaching*, which won him the Victoria Medal. He obtained a commission to paint a picture for the House of Lords, the subject being *The*

Spirit of Religion, and in the upper waiting hall he painted one of the illustrations from English poets, viz. *Ithuriel's Spear*, from MILTON. Another work, produced about the same time, was *Prince Hal assuming the Crown*. But he recognised that his gifts were not adapted to high art, or that there was less demand for such pictures than for those on a small scale, and he returned to the class in which he had succeeded from his first attempt. Mr. HORSLEY was also one of the artists who had aided in launching the schools of design. His works were well adapted to be ornaments in English houses—we might say in English parsonages. There was nothing in the subjects which could not be discussed. Although he only once, we believe, attempted religious themes, it could be claimed that the spirit of religion was suggested by many of his pictures. Born in 1817, he became an Associate of the Academy in 1855 and an Academician in 1866. He rendered loyal service to that institution not only by acting as treasurer for several years, but also by his zeal in the organisation of the winter exhibitions. Mr. HORSLEY was happy in having the desired accompaniments of old age, "love, honour, obedience, troops of friends," and he well deserved them.

THE present age must be allowed credit for endeavouring to revive interest in people whose names and claims were ignored. Among the latest discoveries is OTTO VON GUERICKE. He was the inventor of the air pump and lived between 1602 and 1686. It is proposed to set up a memorial of him in his native city, Magdeburg, at a cost of 60,000 marks. The competition is confined to three Berlin sculptors, viz. Professor GÖTZ, Professor VON NECHKRITZ and Professor UPHUES, who are to send in models before New Year's Day. Little is known about VON GUERICKE. He was a studious philosopher who gave his attention mainly to pneumatics. In order to obtain a space entirely void of air he filled a barrel with water, and having closed it all round began to draw out the water by the aid of a sucking-pump. The air, however, burst into the barrel with a loud noise. Other trials failed, and it was only when he employed a glass sphere that a vacuum was obtained. The event occurred about 1650. He was summoned in 1654 to repeat his experiments before FERDINAND II. Afterwards ROBERT BOYLE substituted for the sphere a receiver of a more suitable form, and a pump which could be more easily worked.

THE Metropolitan Water Board have shown they can appreciate fitness by inviting Mr. H. W. LONSDALE to design a seal for them. The design was submitted at the last meeting. It shows a figure representing London drawing water from a reservoir of masonry, which is supplied by a stream issuing from a rock, symbolising the artificial distribution of water obtained from a pure source. In the background are seen St. Paul's, the towers of Westminster, &c., indicative of the Metropolis generally. The inscription as amended is "Metropolitan Water Board, 2 EDWARD VII." It is to be hoped a competent engraver will be selected to translate the design on metal.

M. COQUELIN will have to be alert in constructing his theatre, which is guaranteed to be unflammable, for other managers appear to be dealing with the same problem. The municipal theatre of Nantes has already inaugurated a system which is supposed to be perfect. The building was tested on the 3rd inst. in the presence of official delegates from Paris, lessees and directors of theatres with other experts. Testimony has been given about the success of the system. All parts of the theatre are traversed by conduits with branches. Each of the latter is furnished with automatic extinguishers, which can be set in action by an increase beyond the normal heat in the building. At the same time electric bells and other announcements are set ringing to summon the attendants and firemen, and the exact position of the evil is indicated. Torrents of water saturated with carbonic acid are also put in movement. In the experiments which were made a fire was suppressed in 45 seconds. The system has been carried out in the Grand Theatre Municipal under the direction of M. PONTET, with the co-operation of M. GOUZÉ, the chief of the fire brigade.

ROME AS AN ART SCHOOL.

THE Convention of the American Institute of Architects, as we mentioned last week, was to be occupied at Cleveland, Ohio, with a consideration of such subjects as the Advantages of Rome to Mural Painters, Sculptors and Architectural Students. It is not a little remarkable to find busy men in so modern a place and so remote from Rome in the beginning of the twentieth century turning their attention towards the ancient capital with as much eagerness as an inhabitant of Western Europe might have shown in the tenth century. We must remember also that Rome and all it still possesses can become more familiar than in any former age to every student of painting, sculpture and architecture without undertaking a voyage across the Atlantic and a journey across Europe. There have been countless descriptions of the city, its buildings and its treasures published in English as well as other languages. There is hardly a picture or statue which has not been made the subject of an engraving or a photograph, and the representations are of unquestioned accuracy. What more does a student need than to sit down in one of the public libraries in America, which are so richly endowed, and there to become acquainted with the appearance of every model which is likely to be useful to him? He can also learn with but little research how many artists have been successful in Europe without spending one day in Rome.

While all this must be admitted, it has been shown by experience that impressions are received by a visit to the city which can be gained in no other way. What GRAY, the poet, said of the Tiber is applicable to much else belonging to the city. The river, he wrote in one of his letters, is made more considerable than any merit of its own could have done. Anywhere else it would be little more than a muddy stream, but in Rome it becomes Father Tiber, and we do not wonder at the people praying to it. If the TOWNLEY and other marbles in the British Museum could be brought back to Rome and set up in some ancient villa, they would all gain in majesty and beauty.

The peculiar state of mind which we have suggested will be familiar to many of our readers. It has been often noted by travellers from all lands, and never more accurately than by JOSEPH WOODS, the English architect, in 1817. "In spite of all that may have been seen elsewhere of magnificent buildings, and all the views and drawings which have been published of the eternal city, Rome is still," he said, "a new world to an architect. You may know in detail the appearance of every building here, but you can feel nothing, you can imagine nothing, of the effect produced on seeing, on finding yourself thus amongst them. A vague feeling of admiration mixes itself with every perception and every recollection, and the mind forcibly rejects all inharmonious ideas. It is not any one thing that you see any more than it is one point of history that you have to remember; multitudes of fragments are included in one view, not very perfect and distinct in their forms, yet sufficient to excite the imagination. They crowd on the eye as the scenes of history on the memory. The strong emotion and the high tone of feeling excited leave no power of criticising. There seems to be a magic in the mere names. The first eight days I spent in Rome were all hurry and confusion. I could attend to nothing systematically, nor even examine anything with accuracy; a sort of restless eagerness to see everything, and know something about everything, gave me no power of fixing my attention on any one particular."

It is well to experience an emotion of that kind, although it may sometimes be accompanied by disappointment. It is only when we begin to realise how many revolutions and how much confusion in the world were necessary to bring about the tumble-down condition which we still can see before us in several parts of the city that Rome can be properly recognised. All the troubles and outbreaks, civil wars, invasions of enemies, which elsewhere were spread over immense areas, appear to have been concentrated in this one spot. On that account it must be allowed the student of archæology can no longer have the same sentiments in modern Rome that he used to feel before Italy was united. Logically and politically it is right there should be tall new buildings and broad streets, con-

venient railway stations, tramways, and so on, for the concomitants of a modern city, an imitation of which would be a kind of Paris. It used to be said to be home to us in a more convincing way than was possible in any German treatise that if the streets were as they were in Rome was because the Romans, like most southern people, cared little about their own firesides, and were willing to live in small rooms in tall houses so long as there were open spaces like the Forum, where they could congregate, or theatres like the Colosseum, where they could see spectacles, rarely of a refined kind, and where they were operated on not merely by the stage but by vapours, where they could witness exercises or theatrical performances, lounge over paintings and statues, or, if they were studious, enjoy the pleasures of a library. The contrast between the present and the past, which is now so apparent, may cause visitors to undervalue the remains of antiquity; but of all the transformations, enough yet remain to make Rome unique as a representative of the past whose influence continues potent.

It is still repeated so often that the Romans originate anything great in art, there may be some truth at Americans going there for inspiration. But the system practised by the Romans prevalent in Italy. We continue to be in the fullest sense heirs of the Romans, and if it were not for our predecessors' wealth and power, we should indeed so far as the arts are concerned be poor mechanical and other inventions the Americans need to go to Rome; but for painting, sculpture and architecture they are wise in following the example of the Romans, and to take their share of the spoils of the past. Nowhere are they more abundant than in Rome.

If the Romans were not inventive they displayed at least surprising powers of adaptability. That their forms were stereotyped is not entirely true. There is infinite variety in their arrangements and details; and, if we possess more refined tastes, we can let us surpass them. In modern times Domestic architecture is most in request. Unfortunately there are no revivals of the Roman houses, but the Renaissance villas are an excellent substitute for them. The Roman style prevails beyond all others throughout the world. In Rome some of its noblest examples are standing.

There may be cities like Florence and Venice, but some will maintain afford better schools for the study of Italian architecture. But there can be no question of the superiority of Rome as a school of sculpture. FLAXMAN it was recorded that "whether he was making from the antique, or making studies from the groups and figures abounding in the venerable ruins of its environs, each object, animate and inanimate, seemed to him beautiful or noble and all-inspiring; no day was suffered to pass without some improvement in his art, and except his health and strength failed, no day was suffered to pass without some improvement in his art. The value of Rome as a means of inspiration, was tested by his own progress, was always present in his mind. He never failed to recommend a study of the masterpieces when he was lecturing on art. It is true, when he lectured on Egyptian, Grecian, Gothic, or Roman sculpture he did not attempt to treat that of the present. It was doubtful whether the artists of the Roman Empire were competent to produce works worthy of survival. The Roman compositions owed no inspiration to the Muses. Describing the columns and arches, he said "the forms of the limbs are interrupted by mail or plate armor, the heads are so brutal and savage as to excite compassion for the barbarians who have fallen into their hands. There are, however, incomparable Greek works. It is true, casts of them are to be found in the museums, but who can deny that a wide gulf separates them from the people who gaze on them? In the statues do not appear as strangers or intruders from modern life. Imagination easily makes a connection between them and the Romans. In the same way the Gothic figure does not seem strange in an English town. The value of the sculpture is enhanced, for it ceases to be a representation of the past, beyond the world. To those who know Rome, it is to be no absurdity when HAWTHORNE, in his

...n," makes one of his characters—an American lady inter—say that their friend DONATELLO was the son of the Faun of PRAXITELES, and ask whether the influence extends to the very tips of his ears. DONATELLO was probably a representation of THOREAU of Concord, but for the occasion his New England character was modified, and he became a Roman with the groves within him. And thus it happened that the girl and the youth improvised a dance in which joined, "it seemed the realisation of one of those bas-reliefs where a dance of nymphs, satyrs or bacchanals is round the circle of an antique vase; or it was like a pictured scene on the front and sides of a sarcophagus, often as any other device, a festive procession of the ashes and white bones that are treasured up. Anywhere else the dance would be commonplace, but in Rome it was subjected to the *genius* and became sculptural. No modern writer has the assimilative virtue which we have claimed for Hawthorne, and his "Transformation" always exerts influence on his countrymen who possess instincts.

Weeks ago we gave some extracts from the letters of THOMAS LAWRENCE, President of the Royal Academy. This will he went to Rome to paint a portrait of a man, and he was not in a mood to be smitten by its charms. But no sooner was he in Rome than the blasé world who was laden with cares was conquered by the imagination. As he said, he became more and more at home with Rome as the period approached when he had to paint it. All Rome, according to REYNOLDS, is an open-air museum, and it is no wonder that in its early days students of the Royal Academy were sent there as if it were a necessity in the education of a painter. Of ancient Rome there is little to show. But of the periods of its greatness it is a true treasury. Strictly speaking, there was no Roman School, but for the modern student the advantage, for all the schools of Italy have taken from it. Reaching the city. What is of great importance in the principal works are to be found in the positions in which they were painted. There is in consequence a richness which is not to be understood from seeing works in a gallery amidst surroundings which were never conceived by the artists.

There is no doubt that in contemplating the possibility of going to Rome for painters, sculptors and architects our own architects have shown they possess a large share of the shrewdness of their countrymen. All the countries of Europe, with the exception of Great Britain and Turkey, have made arrangements by which the student should be provided with opportunities to derive from Rome. In some cases the gain has been in all human affairs we must calculate on a probability of failures. There are artists who can dispense with studies. But the experience of those most likely to judge has been favourable to a sojourn in Italy. Americans will do well to assert their equality with France, Germany, Spain and Russia by sending representatives who will utilise its artistic wealth.

ARCHITECTURE AND THE INFANT ACADEMY.—II.

Referred last week to the absence of churches from the four earliest exhibitions of the Royal Academy. In the fifth we find EDWARD STEVENS, A.R.A., on "Elevation of a Sepulchral Church, designed by the late Royal Highness the Princess of WALES." It was the first example of its class, and seems to have been carried out, although the artist was the mother of GEORGE III. By the same artist was a design for a temple dedicated to painting, and architecture, which he had prepared for the artist GREY. Temples of the kind were often set in gardens. More surprise was likely to be shown in a plan and elevation of a cold bath by WILLIAM HAYDON, and a design for a public bath by JOHN HAYDON. Neither public nor private baths were then appreciated. JOHNSON advised a friend who showed him a

bath not to make use of it, and he expressed his own conviction of their inutility by saying, "I hate immersion."

In 1774 JAMES GANDON, who won the Academy's first gold medal for architecture as a student, appeared for the first time as an exhibitor, with a design for a villa for a gentleman in Ireland, and a sketch design for a church. He is principally known by the noble buildings he erected in Dublin, including the Custom House, the Four Courts, and part of the Parliament House. For its architectural character the city owes much to him. J. JAEGER sent the elevation of the north front of the new bridge at Bath. About that time there were two THOMAS MALTONS, and both were represented in the exhibition of 1774. The elder prepared a view of the interior of Walbrook Church. In the same year he published "The Royal Road to Geometry," and in 1775, his treatise on perspective; he also delivered a course of lectures on the subject in his house in Poland Street. THOMAS MALTON, the younger, was an Academy student, and he exhibited a view on the Thames from the Adelphi Buildings to Blackfriars Bridge. He afterwards produced several aquatint views of London and Oxford, and was one of JAMES GANDON'S assistants. The improvement of Lincoln's Inn was then contemplated. Stone Buildings were erected under the direction of Sir ROBERT TAYLOR in 1790. In the exhibition of 1774 were "Three Designs for a Forum, for the Four Courts of Judicature, designed to be built in Lincoln's Inn Fields," by THOMAS RAWLINS. The scope of the Academy was not then rigidly defined, for GEORGE RICHARDSON, architect, the author of "The New Vitruvius Britannicus" and other works, was allowed to exhibit a design for a carpet as well as two designs for ceilings. THOMAS WHETTEN sent a design for a park gate. He was a pupil of CHAMBERS and won both the silver and gold medal for architectural drawings and design. Fortunately for him he inherited property and was able to retire from practice. He lived until 1836. For some reason which is still unknown, the majority of designs did not bear their exact titles. We have town mansions, villas, garden buildings, &c., which cannot be identified. It would be interesting to know where is the structure described as "The Principal Front of a Design for a Town Hall," by JOHN YENN, for works of that class were not often erected in the eighteenth century.

The exhibition of 1775 contained a design for the Castle of Swartsco, the seat of the Queen Dowager of SWEDEN, near Stockholm, by Sir WILLIAM CHAMBERS, which suggests that he had retained interest in his native country. WILLIAM BLACKBURN, who was an Academy student, sent a "Garden-Seat designed for a Gentleman in Surrey," and a stable building. Afterwards he was successful in works of a different character. He was the first to aid HOWARD, the philanthropist, by preparing designs for prisons which would not be death-traps. In 1782 he obtained a premium of 100 guineas offered for a penitentiary. He was architect for the county gaol of Oxford, and was generally consulted by prison authorities. He was also architect for St. Thomas's Hospital and Guy's Hospital. He sustained an attack of paralysis at Preston on his way to Glasgow and died in his fortieth year. A want of the time was indicated by JOHN DOTCHEN'S "Design for a Church, intended for a central situation at the West End of the Town." An example of a class of work sometimes referred to in the literature of the eighteenth century is found in the plan and elevation of a temple dedicated to Taste by WILLIAM MOSS. He was a student of the Academy, and afterwards won the gold medal. There was also a Temple to Victory by SAMUEL ROBINSON.

The exhibition of 1776 was not important for its architectural designs. Among the drawings were an elevation of the principal front of the Town Hall, Bath, by E. BELK; a section of the concert-room, Hanover Square, by R. EDWIN; the principal front of Boyles, Essex, by THOMAS LEVERTON; the "Section of a City House of the ancient Romans, designed for the second volume of the Translation of Vitruvius," and an "Elevation of the Villa Urbano," by WILLIAM NEWTON, the clerk of the works at Greenwich Hospital, and lastly SOANE'S principal façade and plan of a design for a Royal Academy.

The reputation of JOHN ALEFOUNDER is based on his portraits and miniatures; but the first work he exhibited

was a design for a "Lunatic Hospital," which was seen in 1777. CHAMBERS sent a bridge at Woburn Abbey. By THOMAS HARRISON, who suggested to Lord ELGIN the necessity of obtaining casts of the Parthenon marbles, and who is remembered mainly by his arch of 200 feet span across the Dee, were some Roman drawings, viz.:—"Half the Plan of a Design for the Piazza del Popolo, the Principal Entrance into Rome, Elevations of one Flank and Gate end of the Square, Sections of the Church, Chapel, &c., Sections of the Square and Convent." There were English peers in the seventeenth and eighteenth centuries who considered it was incumbent on them to take an interest in ancient Rome, and to obtain promising draughtsmen to study the buildings and produce representations of them. In that way HARRISON was sent by Lord DUNDAS to Rome, where he distinguished himself. He was elected a member of the Academy of St. Luke. On his return to England he was largely employed in architectural and engineering works, and he lived until 1829. The exhibition of 1777 contained some work by JOSEPH CERACCHI. He was employed by CARLINI, the sculptor, who was one of the original Academicians. He obtained commissions from ROBERT ADAM, and produced some of the sculpture for Somerset House. The description of one of the works of 1777 reveals the leisurely character of the time, for who would now have the patience to go through the following paragraph in Burlington House, "CASTOR is agreeably surprised in the chase by POLLUX, his brother, who offers to share with him alternately that immortality which he himself had before enjoyed; and, laying aside his arms, tenderly invites him to make the circuit of the Zodiac"? Nor is it easy to realise how such an affair was represented. CERACCHI would have succeeded in England, but after various adventures in Europe and America he drifted to Paris. There he was implicated in a plot of TOPINO LE BRUN to assassinate NAPOLEON, and was condemned. He was drawn to the guillotine in the high Roman fashion in a triumphal car designed by himself, and he wore the robes of a stage emperor.

The name of JOHN DONOWELL is met with for the first time in the exhibition catalogue of 1778, attached to a perspective view of the Steyne at Brighthelmstone from the south end. By GANDON was the design offered for the hospital for lunatics. A design for a Gothic church by W. PORDEN recalls an architect who had a varied career. Through an introduction by WILLIAM MASON, the poet, a man who was in esteem at that time, he was received in the office of JAMES WYATT. Afterwards he became the pupil of SAMUEL COCKERELL, the architect to the East India Company, and the father of the professor. Lord SHEFFIELD made PORDEN his secretary and appointed him paymaster of a regiment of Dragoons. When the regiment was reduced he went back to architecture, and had the courage to exhibit the Gothic design at a time when the style was but little valued. He was official surveyor to the parish of St. George's, Hanover Square. In 1784 it was resolved to have a commemoration of HANDEL in Westminster Abbey, where the composer was buried in Poets' Corner in 1759. It was to be under the patronage of the king. The arrangements for seating the audience were entrusted to PORDEN. Lord GROSVENOR selected him to be surveyor to his London property. He was also engaged at Eaton Hall, and on being superseded, he died shortly afterwards of grief. By WILLIAM TYLER was a model of a monument. He was known both as an architect and a sculptor, and designed the Freemasons' Tavern, but although one of the foundation members of the Royal Academy, he never succeeded in obtaining a prominent position in any of the arts. RICHARD JUPP, jun., is credited with a drawing of the principal front of the villa in the gardens of Payne's Hill. He belonged to a family that was associated with the City companies, and should therefore be considered as one of the earliest City architects. The façade of India House in Leadenhall Street was designed by him.

The last exhibition in Pall Mall was held in 1779. THOMAS HARRISON showed a design for "A National Monument to Commemorate great Public Characters, occasioned by an Idea which occurred in Parliament on the death of Lord CHATHAM," which never got beyond the paper stage. By SOANE was a design for a British Senate House. It is remarkable that he lived long enough to have

competed for the Houses of Parliament if he wished. Owing to failure of sight he declined all new work in 1833. JOHN PLAW, jun., contributed a design for a bridge over the river Suir, from the city of Waterford, county of Kilkenny in Ireland, with centre arch 100 feet wide. The indifference of Irishmen to works of utility is manifest when we find that a few months after the commission was inquiring into the possibility of the erection of a similar structure, and unless there is a change of mind in 1779 the necessity for a substantial bridge will continue to be unsatisfied. CHAMBERS appears to have been too busy to have exhibited in 1779.

In all the exhibitions in Pall Mall the architectural drawings appear to have occupied the small space which there were no paintings of suitable size. But in 1780 there was a change, architecture, sculpture, and drawings were collected in a separate room. This was the beginning of a new condition of affairs which was attended with some disadvantages. But the change was one of the indications that the days of the Academy were numbered. REYNOLDS had represented as an infant were at the time. As the President said at the time, "We have the hope of seeing the arts in a state to which they never before arrived in this nation. This building [Somerset House] which we are now assembled will remain to manifest an illustrious specimen of the architect's abilities. It is our duty to endeavour that those who gaze with admiration at the structure may not be disappointed when they enter the apartments." It was soon realised that both architects and sculptors had reason to complain about the deficiency of Somerset House for their purpose as exhibited. The accommodation may not have been less than in former exhibitions, but so much was anticipated for a royal gift, the exhibitors were not easily satisfied.

THE ARCHITECTURAL ASSOCIATION

A MEETING of the Association was held on the evening last, Mr. H. T. Hare, president, in the hall. On the motion of the President a unanimous vote of thanks was passed to the Royal Institute of British Architects for the promise of 500*l.* towards the new premises fund. The President was greatly appreciated, said the President, not only for the actual value of the contribution, but more particularly for it was a manifestation of that sympathy which the Association had always shown towards the work of the Association.

The following were elected as members:—Messrs. Horden, C. H. Simpson, E. S. Charlton, H. C. Benson, Munnings, L. W. Edmonds, Leslie W. Green, J. A. E. C. Burrows, B. Oliver, A. E. Hunt, L. S. Sullivan, Kipps, H. R. Smale, E. F. Duncanson, J. S. Turner, H. B. Newbold, R. I. Jones, C. S. Kimpton, F. H. D. Man, C. R. Davy, L. Kesteven, T. A. D'Arcy Braddell, White, J. M. Kellett, H. M. Gundry, C. E. Hanscom, Woodin, F. J. Park, T. Braddock, C. R. Shield, J. B. E. S. Whitney, F. T. Bush, G. R. Griffith, S. H. Colson, Scriven, J. T. Sugden, L. T. W. Simkins, C. A. Covey, H. Milne, W. H. Ludlow, D. W. Clark, Percy M. Chandler, R. W. Pickering, G. D. Burgess, F. E. M. Harvey, L. H. Read and L. A. D. Shiner.

Mr. A. T. BOLTON read a paper on the

Day School Teaching in Relation to Architectural Pupilage.

It is my pleasant duty this evening to appear before you to render an account of my stewardship as organiser of the Architectural Association day school during the past two years. It is particularly gratifying to me that my friend and colleague Mr. Hugh P. G. Maule, has allowed his name to be associated with our subject to-night. You will not, I am sure, expect him upon his entrance on his new task the more difficult that he will be better able to give you later on when he comes to attend this audit; nor will you naturally assume in every respect he endorses such conclusions and suggestions that I may feel bound to bring before you as the outcome of my own experiences.

The idea of establishing a day school had for many years been contemplated by the Architectural Association. The chief hindrance was, I think, the idea that such a school would destroy the long-established and well-tryed architectural pupilage. Fortunately it has been proved that this particular danger had been exaggerated, and it was found possible, thanks to the loyal concurrence of the profession, to work the school as a preparation rather than a substitute for pupilage.

architectural profession has been fortunate in retaining a traditional system of pupilage during a period of change and reforms until the reaction has set in, so that it is possible for us to develop rather than to destroy a method of training which, rightly understood and carried out, is still adapted to a profession like our own. It is generally held that a boy from school entering an office direct is handicapped, and runs a great risk of losing the years of his articles owing to his inability to pick up work of so uncharacteristic a character to his previous training.

Every day school is not only the pupils' charter, but is also a source of relief to the mind of the conscientious architect. The number of pupils sent to us at the Architectural Association school by the profession is conclusive on this point. What shall we say about the raw material as we receive it from the public school? Everyone knows the truth on this point: the correspondence in the Press is on a par with that of the head-masters would seem to approximate to that of the railway magnates. I do not propose on the strength of my own experiences to join in the chorus, but if I had a conference of five minutes with one of them I should ask what is the vicious circle in which you are revolving. Your case is to be that the public schools are waiting for the cities, while the latter allege that they cannot move on for particular account.

Is not this all very much beside the mark? What are the responsibilities of public school boys who go to the university, and are the responsibilities of the schools to those whom they send into life ill prepared for their future work? For years public schools have been drawing on their great asset, the instinct that determines the parent to send his son to one of the great schools, for the sake of the development of that kind of character which will mean so much hereafter in his life. Those present saw, doubtless, Lord Cromer's striking reference to the public on this point. But giving such conditions due value, are the schools right in supposing that they can for ever defy the competition of the best continental schools and of new institutions growing up on similar lines? Give the usual reply, "Look at my modern side," but ask a school boy why he did effect a transfer. It is as if you asked to know why he did not forthwith become a pariah. Colenso days we might have had a reference to "my class." Now I am afraid we are coming to "my primary Royal Institute of British Architects' examination." This last is a frightful outcome of our pet mania; we are missing ourselves with China as the two examining nations. It has occurred to some to wonder when it will be common knowledge that our primary schools work no longer under the supervision but through inspection, to the immense relief of the teacher and the great benefit of the scholar. It is almost a crime like that of *Oliver Twist* in asking for more. I suggest that a certain architectural school might recruit its pupils by a similar method.

The cause of public school deficiencies lies fairly deep. The remedy is known, but it is the will to apply it that is lacking. We have had our lesson, but Africa is a long way off. The real strain has perhaps not yet come sufficiently home to our shores. To justify such views it will be necessary to consider in brief outline the ideal of education which we have in our minds, and to try and arrive at certain deductions from experience and observation which may guide us in a method of such complexity as education.

In the first place, let us start with the principle that education is not the acquisition of certain definite information, but the training of the mind to meet contingencies that can never be accurately foreseen. In the clear meaning of the term it is the leading out or development of the powers of the mind, rather than to some extent with a correcting and supplementing of its qualities. I am afraid this last limitation may not be to some enthusiastic teacher engaged in the most thankless educational enterprises, that of instilling refinement in a child of an incurably base type. May the teacher gain by the

method, now, is the ultimate object of education? I should say that man, of himself, in relation to his surroundings is deprived of power, in other words ignorant, if you will, and in all the great eventual facts of his existence. This condition of fate is made more tolerable to us by its recurrence in universality, and the important part played by education in mentally considered, is that of giving us the support of great minds that, thinking on these things, have endowed us with the accumulated wisdom of the race. I take this to be the essential justification of classical, using the word in the sense of sense, training, and an adequate defence of the study of the great literature of the past. Unfortunately, this view of the essentially practical character of such studies is constantly obscured by the pedantry of that scholarship which concerns itself not with the wider bearing of the subject studied, but with the minute facts of the workmanship of the casket in which the jewel lies hid.

No one for certain pursuing a study that rises to the level of an art would for a moment depreciate points of form or understand the power of verbal felicity of expression, but it is idle to deny that under an over-zealous pursuit of scholastic and grammatical points the wider bearings of the subject are too commonly wholly lost, and never reaches the mind of the student so as to influence his thoughts. The study of the classics under such unfortunate auspices is made not only repulsive, but also so unpractical that even people of some education will be found to condemn it as wholly useless. From this arises the curious distinction drawn by so many people between theoretical and practical learning, whereas in reality no such distinction can exist in true education.

The ideal of education is simply the development of mental power. The true educated man is not necessarily a product of university training, nor even as a matter of course a student of wide reading in books. This is a perpetual stumbling-block to many worthy people who confound the means with the end, and fail to realise by how many paths the goal of a well-developed and rightly-ordered mind may be reached. "Small Latin hadst thou, and less Greek," is the astonished exclamation of the scholar poet to the master he hailed as one grounded in nature's own school. There is a striking passage in a great French writer, in which he points to discussions in the tents of the Bedouin as originating Oriental philosophy, and as the equivalents of our universities. You are doubtless aware that the Greek philosophers educated by means of conversational discussion. An acquaintance with their methods is an aid in grasping the characteristics of Greek art. The bearing of these remarks lies in this, that the accumulation of facts is of itself of no value whatever unless it is accompanied by a simultaneous development of the reasoning powers, nor is the study of grammatical niceties essential to a comprehension of a great literature or art.

We must not, in fact, reverse the natural order of the acquisition of knowledge. Observe the process of a child's mental development. It is in essence a perfect specimen of the Socratic dialogue. The child's interest is first aroused, then comes the question, and, following swiftly on the reply, his more or less logical deduction, ending possibly in a perfect dilemma for the unfortunate parent, who is often driven to resort to the common form of nursery closure in order to end the discussion. It is a mystery to me that so many teachers ignore this natural method. Students are drawn up blank against some concentrated essence, mainly grammatical, of a subject, and expected to develop an interest in the dry and often useless facts of which they utterly fail to grasp the bearing. The customary excuse is that of the importance of accuracy, which, however, is to be taught of itself, and probably can be far better inculcated through the verifications of experimental science than by literary and grammatical means.

Let us now apply these principles to architectural education. In the first place it will follow that neither Gothic nor Classic art of themselves are wholly necessary to salvation, and that the mere examination facts, as I will call them, are not of themselves of any value whatever. What we shall need will be to give our beginner a good general survey of the historical development of architecture treated in relation to the character and conditions of the people and countries where it originated, utilising for this purpose the method of the contrast of opposites and its contrary of imitative resemblance.

This survey should lead to the apprehension of certain central facts, the unity of all architectural expression in spite of its diversity, the possession of common qualities and the permanence of artistic expression. When a student reaches the point that he can, as it were, make a summary division into two styles, the plain and the ornamental, has learnt that there is no monopoly in beauty, and realises that proportion, grace, character and fitness are all parts of one whole, then he has begun to justify his education, and has entered upon a path presenting possibilities of progressive growth. A stumbling-block for the young student is that presented in the right relation of art to nature, more especially in architecture. When told "to study nature" in the common phrase, the impression most probably produced on his mind is either one of mere bewilderment, or else a confusion of the imitation of concrete form with the outcome of deductions from an observation of natural facts, directed towards the apprehension of abstract qualities capable of illustration in architecture.

Take the commonest fancy of the amateur, that the nave of a Gothic cathedral is a copy of a grove of trees, and compare with this Darwin's suggestion that the awe which we feel on entering a grand building finds its origin in the effect produced on early man by the caverns and forests in nature. The fallacy of the grove of trees strikes you at once as too gross for discussion, but the underlying idea is always cropping up in changing forms. Its plausibility depends on the fact of a certain coincidence of result in the works of man, reached through a long series of logical developments, with the seemingly irresponsible work of nature. An instance given in Garbett's "Principles of Design" is the relation between the

elephant's foot, the human hand when raised to uphold a weight and the highly-developed Doric column. Similarly in Gothic architecture, in certain phases of its fullest expression an analogy may be felt between the intricate clustering of relief and open work and the tree tracery of the woods in winter. In Renaissance work quite recently an attempt was made to base a theory on forms coincident with nature's spirals as seen in shells.

The student once having found admittance to nature's school is provided with a field of unending study. This observation and reflection on nature is in many cases purely instinctive, and, I believe, not seldom possessed without any capacity of expression, as it will be found welling up among dwellers in the country in unexpected forms. Every Shakespeare lover knows the poet's marvellous instinct and extraordinary wealth of illustration obtained from this source. I should go so far as to fancy that the instant impression of supreme artistic creation on all classes derives a large part of its effect from the revelation agreeing with past subconscious observations on the part of the spectator.

Much is said of the refinement of Turner's landscape, but to the artist himself, full of the sense of nature obtained from life in the open, his work was doubtless but a coarse transcript of infinite subtleties. No student must rest content with a mere feeling after nature's charm. Emotion must be translated into work, however imperfect, and the effort maintained through cloud as well as sunshine. Nature's process is infinitely slow, and artistic stature cannot be increased by taking thought any more than physical. The student's greatest enemy is his own self-conceit. There is always a place for the patient worker; but the flashy student incapable of independent and sustained effort will always remain a burden to his teacher. Every student is a problem in himself and needs individual care, and the wisest teacher will be the least dogmatic in his judgment of capabilities and the least ready to shut the door.

In this hasty and imperfect sketch, fellow students, I have tried to indicate to you the underlying spirit in which your education may be pursued. You came here perhaps expecting to hear about the details of the method employed in the day school. We can all differ in that respect, and a student's own experiences will colour his personal prepossessions. I do not propose to justify the particular means employed—I might find myself launched into biographical particulars—but the foundation requires to be sure, and the basis must be a close touch with the actualities of our own day and a solid continuity of effort on the part of the student not afraid of hard work. We are not entitled to set our students on a path which will make it harder than it need be for them to earn money within a reasonable period. The day school has been run on semi-office lines, with an effort after a thorough grounding in the drawing methods in common use. We may agree that skill in draughtsmanship is by no means the essential quality of an architect, but it is certainly a necessary qualification for an assistant requiring a place in an office, and we must look forward to the anxious period when, at the expiration of his articles, our day school student has to give workaday proof of his powers. While giving prominence to draughtsmanship, I never could myself agree to its pursuit to the detriment of the study of design, nor could I see the reason for postponing that important subject to quite a late stage in the student's career.

In the second year course of the day school we have started the student in that important branch of his future work on very conservative lines, utilising the interest of the student in creating something, to deepen his studies of the first year, and guiding him in his first essays by the sure aid of the past examples of his art.

If you will look at the drawings in the second year, I think they will show you how interesting and practical the study of historical architecture may be made, and you will realise that for the preparation of these designs something more than a surface knowledge of the particular phrases illustrated must have been acquired.

I have a particular wish to secure your support for my successor in his important task of developing the equipment of the day school. The liberal assistance from the committee and the general body should be forthcoming in this matter. I am sure all the staff of the Architectural Association will hail with especial thankfulness the solution of the premises problem, which has lain across the path of the natural development of the Association for so many years. Hurry up and pay off this debt, so that the committee may devote themselves to the reorganising and equipment of the schools, which should do so much for the coming generation of architects.

The day school has doubtless been a useful piece of underpinning, but there has always seemed to me to be a top storey wanting in our educational structure. A pretty good believer myself in Architectural Association methods, and fairly diligent in the classes, there came all the same a time when something more consecutive and thorough seemed to me to be essential. In my view, it need not have been necessary to go outside the Architectural Association for such further study. Are our

young students quite satisfied to-day after, say, a year in the school of design? And if they are now, will they pass up from the day school continue to find this so admirable as it is within its limits, sufficient for the course of their training? It is probably much better that the Architectural Association should finish its own students, and then, on the slightest indication of the demand, the advanced education that can be given.

Whatever the future development may be, let us hope the Architectural Association will know how to preserve its characteristic of mutual instruction, free from the effect of systems of education that separate the teacher from the taught into separate castes. In the day school I have seen a smile on the faces of the class when I have touched this point, but for myself I sincerely state that I have learned much from my two years' experiences, and I earnestly commend some of our brilliant students to seriously consider whether they ought not to take their turn in our educational work. You all know of the zeal of the late Arthur C. Cook, whose loss the Architectural Association has so much to regret. In the last conversation I had with him it was one of the points he insisted upon, urging the value of effort to teach others to the teacher himself.

The Architectural Association ought to maintain a large and able staff, as the numbers of students passing through the schools offers a very considerable field of selection. It is an honour to serve, understaffing need never exist, and the strain of teaching can be immensely lightened by intelligent policy in this respect. Intercommunication and co-operation on the part of the teaching staff will naturally result with reorganisation in our new home, to the great benefit of the students and the avoidance of overlapping.

In labouring on behalf of our young students, architects find a practical solution of many divergencies. Pardon me for parting word of advice, "Retain your own opinions, but make them an excuse for holding back from the work."

Mr. H. P. G. MAULE contributed a second paper on the same subject. He said:—It is with very great diffidence I find myself in the position of having to say anything to-night on the subject of day school training, for the limited experience I have had does not entitle me to offer any views or opinions which I may have formed on the subject. I must ask you therefore to believe that it is only at the wish of our friend, Mr. A. T. Bolton, that I venture to present what he has said by emphasising a few of the points which appear to me salient features in architectural day school training. With the general outline of what he has said I cordially agree, and I feel I do not even do him justice when I tell you that I know the difficulty of my task in carrying out the work is light compared to his, in starting it, and handing it over to me every detail, every paper, was laid out in method and order.

With the Architectural Association scheme it is not easy to bear two facts in mind. First, that the first year of training consists in reality of only nine months' actual work in the school, as three months are allowed for independent work and door study, which forms an important part of the training. Secondly, that almost the most important part of the training is the second year, when the student is, in the school, during which time his study takes the form of directed exercises in design. This obviates the charge of academic teaching, as the student is brought into contact with the actual professional work of the day.

Now, the primary object of the day school is to enable the student to acquire during the first year such a knowledge of architectural drawing, of history and of construction that, when he goes into an office as pupil, he can begin at once to the advantage of what he will there see and learn, and thus to dispense with that awkward period, which most of us have experienced, of being plunged into an office with none but the vaguest idea of what to learn or how to learn it.

There is another important feature, and that is in the organisation and method of the school training should be such as to enable the student to carry on his own education subsequently to the school, of course, by lectures and classes) with more interest and method and application than is possible from an initial period in an office. Now, the amount of "in-school" time available for the first year's course—namely, actually only nine months—seems to me to make it imperative that the training during this period should be on the broadest and simplest lines possible, so that the training should, in fact, be mainly directed to the student a method of learning. To begin to learn to observe; to begin to learn to think; to begin to learn to create; above all, to endeavour to naturally fire and regulate the student's enthusiasm, and lead him to love his work for its own sake. Without this latter as a resultant of the training, the student's labour lost so far as architectural training is concerned, and no doubt much useful knowledge would be gained which would always be an advantage in any work afterwards taken up.

The training, or rather the evolving, of an architect

product of the public school is a long and complicated one, and when the shortness of the initial period and the lack of technical and constructive knowledge that is ultimately required is taken into consideration, it seems to me that this early period should be made broad and liberal, and, above all, not too technical. It must not be remembered that, no matter what brains a student may have, nor how highly trained he may be so far as general education goes, the special subjects of an architect's calling, whether history, construction or elementary design, he is in almost all cases very ignorant. His mind, therefore, no matter how receptive, cannot assimilate more than a certain amount of matter, and it is assimilation and thought, and not an unselected assortment of facts, that really constitutes a good education.

Drawing.

The construction subject as inaugurated by Mr. Bolton is to me the best of all methods for insuring a simple and thorough grounding in elementary construction and materials, and as the complete and direct relationship between materials, construction and design is clearly kept before the student. It also attaches great importance to the early, careful and systematic drawing of simple full-size details in connection with the construction subject, for an abbreviation, such as a set of eighth scale drawings, cannot be properly understood—or unless the component parts, such as door and window openings which they abbreviate are clearly understood in advance. In all the work done in the school great care should be taken to insure accuracy and clearness, and special attention should be directed to printing and the value of clear and legible working drawings and tracings.

Observation and Thought.

In an assembly of architects it is quite unnecessary to emphasise the importance of observation or the necessity for it. The eye sees what it is trained to see, and the eye is the greatest of all educators; the mind also develops its reasoning faculty by knowing what to think about. Unfortunately the cultivation of observation does not apparently form part of an English school curriculum, and though most little children are observant, the habit is generally crushed out of them long before they have arrived at an age when observation, and the deduction from that observation, complement one another. To reawaken the lost habit, if, unfortunately, lost it should be one of the great aims of the training, and this training of observation, directed as it is, will surely bring about the development of thought. Organised, logical thought, the thought that will eventually enable a man to deal with beauty and build with truth, because he sees clearly without confusion, can only come with years, but the germ surely be planted and tended during the first year in the school.

At last, but not least,

Enthusiasm.

A famous writer once said that nothing was so catching as enthusiasm, and certainly no lifework should be so capable of creating enthusiasm as the study and practice of architecture, but if the early years of training are overburdened with technicalities, or with work too far in advance of fairly easy comprehension, there is grave fear of the failure to awaken the divine spark, without which the whole structure of architectural education falls to the ground.

In conclusion, I can only say I hope I have not dogmatised at the sight of the fact that my very limited experience hardly entitles me to put before you what I personally conceive to be some of the essential features of that primary architectural education which I believe all members of our Association should so earnestly at heart.

Mr. MAURICE B. ADAMS, who proposed a vote of thanks to the authors of the two papers, said he was delighted with the system and method of training in the initial stage of the school when he realised it was an experiment they had all put in their hands to. He looked back on the days of his own pupilage, and considered what the training of the young architect was then, and the advantages of the day school preparation were apparent. He did not think the architect whose office entered as pupil ever spent more than one-quarter of an hour in instruction during the time of his pupilage, and this experience he (the speaker) supposed was the experience of thousands of others. Nowadays architects seemed to realise their duties towards the pupil, but in earlier days the pupil received knowledge as best he could. The new departure of the Association was certainly an improvement which would fit the profession. Before being articulated in an office the young man could attend the school and ascertain thereby whether architecture was the kind of work he was cut out for, and whether he had the necessary qualifications to carry on a profession with credit to himself and satisfaction to his clients. The plan adopted by the Association was admirable,

and he agreed with the two speakers as to the benefits of mutual assistance and the advantages of young men teaching young men. The day school promised extraordinary developments in the future, the results of which could not be foreseen.

Mr. A. M. WATSON seconded the motion.

Mr. G. H. JENKINS and Mr. MAX CLARKE also spoke.

STRAND IMPROVEMENT.

A REPORT was submitted on Tuesday by the improvements committee of the London County Council respecting various proposals for setting back the northern line of frontage in the Strand between Wellington Street and the Law Courts. The committee say:—"If the modification originally suggested by Mr. Thornycroft were carried out it would necessitate the addition to the public way of the Strand and Aldwych of land which would otherwise be let for building purposes, and is valued by the Council's valuer at 350,000*l.*, to which must be added the cost of altering the existing vaults, paving, &c., estimated at 10,000*l.*, making a total of 360,000*l.*; the loss of recoupment if the Council were to adopt the plan submitted by the Further Strand improvement committee would be 239,400*l.* for land and 10,000*l.* for works, making a total of 249,400*l.*; the loss of recoupment if the Council were to adopt the amendment suggested by the Royal Institute of British Architects, and now accepted by Mr. Thornycroft, is estimated at 70,000*l.* for land surrendered and 4,000*l.* for alteration of vaults, paving, &c., making a total of 74,000*l.*; while the loss to the Council if the suggestion made by the Council's superintending architect were adopted is estimated at 59,000*l.* for land and 4,000*l.* for vaults, paving, &c., making a total of 63,000*l.* After the most full and careful consideration of all the facts, and having carefully viewed on the site of the improvement the effect of the various proposals made, we have arrived at the conclusion that the width already provided by the Council for the widened Strand, namely, a minimum of 100 feet, is in every respect ample for the present and prospective traffic. It must not be forgotten that when Aldwych and Kingsway are completed much of the traffic passing to and from the new street and the southern, eastern and western parts of London will not use the portion of the Strand between Wellington Street and the Law Courts; that part of the thoroughfare will accordingly be used almost entirely by the traffic passing from Fleet Street westwards, and from the western portion of the Strand eastwards to Fleet Street. Fleet Street is being widened by the City Corporation to 60 feet, and the Council is contributing part of the cost. The portion of the Strand opposite the Hotel Cecil has been widened at the cost of the Council to 80 feet, and the same width has been adopted for the improvement at the portion of the Strand east of the Hotel Cecil and opposite Beaufort Buildings, now being undertaken by the Westminster City Council, with a contribution from the Council. It will be apparent, therefore, that while the portion of the Strand between Wellington Street and the Law Courts will presently be relieved of a large amount of traffic which at present passes along it, the Council is providing a width of street far in excess of that which has been adopted for other portions of the same line of thoroughfare. Moreover, the width of 100 feet is considerably in excess of that generally adopted for street improvements in the past. During the 33 years of the Metropolitan Board of Works the average width adopted for main thoroughfares was 60 feet, which in our opinion was in some cases not sufficient. Charing Cross Road and Shaftesbury Avenue should, we think, have been made more than 60 feet wide; but there is a very considerable difference between the 60 feet provided for those thoroughfares and the 100 feet to which the Council has widened the Strand at that part which shortly will be relieved of some of the traffic. Very few streets constructed by the Board were as wide as 80 feet, and the only thoroughfares which exceeded that width (80 feet) were Northumberland Avenue (90 feet) and the Victoria Embankment (100 feet). The Council, when effecting county improvements, has, whenever possible, adopted a width of 70 feet and 80 feet. With these facts before us, it appears that any proposal for increasing the width of 100 feet for the portion of the Strand between Wellington Street and the Law Courts cannot be made merely on the ground of meeting the needs of the traffic, but must partake almost entirely of the nature of an æsthetic proposal, the chief argument in support of the proposal being to secure better architectural effect by bringing into greater prominence the church of St. Mary-le-Strand and the Law Courts. We have not yet been convinced that by throwing open to view various portions of the Law Courts buildings the architectural effect in the Strand would be considerably enhanced, but whether this would be so or not, we feel that the Council would not be justified in incurring so large an expenditure as would be involved in securing a doubtful enhancement of the architectural view in the Strand."

NOTES AND COMMENTS.

SPAIN appears to be giving more attention to architecture of late years than during the greater part of the nineteenth century. It has been decided to hold an international congress of architects in Madrid from April 6 to April 14, 1904. The subjects arranged for consideration are the following:—(1) Modern art in works of architecture; (2) the preservation and restoration of monuments of architecture; (3) the characteristic effects of scientific studies in the general education of the architect; (4) influence of modern processes of construction upon artistic forms; (5) artistic ownership of architectural designs; (6) instruction of building mechanics; (7) the influence of city building regulations upon contemporary private architecture; (8) the appropriation of works of architectural art; (9) may the architect act as arbitrator between contractors and workmen? The subjects, it will be observed, are of a general character, but that is we suppose deemed essential in an international congress. Visitors would have liked to hear some topics connected with Spanish architecture adequately treated, for the accounts given by the majority of modern travellers and foreign investigators are insufficient.

ARLES is known to archaeologists as one of the most interesting cities in Europe. As studies of Greek and Roman art increase, it is possible it may become much more important. When Greece was conquered it is believed that many artists fled not only to Rome but to Arles, which, like Massilia or Marseilles, could be considered as partly a Greek city. Enough remains have been found to suggest Greek influence. The amphitheatre is no doubt a Roman work. It had also triumphal arches, of which the most beautiful one, dedicated to CONSTANTINE, was destroyed in 1743 in order that a street might be enlarged. Under Roman administration it was a city remarkable for its grandeur. But the remains of the theatre suggest that Greek influence was much stronger in Arles than is generally supposed. The well-known *Venus of Arles* is also evidence of the presence of Greek sculptors. We can understand the desire of the municipal authorities of Arles to impress the world with the belief of the classicism of the city. But the history of Arles did not end with the fall of Rome. To archaeologists the sarcophagi which have been found in the cemetery are often most interesting, because on them Scriptural scenes are represented by Roman sculptors. The first bishop of Arles was, according to tradition, one of St. PAUL's disciples. There is no reason why any objects relating to the history of the place in Mediæval times should not be respected. The Municipal Council have, however, declared that one important example, known as the Gate of Calvary, is without any archaeological or artistic value, and arrangements have been made for its destruction. It is believed, however, that remonstrances from lovers of art will prevent the Council from carrying out the resolution. People condemn the zeal by which in early Christian times so much ancient art was destroyed. But it is evident that a similar iconoclastic spirit prevails in Arles, the only difference being that pseudo-Classicists are taking their revenge on Christian art. In many parts of France it now seems to be necessary, after clearing out the religious orders, to destroy the art which they had created several centuries back.

THE date of the birth of MASACCIO is uncertain; 1401, 1402 and 1403 are mentioned. But the people of San Giovanni, a small town between Florence and Arezzo, maintain that Sunday next will be the five hundredth anniversary of the painter's birth. They have accordingly decided to hold a fête on that day and unveil a monument of the artist. The town does not present many examples of his style. His most remarkable works are his frescoes in the Brancacci Chapel in the Carmine, Florence, where he continued the series commenced by his master MASOLINO. His nickname MASACCIO warrants the description of him by VASARI, who says:—"He was remarkably absent and careless of externals, as one who, having fixed his whole mind and thought on art, cared little for himself or his personal interests, and meddled still less with the affairs of others; he

could by no means be induced to bestow his attention on the cares of the world and the general interests of his country, insomuch that he would give no thought to his clothing, nor was he ever wont to require payment from his disciples until he was first reduced to the extremity of want. DA VINCI looked on him as the second creator of Italian painting, for when the art had declined he "showed how perfect works how those who take for their standard are not but nature—the mistress of all masters—wearied them in vain." All the great masters of the Renaissance studied MASACCIO's paintings, which formed a school of art as was before them, if we can believe CELLINI, and TORREGIANO broke MICHEL ANGIOLO's nose because he laughed at efforts to draw from them which were less successful than his own. MASACCIO, who accomplished much, died in 1428. He was very poor. He was essentially a frescoist, and consequently can only be studied in Florence. A portrait of a young man in a record in our National Gallery used to be attributed to him, but the work is now recognised as having come from an inferior hand.

HOUSE, BAY PARK ROAD, MAIDENHEAD.—GARDEN FRONT. HALL. THE ELEVATION TO DRIVE. THE TERRACE. GARDEN FRONT.

THIS building was recently erected as a summer residence for Mr. G. C. BULLER. Owing to the site being low-lying ground, the building was raised 4 feet above the road level to prevent flooding, thus giving an opportunity to introduce a terrace, which has been taken full advantage of. The ground plan comprises a drawing room, dining-room (with oak dado), a large study and usual offices, and outer hall which gives access to the kitchen apartments from the front entrance without passing through the large hall, and from which the ground-floor lavatory is entered. The large hall is the chief feature of the plan, having a high oak dado and oak staircase, a gallery around same on first floor, from which the first-floor bedrooms are approached. The corridor, entered from the dining-room, is intended to communicate with the future palm house, and is used as a smoking lounge. On the first floor, five bedrooms, a study and three servants' bedrooms are provided, with a large balcony approached from the staircase gallery which overlooks the greater portion of the garden. The flat over the corridor forms a spacious open balcony, and is approached from the dressing-room. A circular staircase leads to the turret.

The external walls are of Messrs. J. K. COOPER & SONS' facing bricks, with half-timber work filled in with rough-cast above. The roofs are covered with local red-faced tiles. Plain, clear glass leadlights are used in the transoms and first floor windows. The large window in the hall is filled with stained glass to special design. The places were supplied by Messrs. GEO. WRIGHT & CO. Messrs. PULHAM & SONS executed the terrace balustrade in their Pulhamite stone. The gardens were laid by Messrs. CHEAL & SONS under the direction of Mr. BULLER. Messrs. J. K. COOPER & SONS, of Maidenhead, efficiently carried out the work in the exceptionally short time of six months, including executing the oakwork, entrance porch and making-up the drives. The architects were Messrs. MACINTOSH & NEWMAN, Birkbeck Bank Chambers, W.C.

HOUSE, TREVOR HILL, CHURCH STRETTON.

THIS house has been built on the slope of the hill to the west of the town. It is beautifully situated as to the golf house and links, and commands exquisite views of the town and the range of hills to the east side thereof, including Caradoc and the beautiful valleys to the north and south. The cost has been about 800£, and the builder, Mr. SPRAKE, of Church Stretton, has executed the work very well.

work, and are therefore associated with Alfred in the founda-
tion. It stood so close to the cathedral of St. Swithun that
annoyance was occasioned by singing, playing and the ringing
of bells during simultaneous services, so by Henry I. and
Bishop Giffard it was translated to Hyde.

The new building was dedicated in honour of St. Peter, St.
Grimbald, St. Columban and St. Barnabas.

In the early days of the Church its higher dignitaries were
essentially militant. Bishops and others had their armed
retainers, and many village churches were constructed to resist
a siege. It is probable, therefore, that when the abbot of St.
Peter's took possession of Sanderstead he would welcome the
position of the old castle, and would convert it into his grange,
and, if so, the thread is again joined.

But though the clergy were combative, much good work in
the land was done by them; they built the bridges, they sunk
the wells, they wrote the books, while they fed the hungry,
clothed the naked and tended the sick. A well they sunk
some 350 feet deep can still be seen in Sanderstead Park, and
a tradition exists that it stood within the precincts of a priory,

whose foundations can still be traced in a dry summer. No
priory, however, is believed to have ever been there, but in
connection with holy wells chapels were often built, and this
probably was one of them, and it might have had a guest-
house attached for the use of pilgrims. The building stood
until after the Reformation, and it has been suggested that the
materials were used for the construction of Sanderstead Place,
which was pulled down about 200 years ago, and the site added
to Sanderstead Park.

In Selsdon House some panelled ceilings attract the
attention: two of them symbolise the Church and State. The
one in the dining-room has the words "Fides, Spes, Caritas,"
running along three sides of the chief panels. Now Faith,
Hope and Charity are the three theological virtues of the
Roman Church, so may it not be possible that it was con-
structed by one of the abbots? In the smaller divisions some
later ornamentation has been introduced. Of the date of the
billiard-room ceiling there can be no question. In every panel
there are four badges. The Fleur-de-lis, first used by Henry V.;
the Tudor Rose formed of the Red and White Roses of

Lancaster and York, united by Henry VII.; the Poort-colyce, or Portcullis, first used by the same king, and the Pomegranate, the badge of Catharine of Aragon. Henry VIII.'s marriage with her took place in 1509, and she was divorced in 1533, so between these dates we may reasonably place the ceiling; and possibly it may be more nearly dated, for in 1521 Pope Leo X. conferred upon Henry the title of Defender of the Faith; so to honour the king the abbot at that time may have embellished his room.

The names of forty of the abbots are known. They were mitred, and some were summoned to Parliament; of a few only it is necessary to speak. The first was Grimbald, who was placed there by King Alfred, and was honoured at the dedication of the later abbey. In 1271 the Prior of Bermondsey had a suit against William de Wigorn or Worcester, the then abbot, for attaching some of his land to Sanderstede; and five years later the same abbot retaliated, and impleaded the Prior for erecting a gallows in his manor of Sanderstede, but the Prior pleaded it was in his own manor of Warlingham. This was in the reign of Edward I.; and then, in 1287, there is a brief record in contracted Latin. The translation kindly made by the Rev. Sir W. Earle, Bart., runs:—"Between Ralph de Ditton and Joan his wife plaintiffs, and Robert de Waleton and Isabella his wife, concerning the transfer of four messuages, one hundred and thirty acres of woods, and rents eleven shillings and elevenpence realities with their appurten-

ARCH FROM BLACKFRIARS MONASTERY. (IN SELSDON PARK.)

ances in Sanderstede and Sellesdone." This passage is interesting as showing that although Selsdon was in Sanderstead, it was of sufficient importance to be separately mentioned.

In 1327 a license was granted in the reign of Edward II. to Abbot Walter de Fyflyde for him to lease Sanderstead to Walter, Bishop of Exeter, for ten years; so Selsdon may then have become one of his palaces. The last abbot, John Sulcot, was seemingly in the royal favour, for Henry VIII. gave him license to alienate the manor to Sir John Gresham, afterwards Lord Mayor of London. Willis tells us that Sulcot had been educated in the University of Cambridge, and was instrumental in engaging his University to comply with the king's divorce from Catharine of Aragon. The sale, however, was not effected, and at the Reformation Henry himself sold the manor of Sanderstead, with Selsdon House, to Sir John. Sulcot, however, was wise in his generation; to the visitation he made no objection, and instead of going to the gallows, like many good men did, he accepted the bishopric of Bangor, being permitted to retain his title of Abbot of Hyde, and in 1539 he was translated to the see of Salisbury.

The manor of Sanderstead successively passed to Sir John's widow, to his son Edmund, and his grandson Richard, who in 1591 sold it to John Ownsted of Addington, who for some years may have resided at Selsdon House.

This Ownsted was a man whom all lovers of old might have envied, for on his monument in the church of Saints, Sanderstead, where his kneeling effigy in alabaster, we read:—"Here lieth buried the bodie of John Ownsted, Esquier, Servaunt to the most excellent Prince our dread Sovereigne Queen Elizabeth, and Serjeant Maties. carriage by ye space of 40 yeres. He was 66 yere of his age on the 9th of August, 1600." He had to see to her safe transit during the many royal progresses.

In the records of baptisms in Sanderstead Church following entries appear in Latin:—Elizabeth Ownsted, daughter of Henry Ownsted, of Selsdon, October 29, 1596; Anna Ownsted, daughter of George Ownsted, of Selsdon, September 3, 1598; Atwoode Ownstede, son of John Ownstede, of Seels Downe, November 2, 1606; and burials is Anna Ownsted, daughter of George Ownsted, September 12, 1598.

Ownsted died childless, and the estate passed to an attorney in Clifford's Inn, named Harman Atwoode, a curious specimen of orthography. The family name went various changes. In the time of Edward VI. Atwoode, in Edward III.'s reign it was Atte Wood, and a plate in Sanderstead Church bears the inscription: "Lyeth Nycholas Wood, the thirde sonne of John Atwoode, Sanderstede Corte, who served Queene Elizabeth the second yere of her rayne, and deceased the xiiij. of November, 1586." Of Sanderstead Court the earliest mention is in 1676. Christopher Bowyer then became the owner of Selsdon House, and John Aubrey describes him as a hospitable person, and possibly to him is due the addition of the drawing-room, though it may be a later addition.

The last of the Attwoods died in 1759, and the estate passed to a cousin, Thomas Wigsell, an attorney of Norwich, whose relatives, the Arkwrights, now own the manor.

From the Wigsells William Coles seems to have bought Selsdon House, and in 1805 he sold it to George Smith, brother of Robert, Lord Carrington. Dying in 1831, he was succeeded by his eldest son, George Robert Smith, who was M.P. for Midhurst and afterwards for High Wycombe. The house had been reduced and enlarged by its various owners, and by the Smiths some of the walls were rebuilt and were encased with red brick; a conservatory in the Italian style was also constructed from designs by Messrs. P. and C. Brandon, and one writer suggests that the present drawing-room was added by the Smiths, but it is more probable that it was merely altered and fresh windows introduced. In the drawing-room a beautifully carved wood fireplace was erected in the 18th century, which came from Purley House, in Sanderstead parish. Rev. John Horne, who assumed the name of Thomas, wrote "The Diversions of Purley," and in it he mentions the house was the seat of Bradshaw, the regicide, and repeats the statement. John Bradshaw was born in Wilbersley Hall, Stockport. For a time he lived at Selsdon, and then in Basinghall Street. He was called to the bar at Gray's Inn on April 23, 1627. At the trial of Charles I. his name headed the death-warrant, and for his services on that occasion he was paid a thousand pounds in money. He was awarded the estates of the Earl of St. Albans and of Cottingham, which were valued at two thousand a year. As Deanery at Westminster he made his town residence, and died in 1659 in his house at Enfield, which still stands. He will left estates in Berkshire, Southampton, Wiltshire, and Middlesex, which were confiscated at the Restoration.

In 1879 Selsdon House was rented by the See of Exeter for Anthony Wilson Thorold, its bishop, and what was then his billiard-room was then his chapel. Candidates for the See invariably spent the week-ends there, and the clergy of the diocese there took their holidays, gaining strength in the sylvan solitudes of Selsdon. At Selsdon services were regularly held in the chapel twice a week, and on Sundays, it was not all prayer and praise, for bishops occasionally unbend, and there were moments in the hall, for in an article in *The World* it is mentioned that a favourite game there was "the errand," which the bishop had brought from America, and was to be the only one in England. It is described as a game with a marble top, divided into various compartments, and nine pins of different values were placed. The spinners, polished steel, and the object was to overturn the pins. The Archbishop of Canterbury, bishops of London and other dignitaries of the Church took part in the game. Wilson Thorold and his little daughters, and the scores, carefully registered, show that the poorest players were the highest officials of the Church.

William Stevens was the next tenant of Selsdon House, the present occupant and owner is Mr. Wickham Noakes. A beautiful home is ever a scene of life and happiness, and it is not surprising that so many pleasant shooting parties make Selsdon House a place of resort.

Wood. The house stands some 576 feet above the sea and from the tower a wooded scene is presented that is equalled in Surrey.

Noakes an arch from the monastery at Blackfriars, which was revealed in 1900, was re-erected at Selsdon, and a suitable spot could scarcely have been chosen. The Blackfriars had their first settlement in Holborn, and to the place bearing their name they removed in 1276. The Black Parliaments were held there, and it was there that the marriage of Aragon was tried, the sentence of divorce pronounced by Cardinal Wolsey. We have seen her name at Selsdon, and have heard how the Abbot of Hyde was wrecking her life. In Sanderstead Church, too, there is a tomb to Mrs. Mary Atwood, late wife of Mr. George Atwood, a Blackfriars, London, who died April 4, 1761; and in the church we read that Mary Atwood, of St. Ann, Blackfriars, was buried May 9, 1748; that Elizabeth Atwood, of St. Ann, Blackfriars, London, was buried March 14, 1750; that Mary, wife of George Atwood, of the parish of St. Ann, London, was buried in Linnen, April 14, 1761. In connection with the arch, it may be mentioned that some 150 years ago the premises of the printing office were being enlarged and part of the old London wall was being removed. Behind it some remains of the monastery were found. The *Times* described them as a plinth standing on a mass of brick and chalk 6 feet high, and projecting from the face of the wall 4 feet 2 inches, and near the buttress on the south side forming the jamb of a door. Until 1856 they were left in situ, but a further enlargement of the printing office made them be taken down. Some of us may regard the religious houses as having been living, breathing, and the reappearance of remnants of them ages after their destruction recalls to mind the line of Thomas Hood, "All the corpse lay bare."

Up, Sanderstead Place was erected after the Refoundation of Sanderstead Court no record seems to exist before the reign of Elizabeth, whereas Selsdon is distinctly mentioned in the times, and part of the house is obviously of Tudor date. Selsdon is the home of an English gentleman, a man of note have lived within its walls; it has served as a residence for a bishop of Rochester, and may we not assume the palace of a bishop of Exeter, the grange of the monks of Winchester and Hyde, and the castle of a Saxon duke?

SELSDON HOUSE, MAIN ENTRANCE.

After the Norman Conquest the manor of Croydon was conferred upon Archbishop Lanfranc, who is believed to have had it there, though by some writers its erection is ascribed to Henry Langton. A mandate signed in 1273 by King Edward I. was then in existence. It was built of wood on low ground, and was surrounded by a moat formed by little waterways of mud, and was buried by trees. It was damp, dark and unhealthy. Henry VIII. said he could never be at Croydon House without sickness, and Archbishop Grindall wrote in 1567 that Croydon House is no wholesome house. It did not affect Elizabeth, for in 1567 she visited Archbishop Grindall there, and in July 1573 was his guest for seven days. She also honoured in August 1600 Archbishop Abbot in some of the timber to gain light and air, but Archbishop Potter and Archbishop Herring are the latest prelates who resided there for any length of time. During the Commonwealth it had been let to the Earl of Nottingham, and after to Sir William Brereton. By Archbishop Secker, in 1758, it was abandoned, and in 1780 it was sold by the trustees to Alderman Pitches for 2,520*l.*, the proceeds being applied towards the construction of Westminster Bridge. It was

afterwards converted into a washing and bleaching establishment, and in 1887 it was rescued by the Duke of Newcastle, who presented it to the Church Extension Association, and under their control the Sisters of the Church are doing much good work in the district.

Among the present remains of the palace are the guard chamber, the hall and the chapel. The guard chamber was built by Archbishop Arundel between 1396 and 1413. The perpendicular hall was erected by Archbishop Stafford, who was elected in 1443. On the corbels are the shields and arms of Stafford and other occupants of the see. The chapel was commenced by Archbishop Laud about 1634, and was finished by Juxon, his successor. At the west end on the south side there is a small gallery with a carved front of the time of King James. It is popularly known as Queen Elizabeth's pew, although her seat was a canopied throne. Three underground cells also remain, and in 1898 two subterranean passages were discovered, the one leading to South Street, the other towards Beddington Park.

In a paper like the present, where so much is hypothetical, it would scarcely be correct to mention authorities, but for various details and dates many writers have been consulted, and among them mention may be made of Dr. Nutall, John Mitchell Kemble, J. A. Davis, William Dugdale, Mackenzie Walcott, Granville Leveson Gower, Frederick George Lee, Sir Bernard Burke, the Rev. Owen Manning, William Bray, E. W. Brayley, Edward Walford, E. R. Kelly, S. L. Lee, John Timbs, Walter Stanhope, William Hone, Edward A. Martin and Captain L. Broke Willoughby, whose account of Selsdon Park recently appeared in the *Sketch*.

The illustrations are from photographs kindly lent by Mr. Wickham Noakes and Mr. A. J. Quartermain.

THE SOCIETY OF ARCHITECTS.

THE annual report of the Council for the session ending October 31, 1903, states:—The Council has pleasure in reporting a satisfactory increase in the membership, more than fifty applications having been approved and thirty-three candidates were elected, the remainder pending election. Fifteen members and two associates have resigned, one member has been transferred to hon. membership, four members have been removed from the roll and three have died. Over twenty applications have been approved for the students' register, of whom thirteen have been elected this year, and there have been four resignations. Two competitions have been held during the past session, the subjects selected being "A Design for a Cottage Hospital," and "Measured Drawings of a Chancel or Side Chapel Screen," a prize of the value of three guineas being offered in each case.

The designs submitted in the first competition were carefully prepared and were very close in order of merit. The following were the successful competitors:—B. C. Ernest Bayley, first, J. Nixon Scaife, hon. mention. There were no entries for the second competition.

During the session the following papers were read before the Society:—Presidential Address, S. Trevel, J.P., F.R.I.B.A.; "Some recent Conflagrations and their Lessons to Architects," by Ellis Marsland, hon. sec.; "The Legal Rights and Liabilities of Architects and Surveyors," by H. H. Richardson, solicitor; "Acetylene Gas-Lighting for Country Houses," by J. W. Woodall, M.A., and W. Windham, M.Inst.C.E.; "Ventilation and Warming," by B. R. Tucker; "Modern Terra Cotta, Faience and Ceramic Mural Decoration," by J. Miller Carr; "Impressions of Architectural Rambles on the Continent," by S. Trevel, J.P., F.R.I.B.A., president.

The all-important question of registration has received fresh impetus during the past year, and good progress has been made in preparing the way for further action. Early in the session the Architects' Registration Bill committee was amalgamated with the Council of the Society of Architects, as a joint registration committee, under the chairmanship of the President of the Society for the time being. Steps were then taken by means of a circular letter and reply postcard to ascertain the views of recognised members of the profession on the principle of registration. It has been ascertained that some two-thirds of the profession has declared itself in sympathy with the movement for obtaining the statutory examination and registration of all persons entering the profession of architecture, and from the fact that less than 170 voted against the principle, and as every possible facility was given for voting one way or the other, it may reasonably be inferred that an overwhelming majority of the profession is in favour of legislation on the lines indicated. The Society's circular received consideration by the Council of the Royal Institute of British Architects, which issued a counter-statement, followed by a request to the allied societies to express their opinions on the matter. Several of the latter have since passed resolutions in favour of the movement, thus

confirming the individual voting of their members, which shows that almost without exception the allied societies agree with the principle of registration. The persistent action of the Society has naturally revived the antagonism of the few who from the first have strongly opposed any measure of the kind contemplated, and the usual paper controversy has resulted; but, on the other hand, many architects who hitherto have remained neutral and some who formerly opposed have thrown in their lot with the "Registrationists," and the support which the Society has received will enable it undoubtedly to attain its aim in due course. The Architects' Registration Bill, which is under the charge of Mr. L. A. Atherley-Jones, K.C., M.P., has been carefully revised by the joint committee and again introduced into Parliament, and no effort will be wanting on the part of its supporters to secure its passage. The Council feels that many of the difficulties inseparable from the movement are being successfully overcome and that steady progress is being made towards attaining the object in view.

The Council has had before it the proposed London Building Act Amendment Bill brought in by the London County Council with the view of minimising the danger of fires; the Bill, however, was subsequently withdrawn, and the London County Council has since invited the Society to make suggestions as to any revisions to the Building Act generally. The matter is being dealt with by a sub-committee.

The St. James's Hall property having been sold, it has become necessary to find other quarters, and the Council is in negotiation for premises in Holborn, which are well suited for the purpose. It is hoped shortly to make a more definite announcement.

Having been invited by the City Churches Preservation Society to give an opinion on the proposed demolition of All Hallows, Lombard Street, the Council, after full consideration of the circumstances of the case, expressed the view that it being understood that by the sale of the site a large sum of money would be available for the provision of churches and clergy in the poorer parts of the Metropolis, and that there would be no difficulty in removing and re-erecting the building elsewhere and preserving it for more extended use and service, the sale of the site was, under these circumstances, justifiable. The suggestion attracted a good deal of attention, and resulted in the Council receiving an offer of a freehold site near London and a considerable sum of money towards the expenses of the removal and re-erection of the church, together with an annual income towards its upkeep. The Bishop of London was communicated with, and expressed his approval of the principle of the suggestion and asked for details of the scheme, which were supplied to him by the owner of the site. From communications since received it is understood that the position of the proposed site is such as may render it impossible for the offer to be accepted, but that if anything is done by the present owner it will be in conjunction with the Society.

At the invitation of the International Fire Prevention Committee, the Sanitary Institute and the Royal Institute of Public Health, the Society was officially represented at the International Fire Prevention Congress, London; Sanitary Institute Congress, Bradford; and Royal Institute of Public Health, Liverpool.

The Council has under consideration the drafting of a scale of charges and a form of contract for the exclusive use of the members, it having been represented that such would be of service. Many difficulties present themselves in formulating a scheme which will meet with general acceptance, and members can greatly assist the Council by suggestions.

A large number of inquiries continue to be received for the half-yearly examinations, and the number of candidates is increasing. Examinations have been held during the session at London and Leeds, when candidates qualified. The arrangements at Leeds were kindly undertaken by Messrs. Kendall & Bakes, in conjunction with Mr. W. S. Braithwaite. Arrangements were also practically completed for a centre in Ireland, but these had to be postponed. The syllabus has been further revised and the regulations as to the admission of candidates made more stringent.

A number of vacancies have been filled through the medium of the employment register, but more use might, with advantage, be made of it. A number of assistants are at present on the books. There is no charge to members and students.

In view of the recent introduction into Parliament of a Bill to amend the law relating to ancient lights, drafted by the R.I.B.A. and the Surveyors' Institution, the question of further action by the Society in the way of legislation is in abeyance pending the report of a committee upon the proposed Bill.

The outgoings during the year have necessarily increased with the development of the Society's work, and there have not been such exceptional opportunities as occurred last year for augmenting the finances, more particularly in connection with subletting the hall, but it is expected that the auditor's report will show an increase in the ordinary income and a satisfactory surplus.

During the session the Council has met eleven times, the practice committee, ten; finance, nine; examination, eight; registration, eight; and literary, one. Seven ordinary meetings have been held. The practice committee is able to help several members with advice on points connected with their work, and its services are at the disposal of members requiring assistance of this kind. The committee does not undertake questions.

Good progress continues to be made in every direction. The membership in particular has shown a more than satisfactory increase, there being a total membership of 1,200, while there are indications of a further steady increase in membership and influence. The step which the Council has taken with regard to registration has met with general approval and support, and the Society has a weight of opinion in addition to its membership, which will greatly assist its further prosecution of the movement. The Council has also its wish expressed in previous reports, to make the Society an increased source of benefit and assistance to its members, the profession generally, and to this end seeks the cooperation of the members. The Council takes this opportunity of thanking those members and others who have contributed to the pleasure or profit of the members and the Society generally, by preparing and reading papers, assisting in the execution of the social functions, and in other ways using their influence in advancing the objects and interests of the Society.

IRISH ANTIQUITIES.

THE annual report of the Commissioners of Public Works in Ireland records that the important ruins of the 12th century in Louth, have been acquired as a national monument in the custody of this group of ruins was vested in the Board of Works of July 12, 1902, by the owner, Mr. Blayney R. T. B. B. The group comprises (1) the site and ruins of the 12th century Castle, sometimes called "Moore's Castle," "The Castle," "the Abbey," or "The Mill"; (2) the ruined church of the 12th century on the hill, called "The Chapel of St. Bernard"; (3) the ruins of the Cistercian abbey of Mellifont, consisting of the choir, nave, aisles and transepts, with the chapter house, lavabo, cloister garth and other remains of the 12th century buildings.

The ruins comprised in item 3 had been vested in the Church Temporalities Commissioners by vesting order of October 30, 1880, made in pursuance of the Irish Church Act, 1869, sec. 25. The ruins comprised in clauses 1 and 2 were not so vested.

The owner of the property offered no objection to the vesting by the Church Temporalities Commissioners, and it was ascertained that a tenant claimed rights over the site as part of a holding for which a judicial rent had been fixed. When the application of the tenant came before the Land Commission for a revision of the rent of the holding, steps were taken by the owner to resume possession of the portion of the farm on which the ruins were situated. The tenant received compensation and the landlord was at liberty to vest the custody of the whole of the premises in the Board, which he accordingly did.

After the original vesting in 1880 some excavations were made which partially revealed the extent of the ruins of the church. During the past year, through the facilities afforded by Mr. Balfour, these excavations have been extended, and the result that the foundations of the whole of the abbey, showing its original extent, have been uncovered. A complete ground plan of the structure has now for the first time been ascertained. The dimensions of the church as revealed show a total internal length of 191 feet, the width of the transept being 116 feet. The following are the dimensions:—

Nave, 116 feet in length by 54 feet wide, including the aisles.

Two aisles, each 105 feet long.

North transept, 54 feet 6 inches by 42 feet 2 inches.

South transept, 40 feet by 40 feet.

Choir, 42 feet 8 inches by 26 feet 2 inches.

Space under tower, 34 feet by 32 feet.

Cloister garth, 132 feet 9 inches by 101 feet.

It is now evident that the structure commonly known as the baptistery, which was undoubtedly the lavabo, was part of the original design, and is consequently the oldest portion of the ruin now above ground.

The foundation of the abbey is ascribed to O'Carroll of Uriel, in the year 1142. The parent house was that of the Cistercian abbey of Clairvaux, of which St. Bernard was the first abbot. Mellifont was the first Cistercian abbey in Ireland, and it was probably the finest. The 20th century Mellifont were peers of Parliament, and took precedence of all similar establishments in Ireland. In 1254 an abbot was fined and superseded on the complaint of Edward II. to the Pope for disregarding the statute prohibiting

from being admitted monk who could not swear he English descent. The abbey was suppressed in 1539, and the site was leased to Sir Edward Moore, who converted it into a residence which his descendants occupied until 1727, when the fifth Earl of Drogheda removed to Moore Abbey, co. Kildare. The Mellifont estate was subsequently taken on lease for ever by the ancestor of the present Lord R. T. Balfour, of Townley Hall, the present Lord who has done much to facilitate the conservation of the

Excavations at Tara.

The excavations, now happily suspended, or as is hoped at an end, have been the source of much anxiety to the public, and may be inferred from the number of questions on the subject put in the House of Commons for some time past. The ruins at Tara, constituting the only remains of the prehistoric period once occupying the hill, are among the most important scheduled under the Ancient Monuments Protection Act. The legal effect of scheduling is to give the Board of Works certain very limited powers for preservation. When a monument is scheduled the Commissioners have power to prevent, for injury or disfigurement of the ruin, all persons from doing any work on the owner or any one acting on his behalf and with his authority. As against the owner and any person acting by his authority, "scheduling" gives the Board no remedy, and there is no means for protection of the monument against the owner. The Act enables the owner to vest the custody of the monument in the Board, and where this step is taken the Commissioners are clothed with powers against the owner and any person acting on his behalf similar to those which the mere "scheduling" gives against other persons. The question of vesting the custody of the monument has been the subject of correspondence, but the Board have not seen their way to vest, and powers are now only confined to those which result from the "scheduling" of the monument.

The 1899 excavations were commenced on a portion of the hill within the scheduled area. The excavations were carried out by some parties with the consent and authorisation of the owner of the portion referred to, for the purpose of ascertaining the position of the Ark of the Covenant. No opposition to the excavations was made by the then occupying tenant. On ascertaining all the circumstances, the Commissioners recognised that they were powerless to interfere by legal process, and consequently confined their action to an endeavour, which was unsuccessful, to secure by persuasion the cessation of the excavations. The excavations continued during the summer and were only suspended in the spring of the following year to a limited extent. In December of that year a fire took place in the farm on which the excavations had been carried out, and, in consequence of representations made to the Board by the inspector of national and ancient monuments and others, he interposed to prevent further defacement. A small excavation was commenced in the spring of 1902, at the instance of the tenant. The holding has since been changed hands, and the present tenant is reported to be opposed to any interference with the mounds. There is no reason under all the circumstances to hope that excavations will not be resumed. It should be stated that Earl of Drogheda, who owns a portion of the hill, has evinced deep interest in the conservation of the mounds on his land, and they are now in a good state of preservation.

Ogham Stone on Inishvickillane Island.

During the course of the year an ogham stone of considerable importance was removed from the ancient church on the island of Inishvickillane—one of the Blasquet islands on the coast of Donegal—by the Rev. J. Mahaffy, Senior Fellow, Trinity College, Dublin, with the consent of the Earl of Cork, the owner of the island, in order to be placed in the museum of Trinity College. The stone is one of many ruins vested in this Board as a national monument by the Commissioners of Church Temples in 1880, under the provisions of section 25 of the Church Act, 1869. The stone did not form part of the church structure. It was taken, many years ago, by a gentleman interested in its preservation from a spot in which it was exposed to be trodden on, and was placed, evidently with a view to its safety, over the doorway of the church.

With regard to the connection of the Board with the stone, and to the interest felt in the stone, the Commissioners thought it right to record its removal, and to indicate the fact in which it is contemplated that it will be preserved for the future.

AMERICAN CO-OPERATIVE STUDIOS

IN the *Architectural Record* of New York is an interesting description, with illustrations, of "A Co-operative Studio Building" in that city, the experiment being worthy of imitation elsewhere. Mr. A. C. David says:—

It has always been difficult to find in New York studios that were well planned and sufficiently large, and it has been still more difficult to find attached to those studios pleasant and well-arranged living accommodations. It has never paid speculative builders to give much attention to the matter, and in the two largest studio buildings hitherto erected in the city—those at Fifty-seventh Street and Seventh Avenue, and at Fortieth Street and Sixth Avenue—there are few housekeeping accommodations connected with the apartments, and the prices are very high. It is no wonder, consequently, that the idea has occurred to interested people of erecting a studio and apartment building, especially although by no means exclusively for the use of artists, and it is natural also that a very particular effort should be made to secure for the appearance and the arrangements of the rooms in this building advantages in the way of space, light and planning which are denied to the rooms of the average apartment-house of the same grade. One of the interested people to whom the idea occurred was Mr. Henry W. Ranger, the well-known landscape-painter, and he cherished it for many years before he had the chance to realise it. About two years ago, however, he succeeded in interesting in the scheme several other well-known artists, and a co-operative society was organised in order to finance the project. Mr. Ranger became president of the Society, Mr. V. V. Sewell, vice-president, Mr. Jules Turcas, treasurer, and Mr. Louis Paul Dessar, secretary. Other stockholders are Allan Talcott, Childe Hassam, Sidney Smith, Edward Naegle and Frank V. Dumond.

To find an entirely satisfactory location for a building of this kind was not an easy matter, for the requirements were many and various. The absolutely essential requirement was, of course, that unimpeded access should be obtained to the north light, and that this access should be placed beyond the reach of subsequent interference. It was necessary consequently either to place the building on the south side of a broad street, or in case it was situated on the north side of the street to have some assurance that the buildings which backed up against the studio building were and were to remain low buildings. The best way to obtain this assurance was to buy immediately south of a street the buildings of which were restricted to private dwellings. Such a street was found on the north side of Sixty-seventh Street, between Central Park West and Columbus Avenue, and a site on this street had many additional advantages.

But even more important than the location of a studio building is its plan, and it is the plan of the studio building on Sixty-seventh Street which gives it its unique character. The general idea of this plan, which had long had a lodging in Mr. Ranger's head, consisted in recognising the advantage of uniting what is known as a duplex or two-storeyed apartment with a studio apartment. One of the necessities of a well-lighted studio is height; its ceiling should be perhaps twice as high as that of an ordinary room. But to make the whole floor of a flat, the bedrooms, dining and service rooms as high as the studio would mean a tremendous waste of space, which could be paid for only by the exaction of very high rents. The most economical way of combining a good high studio with an economical disposition of space would be to make the studio apartment two-storeyed in the service and living portions, and only one-storeyed in the space devoted to the studio. Of course, this idea is not original with the designers of the buildings we are now describing; it has been used before in the planning of studios both in New York and Paris, but if it has ever before been carried out so consistently and with such advantages in the way of area and opportunity, the instance of it has not yet come under our notice.

It had been originally intended to erect the building on a 50-foot plot, with two duplex apartments on each studio floor—the studio, of course, to be situated in the rear; but it was found that with a lot of this dimension the plan did not work out very well, for a depth greater than 50 feet was disadvantageous to an apartment so planned, and if the house was limited to that depth some 20 per cent. of the lot which under the law could be occupied by the building would be wasted. It was found consequently that a very much more economical plan could be drawn by increasing the size of the plot to 75 by 100, and by combining with the major duplex apartments a series of smaller apartments without kitchens and with studios of lower height. The plan as finally adopted figures out something as follows. The building contains in the front two duplex apartments on each of seven floors. Counting the height of the studios, which is 18 feet, as one floor, it is seven storeys high, but counting each studio apartment as containing two floors, it is fourteen storeys high. Each of these apartments measures, roughly speaking, 37½ by 50, running through from front to rear, and occupying the whole of the front, but

Meeting of clergy and laity, held at Newcastle-on-Tyne, decided to raise a fund of 100,000 for the formation of new parishes, the building of new churches, the improvement of poor livings, and for church extension work necessitated by the growth of the diocese, the population of which increased during the past twenty years by 200,000.

not the whole of the rear. The portion of the rear which is occupied and which gets the light contains the studio, a room of (for New York) truly magnificent dimensions. The front is occupied by the dining-room, study and kitchen. But in addition to the two duplex apartments on each floor of the front part of the building, there are also two smaller one-storey apartments in the rear. These apartments occupy what might be called an extension at the centre of the building at the back and run out some 30 feet beyond the rear line of the large studios. They contain two rooms and a bath on one side and three rooms and a bath on the other. The largest room in these smaller apartments is also supplied with studio lights, but its height is neither so great as that of the studio in the larger apartment nor so small as that of the dining-room in the larger apartment. It measures somewhere in between, so that the fourteen floors in the front are equivalent to some ten floors in the rear. There are consequently three different levels in the floors of the building—the level of large studio, the level of the mezzanine floors belonging to the large studios, and the level of the rear apartments. Altogether it is an extremely economical and ingenious utilisation of the available space.

On the advantages of these larger apartments for artists one scarcely needs to dwell. The studios are spacious, airy and excellently lighted; the service and living rooms are all of good size, and obtain outside air and light; and these advantages will not be taken from them, even should buildings equally as tall be erected on either side. The interior arrangements are compact and convenient. The second or mezzanine floors have separate entrances from the elevator halls, these entrances leading to a balcony opening on the studio, and in case any large entertainment is being given such separate entrances are very useful, for guests can enter on the second floor, disrobe, and come downstairs to the large room without any entanglement or interference with the guests that have already arrived. Consequently, while the apartments are designed particularly for artists, they would make very pleasant and convenient habitations for anybody who could appreciate the advantage of having such a fine spacious room as the big studio to inhabit and decorate. The limitation of the apartments is, of course, that they can be used by small families only. There are only four bedrooms to each suite, including the servant's bedroom at the top of the house. An apartment of the same superficial area, erected by a speculative builder would, of course, distribute the space differently, but a building erected for a special purpose, as has been the one under consideration, can afford to ignore the average requirements.

The finish of the rooms and halls of this studio building is as different from those of the ordinary apartment-house as is its plan; no money has been wasted on useless and tawdry decoration. The entrance is plain and is attractive by reason of its simplicity and excellent proportions. The hallway on the ground floor is narrower and much less ornate than those ordinarily provided, but its bareness, relieved only by a decorative frieze painted by Mr. V. V. Sewell, is just what a man of taste would want; and so it is with the elevator hallways above. They are of much the same economical simplicity as the hallways, say, of a college dormitory, and if marble and Lincrusta-Walton are conspicuous by their absence in the common passage ways, so is machine-made trim from the woodwork of the interiors. The wood used for this trim is stained-oak, and the mouldings are of the simplicity which the visitor finally comes to expect. The design of the mantelpieces is not as well proportioned and appropriate as is the design of the other interior members, but these mantelpieces are at least architecturally correct and inoffensive. The ceilings also are very different from those generally in use, because they consist simply of the arches of the fireproof floor immediately above, plastered and painted so as to harmonise with the prevailing tone of the room. As to the opportunity which the ample dimensions and abundant wall spaces of the large studios offer for the placing of furniture and the hanging of pictures and fabrics, that may be appreciated by an examination of the appearance of some of these studios. Of course the tenants of the apartments have had the advantage of colouring, arranging and hanging their rooms to suit themselves, and very different dispositions of space have been adopted in different cases.

The financial aspect of the building is as interesting as its design and plan. As already mentioned the building has been financed upon a co-operative method. The stockholders pay their yearly rental dues to the original fund, and each draws his dividend from the stock. The amount of their dividends will depend upon the success which the company has in renting its other apartments, and it looks as if by this plan their rents would be diminished and a fund accumulated to pay off the purchase debt. The price which these stockholders will have to pay for a large studio apartment amounts to some 2,000 dols. a year. This is a large sum for the average artist to pay, but the price per square foot for the space the tenant occupies being 70 cents, is extraordinarily small, and the rents charged for the smaller apartments, 600 dols. for two rooms and a bath,

and 750 dols. for three rooms and a bath, is less than for similar accommodation in apartments built in the commercial way. To date the land and building has cost 350,000 dols., and the gross rentals, making no allowance for vacancies, which the company expects to obtain is 400,000 dols. It is stated that were the price per square foot charged for building which is charged for living accommodation in the same grade elsewhere, the gross rental would be 53,000 dols. even with the total income placed at 43,000 dols. according to the number of vacancies, it will be seen that the company has a good chance of making an extremely good thing out of its enterprise.

TESSERÆ.

Robert Adam.

IN spite of the tawdriness and flimsiness that pervade some of his designs, there are numerous redeeming qualities in Adam's style; and, although almost invariably new to the world, his own infelicity, many real excellences. Invention is certainly possessed, and his designs abound with ideas capable of furnishing far more beautiful compositions than any of his own. His external architecture was generally good, though he seems to have depended by far too much on meretricious embellishment, covering even his architraves with scrolls, while the windows are altogether naked. His forte was in the arrangement and decoration of interiors; nor is it too much to affirm that it is to him we are indebted for much of the modern interior combined with elegance which is so peculiarly characteristic of an English house. Adam's immediate predecessors seem to have had either no notions of interior decoration, or paid but very little attention to, convenience in interior design. The mansions designed by them might properly be described by the sarcastic compliment bestowed on an Italian critic on the palaces of his native country, "tutti belli come maschere," were it not that the adjective *belle* might be omitted, or rather a very offensive one substituted in its place. Many of Adam's ground plans are admirable, and, independently of their able distribution, they display a knowledge of the forms and proportions of the separate apartments, and a keen attention to contrast and scenic effect that deserve to be more fully studied. An inspection of his designs for the interior of the Sion House, all of which were unfortunately not carried out, will suffice to convince us of his talent in this respect. It cannot indeed be denied that his detail was frequently florid even for interiors; and we also admit that there were always that due keeping between the different parts of his compositions, or, in fact, that attention to character and to unity and chastity of effect in the *tout ensemble*: even so, it was one of his chief errors, a fault easy to be corrected, of paring away his redundancies and omitting his superfluous ornaments. We may obtain many very tasteful pieces of ornamentation, but it was also too much of mere fashion in his style—of that which is altogether arbitrary; hence, having only the fictitious temporary value conferred by novelty, it has already passed its *passé*, like many other things that are doomed to become antiquated, but which will never be antiquated. Here it may be observed that, allied as they seem in the early part of the eighteenth century, originality and caprice are the antipodes of each other. The want of attending to which simple but highly important distinction, not only have those who have mistaken the one for the other indulged in the most offensive monstrosities, but the very injurious prejudice has been created against all originality, let it be ever so tasteful or ever so consistent with the most mature principles. Originality ever conforms to such principles for it is in fact based upon them; if it departs, as freedom will, from the written letter of the law, never does it violate the spirit. It is the vital germ of all art; destroy it, and there is nothing to supply its place but dull extravagance and mechanical routine. Caprice, on the contrary, acts in opposition to the principles, and deviating from them, substitutes dissipation and variety, for invention, whim, while it rejects study as altogether superfluous.

Richard Wilson, R.A.

Although usually represented at best but as a "diamond," Wilson was a man of high spirit and generous feeling. His classic taste was not confined to his art. He was an accomplished scholar, and when not under a morose repression of spirits, courteous in address and brilliant in conversation. One of the most distinguished members of the Literary Club, after accosting him and Allan Ramsay at the foot of the stairs which led to the meeting-room on the first floor, observed to Topham Beauclerk:—"Sir, Wilson is a man who can talk with the best of us as well-read as any of the learned dons above." This literary knowledge, however, was somewhat obscured by the too general practice of the artists, in common with most other professions, of the age of George I. and George II., manifested for a

humourist. The pipe, the punch-bowl and late hours, a disposition for mirth; and the morning tale, borne by an amateur from one painter's studio to another's was daily interlarded with the wit and frolic of the overnight. The grave family-men, in these social times, mostly passed their evenings at the tavern, and sometimes prolonged their sittings to the hour indicated on the dial of Hogarth's inimitable "Modern Midnight Conversation." For those who had no imagination nor wit would sit comfortably entrenched in their pipes, and smoke, and nod, and smile at the lively tales of their more enlightened friends and neighbours. Wilson resided for several years at the house No. 36 Charlotte Street, corner of North Street, of which he took a lease for a specific reason, "Because," said he, "there is no building interposed between us and the open country." The house was subsequently tenanted by Woollett, the renowned engraver of Wilson's works; and within the detached building at the end of the garden many of the best efforts of his burin were executed. At this period, and for several subsequent years, from his windows Wilson had a view of Hampstead and the gate. He was accustomed on a fine evening to throw open the sashes of his first floor, and invite whoever might care to be with him to behold the glowing effect which the setting sun dispensed to the wooded heights of those hills, which were the charm of Middlesex. There were many rural objects immediately north of the New Road at that period, which interested Wilson with constant theme for contemplation, and occasionally as prototypes for the exercise of his pencil. He made sketches in chalk of the aged elms that stood in front of Marylebone Gardens, the northern Vauxhall of the middle of the eighteenth century; and an old friend of Wilson's, Captain William Baillie, related that, walking with him in the fields on a fine autumnal evening, the enthusiastic painter suddenly exclaimed:—"Baillie, did you ever behold so fine a study for colour as those old walls afford?" adding, "I will give a guinea for my painting tools." The effect became more resplendent, and then decayed. "Ah," said he, "our joys, they happen not often, and then, alas! how transient." Captain Baillie was almost as enthusiastic an admirer of the incidents of light and shade as this great landscape-painter, and used to boast, on returning from these delightful evening rambles:—"Wilson and I, sir, have been long nature."

Rectors and Chancels.

Erroneous notions prevail about the extent of the rector's rights and interests in the chancels of churches. A few years ago a lay rector claimed in court the right to the exclusive use of a door leading from the chancel into the churchyard. The court decided against the claim. In the judgment it was said that as churches in their origin were dedicated by those who erected them and gave the sites on which they were built for the purposes of religion, it would obviously be inconsistent with the object for which they were established to hold that in the case of a lay impropriator the right of possession followed freehold, which in contemplation of law is in the rector. The naked abstract right to the freehold carries with it no right of possession, the latter being in the incumbent, who is responsible to the Ordinary for the celebration of public worship. It was laid down, further, that the rector has no special interest or property in the chancel beyond the right to his chief seat there, but that this general right does not carry with it any further consequence as relates to any peculiar right of interest in that part of the church. The jurisdiction of the Ordinary for the benefit of the parishioners extends to the distribution of the seats there in like manner as of those in the body of the church. By custom the rector is bound to repair the chancel, as the parish are bound to keep the nave in repair. The reason of this is suggested to be that whereas originally the cost of the repair of the whole church was paid out of the tithes (which, or the largest share in which, went to the rector), yet that the use of the nave being appropriated to the parishioners, while that of the chancel was appropriated to the performance of the holy offices and seats of the ministers, in process of time the clergy succeeded in imposing the laity to take upon them the burden of repairing the fabric of the church allotted to them. This obligation, however, of the parishioners to repair the nave does not give them the right to dispose of the seats therein, nor in any way oust the jurisdiction of the Ordinary. Similarly the obligation on the rector to repair the chancel does not give him any such right.

Lübeck Cathedral.

Lübeck is perhaps the noblest Gothic city of the extreme north. Its churches are numerous and large, its Rathhaus, hospitals and gateways among the finest in Europe, and all of them are built almost entirely of brick. The *coup d'œil* of the whole city is surpassingly picturesque and striking, and this notwithstanding that the great churches rising boldly up against the sky are unbroken masses of deep red brick,

relieved very little indeed by stonework, but much by the beautifully contrasted green-tint of the copper-covered spires, with which almost all of them are adorned. The cathedral was consecrated in 1170 in honour of SS. John Baptist and Nicolas, and of this church the lower part of the west front and the main arcades still remain. They are of the very simplest character. The piers are entirely of brick, with no more attempt at enrichment than can be obtained by the juxtaposition of rectangular faces, and there are few, if any, moulded bricks. The arches are of one, two and three orders, all perfectly plain and square in section, some pointed and some round. The groining is quadripartite, but generally without ribs. The whole is of brick, which is even used for some of the altars to support their stone mensae. This brickwork was obviously intended to be seen, though it has usually suffered as much as have our own old buildings from that rage for whitewash which so much distinguished the age during which Renaissance art and its disciples ruled throughout Europe. The north porch is a thirteenth-century addition to the cathedral; it is of two bays in depth, with groining piers of clustered shafts with sculptured capitals, and a many-shafted doorway of the best character. Its interior is probably mainly of stone, but the exterior is all of brick. The archway is boldly moulded, and above it is a horizontal arcaded corbel table, stepped up in the centre to admit the arch. The gable is boldly arcaded upon shafts, and has a stepped corbel table, with a double line of moulded bricks above it, next to the tiles. A couple of simple open arches are pierced in each side wall, and there are flat pilasters at the angles. In the gable, enclosed within the arcading, are some circular openings, one of which is cusped with small foliations formed of brick. The moulded bricks in the main arch are of two kinds only, one a large boutell, the other a large hollow, and these arranged alternately with plain square-edged bricks produce as much variety as is needful. The jamb of the doorway is of plain bricks built with square recesses, in which detached stone shafts are placed. The capitals throughout are of stone and carved with simple foliage. On the exterior of the porch the whole is of brick, simple in all its details, yet sufficiently enriched by their skilful arrangement to be thoroughly effective; whilst in the interior, where more adornment was naturally required, brick is frankly abandoned and the richly moulded and sculptured ribs and archivols are all of stone, though the vaulting and walls are, as on the outside, of brick. The gable of the transept above this porch is another good example of early brickwork. It has two windows, each of three lights, entirely of brick, and of a design which throughout this part of Germany was almost of necessity reproduced wherever brick only was used for window traceries. The outer arch is well moulded, and the lights have simply arched heads running up to and touching the enclosing arch. The truth is that if monials and traceries are to be of brick, there is hardly any alternative between the tame insipidity of this design and the rich intricacy of the terra-cotta reticulations, and both are alike valuable as showing that both the cheapest and the most economical plan, as it is by far the most effective, is to use stone rather than brick for traceries within the enclosing brick arch. The only tracery which can be properly executed in brick is in fact the simplest plate tracery (and even this requires great skill and care in its execution), or that simple fringe of cusping round an opening which occurs in the porch, and which may be executed with ease with a single pattern of moulded brick often repeated. To return to the transept. Over the windows is a horizontal band of enrichment, consisting of an arcade of intersecting round arches, then two courses of brick, then a course of brick set diagonally on the bed, a plain course, and again another diagonal course. The eaves of the gable have bold moulded bricks under them, and then a broad band of enrichment of the same character as that just described, though varied in its arrangement.

Genoa.

Genoa is called "the superb," and not without some reason, though the justice of that unbounded encomium bestowed upon the town by Italians, and generally acceded to by travellers, is questionable. The city itself does not merit the title of superb. Its internal aspect is rich without being effective. That which is truly good must be sought within doors; the rest is, in general, gaudy and theatrical. A long street divided into three parts, each known by a different name, is said to be composed of palaces. Three streets of palaces. Superb indeed. But every house at all above the common run is in Italy called a palazzo. In the fronts of the Genoese palazzi we frequently see the chisel entirely cheated of its labour by the painter's brush; and the eye of the architect (however that of the "happy ignorant" may be deceived) is apt to alight with some degree of severity upon this miserable apology for the thing imitated. The weather, too, as it seems, is equally inimical to such architectural hypocrisy, for there is hardly a single instance where the artist might not go over his work again, and patch upon the lie to make it good. Let it be con-

fessed, however, that the profusion of marble columns, vases, statues, staircases, &c., is in extent almost beyond computation, and that the Ducal Palace is no less prominent for the excellence of its design than for the costliness of its material and masterly execution. Its saloon and external façade are deservedly celebrated for architectural beauty. The saloon in the Palazzo Serra is allowed to be one of the most magnificent rooms in Europe, and people go to see the furniture in the Durazzo Palace. For internal splendour the churches of Genoa yield to none in Italy, except St. Peter's at Rome; the Annunziata is perhaps the most costly. But it is the situation of Genoa that should confer upon it the title of "superb." The first view on passing the Lanthorn is striking and picturesque. With a beautiful bay in front, the city rises in amphitheatrical form from the waters of the Mediterranean up the slope of the Apennines, presenting a rich assemblage of villas, vineyards, terraces and marble staircases. Nor is the prospect from the heights behind the town unworthy the excessive toil of ascending; from thence the bay appears to the greatest advantage, and Corsica is seen dimly in the distance. Altogether Genoa is a charming place. There is much maritime bustle upon its quays, and the street of palaces is the only portion of the town where any person can walk with pleasure whose ears take offence at the "noise of hammers closing rivets up."

RALEGH'S HOUSE, YOUGHAL.*

THE building known as Sir Walter Raleigh's house at Youghal looks to-day from the outside much the same as it must have looked more than 300 years ago, when the famous soldier, sea-captain, coloniser, poet, historian, statesman and courtier (to give him a few of his titles to fame) of Queen Elizabeth's reign is believed to have some time sojourned there. Slates, indeed, replace the original thatch on the roof, and modern glass the ancient leaded panes in the windows; but the pleasantly broken front, with its three gables, projecting porch and bay window; the south end with its sunny oriel; the back with its towering chimneys; the massive wall, 5 feet thick; the high-pitched gables—all remain, perhaps almost unchanged. Entering the house, we pass through the hall and visit the low dining-room on the ground floor, from which a subterranean passage is said to have connected the house with St. Mary's Church. Upstairs there are handsome rooms wainscotted with dark oak. One of these retains in its fireplace the old blue Dutch tiles with Scriptural subjects enclosed in a circular border. In a recess in this room behind the wainscoting was discovered about the middle of the last century "a part of the old monkish library hidden at the period of the Reformation." One volume contained a black-letter compendium of Scriptural events from the Creation to the days of the Apostles, printed at Mantua in 1479, together with Peter Comestor's "Historia Scolastica," printed at Strasburg in 1483. It is a pity we have not a complete list of the library, as it might help to throw light on the date of the house. The principal room, that with the sunny oriel window, still preserves its beautiful mantelpiece of elaborately carved oak rising up to the panelled ceiling. Three figures, representing Faith, Hope and Charity, support the cornice, above which is an openwork parapet by an apparently later and inferior hand. The panels between the figures are ornamented with fantastic shields, while an exquisite design runs over the lintel of the fireplace, itself supported by grotesque figures. Unfortunately the original tiles of the fireplace have in this instance been removed.

In the garden four old yew trees, said to have been planted by Raleigh himself, are still flourishing, and look very young for their age. The myrtle trees, however, which were also supposed to date from his time, and which at one period gave their name to the house, were destroyed in a storm some years ago. Here Raleigh is believed to have planted the first potatoes ever grown in Ireland, and to have smoked, if not even planted, the first tobacco, and, no doubt, "found many rare and wonderful experiments of the virtues thereof." At any rate, we know that in these and in many other directions, such as mining enterprises, fruit culture, making pipestaves, exporting wool, &c., he was busily engaged at the Irish industrial revival just three centuries before the time.

The house is believed to have been originally intended for the residence of the warden of the college of Youghal, and to have been built soon after the year 1464, when the college was founded by Thomas, the eighth Earl of Desmond. (See the article contributed by the Rev. Samuel Hayman to the Society's Journal for the year 1856, pp. 16-28.) The house can be plainly identified in the map of "Youghal as in Elizabeth's reign when sacked by the Earl of Desmond," reproduced from a MS. in Trinity College, Dublin, in the Society's Journal, 1868-69, p. 469, more doubtfully in the map of Youghal in "Pacata Hibernia." For Sir Walter Raleigh's connection with it we have to rely on

tradition, in this case probably well founded. He probably obtained possession of it about the year 1587, in connection with a Crown grant of 42,000 acres on the rivers Blackwater and Bride. His visits to Ireland, however, at this time were fitful and only for short periods, confined probably to the years 1587 to 1589. He managed his huge estates by contract, and they went from bad to worse; and in December 1602 sold them all, including the college of Youghal, to Sir Robert Boyle, afterwards first Earl of Cork. Since then the house has changed hands many times. Not many years ago it was occupied by Sir John Pope Hennessy, who in 1883 wrote a bitter monograph on Sir Walter Raleigh in Ireland. The house has been known in legal documents as Sir Lawrence Parsons's house, and in recent times as Ivy Grove, &c.; but, in a truer historical perspective, it is indissolubly linked with the memory of one of the most remarkable personalities of his own or indeed of any age—Sir Walter Raleigh.

GENERAL.

Mr. Wingfield Digby, M.P., has decided that the remains of a Roman villa found on his property at Fifehead Neville, Dorset, shall be covered in to secure their preservation and prevent injury. It has, however, been resolved that a permanent record shall be taken of the discovery, in the shape of plans and drawings, and this work has been undertaken by the Imperial Field Club, the president of which is Lord Eustace Cecil. When completed they will be placed in the Dorset County Museum at Dorchester.

Plans and Specifications have been prepared for a new and more commodious gaol, to be erected near the site of the existing Pretoria prison. The female quarters will be built first, and it is intended that the whole structure shall be finished in eighteen months.

The Memorials of the late Emperor and Empress Frederick, which have been erected near the Brandenburger Gate in Berlin, were unveiled on Sunday last. We have already described the statues which were executed by Prof. Adolf Brütt and Herr Fritz Gerth.

The Tender of Mr. C. Wall, London, for the erection of a superstructure of Vauxhall Bridge, at a cost of 142,942*l.* 9*s.* 6*d.* was accepted on Tuesday by the London County Council. The committee had recommended the tender of Messrs. Henry & Froude, Ltd., at 154,584*l.*

Sir Michael Hicks Beach, M.P., has promised to restore the Hickes tomb and the Hickes chapel in St. Mary's Church, Leyton, and has also contributed towards the fund for the renovation of the church.

An Exhibition of works in metal and stone from all countries will be held in St. Petersburg from November 1st to February. It will be under the patronage of the Prince of Elizabeth Mawrikiwna.

The London County Council improvements committee have settled at 183,150*l.* the claim, amounting to 320,931*l.* of the Metropolitan Electric Supply Company in respect of the cost of erecting and fitting up a new generating station, plant, &c., and of the expenses connected with the taking up, replacing, &c., of the company's mains. The Council is required by statute to provide a site, partly freehold and partly leasehold, for the reinstatement of the Company's premises.

An International Competition has been arranged by the Mexican Government for a statue of General Morelos. Pardon. The cost of the memorial is to be 80,000 Mexican silver piastres.

The Bishop of London consecrated on Saturday a new chancel, side chapel, organ chamber and vestries which have been added to the church of St. Paul, at Harringay, at a cost of 5,502*l.* The altar and altar rails are of oak and the walls are of alabaster, the sanctuary being paved with white and green Italian marble. Vestry and other accommodation is provided in the basement. The design is of thirteenth-century character, and has been prepared by Mr. Silley.

It is well known among Connoisseurs that the first collection of proofs by the great master of etching has belonged for many years to Mr. Mortimer Menpes. This collection covers nearly the whole field of Mr. Whistler's art, and includes superb impressions of his finest and rarest plates. Mr. Menpes has been the possessor of a large number of unique and hitherto unknown etchings. It will be good news for those interested in art matters that Messrs. Ernest Brown & Phillips, of Leicester Galleries, Leicester Square, have arranged to follow up very shortly the exhibition of the late Mr. Phil May's work, which they are at present holding, with an exhibition of Mr. Menpes's famous collection.

The Directors of the London and Lancashire Fire Insurance Company have declared an interim dividend of 5*s.* per share (being at the same rate as the last interim dividend), payable on November 4.

EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff a VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Readers are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

Great disappointment is frequently expressed at the non-issuance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

—Nov. 30.—The committee of Bray Pavilion and Gardens invite plans for proposed pavilion and winter hut at Bray. First prize, 30*l*; second prize, 15*l*; third prize, 5*l*; with three prizes of 5*l* 5*s* each. Messrs. Frank Edw. Lee and P. Macdonnell, hon. secretaries, Town Hall, Bray.

—Nov. 9.—Designs are invited for a new public library. Premiums of 50*l*, 30*l*, and 20*l* will be paid to the first, second and third premiated designs respectively. Particulars to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Brighton and Hove Hospital for Women, 76 West Brighton.

—Oct. 26.—Competitive designs are invited for a new iron and glass pump-room and colonnade in the gardens. Mr. F. Bagshaw, borough engineer, Municipal Offices, Brighton.

—Dec. 16.—The Lambeth Borough Council are erecting a public library, with residence for librarian, in the Herne Hill ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for a public library, with residence for librarian, in

the Herne Hill ward of the borough to Mr. H. J. Smith, town clerk, Lambeth Town Hall, Kennington Green, by 12 noon on December 16. General information as to the extent and nature of the accommodation required in the proposed library and residence can be obtained on application to the town clerk.

SCOTLAND.—Nov. 9.—Competitive plans for the erection of a tenement of shops and workmen's dwelling-houses on ground belonging to the Kilmarnock Corporation in Fore Street are invited. Premiums of £15 15*s*, £10 10*s*, and £5 5*s* will be given for the sets of plans and certificate which may be adjudged first, second and third respectively. Mr. W. Middlemas, town clerk, Kilmarnock.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums of 100*l*, 50*l*, and 25*l* will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20*l*, 10*l*, and 5*l* will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WALES.—Nov. 9.—Competitive designs are invited for a public library to be erected in Evelyn Road, the total expenditure, including fixtures, not to exceed £2,000. A premium of £10 10*s* will be paid for the approved design. Mr. Samuel Jones, clerk, Old Road, Skewen, Neath.

WILLESDEN.—Nov. 4.—For the erection of a ward block at the workhouse infirmary, Acton Lane. Mr. Alfred Saxon Snell, architect, 22 Southampton Buildings, Chancery Lane, W.C.

THE question of the erection of a new orphanage, which has been before the Primitive Methodist Connexion for some years, is approaching a practical settlement. The special com- mittee entrusted by the Conference with the matter has had under consideration forty-one sites recommended by the respective district authorities, and has decided in favour of one at Harrogate containing nearly 11 acres and in every respect meeting the requirements of the Conference. The general committee at its last meeting approved of the site recommended, and authorised its purchase for 5,500/.

NEW church which has been erected in Glasgow Street, ssan, for the E. U. congregation was opened on the inst. The building is capable of seating 500, and it is used to erect at a later date, if found necessary, a gallery seating accommodation for 170. The total cost of the ng exceeds 3,00 £.

TRADE NOTES.

THE Welsh Congregational church and school, Clifton Road, Birkenhead, has recently been fitted with the latest improved "small tube" hot-water heating apparatus, by Messrs. John King, Ltd., engineers, Liverpool, employing their well-known economical coil heater.

MESSRS. WM. POTTS & SONS, clock manufacturers, Leeds and Newcastle-on-Tyne, have received instructions to make and fix a clock with four dials and bell, with all Lord Grimthorpe's improvements inserted, at the new Kirkgate Market, Leeds, and have fixed one at the parish church, Kirkby-in-Furness, N. Lancs

MESSRS. DINNING & COOKE, the well-known Northern firm of heating and sanitary engineers, have been consulted in reference to a drainage scheme for a mansion at Bordighera for his Grace the Duke of Leeds, and the work is now in progress under the supervision of Mr. R. P. Cooke.

MESSRS MUSGRAVE & CO., LTD, Belfast, have appointed Mr. F. S. Lister, their London engineer and manager for engineering work in connection with their well-known fan systems of heating and ventilation, drying and mechanical draught furnaces and incidental power plant. The offices are at 53 Victoria Street, S.W.

THE B & S Folding Gate Co., sole manufacturers of the B. & S. patent folding gates, 19, 20 and 21 Tower Street, Upper St Martin's Lane, announce that owing to the continued growth of their business, they have arranged for their interest in electric and hydraulic passenger and goods lifts to be taken over by Messrs. Wm. Aug's Gibson, Ltd, of Temple Bar House, 28 Fleet Street, E.C. They have also arranged for their interest in the Quimby screw pumps to be taken over by the Quimby Screw Pump Co., Ltd., of Temple Bar House, 28 Fleet Street, E.C. They will in future devote their attention to their regular well-known lines:—B. & S. patent folding gates, Kinnear patent steel rolling shutters, patent interlocking rubber tiling, grilles, lift enclosures, Cabot's insulating and deafening quilt, &c.

THE newly-erected church of St. Silas, at Nunhead, was consecrated on Saturday. It is constructed of stone in the Perpendicular style and has a pitch-pine roof. It has seating accommodation for 750 and has cost 8,000£.

ELECTRIC NOTES.

THE works of the Great Northern and City Railway, which are now approaching completion, will include a moving staircase at the City terminus of the line. It is calculated that such a staircase will be able to do the work of several lifts, thus economising working expenses; while from the passengers' point of view, it must be more convenient to be able to step on to a staircase immediately on reaching the station, than to have to wait possibly several minutes for the starting of the lift.

As the adoption of the conduit system in the electrification of North London tramways will involve the reconstruction of numerous bridges the London County Council have asked the Islington Borough Council, amongst other road authorities concerned, to permit of the introduction of the overhead trolley method. The Islington Council had previously declared in favour of the former system, and now, before replying to the request of the County Council, it is recommended that a conference of representatives of the several metropolitan boroughs affected should be held to consider the question "with a view to united action being taken in the matter."

COLONEL A. J. HEPPER, a Local Government Board inspector, recently held an inquiry in the Council chamber at the town hall, West Bromwich, relative to an application made by the Town Council for sanction to borrow a sum of 12,217*l.*, to cover the cost of extensions in connection with the Corporation electricity undertaking. The town clerk (Mr. A. Caddick) explained that the application was made for the purpose of extending the electrical works, and the cost of the scheme would be 9,331*l.* 9*s.* 4*d.* The outstanding debt at the present time was 223,895*l.* There was no opposition.

At the monthly meeting of the Urmston District Council on the 14th inst. the clerk reported that he had communicated with the town clerk of Manchester as to the time when the Corporation would proceed with the construction of the South Manchester tramway scheme. A portion of the lines will run through Urmston and Davyhulme to Barton Bridge, where it is proposed to connect with the lines of the Eccles Corporation. The town clerk stated that the matter would be discussed shortly by the Manchester Corporation tramways committee, and that he would report to the Urmston Council as soon as possible.

A SPECIAL meeting of Stourbridge Council was held on the 14th inst., Mr. Nash presiding, to receive the com-

mittee's report regarding the electric works, together plans and estimates. The committee submitted alternative schemes by Mr. J. B. Clarke, electrical engineer, and they were unanimously of opinion that the larger scheme was preferable, and they accordingly recommended its acceptance by the Council. The proposed lighting area has been extended to include Church Street, Red Hill, Glasshouse Hill, Hagley Road. Mr. W. B. Collis, in presenting the report, said the Council had decided to work the electric-lighting order themselves, and although there might be for two or three years a small loss, yet there was reason to believe that the works would in a few years become a profit. Of course we understood the works would be in combination with the gas destructor, and they should use the heat it gave them, but as a supplementary boiler on which to fall back. If they were prepared to give effect to the scheme recommended by the committee, he should propose that they ask the Local Government Board to sanction a loan of 16,000*l.* for the works, and also he should ask them to appoint Mr. Clarke as engineer. He moved the reception of the report, which was seconded by Mr. Waugh and carried. The estimates submitted by Mr. Clarke showed a possible deficit on the first year's working of the smaller scheme of 379*l.*, and on the larger one of 633*l.*

BUILDING AND BUILDERS.

THE memorial-stone in connection with St. Luke's Sunday schools at Barrow was laid on Saturday. The school consist of numerous classrooms, with a large central hall to accommodate 1,000 children. The cost will be 2,500*l.*

THE foundation-stone of St. John's Church, Palmer's Green, Southgate, was laid on Saturday by Mr. V. E. Walker, who has given the site. At present only one portion of the church is being erected, at a cost of 8,500*l.*, to accommodate 400 people. The second portion will cost 5,000*l.*, and further accommodation will be provided for 350.

SIXTY-TWO competitive designs have been received for a new free library to be erected at Heywood, Lancs., at a cost of 5,000*l.* The prizes offered were 30*l.*, 20*l.*, and 10*l.*, and the following awards have been announced:—First, Messrs. P. & Robin, London; second, Mr. David Bird, Manchester; third, Mr. R. J. Macbeath, Sale. The first-named will have the carrying out of the work.

FOR A SMALL HOUSE IN SOMERSETSHIRE.

have been approved for the Twickenham Green
ch and schools. The block comprises church
(adults), two vestries, cloak-room, church parlour,
room, infants' room, seniors' classrooms, kitchen
conveniences. The buildings are designed in a
of Perpendicular Gothic freely treated. A bold
forms a prominent feature at one corner. The
st is about 5,500 c^{t} . The architects are Messrs.
aines, 5 Clement's Inn, Strand, W C.

olition of the houses at the junction of Church
lagley Street, Stourbridge, has just been carried
ry to the erection of the Carnegie Library and
hools on the site. One effect of this has been to
umber of cottage dwellings in the town, and there
ly be more heard of the housing scheme. The
e working classes committee will present a report
t at the next meeting of the District Council, and
the Council to authorise the purchase of a plot
o yards in extent between Wheeler Street and
en Road for erecting houses thereon.

oundation-stone has been laid of the new St John's
chools and school chapel, being erected for the
olics of the New Ferry district. The new premises
nstructed on land in Bebington Road, and are
accommodate on the ground floor about 250
on the upper storey, which is to be equipped as
ut 300 worshippers. The school chapel stands
m the road, the space in front being reserved for
ection of a church. The site cost 90 c^{t} , and the

present buildings, which are of Ruabon brick, will cost 4,500 c^{t} .
The architect is Mr. John Barnes, of Bebington, and the
builder Mr. Peter Rothwell, Birkenhead.

THE foundation-stone of Liberton parish church, Craig-
millar, near Edinburgh, was laid on Saturday. Situated a
little distance south-west from Duddingston and Craigmillar
(suburban) railway station, the building, which will be used for
both church and social purposes, has been rendered necessary
by the growth of population in this part of the parish in recent
years. The double purpose which the building is to serve,
coupled with the difficulty of raising the requisite funds, has
necessitated a free and simple treatment of a slightly ecclesi-
astical character. It will accommodate about 300 people. It
is cruciform in plan, with large vestry or committee-room,
lavatory and heating chamber behind. The total cost will be
about 1,600 c^{t} . The work is being carried through under the
superintendence of and from plans prepared by Mr. James
Morrison, architect, 4 York Buildings.

THE Leigh (Lancs) Town Council have reported that the
general purposes committee had had before them the sketch
plans prepared by Mr. J. C. Prestwich for the erection of
municipal offices, in combination with shops, on the vacant
land in Market Street. The estimated cost was 10,000 c^{t} for
1,898 square yards of land, 19,000 c^{t} for municipal offices; 4,410 c^{t}
for shops, 2,000 c^{t} for furniture and 2,000 c^{t} for decoration and
contingencies; total, 37,410 c^{t} . Deducting 3,478 c^{t} for the value
of the present town hall, the net cost would be 33,932 c^{t} . In
regard to the estimated charge on the rates, the annual repay-
ment of combined instalments of principal and interest over a
period of sixty years in respect of 33,930 c^{t} at 3 $\frac{1}{2}$ per cent. would
be 1,360 c^{t} . The total annual charge on the rates would be
535 c^{t} , less than a penny in the pound. The committee's recom-
mendation that the sketch plan and estimate be adopted was
passed without any opposition whatever and without comment,
and the result was greeted with acclamation. It was unani-
mously resolved that the Town Clerk be instructed to make
application to the Local Government Board for their approval
to the proposal.

THE restoration of St. Cuthbert's Church tower at Kirkby
in-Furness has now been completed. The church is almost as
ancient as Furness Abbey, and the tower was crumbling to
decay. The restoration cost 400 c^{t} .

VARIETIES.

A NEW church and schools, which have been built in Ashley Lane, Moston, in connection with the Manchester Victoria Circuit, have been opened. They take the place of older buildings in the neighbourhood which had become inadequate for the wants of the large population which has sprung up in the Moston Lane district. The whole scheme has been carried out at a cost of 7,600*l*., including the capitalised value of the site.

WE greatly regret to announce the death of Mr. James F. Cartland, head of the well-known Birmingham brassworkers' firm of Messrs. James Cartland & Son, of Birmingham, who was found dead in a field near his residence at Edgbaston on Sunday. He had been shot with a revolver. Mr. Cartland had been in indifferent health for some time and had been under treatment by a doctor for severe pains in the head. The deceased gentleman was a prominent figure in public and commercial life in Birmingham, and was a magistrate for the city.

THE note of selfish luxury, which is the characteristic of Nevill Letchmere, the hero of Mr. Pinero's new play, "Letty," now running at the Duke of York's Theatre, is struck with a firm hand in the setting of the scene of his flat in Bond Street. Self-indulgence and a love of material pleasure seem to be suggested by the beautiful old French furniture, with its soft-coloured tapestries and its dainty Watteau panelled cabinets, and there is luxury in the rich red damask couches and draperies, and a love of art in the fine bronzes and bits of old china. The room is a clever example of stage furnishing, as understood by experts such as Messrs. Oetzmann & Co., of Hampstead Road, W., to whom the furnishing was entrusted.

THE Royal Waterloo Hospital for Children and Women, Waterloo Bridge Road, S.E., founded in the reign of George III., is now being rebuilt, reorganised and enlarged at a cost of over 50,000*l*.. To enable the out-patient department (more than 150 cases daily) to be carried on, the new buildings are now being erected in three sections, the walls of the first portion of which have now reached their highest point. Towering over the surrounding buildings, they can be easily seen from the north side of the river. It is hoped that early next year this portion may be thrown open. H.R.H. the Duchess of Albany is laying the memorial-stone at 3 P.M. on the 26th inst., and will be received by the Lord Mayor (president of the hospital) and Sheriffs in state.

THE General Hospital for Pontypool and has been erected on an elevated site on the Pontnewynydd, at a cost of 6,384*l*., was formally opened on Monday. The plans were prepared by Mr. Robert Bailey, architect, London, and the contract was entrusted to Bailey Bros., Pontnewynydd. It is estimated that furnishing the hospital will amount to 1,200*l*., with the provision of an ambulance, &c., will bring the total to 8,500*l*.. The hospital is built of dark red Abergavenny stone relieved with dressings of Monks Park stone of a light tint. The buildings consist of basement and ground floors. The usual administration rooms, kitchen, mortuary, fumigation chamber, &c. The accommodation is for nineteen beds, including two for hernia, one for eight for males and eight for females.

ST. SERP'S Established Church, Goldenacre Road, was opened on the 17th inst. The building is in the 13th century Gothic style principally and consists of a nave, side aisles, divided by red polished stone pillars, a transept, also a temporary chancel, which is a portion of the chancel arch, the remainder being of modern construction. The roof of the nave is circular timbered, resting on arches, the principal timbers being supported by corbelled trusses. The entrance hall, over which is a loft gallery facing the chancel, is divided by a glazed wooden screen from the church. The exterior of the church, which is in red and white stone, is heavily carved and pierced by many richly foliated triflight windows. Electric lighting is skilfully carried out on modern lines. Opal open cups spring from black suspended girandoles, which enhance the severe style of the building. The chair-sitting accommodation is for over 600. The complete building will seat about 1,000.

A NEW hall erected for the Wesleyan Missionary Society, 26,000*l*., was opened at Deptford on Friday last. The model of the well-known Bermondsey Hall, which accommodates 2,000 hearers. A wide and lofty vestibule leads to the vestibule, thence to the large hall, which on the right of the porch lead into the lecture hall, which holds 500 or 600 adults. Doors on the left of the porch lead to a suite of classrooms, the staircase to the gallery, which hall and to further classrooms. Inside the great hall of octagonal shape, the rostrum and pulpit form a conspicuous object. The preacher is placed almost directly in front with a bank of seats at the back for choir and orchestra.

CONCRETE UNDER WATER.

ed concrete for the Nussdorf lock at Vienna the *Zeitschrift* of the Austrian Society of ly. The excavation was made to a depth of water level and a very large mass of concrete ver the surface through movable vertical k has a total width of 92 feet over all and side. The excavation was made full width ng, and the bottom was filled in with rammed so as to form a kind of invert, with its horizontal in the middle and sloping upwards a les. On this foundation was built a mass ng a total thickness of 13.12 feet in the he upper surface was 13.12 feet below he sides of the lock the concrete walls were height of 3.28 feet above water level, with a feet. Three longitudinal rows of piles were de of the axis of the lock and supported a out 7 feet above water level. On this track ages which spanned the full width of the lock ch carriage had three trolleys, one in each of

the main panels of the transverse bents of piles. Each trolley carried a vertical telescopic tube through which concrete was deposited on the bottom of the lock. The tops of these tubes were level with a transverse track which ran from end to end of the carriage. The ends of these tracks just cleared the outside rows of piles which, on one side of the lock, supported a distribution track parallel with the axis of the lock. The concrete was delivered by dump cars running on the distribution track, which delivered it to smaller dump cars on the carriage tracks. These cars in turn discharged their contents into either of the three chutes on each carriage. The carriages were traversed from end to end of the lock, and as each chute moved nearly one-third the length of the carriage, the whole area of the lock was commanded by the nine chutes. The concrete was deposited in three horizontal layers 3.28 feet thick, but these layers were not laid continuously, being built in comparatively narrow banks or ridges, so that the different strata would key together and form a corrugated mass that was thought to be more satisfactory than one with continuous horizontal joints. As the concrete was deposited the chutes were shortened, and the three layers were successively placed. After the main body of the bottom and the side walls had been built by this method, the water was pumped out and a 2.3-foot layer of concrete was rammed over the bottom and completed with a finishing surface 0.9 foot thick. The chutes were of different lengths in the three carriages, the first ones depositing the concrete up to a level of 23 feet below the surface, the next set depositing the concrete between that level and 19.7 feet, and the last completing the sub-aqueous work up to the final height of 16.4 feet below the surface.

AMERICAN BUILDERS AND WORKMEN.

THE situation in building matters in New York does not improve, as we glean from the *American Architect*. The stone-setters' union has now broken with the employers' association, and refuses to set the stonework in buildings; and as the bricklayers cannot set the brickwork unless the stone-work is set in connection with it, and delay in the brickwork delays all the other branches of construction, the stone-setters have the whole building interest at their mercy. It is hardly necessary to point out that one of the principal objects of labour organisation, as now carried on, and the specialisation of trades, is to accomplish this very result, of controlling a vast interest by means of a small branch of it. Years ago a few

ular columniated crush-room, with retiring-rooms and
e, from which staircases lead right and left up to the
at the rear of the grand circle. This again goes—one
d one left—for the full width of the tier, with three
es thereto and down both sides of it, with additional
es at the bottom, and midway between them on either
extra exit-on to the street, which obviates the necessity
ng through the crush-room in the event of a panic.
angement obtains practically in all parts of the house.
he crush-room is the stalls saloon, and above it are the
to the grand circle, balcony and gallery, all following the
the crush-room and circular or oval in plan. A special
has been made of private retiring-rooms or lounges to the
boxes of the stalls and grand circle tiers. Those to the
the "O.P." side are intended for the use of Royalty,
separate entrance from Aldwych, and with private and
accommodation. The Royal rooms are in the Adam
with modelled frieze, ceilings and panelled walls. The
re covered with carpets of superior texture, on which
ed inlaid satinwood furniture in keeping with the
s" decoration, while the drapings and furniture cover-
e of heliotrope silk, which Messrs. Shoolbred have had
y woven for the purpose. The range of boxes and the
g retiring-rooms can be respectively thrown into one
required. In designing the line of the tiers, care has
ken to insure a perfect view of the whole of the stage
very seat in the house.

The new theatre is what is known as a "three-tier house,"
of accommodating some 1,326 people, viz., 400 in the
e, 260 in the upper circle, 172 in the dress circle, 146 in
alls, 300 in the pit and 48 in the private boxes.
ditorium is 60 feet wide by 64 feet deep, and the
ium 35 feet wide by over 36 feet high. Behind the
ium is the commodious stage, 40 feet deep and of an
e width of 80 feet, with a mezzanine floor and cellar.
Right and left to the Strand and Aldwych are the
eading to the stage exit and entrance and the dressing-
some twenty-nine in number. The "gridiron," which
ore than usual working capacity, is 70 feet above the

hich assures that if ever a fire should occur on the stage
delights in the lantern in the roof would open auto-
ally, and the flames be carried upwards to exhaust their
th so soon as they found nothing more to feed upon.
e whole interior of the theatre has been admirably

planned. With regard to the colour scheme, the mural
decorations consist of a material by Rottmans, having a
ground work, as seen by artificial light, of old rose, with a
raised *art nouveau* designed in gold, cerulean blue, Hooker's
green and permanent red being sparingly introduced. The
foyer is treated in hardwood, the panels being occupied by
full-length portraits of the Gaiety favourites—Miss Nelly
Farren, Miss Kate Vaughan, Miss Letty Lind, Miss Sylvia
Grey and Miss Ellaline Terriss. Special care has been
taken in the furnishing of the new building, which has
been carried out by Messrs. Shoolbred under the personal
supervision of the architects, Messrs. Rüntz & Ford.
The staircases and corridors are covered with a soft
velvety Axminster carpet in artistic shades of green. This
carpet also covers the floors of the stalls, dress and upper
circles and saloons, and forms an admirable foundation for the
general colour scheme of the auditorium. The seats are of
quite a novel kind, conveying the impression of cosy drawing-
room easy chairs, with polished mahogany frames inlaid with
satinwood, into which is worked the number of the respec-
tive seats. The covering is of English-made silk brocade,
having a white design on a ground of green in harmony
with the carpet. At the back of each chair are fitted
two shelves, the upper for fan or opera-glass, the lower
for a hat. The orchestra and boxes are hung with green
satin, on which is embroidered a handsome design in
various shades of silks and needlework, richly trimmed with
fringe and tassels, the whole forming a graceful draping. The
chairs in the boxes are likewise covered with the same material,
and are quite in keeping with those in the stalls, as is also the
furnishing of the private retiring-rooms. The act drop is an
excellent specimen of Mr Joseph Harker's art. As regards
fire-resisting and sanitary appliances, and the ventilation and
heating of the theatre, everything has been provided that
ingenuity can suggest for the safety and comfort of the patrons
of the new Gaiety.

The electrical installation, in connection with which every
precaution has been taken to minimise the risk of total extinc-
tion through the failure of supply, is of the most complete
character. There are over 1,500 incandescent lights on the
stage alone, as well as twenty-four arc lamps for limelight
purposes, and 1,800 lights in the house. The engineers, Roger
Dawson, Ltd., have laid no less than twenty-two miles of wire
and cables in the theatre, and over five miles of steel tubing.
The installation of the electric light alone has necessitated the

employment of no fewer than thirty men during a period of eight months. A particular feature is to be seen in the Royal rooms, where the fittings designed represent the Rose, Thistle and Shamrock, carried out in oxidised silver. The contractor, who has done his share of the work admirably, was Mr. Henry Lovatt, of London and Wolverhampton.

A detailed description of the building appeared in *The Architect* on May 1.

NEW CHURCH AT SALFORD.

THE church of St. Ignatius, which will be consecrated by the Bishop of Manchester to-day (Friday) has been built by Earl Egerton of Tatton in a new district, comprising about 8,000 inhabitants, taken from the parish of St. Bartholomew's, Salford. The site is a part of the ground originally belonging to the Tatton estate, occupied for so many years by the infantry barracks, and sold by the War Office to the Salford Corporation, from whom it was purchased. It fronts Oxford Street, leading into Regent Road, and is bounded on the east and south by streets recently laid out. The new church will seat about 500 persons. The church of St. Ignatius has not been controlled—as was St. Cyprian's—by any architectural surroundings, and Earl Egerton decided to adopt the round-arched Romanesque or Byzantine style, which found such beautiful expression in North Italy and Germany. The material is brick, with terra-cotta dressings, and the nave columns are of mottled red Runcorn stone. The east end is apsidal, and the columns of the arcading are of variegated serpentine, the circular-headed panels being fitted with mosaics representing vases of lilies on a gold ground. The altar table and reredos are in oak, chestnut, walnut and yew grown on the Tatton estate, and the picture of the Last Supper has been painted by the Hon. Mrs. Mitford, with gold background and other enrichments. The altar cloth and frontal of silk, ornamented with white lilies and a gold cross, have been embroidered by the Duchess of Buckingham and Chandos. A handsome campanile stands at the west end, next Oxford Street. Opposite the west door is a recess containing a font of Caen stone with a granite shaft. Besides the church accommodation a large parish-room has been provided in the basement under the choir vestry and south transept, with separate entrance from the new street on the east side. The buildings are supplied with electric light from the Corporation cables, and the fittings are of appropriate design. The church

has been built from the designs and under the superintendence of the architects, Messrs Darbyshire & Smith. Its cost for the furniture, is about 9,500*l*.

MANCHESTER IMPROVEMENT.

THE question of the improvement of what is known as Market Street area is once more to the front. Several have been put forward, and each in its turn has been abandoned, but it would seem, says the *Manchester Guardian*, that the public will shortly be in possession of the details of an entirely new proposal which is not lacking in boldness, and which, in the judgment of those members of the Council who have given attention to it, is likely to solve the problem which has engaged so much attention in recent years. The special committee of the Corporation appointed to deal with this question, in mitigating the pressure on Manchester's great thoroughfare (Market Street) had another meeting at the Town Hall. They are not yet prepared with their report on the subject, but understand they will have it ready for presentation to the Council at the November meeting. They have got together a great deal of valuable information on the subject of value, measurements, and in a few days they hope to have the verification of all the calculations which have been made by the officials of the Corporation with regard to the project that will be affected by the plan now proposed.

The new scheme, as already hinted, is a bold departure from those which have hitherto been suggested. Instead of taking the block of property situated between Corporation Street, New Brown Street, Cannon Street and Market Street, and making a new street diagonally from the Market Street corner of New Brown Street to the Corporation Street corner of Cannon Street, as was at one time proposed, the committee have resolved on starting from Victoria Street and cutting a way through the property between that street and Market Place, thence to Corporation Street, New Brown Street, across High Street, and on to Oldham Street. This new street will, of course, relieve the pressure of traffic on Market Street, but an additional source of relief will be obtained by the widening—as the committee propose—of Cateaton Street and Cannon Street. These improvements will, in the committee's opinion, render unnecessary the very costly plan of widening Market Street. Moreover, since that Market Street possesses a double line of tramways and

20 yards in width, it is believed that the margin of safety would be lessened by widening the street. In this, the element of risk to people who have to cross the street is increased if the street were made wider than it is. It is also intended that Oldham Street should be widened from Piccadilly to the junction with the proposed new street. What will this new project cost? The question arises, What will this new project cost? It is, in round figures, over a million pounds. This is undoubtedly, but the committee contend that it will be a loss. There will be several compensating advantages. Much of the property which will be destroyed is of an old and antiquated character. A portion of this old property will be replaced by property of a higher value. There will be between 20,000 and 30,000 square yards of what will be regarded as very valuable land available for other purposes. This, in brief, is the scheme which the committee have in view. In a few days the full details will be published.

NEWCASTLE ARCHITECTURAL ASSOCIATION.

The church of St. Chad, Bensham, which was consecrated by the Bishop of Durham on the 29th ult., was on the 1st inst. inspected by the members of the Newcastle Architectural Association. A large number of the members of the Association were highly pleased with the extreme beauty of the church, and the excellent character of the work. The visitors were afterwards entertained to afternoon tea in the parish-room by the vicar. In proposing a vote of thanks for this hospitality, the President of the Association, Mr. Taylor, expressed in a few words their deep sense of the loss they had suffered by the untimely death of the architect of the church, Mr. Hicks, who had not only been one of their most respected members, but also a personal friend of many of them. He also said that they had heard much of the beauty of the church beforehand, but what they had just seen greatly exceeded their expectation. He also complimented Mr. Taylor of Dunston, the contractor, on the manner of the execution of the work. In replying to the vote of thanks, Mr. Taylor took the opportunity of speaking to the services rendered by their clerk of works, Mr. C. H. Hough, of Durham. The church has been built

and furnished in the most complete manner, with every requisite of the very best quality, by the munificence of Miss E. Easton, and the architects were Messrs. Hicks & Charlewood, of Newcastle. The chief features externally are the lofty octagonal central tower and the north porch, which is richly moulded and carved, having three niches in the gable containing figures of St. Chad, St. Aidan and St. Theodore. These are the work of Mr. Milburn, of York; while the rest of the stone carving is by Mr. Beall, of Newcastle. The octagonal font is of Derbyshire alabaster, with beautifully carved statuettes in niches at the angles, and has a lofty oak canopy, surmounted by a dove. Behind the font is a tablet with inscription stating that it, together with the stained glass west window, is erected by Miss Easton as a memorial of the architect, Mr. W. S. Hicks, who died during the erection of the church. The twelve subjects in this window all relate to the building of either the material or the spiritual church. The east window of seven lights is also filled with stained glass. Below this window is a fine fresco painting of the Annunciation. Behind the chancel is a small morning chapel with access from a north-east porch. The rood-screen, pulpit, pelican lectern, Litany desk, bishop's chair and reredos, which are all very elaborately carved in oak, are by Mr. R. Hedley, who has also done all the other wood carving in the chancel side screens, &c. The roofs are of pitch-pine, with carved cornice and bosses, and all the seating, choir stalls and other fittings are of best wainscot oak. The chancel floor is in various coloured marble, and the floors under seats are of solid oak-blocks, with rubbed stone and small black marble squares in the aisles.

SLAG PORTLAND CEMENT.

The American Consul-General at Coburg, Germany, reports:—

Portland cement has been made from blast-furnace slag for several years in various cement works in Germany, Luxemburg and Belgium, and has yielded very satisfactory results, especially in regard to quality. Negotiations are being carried on with some blast-furnace works with a view to the introduction of the slag-cement industry into England, Austria and France. In some respects a blast works has a considerable advantage over other Portland cement factories because the motive power from the cement works can be supplied by a blast-furnace gas motor with electric transmission, the rubble or waste coke from the blast furnaces can be utilised in the

WRITE FOR QUOTATIONS.

cement kiln, and the principal raw materials—namely, the granulated slag and the limestone—are close at hand. Besides, there are other minor advantages.

Portland slag cement has also some advantages over natural Portland cement; for while the yield from the raw materials when the former is used is about 85 per cent, the yield when the ordinary raw materials are used is seldom more than 60 per cent. As the cost of production per ton of raw materials is nearly equal in both cases, a saving of about 20 per cent. in fuel, labour, &c., is effected in the case of slag cement. Besides this, Portland slag cement is more trustworthy and more regular, and its manufacture can be more easily controlled than that of the so-called natural Portland cement, because the principal raw material—namely, the blast-furnace slag—is as a rule a regular product whose chemical composition is easily controlled; consequently, any alterations which are liable to take place are known beforehand, and precautions can accordingly be taken in time. This is not the case when the natural raw materials are used.

Some recent tests with Portland cement from blast-furnace slag, made in the municipal laboratory at Vienna, showed that mortar composed of three parts of sand with one part of this cement gave the following results:—

1. *After seven days' hardening.*—Tensile strength, 383 pounds per square inch; strength of compression, 3,880 pounds per square inch

2. *After twenty-eight days' hardening.*—Tensile strength, 551 pounds per square inch; strength of compression, 5,411 pounds per square inch.

STRAIGHTENING A CHIMNEY.

A LEANING chimney in Cranston, Rhode Island, U.S., has been straightened by a simple method devised by Mr. Joseph H. Gerhard, of Providence. The stack is 8 feet in diameter inside and 192 feet high. A short time after completion it began to lean to the east until the movement reached 4 feet and was apparently still continuing. To straighten it a course of brick on the west side of the stack was removed for a depth of three-fourths of the thickness of the shell, and the space filled with oak wedges. On the east side a thick 10 by 20-foot bed of concrete was laid against the foundation. Two holes were then cut through the shell on the east side and heavy

steel beams passed through them. Jack screws were placed between the concrete and the beams, and with their stroke was slowly brought back to a vertical position, the beams being burnt out by a gas flame driven against them with a blast. When the straightening was finished the holes were filled with concrete, the steel being left in place.

A HIGH TOWER.

THE Eiffel Tower is to be eclipsed at the St. Louis Exposition next year, and, not content with that, its inventor offers a higher tower to London or any other city or private enterprise, happening to be in want of "a monument of Beauty as well as of Power into the Heavens as a Memorial of the Progress of the Twentieth Century." Only 390,000*l.* is wanted to erect the "National Tower of Amusement and Recreation," and with the "Graydon Double Spiral Cloud Railway" for the "By Train to the Heavens in the elegant coaches of the Clouds Through-Clouds Express."

Lieut. J. W. Graydon, the American engineer who constructed the Big Wheel at Earl's Court, informed a representative of the *Daily News* that he had arranged to construct a tower at St. Louis 1,200 feet high, with trains running on the top. He had submitted two designs, and the one which has been chosen was vertical, or ran straight up into the air, to be built entirely of steel, and will be fitted with one cable railway running up outside and another running down inside. The four trains, which will be run simultaneously both ways, will be fixed on to a cable at intervals, so that when a train is made each of the eight will be at one of the different stations. The wheels will run in deep gulleys instead of on rails, and in case of the cable snapping, or the driving gear breaking, each train will be fitted with electric motors. How much it is to cost its inventor did not care to disclose, but he considers the 390,000*l.* one which he wishes the London Corporation to erect on the highest spot in London much cheaper, because it rises to a point from a large base, and enables the ball-rooms, restaurants, theatres, concert halls, and other pleasure resorts constructed on platforms throughout the height to be much more spacious. On the top platform the inventor has his "Monument Light" for throwing pictures on the sky, and also "snowstorm illusions." But the fair-weather

MILL ARCHITECTURE.

of a few industries the work of the mill architect has
preciated until recently. It was formerly held by
ufacturers, says the *Engineering Record*, that they
they needed in the way of machinery, that a local
was competent to put in their power plant and a
er to design and erect their mills. The idea that
er could give them useful information concerning the
in their own industry or tell them how to arrange
to the best advantage seemed preposterous. The
n's buildings answered their purpose, although the
etimes sagged and the shafting was more often out
alignment, owing to the deflections of the structural
The bills for fuel were too high to seem right or the
veloped by the wheels was too small when compared
ead, but these conditions existed in rival mills and no
r them was apparent.

raduates of technical schools found their way in
time into responsible places in manufacturing
ents and brought about a change in the methods of
plants. Skill and experience gained in bridge
re brought to bear on the structural planning of the
with the result that they often cost less than before
always stronger. Men devoting their entire time to
ineering were able to design power plants that saved
tities of fuel, while experienced hydraulicians obtained
power from the same head of water than the old mill-
er dreamed of securing. The mills were lighter and
ence of the better illumination the work was of an
quality. Finally the mills became more comfortable
so that the men looked askance on the older plants
e improvements which increased their respect for
and for themselves.

result of the rapid development of industries of all
e United States a demand arose for the general mill
and this demand has caused the development of the
of mill architecture as it exists to-day. It is un-

questionably one of the most interesting branches of civil
engineering. The mill architect having a large practice is
called upon to plan all kinds of buildings on all kinds of
foundations. In a case that came up not long ago it was
necessary to construct a paper mill on a wharf of piling, filled
in later with earth enclosed by a bulkhead. Some of the
buildings of the Lackawanna Steel Company have their walls
carried by arches sprung from piers that rest on groups of
piles. In still another plant about to be placed under con-
struction it will be necessary to erect most of the buildings by
means of pile platforms constructed about them, for there is no
available place in the vicinity for the storage of materials, and
wharves must be supplied in consequence before work can
commence. The variety of problems which arise in connec-
tion with the superstructures is equally noteworthy. The
structural framing is often just as novel, owing to the arrange-
ment of cranes and tools attached to the columns. In the
power plant the value of the advice of experienced specialists is
equally great and the diversity of work equally interesting.
The information acquired by planning power installations for a
variety of industries often enables the designer to introduce
features from establishments of one class into those of another
much sooner than would be the case were the plant laid out by
a man acquainted with only his own branch of manufacture.

In other words, the development of sound mill architecture
is largely due to the knowledge possessed by the men prac-
tising it of the latest methods in many fields of manufacturing.
The importance of sound construction and equipment, which
will follow from the increasing knowledge of the work others
are doing in mill architecture, was forcibly stated in the address
of President H. E. Walmsley before the New England Cotton
Manufacturers' Association this week. "The competition and
the increasing competition of the modern mill with the mill of
old-time structure and equipment," he said, "is the problem to-
be studied by the older mills. It has been my privilege within
a very recent period to inspect two or three mills of the very
latest and most approved construction. The guiding and
leading principle in the construction and building of these mills
and in their equipment, in fact, in every detail from foundation
to roof, has evidently been the securing of the very best that
human ingenuity and experience could design and devise, and
in this they have succeeded perhaps beyond expectation."

This statement concerning the cotton industry has been
expressed recently by others of equal eminence in paper-
making, steel manufacture, machine tool building and tanning.

NORTHAMPTON MASTER BUILDERS' ASSOCIATION.

THE annual dinner of the Association took place at the Peacock hotel, Northampton, on the 15th inst. The president (Mr. W. Higgins) occupied the chair, and was supported by the mayor (Alderman T. Purser), Councillor H. Martin, J.P., Councillor H. Green, Councillor A. P. Hawtin, Mr. H. Eady (America), Mr. W. Heap, Mr. G. Butcher, Mr. S. F. Harris, Mr. G. H. Stevenson, Mr. W. Fidler (borough surveyor), Mr. A. E. Anderson, Mr. W. I. Brown, Mr. C. Archer (Wellingborough), Mr. J. Barnard (Norwich), Mr. F. J. Airs (hon. sec.), &c. Mr. H. W. Hanwell (vice-president) and Mr. G. Bird were in the vice-chairs.

The usual loyal toasts were given from the chair.

Mr. H. W. Hanwell proposed "The Army, Navy and Reserve Forces," coupling with it the name of Mr. West, who suitably replied.

"The Mayor, Magistrates and Members of the Corporation" was proposed in an eulogistic speech by Mr. H. W. Hanwell. Expressing admiration for the work of the Mayor, Mr. Hanwell congratulated his Worship on the position he held, and remarked that his Worship occupied a position which should be the ambition of every burgess in the town.

The toast was received with musical honours.

The Mayor at the outset of an interesting speech expressed the hope that some gentleman represented in the trade would occupy the office of mayor during the coming year. He could at the same time assure them that the office of mayor of Northampton was no sinecure. It had been an exceptionally heavy year for the Council. He had done what he considered his duty, and he intended to do so to the end of his year of office. The old Book said, "Woe to the man who is spoken well of." He thought, however, he might say that his services were appreciated by the majority of the ratepayers of the town. Concluding, he wished the building trade every success. Of course, their success depended upon the prosperity of the staple trade. He was no pessimist, but he had known Northampton to be in a worse condition.

Councillor H. Martin, replying, congratulated Mr. Hanwell on the recovery from his accident. Speaking for the magistrates, he described Mr. Bishop as being one of the best clerks in the country.

Councillor H. Green, in a short reply, humorously remarked that it was quite refreshing to hear the singing of "Jolly good fellows" to members of the Town Council. The work of the

Council was an increasing quantity, and the work laid on by the School Board being thrown on them added to the

"The Architects" was proposed by Councillor Hawtin. They were exceedingly sorry, he said, that the building trade was not good, and their sympathies in architects were, therefore, rendered more earnest.

The names of Mr. Harris, Mr. Stevenson, Mr. Archer and Mr. Fidler were coupled with the toast. These gentlemen suitably replied.

Mr. Anderson said there was no town in England whose estates had been cut up and built upon as in Northampton. The builders could not expect to be always continuing progress.

Mr. Jeavons proposed "Success to the Northampton Builders' Association."

Replying, the Chairman said they had sustained a loss by the deaths of Mr. W. H. Smith and Mr. F. Leas.

"Success to the Trade and Town of Northampton" was proposed by Mr. J. Barnard.

Mr. G. F. Wilkinson, in the course of an interesting speech, said that if the depression were singular there might be cause for alarm. But it was not singular. Depressions were general, and they were therefore certain it was not through want of enterprise on the part of the manufacturers of Northampton. He considered that the enormous amount of money spent in extraneous matter had taken up capital and crippled the speculator. There was no doubt that the depression had caused much of the trouble, but they trusted that it would be soon in prosperity again.

Mr. J. Bird proposed "The Visitors," coupling the names of Mr. Eady, of America, with the toast, and that gentleman replied, remarking that he had come from America to attend that banquet.

"The Chairman's Health" was proposed in cordial terms by Mr. G. Fisher.

Mr. E. Heap proposed "The Vice-President," and Mr. Hanwell responded.

The health of "The Secretary" (Mr. F. J. Airs) was proposed by Mr. E. Archer and received with enthusiasm.

Mr. Airs, replying, thanked Mr. J. Bird for help he had given in the discharge of the secretarial duties, and referred to the Association as a great agency for good in the trade.

The concluding toasts were "The Press," proposed by T. W. Smith, and "The Host and Hostess," proposed by J. Bird.

THE WEEK.

education committee of Brighton, in common with similar authorities elsewhere, are perplexed by the problem which is before them of providing additional schools. The best example, St Luke's Terrace, has cost 36,200*l.*, or 6*s.* 5*d.* per head. In 1881 a school was erected at the cost of 12*l.* 10*s.* 7*d.*, and in 1890 at 15*l.* 4*s.* 9*d.* It is necessary that additional schools should be constructed, as Leicester has gained a reputation for economical building three of the members with the clerk and surveyor visited that town. According to one of the parties they saw some very fine schools, with magnificent halls, which had been provided at a cost of 11*l.* 1*s.* 11*d.* per head, why could not the same be done in Brighton? Perhaps one might quibble and say that the members of the committee had not got the complete figures before them, but they were bound to accept the figures that were given them." So remarkable a discovery excited displeasure at the last meeting of the education committee. One member stated that in Leicester there was nothing on the walls but painting and colouring, and he hoped that in Brighton they would send their children to places that were little better than barns. Another member stated that in Newcastle, Sunderland and Middlesborough schools were erected on economical terms as in Leicester. One effect of the discussion was that alternative plans for a school in Finsbury Park are to be prepared, as the central hall may have to be omitted in order to save expense.

THERE are some streets in Paris which appear to be unchangeable. One is the Rue Lafayette; another is the Rue de l'Université. The former is animated for its entire length; the latter for a great part seems to belong to a dead and abandoned city. It has, in consequence, been a favourite place for official depôts. At one time there were in it warehouses of charts, artillery, weapons, and, on a site which had been assigned for archives, was a depôt of government marbles, or, in other words, the statuary which was to be purchased, but for which there is no room in the Louvre or elsewhere. The latter depôt will probably come up for consideration if ministers can be found courageous enough to grapple with an onerous difficulty. For years there has been an outcry about the danger attending over the invaluable collections of the Louvre, owing to the presence of the Ministry of the Colonies in part of the adjoining premises. It is from time to time announced in order to quiet the misgivings of the public that the minister with his clerks and documents are about to be evicted. But it is not possible to discover even a temporary shelter for them. It is now proposed to erect a big building on the site of the depôt des Marbres. The question then arises, What is to be done with the examples of the sculptor's art which are stranded? The collection has been growing for at least sixty years. It would be disadvantageous to modern proprietors if the statues were sold by auction, for it may be affirmed that the majority of the figures would have to be got rid of for less sums than were paid for the originals. Any course which would bring down the value of the collection would be dangerous. Many of the examples are considered as official art, and the glories of one régime are distasteful to another. They cannot all be sent to provincial museums. Probably the wisest proceeding would be to despatch the majority to French colonies. The utilisation of the depôt as a site will cause another inconvenience. Some of the sheds used to be assigned to painters and sculptors who were executing enormous works for public buildings, and it will be difficult to discover other quarters as roomy which can be obtained gratuitously.

EVERY archaeologist must desire that the remains of ancient buildings in Ireland will not suffer through the change of ownership of the land. The tenants who are to

be the new proprietors were not always distinguished for respecting ruins. THOMAS DAVIS was not afraid to say, "We have seen pigs housed in the piled friezes of a broken church, cows stabled in the palaces of the DESMONDS, corn threshed on the floor of abbeys and the sheep and the tearing wind tenant the corridors of Aileach. The peasant lugs down a pillar for his sty, the farmer for his gate, the priest for his chapel, the minister for his glebe." Last week we mentioned that the remains of Mellifont Abbey were assigned to the Commissioners of Public Works. It is well known that a large corn mill had been erected with stones from the buildings. Is it to be expected that under the new conditions there will be more reverence displayed? The Land Commission have made an effort towards the preservation of ancient monuments, for one of the rules which come into operation on November 1 is as follows:—"Where any land proposed to be sold under the Land Purchase Acts contains any ancient monuments, application to the Commissioners with a view to having the same dealt with under the provisions of section 14 of the Irish Land Act, 1903, may be made by the vendor or purchaser, or by any public body or association interested in the preservation of same." It will be observed that the application is optional. What should have been enacted was that when land was to be sold in small portions to tenants and others the ruins were to be exempted and assigned to the Irish Board of Works as guardians under the Ancient Monuments Protection Acts. Fortunately many are already secured in that way. It was necessary last year to carry out repairs in about forty of the ruins, including the Round Towers of Clones, Monasterboice, Drumcliff and Dromiskin, and the important abbeys of Claregalway, Kilconnell, Sligo, Ennis, Holycross, Moyne, Quin, Athenry, &c., all having historical as well as architectural interest. The new proprietors are not possessed of skill in restoration, and therefore any reparations by them are likely to be no more than another form of destruction.

ALTHOUGH many objects have been discovered which testify to the existence of Greeks and Romans in France, steles or sepulchral slabs are almost unknown. The discovery of one in Paris and in a street called after DOMINIQUE CASSINI, the Bolognese astronomer, seems therefore almost incredible. It was dedicated to the memory of a smith whose effigy appears on one of the sides. He wears a long apron which is fastened to a girdle, and in his left hand is a large pincers. The slab is supposed to date from the beginning of the second century. It has been deposited in the Musée Carnavelet. The Rue Cassini is near the Observatory, and previous to 1790, when it received that name, the street was known by the names of Maillet, Deux Maillets and Deux Anges. There is no doubt about the connection of the Romans with that part of Lutetia. There was a temple of Mercury near the existing Panthéon, and a palace of which the remains known as the Thermes are a survival, and there was a camp at the Luxembourg. In a position about the upper part of the Rue Fosses Saint-Victor was a circus. The Temple of Jupiter was probably on the site of the cathedral.

THE people of Limoges demonstrated their indifference to history when they demolished the fortifications. It is true they might be considered as failures, for in 1370 the city was captured by the BLACK PRINCE, and some 3,000 of the inhabitants were massacred by his command. A few fragments survive, and they are also doomed to pass away. It may be because it belongs to the fourteenth century that the old bridge known as the Pont St. Etienne is likewise to be destroyed by order of the municipal council. Bridges of that period are rare, and it deserves to be preserved. It would be possible to erect another bridge which would meet all modern demands. But that would be treated as a concession to Mediævalism, which at the present time is obnoxious to the people. Limoges has been celebrated during seven or eight centuries for its pottery, and every example of antiquity has a commercial value because it helps to sustain a belief in the continuous prosperity, which was gained not only by the émaux, but by other varieties of the potter's art.

BALUSTRADES ON BRIDGES.

THE hoardings have been removed for a sufficient length on both sides of London Bridge to enable anyone to anticipate the effect of the improvement. We expect the majority of people will be disappointed. The addition of the width of the old footways to the central roadway was assumed to be sufficient to afford adequate accommodation for wheeled traffic. We might imagine that since the widening began the carts, cabs and carriages have increased, for there are occasions every day when the policemen employed in regulating the traffic appear to be in danger. The up and down lines of vehicles have to run so close together as to allow insufficient space for a man to stand between them. The truth is, the exigencies of trade in the Metropolis demand a much wider bridge than could well be constructed. The London County Council have presumed they could do as they please with the northern side of the Strand because they provided a road of 100 feet in width. London Bridge, however, stands in greater need of this width than the Strand. For it should be remembered that all the traffic crossing the bridge does not simply pass from the southern part of the Metropolis to the northern. A large part turns westward, and much which we see in the Strand proceeding eastward is destined to pass over the bridge. In fact, the bridge and its approaches should correspond in width with the broadest street. The expense, however, would now be prohibitive. In 1820 it was impossible to expect enough foresight among the authorities to anticipate the enormous work which the bridge would be called upon to accomplish. As an excuse for the Corporation and JOHN RENNIE, the engineer who was consulted, it should be recollected that a slight change in the position of the bridge had the effect of doubling the estimated cost, and that eventually the outlay was four or five times as much as was originally contemplated.

RENNIE had for twenty years previous to undertaking London Bridge gained a reputation for that class of construction. The people of London were able to confirm what was said about the skill which he had displayed in Scotland and the North of England. Waterloo Bridge and Southwark Bridge, although they differ in character, are alike testimonies to his remarkable power. He did not superintend the erection of London Bridge, for he was buried in St. Paul's in 1821, but the plans had been sufficiently completed to enable his son to conduct the operations. When the bridge was opened one dissimilarity between it and Waterloo Bridge must have struck observers. At the latter RENNIE designed the parapet as a balustrading, while at London Bridge the parapet was solid. RENNIE was not the kind of man to effect a change of that kind without long deliberation. It is possible that as Waterloo Bridge was to be a toll bridge—for it was constructed at the expense of a company—he concluded that the traffic was never likely to be excessive, and would be dealt with in a leisurely manner. By changing the name from Strand Bridge to Waterloo Bridge it is evident the directors and shareholders intended the structure to be a national memorial of England's greatness; it would, therefore, be respected like any other monumental work. That was the view taken by foreigners at the time of the opening. Baron CHARLES DUPIN said:—"The traveller on beholding this superb monument will suppose that some great prince wished, by many years of labour, to consecrate for ever the glory of his life by this imposing structure. But if tradition instruct the traveller that six years sufficed for the undertaking and finishing of the work—if he learns that an association of a number of private individuals was rich enough to defray the expense of this colossal monument worthy of SESOSTRIS and the CÆSARS—he will admire still more the nation in which similar undertakings could be the fruit of the efforts of a few obscure individuals lost in the crowd of industrious citizens." DUPIN's was not the only testimony to the importance of the bridge. JOHN CONSTABLE's great painting is likewise a record of the spirit then animating the people, for it shows us not the completion of a commercial enterprise, but a scene of national rejoicing, because the bridge was the earliest memorial of Waterloo.

Waterloo Bridge was, however, open to objection if judged by architectural principles. The adornment of the piers with unfluted Doric columns was unnecessary for a

bridge pier has another kind of duty to perform besides supporting a weight like a column. RENNIE profited, I doubt by the criticisms he heard, and the piers of London Bridge are expressive of their purpose by their appearance as a mass. He may also have concluded that his balustrades were akin to his columns, although they were not exact in the same style, and he therefore substituted a solid wall. The arrangement could not fail to be approved. In works of construction, whether engineering or architecture, it is essential the spectator should feel the utmost confidence in its safety. Hence arose the maxim, "A little stronger than strong enough," which is sometimes interpreted by imparting an excess of material in order that fear itself might be overcome. It was possible to walk over London Bridge and feel assured that if a waggon came into collision with either parapet the bridge would not be the sufferer.

One of the innovations introduced in connection with the widening has been the substitution of an open balustrade for RENNIE's solid parapet. We do not care to criticise the individual balusters, for they are of the most commonplace pattern, such as would be supplied without a drawing by a manufacturer, and with the utmost indifference to the purpose they had to serve. There would have been a difficulty in designing a special form, and as the balustrading is the part of the structure which will receive most attention from people passing over London Bridge, the insignificant additional expense involved would not cause much confusion in the City's finances. What we object to, however, are not the atoms, which are unworthy of notice but the whole. We maintain that balustrading is not adapted for the purpose of a parapet, especially in a bridge where accidents are always liable to arise, for it suggests weakness where strength is needed; and, what is more, there must say there are not sufficient precedents to warrant the adoption of the arrangement.

It has been held by some writers that balusters were unknown to the ancients, and are among the creations of the Renaissance period. That conclusion should be regarded as at least doubtful. Men at all times were indifferent about making things of only one set of normal dimensions. They produced larger and smaller sizes. There is nothing extraordinary in the proposition that very short columns were to be seen, although on account of their dimensions many examples have not descended to us. In Saxon churches we meet with baluster columns, and we can hardly suppose they were not derived from more ancient examples. Niches were sometimes flanked by short columns, which were also essential for arcading. Whether they were employed in ancient bridges cannot be asserted or denied as a universal fact. But, judging by the remains, the Roman bridges were provided with solid parapets. The old Ponte S. Angelo in Rome has an open parapet, but it is well known to have been one of BERNINI's alterations. In judging of bridges we should always bear in mind that military engineers had some concern in their erection. If they did not serve for the protection of a town they could be used by an enemy as a means for attack, and it would not be considered advisable to allow parts which could help to guard an approach to become so dangerous by their open sides as to make it impossible to place men on the roadway. It is true we no longer live in more peaceable days, and two lines of balustrading, however exposed, would not afford facilities to invaders in London. All we say is that their use is not warranted by examples constructed in periods when no sane bridge builder would dare to utilise balustrades. Historically considered, their introduction in our times is unwarranted.

If we look to Renaissance precedents we find that balustrading was only employed in positions where there was no likelihood of its strength being tested. It was as familiar as an adornment for the uppermost lines of palaces and other buildings in Italy. The Commissioners of St. Paul's, who insisted against the advice of WREN on its adoption as an edging, had, from seeing examples abroad, come to the conclusion that a building in the Italian style was incomplete unless crowned by balustrading which enabled the sky to be seen through it. WREN, however, judged it to be a purposeless appendage, but no one would now venture to suggest its removal. In some of the Italian palaces which appear to be designed in such a way as to resist an attack, and therefore presented few vulner-

le points, a balustrading at the roof level or on the ground would not cause much harm, and diminished to some extent the severe character of the building. Nowhere was balustrading more applicable than in Venice, where it became an element in balconies and arcades, or for the sides of aircases, positions in which there was little liability of danger.

In any question relating to the details of a masonry bridge there are no better models than those to be found in France, and especially in Paris. There are some illustrated parapets through which children can look at the Seine. But it will be observed that the best examples are of the kind which should have been adopted for London bridge. We do not mean to suggest that we should employ flusters because they are occasionally found in French bridges, or that the baluster should be rigorously prohibited from lining the footway of bridges because Frenchmen consider it unsuitable. It is possible to model them in a way that will be suggestive of strength, for a blank wall is not always preferable to one consisting of voids and solids. But to the baluster used for a parapet a character of strength must be imparted, and the practice should be avoided that seems to have been adopted at London bridge of preferring numbers to form, as if a great many significant parts could be eloquent of strength and power of resistance.

If the people who traverse London Bridge were in the habit of finding enjoyment in gazing at the muddy waters of the Thames through balustrades there would be some reason for making them of a slim form. But the parapet is not too high for people to see over it. Besides, it is a remarkable fact that the only part of the river which seems attractive is the wharf where the steamers are moored near Billingsgate. There is, indeed, no excuse for the arrangement which has been adopted and by which a structure which has inherited so many associations is made to appear unworthy of its renown.

THE MEDIÆVAL SORBONNE CHURCH.

By J. A. RANDOLPH.

THE illustration which we reproduce of "The Sorbonne in 1550," from the Tapestry Map of Paris,* is so picturesque that it is a gain for lovers of the architectural beautiful, that the foundations of that church have recently been discovered under the stones of the great Cour d'Honneur, north of LE MERCIER'S fine church of the Sorbonne. The plan of the old church, recently discovered,

is now being perpetuated in cement *in situ* on the flooring of the repaved quadrangle for the new buildings, and shows a long narrow aisleless and transeptless structure with a circular apse, the nave being about 75 feet long to the chancel and 25 feet wide. East of the apse, and

- A = Steps down to Quadrangle.
- B = Site of Steps in New Quad.
- C = Ditto Old "
- D = Site of Foundation Stone of Richelieu's Buildings.

abutting on it, are two narrow chambers, one with a staircase marked (possibly to cellars or a crypt), and another similar apartment is just north of the one with the staircase, with part of a further northerly chamber showing, and what is apparently the sacristy abuts on due north of the east end of the nave. The orientation is almost exact, and truer than that of the present church.

THE FIRE PREVENTION CONGRESS*

IT is rather early to estimate the beneficial results of the Fire Prevention Congress which was held in July. The proceedings were too multiplex for the time allowed to consider them. The Chairman admits that at future gatherings there ought to be either a reduction in the programme or an increase of working hours. Mr. SACHS's estimate of what was accomplished does not appear to be exaggerated when he asserts:—

(1) It has laid the basis for the foundation of an effective international policy for the prevention of fire, based upon a regular international exchange of experience and thought; (2) it has brought about an international understanding on the subject of requirements of and methods of testing "fire-resistance" in building materials and systems; (3) it has assisted in breaking down the barrier between some of the personal and vested interests of fire prevention and fire extinction, and has brought together leading representatives of each of these branches with the happiest results.

There can be no doubt that the papers read embodied a large amount of information by English and foreign specialists. Some were in German, some in French. As Englishmen are not masters of foreign tongues inconvenience followed, and Mr. SACHS recommends that for the future the English language should be recognised as the language at fire congresses. But the papers, reports and speeches have been translated, while the papers are also printed in their original language for the benefit of readers who may wish to compare them with the English versions. Considering the difficulties which arose from the use of three languages, the reporters have gained a success which is creditable. The folio volume just published merits to be accepted as an encyclopædia of what is now known in all branches of the subject of fire prevention. From the absence of an alphabetical index it is, however, possible the value of the pages may be underestimated.

The resolutions adopted in the various sections will indicate some of the obstacles to safety as well as some of the measures which it is desirable to adopt in guarding against the ill effects of fires. In the first place, it is advocated that "fire-resisting" should be generally substituted for "fireproof." The character of the resistance should be made evident, so as to have it understood whether it is temporary, partial, or full. The adoption of the metric system is suggested. The establishment of testing-stations and a permanent international technical bureau, as well as a periodical revision of local building regulations, were also considered necessary. Other subjects to which the resolutions apply are technical education, fire brigades and fire prevention, the legal status of fire brigades, records, publication of technical fire reports, maintenance of private fire appliances, fire-insurance rating, insurance influence on fire prevention, theatre safety, theatre fire service, lightning, spontaneous combustion, popularising of fire prevention, consolidation and uniformity in legislation, and international publications.

We have already printed some of the papers relating to building construction. But in the course of the discussions a great deal was brought forward which merits consideration. For instance, it was stated that the automatic sprinkler has done remarkable work in America, but every type must stand a test before it is approved by the insurance companies. Professor WOOLSON said that in America they depended very largely on sprinklers, and he was surprised more use of them was not made in England. Mr. RIVERS, the representative of the Office of Works, declared that "The best weight-carrying and fire-resisting floor construction is that in which the steel members, while reinforcing the concrete on the embedded system, are themselves kept to such a sectional area as to avoid disruption of the concrete under the extremes of expansion and contraction. In this sense it becomes evident that in adopting built girders, rolled joists, or cast-iron columns in connection with floor construction, we incur a risk of failure in case of fire, unless this construc-

tion is supplemented by a costly system of protection, which may even then be of doubtful utility." People will, however, hesitate about undergoing the expense which would afford ample protection to the metalwork. In America, for example, where so much attention is given to the subject, it is sometimes considered that plastering wooden beams without any intervention of metal lathing is sufficient. The timber may not be seasoned and may be exposed to rain before it is plastered. Mr. DUNN, an American delegate, remarked he had seen "pieces of timber as large as 10 inches by 12 inches uncovered in buildings which were being torn down, where dry rot had set in to such an extent that a handful of material could be taken right out just like a sponge."

It would be impossible in a limited space to give a sufficient notion of the varied contents of the official report. It deserves wide circulation as well as preservation. Not only architects should be acquainted with it, but all public bodies in charge of fire brigades. When we recollect that the congress was the first of its kind, the successful organisation is noteworthy, and credit is due to the chairman, Mr. SACHS; the honorary secretary, Mr. ELLIS MARSLAND; Mr. MAX CLARKE and Mr. F. W. HAMILTON, who have been associated in this enterprise.

THE ARA PACIS, ROME.

WE have lately referred to the excavations in progress in Rome for revealing the remains of the Augustan altar. The Rome correspondent of the *Globe*, writing on the same subject, says:—Visitors to the splendid Museo delle Terme have noticed workmen at various times during the past year busily modelling and then setting together portions of a design in relief reproducing evidently some important monument of ancient art. They have been, in truth, working under Professor PASQUI, endeavouring to execute a reconstruction of the magnificent Ara Pacis decreed by the Senate in honour of Augustus, B.C. 13, after his successful undertakings in Spain and Gaul, which signalled the peace of the Roman world. The Emperor modestly refused the proffered dedication to himself, and offered it instead to Peace; and at the close of January of that year he dedicated a colossal altar, surrounded by a marble screen, upon which were sculptured exquisite reliefs, representing processions of the noble friends of Augustus, priests and others. These latter were all crowned with laurel, and bore branches of olive in their hands. Above them ran an enriched frieze displaying elaborately carved foliations, flowers and festoons, typifying the fertility of the earth. It was a golden moment in the art-life of Rome, and the design and workmanship were of the finest. The monument consisted of a rectangular platform, having a front and back of 36 feet, with sides measuring 33 feet, and was reached by a flight of steps from the Via Flaminia (Corso). The sculptured marble precinct wall, covered with the aforesaid reliefs, rose up of year in front of the visitor, its continuity being broken in the middle of its face by majestic gates, possibly of gilded bronze. Within this rose a second platform, reached by four more steps, and upon the further side of this stood the altar itself—thus, in its entirety, it rather resembled a graduated depressed pyramid.

The position given to it in the Campus Martius corresponds precisely with the angle of the Via S. Lorenzo in Lucina, where that street opens out of the modern Corso, nearly opposite Via Frattina and adjoining the Palazzo Farnese. Ottoboni, in the cellars and among the foundations of which the present exploration and excavation was lately commenced. For, inspired by the fine volume devoted to illustrating this great monument by Professor Petersen, of the German Archaeological Institute in Rome, the Municipality and the Ministry of Public Instruction, having come to agreement as to the significance of precisely locating the site, approached Signor Almagia, the proprietor of the palace, who (himself a most skilful engineer and enthusiastic lover of archaeology) not only helped to bring about a proper scheme for the desired research, but has generously aided it with money. In consequence the work was put into the hands of Signor Cannizzaro, who began operations on July 27. Early in August an opening was made in Via Lucina, and presently traces led the explorer right on to the longitudinal axis of the spacious altar, even to the sill of the great door opening to the Via Flaminia.

As far back as in 1568 Cardinal Ricci, of Montepulciano, wrote from Rome to the secretary of the Grand Duke of Tuscany that beautiful reliefs on immense blocks of Greek marble (it should have been Carrara) had been found when the Palazzo Ottoboni was being built, and that they would be soon forwarded to Florence. These are still to be seen in

* The First International Fire Prevention Congress, convened by the Executive of the British Fire Prevention Committee, held in London, July 6 to 9, 1903. The Official Congress Report, with an introduction by Edwin O. Sachs. London: Published for the Committee by the *Public Health Engineer*.

in the Uffizi Gallery. Other fragments went to the Medici on Monte Pincio, where they yet adorn the rear of the college. During a restoration of the same palace some dozen further fragments came to light. On January 16, 1899, whilst visiting the Jesuit Church, where we were going on, the present writer was fortunate enough to recognise another fragment, which had been utilised since as the gravestone of a bishop of Lucca. The upper face had been smoothed and inlaid with verde antico and tello marbles so as to represent the arms and cardinal's of Sebastiano Poggio, the said prelate. On its underside sculptured exquisite scrolls and foliations of quite unmissable Augustan work. This was another fragment, measuring 6 feet by 4 feet.

The present condition of the exposed monument would indicate its having been destroyed by fire and by deliberate and the broken fragments are found lying at no distance from the portions to which they once belonged. Several of the jambs of the doors have been recovered, as well as the angular pilasters projecting from the marble screen. One of the most significant discoveries now made has been that of a second, or posterior, door on the eastern side of the monument, with the broad steps leading to it, as represented in a fine bronze of Domitian. It is necessary to state that the excavation has required the formation of several small tunnels, in which are encountered the beautiful portions still remaining *in situ*, as well as splendid decorated blocks, which are obstructing progress and very difficult of extraction. A later enclosing wall, of brick and travertine, has been since noticed, having been constructed, apparently, with a view to isolate the altar from impinging edifices. Much, however, remains to be explored still before we can hope to have a possible and worthy rehabilitation of this capolavoro of antiquity, to which end it will further be needful that the Uffizi and the Vatican shall generously contribute various portions already in their respective keepings.

TESSERÆ.

De Louthembourg and Scene Painting.

GARRICK, soon after the arrival of De Louthembourg, cognomened "prince of scene-painters," engaged that genius to superintend the scenic department of the boards of Drury, at a salary of 500*l.* a year. The first exhibition of his inventive talent in this theatre was in the splendid representation of the "Christmas Tale," wherein there was a fine display of his knowledge of scenery, machinery and all the pictorial concomitants of spectacle and stage effect. The fire-scene was beheld by the audience with astonishment, and the characteristic appearance of Draco and his demons, combined with that pictorial feeling which assimilated with the imaginative beings represented in the painted incantations of the actor Rosa and the hellish Breughel, electrified the audience to delight. This piece attracted all the world of taste, and the artist and connoisseur admitted that De Louthembourg proved that it was possible to render a dramatic scene completely illusive. Satisfied with the advantage which appropriate scenery and its concomitant suitable costume were capable of rendering the stage, Garrick, with the assistance of De Louthembourg, set about a complete reformation of the theatre. Sir Joshua Reynolds and Benjamin West were enlisted on this proposed improvement, and strenuously recommended its adoption; and from this period the absurd and anomalous dresses of the performers gave way to a costume compatible with the respective *dramatis personæ* collected from the best antiquarian authorities as connected with the history and local attributes of the scene. Garrick lived to see successfully the introduction of this desirable improvement on dramatic representation, and what he left unaccomplished was supplied by the liberality and judicious exertions of his successor John Kemble, who rendered the appointments of the stage so admirable that established painters not only declined themselves of its aid, but recommended the theatre to the public as a useful school for the study of grouping and costume. The last exhibition of the powers of De Louthembourg as a scene-painter was in the pantomime performed at Drury Lane Theatre, entitled "Harlequin Omai, or, Obea, Queen of the Sandwich Isles," which for splendour and pictorial effect was perhaps the most astonishing of any scenic representation that the stage has ever produced. In this, for the first time, the whole length of the stage was occupied; and the scene, which represented the Frozen Ocean, forty-two separate pictures were used, to give continuity to the perspective. The pictorial display astonished the audience, for so powerful and effective was the combination, and so judiciously was it planned, that the imitative scene amounted to reality. The costumes for the numerous characters which figured in this pantomime were all strictly correct, being made up in the theatre from prototypes supplied by Webber, the ingenious

painter who accompanied Captain Cook in his last voyage to the Southern Ocean. Every scene, too, was topographically true. De Louthembourg was enthusiastically devoted to this department of his art; hence, for every scene he wrought an elaborate prototype fitted by scale to a small model of the stage of Drury Lane Theatre, from which the other painters on the establishment executed the large scenes under his superintendence; and he usually added to them such improvements as his rich imagination and spirited hand considered necessary to render them effective. The last scenic representation, which constituted De Louthembourg's memorable Eidophusikon—or a series of moving pictures, which were exhibited on a stage of 8 feet in breadth, at an elegant theatre erected for the purpose—was of that surpassing excellence which excited the admiration of all who were capable of appreciating the imitative powers of painting thus applied.

Decadence of Styles.

Our taste depends upon the models we choose for study. It is therefore of the utmost consequence to select those which should suggest pure first principles and produce a fixed impression of correctness in our sensations. The moderns labour under the disadvantage of having continually before their eyes the bad examples of taste which have been erected in the most unfortunate periods of art. The ancients in this particular were more privileged than we. They had to begin from the very commencement, and their primitive wants suggested simple means to supply them. Thus art in Egypt may be seen in its first step—massive, grand, magnificent and imposing—yielding attention to the more important requisites alone in order to produce effect. Having attained this, in course of time a want of further gratification for the senses introduced the minor details of sculpture and painting; so that in Greece, where an exquisite susceptibility for what was captivating to the taste reigned in a high degree, we find the utmost refinement and delicacy; a departure from which, in search of novelty unattended by the same refinement, gave rise to the monuments of Rome. These, however grand and impressive, still offer to the eye and judgment defects we could wish to see corrected. Man then continued gradually to decline, and the taste became more vitiated during the darker ages, of the Lower Empire. To this downfall of Classic taste succeeded Gothic architecture, which brought into play new laws and rules of its own. It set aside the principles of a foreign conception, as it were, and established for itself a less arbitrary and less strict limitation. It seized and canonised into beauties the very defects of Classic art, clothed it in a new garb and gave a scope to fancy. Thus unrestricted it realised those stupendous and delightful creations of which the Christian world has such just reason to be proud—a new and fruitful school of art and science. Gothic architecture flourished during four centuries but yielded at length to the new direction given to men's minds by the reintroduction of Greek and Latin literature. The revival of Classic art, however, produced only very inferior edifices, the exceptions to which do not reach the standard of antiquity. All these last bad examples in the sight of which we are born and bred unhappily influence most materially our present taste, and this can only be corrected by visiting on the spot the monuments of the Classic times.

Colossal Building Stones.

The lintel over the middle gate of the Propylæa at Athens is 22 feet 6 inches in length, 4 feet in thickness and 3 feet 3 inches in breadth. It must accordingly weigh at least 22 tons. That of the second gate is 16 feet 10 inches in length and 3 feet in thickness. That of the smaller gate is 9 feet 6 inches in length and 3 feet in thickness. The largest masses which remain in Greece are the beams of the Propylæan portico, the architraves of the Parthenon, the beams of the Erechtheion, of the Olympeion, and a block at the Pnyx at Athens, the lintels of the treasuries of Atreus at Mycenæ, and of Minyas at Orchomenos, and some stones in the walls of Tiryns and Messene. Some blocks of white marble are found in Italy which vie with those of Greece, particularly two in the Colonna garden at Rome, which are supposed to have belonged to the Temple of the Sun. The largest is 16 feet 3 inches in length and 9 feet 6 inches in thickness. Nor must we omit the architraves of the Pantheon and of the Temple of Antonine. The granite columns of the Baths of Dioclesian and of the Forum of Trajan, as well as the Egyptian obelisks at Rome, are also examples of these stupendous masses. The architraves of the temple at Selinus in Sicily are 22 feet in length. Tavernier mentions some blocks of an amazing size in a pagoda at Golconda or Bagnagar. Chardin asserts that most of the stones of one of the temples at Persepolis are between 30 and 50 feet in length and from 4 to 6 feet in height, and some of them are stated to be 52 feet in length. The columns of the famous temple at Cyzicum in Mysia, of one piece, were 50 cubits in height, but the largest mass that was ever moved by human means was the monolithical Temple of Latona at

Bubos in Egypt, which was a solid cube of 60 feet. There was another monolith at Sais, of 31 feet 6 inches in length, 21 feet in breadth and 12 feet in height. Wood informs us that in a wall at Baalbec three continuous stones measure 190 feet in length, the longest being 64 feet.

Vicenza and Palladio.

Palladio was born in Vicenza, which contains among a large number of his works several of the most select. His name is more devoutly uttered by the ciceroni than that of the city's patron saint; nor will the English architect withhold his sympathy, for Palladio's fame is connected in some degree with British patronage, and his genius was no doubt greatly influential as the guiding star to a superior condition of British taste. Still, this great artist's merit should be rightly understood. It were most unfair to subject his works to a comparison with many now existing; nor is it prudent to vaunt their superiority in regard to actual beauty, where it chiefly exists, in reference to the different circumstances under which they were designed. Palladio did for the Roman what Stuart and Revett have done for Grecian architecture; but the Italian artist filled not his professional chalice at the fountain head, and Roman art contained no less impurity, when compared with the crystal brightness of its Attic source, than the muddy waters of the Tiber when associated with the virgin snow of the Apennine. As an author of original talent he is to be studied; as a man devoted to his profession he is to be imitated; as an artist, most generous in his estimation of contemporary talent, he is to be beloved; but his greatness as an architect is apart from the present worth of his designs, many of which exhibit as much for our careful avoidance as for our grateful acceptance. Let us, however, hesitate to censure such faults as might perhaps have originated in a workman's inaccuracy or patron's wilfulness. Some of the examples bearing his name are wholly unworthy of the genius which is displayed in others; but there is in several instances so much conjecture as to the share which Palladio had in the composition, and such a bewildering commixture of opinions relative to variations and alterations by Scamozzi and others, that we are scarcely at liberty to express anything less than a very lofty opinion of Palladio's general merits. The thick-and-thin eulogiums of his countrymen would do him an essential injury were there not a certain moral weight in his professional celebrity, which would have established it in spite of opposition, and which with equal certainty will preserve it from the ill effects of extravagant encomium. Vicenza is a complete museum of Palladian design. The Corso, or principal street, is lined with buildings of all degrees, from the neat to the beautiful, though the more distinguished edifices are to be found elsewhere. In the famous Basilica we see a noble conquest of difficulties and a singular instance of powerful invention in adapting the then newly revived Classic garb to a most ill-conditioned Gothic body. In some of the principal residences we also find the requisites of modern convenience grafted on the ancient Roman fashion, as transmitted by Vitruvius; and here, too, may we behold an actual restoration of the antique theatre, in the contemplation of which we dream ourselves back to the days of Terence.

Wren and Freemasonry.

In 1698 Sir Christopher Wren was elected a second time to the honourable and distinguished office of Grand Master of the Ancient Order of Free and Accepted Masons, on the resignation of the Duke of Richmond, and continued to preside over the fraternity till the death of King William in 1702. The introduction of Freemasonry into England is supposed to have been prior to the Roman invasion, and the remains of those gigantic works, Stonehenge, Abury, Silbury and other immense circles, called by some Druidical, are adduced as proofs of the proposition. The fraternity flourished with varied success in England till the reign of Charles I., under whom his eminent architect, Inigo Jones, presided as its Grand Master. The Civil Wars and the prevalence of Puritanism in the times of Cromwell interrupted its progress, but prevented not its meetings, which are more than suspected to have contributed by its secret emissaries to the restoration of monarchy. Charles II. certainly patronised the brotherhood both in exile and on the throne. In 1666 Wren was nominated deputy Grand Master under Earl Rivers, and distinguished himself above all his predecessors in legislating for the body at large, and in promoting the interests of the lodges under his immediate care. He was Master of the St. Paul's Lodge, which, during the building of the cathedral, assembled at the Goose and Gridiron in St. Paul's Churchyard, and is now the Lodge of Antiquity, acting by immemorial prescription, and regularly presided at its meetings for upwards of eighteen years. During his presidency he presented that lodge with three mahogany candlesticks, beautifully carved, and the trowel and mallet which he used in laying the first stone of the cathedral, which the brethren of that ancient and distinguished lodge still possess and duly appreciate. During the building of the city

lodges were held by the fraternity in different places several new ones constituted, which were attended by leading architects and the best builders of the day and brethren of the mystic craft. In 1674 Earl Rivers resigned grand-mastership, and George Villiers, Duke of Buckingham, was elected to the dignified office. He left the care of the Grand Lodge and the brotherhood to the deputy Grand Master Wren and his wardens. During the short reign of James II. the lodges were but thinly attended, but in 1685 Sir Christopher Wren was elected Grand Master of the Order, and nominated Gabriel Cibber, the sculptor, and Edward Strong, the mason at St. Paul's and other of the City churches, as wardens. The society has continued with various degrees of success to the present day, and lodges under the constitution of the Grand Lodge of England are held in every part of the habitable globe, as its numerical and annually increasing membership abundantly show.

Lawrence as a Portraitist.

In the first part of his career Lawrence was inclined to carry his taste for the colouring of the old masters a little far, and the pursuit of tone, chiaroscuro and breadth led him into a style rather artificial and approaching to manner; but he gradually got the better of this error, and by incessant study and application became at once more artful and more natural. Indefatigable, and never satisfied with his production, Pope, "he laboured hard to gain a reputation, and laboured hard to maintain it." On one occasion he is said to have painted thirty-eight hours together, without rest or taking any sustenance but coffee. It is remarkable in the latter part of his life, when his great practice might have been expected to make him more rapid in the completion of his works, the increased pains he took, arising no doubt from his improved perceptions, acquired for him the character of slowness—for him who had painted that admirable picture of *Hamlet* in so short a time as one week. But this insatiable ardour, this incessant aim at excellence, enabled him to obtain so consummate a mastery in the theory and practice of the art of painting, and finally to establish an indisputable claim to rank with Titian and Vandyke, Reynolds and Velasquez. Perhaps the genius of Lawrence was best adapted to portraiture; but possessing so far more intellect as he did, with such complete technical skill, more than probable that, under other circumstances, he would have achieved a very high reputation as a painter of history. He was a finished draughtsman, had a perfect knowledge of the human figure in its various classes, an exquisite feeling for the beautiful, the grand and the pathetic, with a rich and luxuriant taste in landscape and background—in short, deficient in no one requisite. He possessed, too, an enthusiastic love for the higher qualities of the art, as was evinced by his admiration of Michel Angelo and Raphael, of Fuseli, Flaxman and Stothard, which, in a country where there was any demand for historical painting, would inevitably have led him to the first rank of excellence. The few examples he has left behind him in this way help to prove it; if we ought not to rate his portraits, such as his Kemble, Siddons, young Lambton, &c., belong equally to this class of art. Titian's portraits have a grave and quiet dignity, and are not to be excelled; to this no doubt the costume and the colouring in which they are embodied is admirably adapted. In these qualities Reynolds came nearest to Titian, and his exquisite representations of infant character surpassed him. Lawrence must yield to his great rivals in these points, but beyond them, and Vandyke, too, as a draughtsman—like them against the latter and Velasquez he may dispute the palm for all respects, and with greatly the advantage in point of originality of invention. His great technical excellence seems to have been drawing, which is undoubtedly the true foundation of painting. Reynolds is a remarkable and almost singular instance of what chiaroscuro and ingenuity may do to compensate the want of it; but it enabled Lawrence to make out his pictures with a surprising minuteness and accuracy of detail, which perhaps were never before combined with so much boldness and delicacy. Some of the Italian critics, however, objected to the harder continental style of finish, though deficient in this particular. "Non è reso" was their remark. "He does not define." This perhaps was an additional reason for their not calling him "Il Tiziano Inglese." In fact, his details are so delicate as to escape a cursory notice, and he knew that brilliancy and vivacity of effect are incompatible with elaborate smoothness.

The Institution of Civil Engineers will hold the ordinary meeting of the eighty-fifth session in their hall in Great Court Street, Westminster, on Tuesday, at 8 o'clock, when William White, F.R.S., will deliver his inaugural address as president.

EXETER CATHEDRAL, No. 469A.—TOMBS OF SIR A. CHICHESTER AND HUMPHRY DE BOHUN IN SOUTH CHOIR AISLE.

NOTES AND COMMENTS.

THE announcement that the French Government will derive a surplus from the Exposition of 1900 will excite not only amazement but chagrin among the unfortunate exhibitors who contributed to that result, and with whose losses there is no sympathy. Probably the profits are no more tangible than the savings of the works committee of the London County Council. Official book-keeping does not always correspond with that employed in successful mercantile establishments. People will, however, be glad to find M. PICARD, at the close of his office as chief commissioner, retiring with so high a reputation. All the other international exhibitions in Paris combined have not been able to show a balance in favour of the State amounting to 2,800,000 francs, or over 100,000*l*. Its predecessor of 1889 gained 1,058,000 francs. There were no profits from the exhibition of 1878. It remains to be seen whether the Paris Municipality will be equally satisfied with the result. The citizens at least who are hotel-keepers have no reason to grumble.

THE advantages of the Ordnance Survey have been especially exemplified in connection with the sales of Irish estates. When the Encumbered Estates Commissioners first began their operations the maps were made the bases for the plans of the estates issued with the descriptions of the property. Subsequently transfers of the maps were employed. In the instructions issued a few days ago in connection with the new Land Act it is ordered that with every originating application or request the vendor is to lodge an Ordnance map on the 6-inch scale mounted on strong linen. The map is to be accompanied by a certificate of the tenement valuation obtained from the office of the Commissioner of Valuation and Boundary Surveyor, a schedule of areas which shall be in such form as the Commissioners may from time to time direct, and an affidavit from a competent surveyor stating that he visited the lands and examined the map upon the ground, that the several holdings, parcels of land and demesne proposed to be sold are correctly marked on the map, and that the schedule of areas is correct. The maps are to show the boundaries in distinctive colours of the holdings; the demesne and parcels of land which the vendor desires to sell and not repurchase; the demesne and parcels of land which the vendor desires to sell and repurchase; and any other lands in the neighbourhood, demesne or otherwise, which the vendor owns but does not desire to sell. Where the holdings are so small that the 6-inch scale is insufficient, an Ordnance map on a larger scale may be used, or an enlargement of the smaller holdings may be made. Maps are to be prepared and furnished by "townlands" or groups of townlands, and when practicable are not to exceed 18 inches by 12 inches in size, and in every case the names of the adjoining townlands are to be shown upon the map. In no case should more than one map be used for sales of parts of the same townland, and the Commissioners may reject any map which appears to them incorrect, insufficient or unsuitable, and require a correct map to be prepared at the expense of the vendor. The Land Act will afford some employment for surveyors, but its extent will be insignificant if compared with what would arise if proper surveys were necessary.

BYRON apostrophised the Pantheon and asked of it:—"While falls or nods arch, empire, each thing round thee, and man plods his way through thorns to ashes—glorious dome, shalt thou not last?" No other relic of ancient Rome has so well resisted all that time and man could do; and what was once said of the Coliseum seems to be more applicable to the Rotunda:—"While it stands Rome shall stand, and when it falls Rome shall fall, and with Rome falls the world." We can therefore well understand the excitement caused in Rome last week when the rumour spread that the building was collapsing. Happily for the world the alarm was not well founded. Some of the stucco which had taken the place of the ancient marbles had fallen, but there was nothing of a graver character to record. An official examination was immediately made, but no new indications of failure were perceived. Everyone knows that

there are cracks in the structure, and indeed they are considered as advantageous to some extent, for it was to them M. CHEDANNE was enabled to examine the and to effect the discoveries which proved that the of the building commonly accepted was entirely erroneous.

LAST year we reported a meeting which was held in connection with the Building Exhibition respecting endeavour to obtain uniformity in the size of bricks. now announced in the "Journal of the Royal Institute of British Architects" that the following standard has been agreed upon between the Institute and the Brick Manufacturers' Association, and has been drafted in consultation with these bodies and representatives of the Institution of Civil Engineers, and ordered to come into force on May 1, 1905. The Council recommend that members should insert in their specifications under the title of "R.I.B.A. Standard Size of Bricks." 1. The length of brick should be double the width, plus the thickness of vertical joint. 2. Brickwork should measure four courses of bricks and four joints to a foot. Joints should be $\frac{1}{8}$ inch thick and an extra $\frac{1}{8}$ inch, making $\frac{5}{8}$ inch, for the bed joints to cover irregularities in the bricks. This gives a standard length of $9\frac{1}{4}$ inches centre to centre of joints. The bricks are to be measured in the following manner:—A. Bricks laid stretchers laid square end and splay end in contact with a straight line to measure 72 inches. B. Eight bricks laid side to side, frog upwards, in a straight line to measure 35 inches. C. Eight bricks, the first brick frog down and then alternately frog to frog and back to back, to measure $21\frac{1}{2}$ inches. A margin of 1 inch less will be allowed as to A, and $\frac{1}{2}$ inch less as to B and C. These rules apply to all classes of walling bricks, both machine-made and hand-made.

ILLUSTRATIONS.

CATHEDRAL SERIES.—EXETER: SPEKE CHANTRY, AND CHAPEL OF ST MARY MAGDALENE.

ABOUT Sir JOHN SPEKE nothing is known, for he did not act a prominent part in the history of his country, but heraldic bearings and insignia adorning the little chapel which was dedicated to his memory suggest his position. Heraldry has done its best for him, and it must be allowed the success is unquestionable. It is supposed that George's Chapel or Chantry was founded in 1518, and would therefore be during the episcopate of HUGH OGDEN or OLDHAM, who had been chaplain to the mother of HENRY VII. He was a resolute prelate in defending the rights of his see, and beside his endowments of Christ College, he founded and endowed the grammar school at Manchester. The chapel is evidence that would not allow the cathedral to be desecrated by unwelcome traditions.

COTTAGE, WEST RUNTON, NORFOLK.

THIS cottage was recently erected, with a frontage of 30 feet facing the village common, at West Runton, about four miles distant from Cromer. It is built of red bricks, with rough-cast and solid half timbered work. The roof being a mansard, reduces the amount of the work without materially reducing the accommodation. The hall is the principal sitting-room; the staircase leading to the first floor from this room forms a feature, and it economises space. The joists over sitting-rooms are visible. Mr. T. PANK, builder, of West Runton, carried out the work for a sum of 490*l*., under the superintendence of Messrs. HAYWARD & MAYNARD, 20 John Street, Adelphi, London W.C.

NEW FRONT TO AN OLD HOUSE.

THIS treatment was intended for an old stock house in Chelsea in which the local character of the building was in some manner thought to be preserved. The materials are Portland stone and red bricks of a good colour, with all woodwork brought well out to the surface, a little modelled plaster being introduced on the bay window. The architect is Mr. W. F. HARBER, Chelsea.

ILLUSTRATIONS—II.

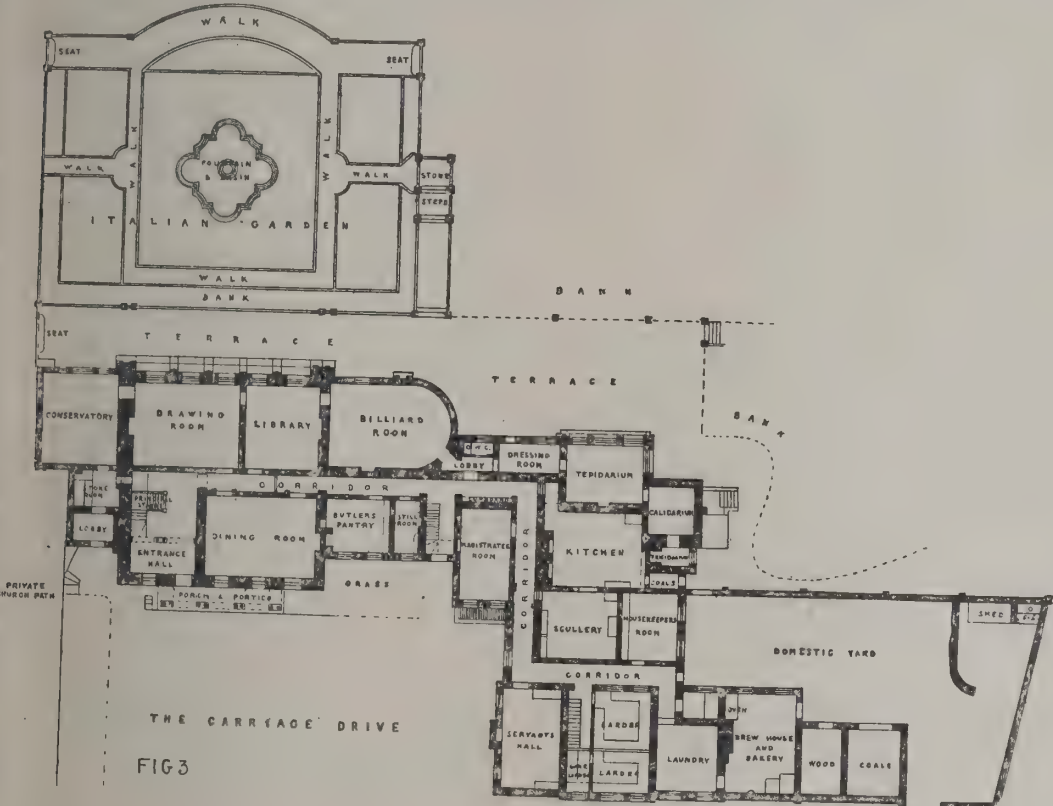

WILEY MANOR.—SOUTH FRONT, SHOWING TERRACE AND GARDEN.—SOUTH FRONT, SHOWING LAKE.—NORTH FRONT.—EAST FRONT.

WILEY Manor-house is situated on the Cotswold hills, about six miles from Cheltenham, ten miles from Cirencester, and eleven miles from Cirencester, and is the residence of Mr. JAMES HORLICK, High Sheriff of Gloucestershire. It is an interesting property, as the source of the River Thames is in the grounds. It appears that the house (fig. 1), which consisted of three floors of about five hundred and fifty square feet, was partially demolished by alterations made between the years 1856-58 (fig. 2), and was the result of an earlier alteration which had been made about 1790. The rubblework and construction of the house as well as the chimney-shafts, gave evidence of the century work of a Domestic character. WILEY Manor-house, like so many of the old country houses in this part of Gloucestershire, was built close to the river and within 25 feet of the tower—an evident disadvantage nowadays, as it materially limits the extension of the house on one side, unless a faculty could be obtained

and the owner of the house were willing to give a piece of land and build a new church on it in another situation.

In or about the years 1856-58 the alterations and additions to the house were considerable, and we learn that even in those days they so much exceeded the original intentions as to involve almost an entirely new building, and that a new block of kitchen offices and additions to the stabling were erected.

Fig. 2 shows what these alterations and additions consisted of. The south front, and portions of the east and west fronts were destroyed, and the north front was recased in stone. A portico, window dressings, cornice and balustrade in stone were added. It appears that the grounds about the house contained a walled kitchen garden on the north side. The carriage drive was on the south side, hemmed in with trees and shrubs. The quick-set hedge was done away with, and an elaborate Italian garden, with terraces and fountains, was laid out. The stone then used for the facing of the house was Birdlip, a quarry of this stone being on the estate. The plinths and steps were from the Forest of Dean. Enriched plaster ceilings, new oak floors and staircase, with maple, walnut and mahogany

WILEY MANOR
CHELTENHAM

veneer doors, were fitted in the principal rooms. The dining and drawing-rooms were painted and gilt in the style of GIULIO ROMANO. The masonry and carpenter's-work were executed by the workpeople collected for the purpose on the estate.

By the year 1874 more alterations and additions had taken place (fig. 3). The boudoir had been turned into a conservatory. A Turkish bath, consisting of a tepidarium, calidarium, frigidarium and dressing-room had been added on the south-west front. Part of the kitchen had been converted into the "magistrate's-room." A new kitchen had been added, and a corridor had been formed to the

FIG 1

servants' offices. In the year 1898 the Turkish bath seems to have received attention from the owner of the house, as we find that the "tepidarium" had been converted into a music-room and the "calidarium" into a strong-room.

In 1900 the present owner of the house decided on making further alterations and additions, and from that date up to the end of 1902 these, with still further alterations and additions, have been in course of construction (fig. 4).

They consisted of the then existing billiard-room and butler's pantry being pulled down, and a new dining-room (42 feet 6 inches by 23 feet 3 inches), billiard-room (30 feet

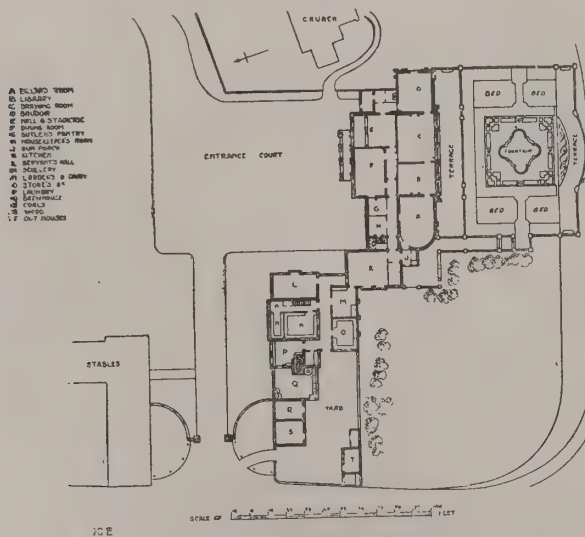

FIG 2

by 18 feet 9 inches), own room, verandah and porch being added, with some twelve bedrooms and two bath-rooms over same, the north and south fronts being extended to form one large block. A secondary staircase was contrived out of part of the kitchen, and the kitchen itself was enlarged. Then a conservatory (27 feet 6 inches by 12 feet) and a ball-room (65 feet by 31 feet) were added on the west side. Over the butler's pantry and adjoining servants' offices six new bedrooms were added, together with extra larders, gun-room, coal and wood sheds. The Italian garden and terrace were also extended to about double their

original size, and a flight of stone steps and terrace to the garden.

The main central south block was also extended, additions already mentioned to about twice its original length, and the details of the existing building were put out in the new work. The new conservatory room were designed to harmonise with the central block, although the details have been kept as plain and as possible. And although the church on the left of the building balances fairly well in elevation with the new room, it is hoped that at some future date a new building will be erected in place of it, so that a perfect balance of the south front may be obtained.

The walls were faced with Birdlip stone, the plinth and dressings being of Hollington stone. The stonework has already toned down so that it is difficult to detect where the new work joins on to the old. Part of the ball-room was covered with green Welsh slates.

The views of the interior show the treatment that has been adopted for the new panelling, staircase, fire mantelpieces, so as to harmonise with the existing work, &c., which were retained.

The ceilings of the hall, dining and billiard rooms were carried out by Messrs. G. JACKSON & SONS, of 15, Place, W., are of plaster, heavily enriched, the frieze of the ceiling and frieze in the dining room being painted. The rest of the ceilings have been painted white. The panelling and mantelpieces in these rooms are of mahogany, the carved shields and swags in the ceiling being of lime wood left "in the white." An elegant mahogany staircase was erected in the front of the house, continued up to the second floor, about 5 feet wide, in lieu of the old one, which was only 2 feet 9 inches.

The panellings, mantelpieces, staircase and fireplaces throughout were executed by Messrs. H. H. MARTYNS of Cheltenham.

The ball-room is painted white and various panels in the wall being covered with crimson. The plaster ceiling and cove, &c., were also painted and carried out also by Messrs. H. H. MARTYNS.

The general contractors were Messrs. J. J. SON, of Rugby.

Messrs. RAWLINGS BROS., of Gloucester carried out the electric wiring and fitting. Messrs. CLEMENTS JEAKES were responsible for the electrical arrangements, and Messrs. ESCARÉ & DUBOIS, of Wardour Street, supplied the large glass electric light fittings. The ormolu grate and fender in the ball-room. Mr. HODNETT acted as clerk of works.

The whole of the work was designed by and carried out under the superintendence of Mr. R. A. BRIGGS, of 12 Norfolk Street, Strand, W.C.

ROYAL WATERLOO HOSPITAL

THE Duchess of Albany, who was accompanied by her daughter the Princess Alice, visited South London on Monday afternoon for the purpose of laying the foundation stone of the new Royal Waterloo hospital, an institution which has outgrown its present accommodation. The new building, which will contain 200 beds, and is now in course of construction on the old site. Designed by Messrs. Waring & Gifford, of Parliament Street, the hospital is being built in three sections, so as to avoid interference with its daily work. The present out-patients' department covering a plot of 10 acres will not be disturbed until the first portion of the new building is ready for use. The building will comprise in-patient, theatre and out-patient departments, with separate waiting-rooms for each member of the medical staff. Every appliance demanded by modern surgery and surgical science is to be furnished, and the total cost of the building will exceed 50,000*l*. On upkeep the further annual expenditure estimated at 10,000*l*, but the assured income is about 2,000*l* per annum less than the expenditure of the old hospital, so that liberal help towards the building is much needed. The constitution forbids the admission of paying patients, and no applicant is ever refused provided there is room and the case is a suitable one for treatment.

BRITISH SCHOOL AT ATHENS.

Annual meeting of the British School at Athens was held on the 22nd inst. Professor Butcher was chairman. Part of the managing committee for the session 1902-03 at the work of the school had been carried on chiefly by Mr. Bosanquet, the director, Mr. Marcus N. Orléans, the assistant director and eight students. They spent six months in Athens arranging the library, increasing the Finlay library, and working on epigraphy with Dr. Orléans. He also spent three months in Crete, after a preliminary study of the epigraphy of Eastern Crete, and assisted in the excavations at Kouraméno, Hagios, Nikólaos and Gortyna. Mr. W. L. H. Duckworth, Fellow of Jesus College, Cambridge, University lecturer in physical anthropology, on the Cretan branch of his subject, and his report was presented to the British Association, to obtain a further grant. Mr. C. T. Currelly, of Victoria College, Toronto, and assistant to Professor Flinders Petrie, was in Palaikastro in the middle of April, on the conclusion of his successful explorations at El Amarah, in Egypt. Mr. J. L. Myres, scholar of Emmanuel College, had made excavations in Sicily and Northern Greece and prepared for the publication of a detailed and illustrated report of Mr. Hogarth's excavations from Zakro. Later he pursued his philological studies in the little visited island of Carpathos. Mr. E. S. Orléans, scholar of Oriel, classified and published the terra-cotta found at Praesos. Mr. A. J. B. Wace, of Pembroke College, Cambridge, chose the comprehensive subject of Hellenic art, which he studied in Germany, Austria, Italy, Egypt, Constantinople, and had published a coin bearing a hitherto unknown Pergamene portrait. Mr. E. W. Webster, scholar of the school, travelled for three months among ancient sites in the remaining two architectural students were Mr. J. L. Myres and Mr. E. F. Reynolds. Two former students of the school had also been at work. Mr. Hasluck, scholar of the school, made four separate journeys to Mysia, and was preparing a dissertation on the history and topography of the region. Mr. A. E. Henderson, of Constantinople, to whom a small special grant had been made, had also been working at Cyzicus. The report contained also an account of excavations at Roussolakkos (Palaikastro proper), which was the ground plan of a Mycenaean farmstead with a courtyard and many other interesting objects. Among the books acknowledged was a most valuable one from the library of the secretary of the Embassy in Constantinople, a reprint of *editio princeps* of Pausanias, printed at Venice in 1568, in the Hostel 581—the highest sum as yet received for a book. The accounts were satisfactory, the balance of 204*l.* odd on revenue and nearly 120*l.* on Mr. Tod had generously foregone his stipend of 150*l.* Craven Fellow, and the late Lord Leighton's sisters, Mrs. Ireland Orr and Mrs. Matthews, had presented 154*l.* of a fund at their disposal. The passengers in the *Argonaut* had given 70*l.* to the school, including new annual subscriptions, while 180*l.* was handed over to an Exploration Fund.

Professor Butcher, in moving the adoption of the report, referred to the death of the first director, Mr. F. C. B. Petrie, and observed that the main work of the school had been carried on in the past year in Crete, where also Mr. A. J. B. Wace was carrying on his fascinating explorations. He would refer to Mr. Evans's paper in the "Annual" of the school, where they would read how the palace at Knossos, with the romantic features of its story, was also a study with elaborate apparatus for making and storing water, and could read also of the remarkable system of drainage arrangements which, according to Mr. Evans, was a parallel in the ancient world; of the stone walls with skillfully constructed curves for carrying off the torrential rain-water; of the porcelain mosaics or *mosaics* representing houses of three or four storeys with apparently a street front, with ladies standing in verandahs or sitting at open windows. There were reproductions of youthful acrobats worked in ivory, and of acrobatic performances, such as backward somersaults of a galloping bull. It was further noteworthy that the symbol of the double axe or *labrys*, the emblem of the deity of Knossos, was found impressed on a number of objects in the Minoan palace, and the discovery was corroborated which made this palace the legendary labyrinth. Continuing, he said that the work of the school for its purpose of training students for archaeological exploration and research was still slight and that there were two chief lines in which such training was given by the school. First, there was the great mass of evidence that had been brought to light in recent years, facts that still to be classified and the conclusions drawn therefrom. Here was so much laboratory material on which the school was constantly receiving fresh accessions from the excavations which did not come before the public eye. For the study of the historic period there was Athens

itself, its monuments, its topography and the contents of its museums. If the school was to fulfil its whole purpose it must do its part in training the explorers of the future. He also desired to put in a word in regard to classical students who could not hope to become experts. The professed archaeologist was perhaps sometimes inclined to look a little coldly on these amateur votaries of his science. Yet even a slight knowledge of archaeology, provided it was sound in its kind, enriched in a wonderful manner classical study. He alluded not merely to the direct light shed on classical texts by archaeological discovery, or to the invigorating influence which the infusion of the scientific spirit exercised on literary training, but to the fact that the literature itself was thus seen in a new and larger setting; it became more real, more concrete. Archaeological research had gone far to efface the boundary lines between historic and prehistoric times. Indeed, in certain respects they could realise a prehistoric civilisation unearthed before their eyes and revealed in such authentic detail as that of Crete, even more clearly than they could the civilisation of the Periclean era. To the classical student, however, the written record, the literature, must of course be the supreme concern; yet he himself had known instances in which a trip to Athens or a cruise among the islands of the Ægean had brought the classical teacher into a fresh contact with reality, which had vivified his teaching by vivifying his own interest in the subject he taught.

Mr. J. L. Myres described his recent successful excavations at Petsofá, in Eastern Crete. The most singular feature of the finds was the abundance of prehistoric terra-cottas throwing new light on the dress and on the religious beliefs of early man in Crete. Especially noteworthy were the large quantities of representations of vermin, apparently for some dedicatory purpose.

COMBINATIONS OF STEEL AND CONCRETE.

THE following regulations about the employment of concrete with strengtheners of steel have been issued by the Bureau of Buildings, Borough of Manhattan, New York:—

1. The term "concrete-steel" in these regulations shall be understood to mean an approved concrete mixture reinforced by steel of any shape, so combined that the steel will take up the tensional stresses and assist in the resistance to shear.

2. Concrete-steel construction will be approved only for buildings which are not required to be fireproof by the Building Code, unless satisfactory fire and water tests shall have been made under the supervision of this Bureau. Such tests shall be made in accordance with the regulations fixed by this Bureau, and conducted as nearly as practicable in the same manner as prescribed for fireproof floor fillings in Section 106 of the Building Code. Each company offering a system of concrete-steel construction for fireproof buildings must submit such construction to a fire and water test.

3. Before permission to erect any concrete-steel structure is issued, complete drawings and specifications must be filed with the superintendent of buildings, showing all details of the construction, the size and position of all reinforcing rods, stirrups, &c., and giving the composition of the concrete.

4. The execution of work shall be confided to workmen who shall be under the control of a competent foreman or superintendent.

5. The concrete must be mixed in the proportions of one of cement, two of sand and four of stone or gravel, or the proportions may be such that the resistance of the concrete to crushing shall not be less than 2,000 lbs. per square inch after hardening for twenty-eight days. The tests to determine this value must be made under the direction of the superintendent of buildings. The concrete used in concrete-steel construction must be what is usually known as a wet mixture.

6. Only high-grade Portland cements shall be permitted in concrete-steel construction. Such cements, when tested neat, shall, after one day in air, develop a tensile strength of at least 300 lbs. per square inch; and after one day in air and six days in water shall develop a tensile strength of at least 500 lbs. per square inch; and after one day in air and twenty-seven days in water shall develop a tensile strength of at least 600 lbs. per square inch. Other tests, as to fineness, constancy of volume, &c., made in accordance with the standard method prescribed by the American Society of Civil Engineers' committee, may from time to time be prescribed by the superintendent of buildings.

7. The sand to be used must be clean, sharp grit sand, free from loam or dirt, and shall not be finer than the standard sample of the Bureau of Buildings.

8. The stone used in the concrete shall be a clean, broken trap rock, or gravel, of a size that will pass through a $\frac{3}{4}$ -inch ring. In case it is desired to use any other material or other kind of stone than that specified, samples of same must first be submitted to and approved by the superintendent of buildings.

9. The steel shall meet the requirements of Section 21 of the Building Code.

10. Concrete-steel shall be so designed that the stresses in the concrete and the steel shall not exceed the following limits:—Extreme fibre stress on concrete in compression, 500 lbs per square inch; shearing stress in concrete, 50 lbs.; concrete in direct compression, 350 lbs.; tensile stress in steel, 16,000 lbs.; shearing stress in steel, 10,000 lbs.

11. The adhesion of concrete to steel shall be assumed to be not greater than the shearing strength of the concrete.

12. The ratio of the moduli of elasticity of concrete and steel shall be taken as 1 to 12.

13. The following assumption shall guide in the determination of the bending moments due to the external forces. Beams and girders shall be considered as simply supported at the ends, no allowance being made for continuous construction over supports. Floor plates, when constructed continuous and when provided with reinforcement at top of plate over the supports may be treated as continuous beams, the bending moment for uniformly distributed loads being taken at not less than $WL \div 10$; the bending moment may be taken at $WL \div 20$ in the case of square floor plates which are reinforced in both directions and supported on all sides. The floor-plate to the extent of not more than ten times the width of any beam or girder may be taken as part of that beam or girder in computing its moment of resistance.

14. The moment of resistance of any concrete-steel construction under transverse loads shall be determined by formulæ based on the following assumptions:—

(a) The bond between the concrete and steel is sufficient to make the two materials act together as a homogeneous solid.

(b) The strain in any fibre is directly proportionate to the distance of that fibre from the neutral axis.

(c) The modulus of elasticity of the concrete remains constant within the limits of the working stresses fixed in these regulations.

From these assumptions it follows that the stress in any fibre is directly proportionate to the distance of that fibre from the neutral axis.

The tensile strength of the concrete shall not be considered.

15. When the shearing stresses developed in any part of a concrete-steel construction exceed the safe working strength of concrete, as fixed in these regulations, a sufficient amount of steel shall be introduced in such a position that the deficiency in the resistance to shear is overcome.

16. When the safe limit of adhesion between the concrete and steel is exceeded, some provision must be made for transmitting the strength of the steel to the concrete.

17. Concrete-steel may be used for columns in which the ratio of length to least side or diameter does not exceed twelve. The reinforcing rods must be tied together at intervals of not more than the least side or diameter of the column.

18. The contractor must be prepared to make load tests on any portion of a concrete-steel construction, within a reasonable time after erection, as often as may be required by the superintendent of buildings. The tests must show that the construction will sustain a load of three times that for which it is designed without any sign of failure.

USHER HALL, EDINBURGH.

THE Lord Provost's committee of the Edinburgh Town Council have approved of the recommendation that the plans for the Usher Hall should be prepared by the Superintendent of Works. The following are samples of the letters which have appeared in the *Scotsman* on the subject:—

"I gather from the *Scotsman* that the Lord Provost's committee has adopted the recent recommendation of its sub-committee to entrust the city superintendent of works and his staff with the preparation of the plans for the erection of the Usher Hall.

"It appears that when the subject came before the sub-committee the question raised 'was whether or not the plans for the hall should be thrown open to competition.' The members of the committee 'were predisposed in favour of competitive plans, but when the matter had been fully discussed they unanimously decided that competition, in the circumstances, was altogether unnecessary. It was contended, and generally admitted, that the site was not one which lent itself to much architectural treatment. It was therefore recommended that the work should be left in the hands of the city superintendent.

"I venture the opinion that the decision of the Lord Provost's committee is based upon misconception, and I am certain that the citizens of Edinburgh will not endorse the view that the erection of the Usher Hall does not display opportunities for architectural treatment. The donor left 100,000*l.*, and although the acquisition of the Synod Hall site restricts the exterior to one principal frontage, it is none the less im-

portant to secure a well-designed frontage and nobly finished interiors for the hall and its many important adjuncts, way of entrance halls, corridors, staircases, &c.

"The erection of a City Hall should afford the opportunity for the display of the greatest architectural skill, and the citizens are entitled to insist upon.

"Should the present proposal be adopted, the Council have to accept the design submitted by the city superintendent and his staff, without any choice, and the city may be left with an unsatisfactory public building.

"The most suitable design can only be obtained by a competition among independent architects, and such a competition must be conducted under proper conditions, so that the best men will prepare and submit designs. An architectural assessor of the highest standing qualified to advise the Council in the selection should be appointed, to secure that the city will obtain the best possible design that can be obtained.

"The latest phase of the Usher Hall question is so ordinary that no apology is needed for writing you on the subject. The painful history of Mr. Usher's munificence, burned into the public mind that I do not need to repeat facts even to our town councillors.

"The report in yesterday's *Scotsman* states that which led the Lord Provost's committee to adopt the committee's recommendation that Mr. Morham be entrusted with the designing of the proposed hall. From the sub-committee meeting, as published in the evening of Monday, we are led to understand that this sub-committee was 'predisposed' to ask that competitive plans be submitted, as 'the site did not lend itself to architectural features' and did not think this necessary. What a tactful way of doing it! How all parties must relish such gentle flattery, while that Mr. Morham's work is good enough only because it is not first-rate; how gratified the relatives and friends of the late Mr. Usher must feel when they hear that at last proposed to erect a hall, but do not think it worth the trouble to try to get the best possible design, for it is not so much to Mr. Morham to suggest that a public competition, as it would the various ways in which different merits the site might be treated, would give the public the best result, having the most architecturally suitable design.

"And, further, although the position may demand a 'featureless' exterior—a point upon which the public can be convinced by the pronouncement of a mere superintendent—it does not follow that there is no planning required for the interior.

"It is stated that some members of Council favour a proposal to hand the work over to Mr. Morham on the ground that his department has already carried out such works as the City Chambers extension and the new fever hospital. At present the air is charged with 'inquiries' as to whether there is any truth in the rumour that the City Council's extension was carried out chiefly on plans, approved by the department certainly, but designed by an architect connected with the department except that he drew through it, who worked in his own office and not in the City Chambers. As regards the new fever hospital—well, the better. But in this case also it is freely stated that the expert was brought from London, and was given the work to carry through the work. Considering that this gentleman's salary, and paid his staff during the drawn-out period of erecting the hospital, further provided all materials and office room, and finally Mr. Morham got an honorarium of 1,000*l.* voted him, for that we might have had at least as cheap and as good a hospital if there had been an open competition, and the plan accepted and carried out under the direction of the architect. But perhaps your own articles are to blame; a success of this Council, which has so freely wasted its resources, it sees a chance of making money by farming the services of an official for whose whole time the hall already pays. 'Let Mr. Morham build the hall,' say the faithful guardians of the city purse, 'and we will pay him.' The architect into the city funds out of the sum left by the late Mr. Usher, following the precedent of that most unfortunate case regarding Mr. Cooper the late burgh engineer's connection with the cabling of the car system.

"Sir Andrew M'Donald has always told us of his interest in the Usher Hall. He is reported to have said on Tuesday evening that the matter 'pained him' and unless things went on satisfactorily he would convene a meeting of citizens to discuss the question. Will a member of the Lord Provost's committee 'preside' at what potent reason made a sub-committee 'preside' at an open competition recommend that the work be handed over to the Public Works Department? Will he tell us what advantages this course offers? Will the citizens get any advantage? Certainly not, for it stands to reason that an open

the attention of front-rank workers, as such an competition must, will be more likely to give us the in all the efforts of even an ably officered Public tment. Will money be saved? Most certainly has to be given out and paid for, as is alleged in mbers extension, or if a numerous and highly-paid e engaged and a substantial honorarium given, as the hospital.

aving all such considerations on one side, the e in the present instance merely administering a t dealing with city funds, which, as a matter of through city departments. ETRUSCAN AND HYKSOS.

ing interesting communication, signed by Messrs. ackay, Percy E. Newberry and John Garstang, in the *Times* :—

problems of ancient history are the mysterious e Hyksos in Egypt and the Etruscans in Italy. aces submitted below suggest that a single e found in a common relation of both peoples to

neological researches of living scholars have ay be claimed, the existence of Hittite diffusion, d domination during a period as remote as the s of Israel, and as late as the Assyrian conquests, oughly, from the Black Sea to the frontier sands an Delta and from the Upper Euphrates across e Ægean. During four centuries, 1600-1200 t kings, resting, as it were, on the Taurus range, of Syria, the Orontes and the Upper Euphrates, length shook off the Pharaohs at the height of a and fade away 500 years later before Assyria. oils and tribute arose, so to say, one of the vast ak, so on the walls of Abu Simbel and the es the eye can still see their fortress stormed, tory, and the treaty between the most renowned hs with their own great king whose daughter . Their sculptures and inscriptions, both still een found as far as Smyrna, on the coast of the Greek Ionia, inland along the plateaux of and the southern gates, at their royal seats e Syrian river and Karkhemish, the chief ford ia to the west. Although their inscriptions rest red, their weathered sculptures reveal distinctive pigtail all Tartars wore, and the tip-tilted shoe is e Chinese, it is said, got both from the Huns e lion is their symbol of power; the human head of the lion (the sphinx) is their familiar monu- divinities stand upon the backs of lion and ekh was their common deity. In the later heon the goddess of their Syrian capital, which rmed, stands on a lion's back holding flowers d and a serpent in her left. Her ornaments d anklets, and upon her head is a horseshoe- ith curling ends. Other deities adopted also an Astarte, lioness-headed lady of horses and Anta, a Syro-Hittite divi. of war. The Hittite decorations are monstrous animal forms, riffin; creatures and figures, winged, double- human-headed, halved and conjoined, the lion chariots and horses, their new and formidable

arm. Their patterns are the concentric circle, the rosette, the twist and coil. They had a rude square lyre; their jewellery is of inlaid stones and granulated goldwork.

Already in the twelfth dynasty, before that eclipse in Egyptian history, the Hyksos period, there is in the statues of Queen Nefert and Amenemhat III. a clear Mongolian or Turanian strain—she wears on her head the horseshoe-like attire, he a pigtail to his wig. The Sphinx appears—indeed, to the reign and to the features of that monarch some scholars have independently related the great Sphinx at Gizeh. The Dahshur jewellery, associated with the daughters of this Queen Nefert, unlike any earlier Egyptian art, is of inlay and granulated gold. An immigrant company is depicted on the walls of a tomb at Beni-Hasan. They wear woven tapestry and fringed garments, and the tip-tilted shoe. One carries a square lyre. Their prince is entitled the ruler of a foreign (mountainous) land—the Sinaitic deserts, it has been conjectured, to the south of Hebron, where Hittite and Semite had intercourse and intermarriage in the age of the patriarchs.

The Hyksos were a confederacy of such chiefs. The statues they made or usurped are Mongoloid: Turanian on a Semitic stock, Hittite-Semite. Before their chariots and horses, the Hittite arm, Egypt yielded. The lists of kings engraved on the national monuments, except those of Thebes, become blank. After the restoration of the monarchy, from some monuments which the Hyksos had made or adopted, their very names were effaced, but amid the silence of Egypt the scarab seals of their administrative system survived. Upon three is the earlier term Hekkhaskhet, significantly altered to the new régime, and the device of sphinx, griffin, animals winged, human-headed; patterns of the twist and coil and concentric circles. The name of one ruler is found also in Crete and Bagdad; the name of another is compounded from the Syro-Hittite deity Anta. The last of the Hyksos lost his throne in the effort to impose upon the Egyptians his foreign deity, the Hittite Sutekh. Ruler and people were driven finally into the mountains of Syria and were lost among the Hittites.

To pass to the Etruscans. The monuments of Imperial Egypt and such documents as the cuneiform despatches of the fourteenth century B.C. are definite history. Among the invaders of the Western Delta were Libyans and pirate peoples of the Asian and Ægean coast, once defeated together before Memphis. They plundered, too, the coast of Syria, amid the disintegration of the great Hittite kingdom, about 1200 B.C. Their galleys are depicted. Among them the Lycians are universally recognised, and the Tursha have been often identified with the Tyrseni. From Herodotus downwards, and particularly among the Latin writers, it was the all but universal belief of antiquity that the Tyrseni sailed to Italy from Lydia and settled among the Umbri beyond the Tiber; corsairs still, they gave their name to the upper and lower waters of Italy, the Tyrrhenian or Tuscan Sea. The classic tradition of their origin has been discredited by modern scholars, who accept Tyrian factories along the African coast in remote antiquity, and can credit the planting by petty Greek towns, neighbours to the ancient Lydians, of colonies beyond the Bay of Naples, and near the mouths of the Rhone. But the new material supplied by Hittite and Egyptian studies places the old problem in a new light. Evidence in support of this classic tradition may well be sought in a comparison of the Asian and Etruscan monuments.

Though the early monuments of Asia Minor are still scarce, the buried tombs and cities of Etruria have given up to history their dead. To turn to these monuments :—

Alike in Hittite Asia Minor and in archaic Etruria are the tip-tilted shoe and top boots; an ample cloak, sometimes under-belted or under-girdled, leaving one arm free or sleeved, with an end thrown over the other shoulder; a tunic belted, with close short sleeves; a fringed or plain garment continuous over the whole figure and under-belted; a skirt or shirt embroidered and fringed; a flounced skirt; a close round cap, a hooded cap; a robe, plain or edged, continuous with the cylindrical hat or the close cap; a conical hat with brim upturned, or with the brow-band decorated; a horned head-dress; a plain fillet; a cylindrical head-dress fluted (hence perhaps the mural crown); the hair in two plaits on each side, with curled ends or without, or gathered together behind like a full pigtail; the significant horseshoe-like head-dress with curling ends; the hand-mirror, a low table with curved legs like the curule seat, and the lyre.

In both alike also are chariots and horses, with almost identical trappings and fittings; for arms and armour—a sword, with short arc-handle, a lozenge spearhead, a short bow, mail, a round shield decorated in concentric circles and devices of animals; for emblems—the double axe, a hammer or mallet, a curved staff (like the *lituus* of the Roman augur), a plain staff, a staff with horned disc or ring at the end of the staff (a Hittite hieroglyph and the Etruscan *caduceus*), and the dove; for emblematic, pictorial or decorative motive, often indeed in similar attitudes—lions rampant, winged or human-headed, bulls, cheetahs or panthers, deer, goats and boars;

monstrous creatures—sphinx, griffin, winged sphinx, winged horse; patterns of the coil, scroll, rosette and concentric circle, and heads for mural carvings. Faces with protruding tongue are suggested by a Hittite hieroglyph. Even for the Asian divinities standing upon the backs of animals there is in Etruria an amulet with similar figures. For ornaments are armlets, necklets and earrings; the resemblance between the beaten bronze and metalwork is notable, while the Dahshur jewellery and the Etruscan in their inlay and granulated work have been related independently. With regard specially to Lydia, in the Western Empire, and Etruria, the similarity in their sepulchres, in decoration, doors, side chambers, funereal couches, their conical tombs, the arch, their towered walls, their alphabet has been often remarked by scholars who have studied particularly the monuments in either country.

The Turanian or Mongolian cast among the Etruscans is portrayed on some of their monuments. In this examination and comparison by detail between Hittite and Etruscan there are very few of the available Hittite characteristics which are missing.

In sum, a triple series of coincidences, Hittite, Hyksos and Etruscan is here submitted to the criticism of scholars without indicating the influence on or relation to earlier, contemporaneous or later civilisations, but in order to elucidate the origin both of the Hyksos and of the Etruscan through the Hittite, restoring for Etruria her classic tradition, reconstituted from that site:—

Saxo incolitur fundata vetusto
Urbis Agyllinæ sedes, ubi Lydia quondam
Gens, bello præclara, jugis insedit Etruscis.

Professor Flinders, in a letter to the *Times*, says:—The theory of connection between these three people is by no means new. It has been threshed over by De Cara at full length in a long series of papers ten years ago in the *Civiltà Cattolica*, and has been since then in the minds of most real students. But—possibly from faults of presentation—it has never raised any serious debate. Before estimating what more may be said for it, we may as well clear the ground in some directions.

The Dahshur jewellery is quoted as in some parts resembling Etruscan. It cannot be compared with either Hittite or Hyksos jewellery, because none is known in detail. Now, so far as it is connected with Etruscan style, so far it defeats the argument, as neither Hyksos nor Hittites were connected with Egypt in those days. It is of an age before either race had appeared on the Mediterranean; and thus points to Etrurian art being already in the Mediterranean before either of the other peoples were present.

The immigrants shown at Beni Hasan have nothing to do with either Hittites or Etruscans, as they are entirely different in features.

Of the Hyksos nothing whatever is yet known as to features, all of the monuments bearing their names being older carvings usurped by them. As to gleaning their art from a few small remains with scarcely any distinctive motives, it must first be shown that the motives are not older, nor belonging to other sources. Practically identifications with Hyksos can only rest on guesses and possibilities at present, as there is no material to give proofs either way.

The question really open to debate is the similarity between Hittite and Etruscan details. As both peoples came down through Alpine countries to their later homes, all that relates to clothing would be evolved under the same conditions, and therefore probably similar in nature. Of the other connections many belong to Egypt before the Hyksos or Hittites—such as the use of mirrors, the hair dressing in plaits and pigtail (women) and horseshoe head-dress. The horned head-dress is not Hittite, but Western. The plain fillet is common to many lands. In short, much of what is named is Egypto-Mediterranean, long before Hyksos or Hittites.

THE EVOLUTION OF DESIGN.*

THE architect can never count on immediate recognition of his efforts. Although his achievements be the product of an earlier period of his professional life when, unnoticed and not comprehended by others, he conceived the inspired thoughts which eventuated in his final success, it is not until after years of trials and tribulations that he may secure the ideal reward. He must therefore draw very largely on his conscientiousness, born of a sense of "duty well performed," for his recompense, and content himself with a mere pecuniary reward for his labours—a compensation which often dwindles into insignificance compared with that of kindred professions.

Endless study and constant toil in the endeavour to meet the modern demands; to obtain the mastery over the principles

* A paper by Mr. J. L. Smithmeyer, read at the Convention of the American Institute of Architects in Washington.

underlying sound construction and the use of the new building materials; to understand the new heating and ventilating, and other appliances of a comfort-giving nature, exact more time and energy from the architect than at any previous era; and he casts his lot to the votaries of the sister arts, sculpture and painting, who, as a rule, reap the fruits of their labours easier than he.

Architecture is a useful art. Its first requirement is utility. "Beauty," the visible form, is a secondary consideration; yet no architectural effort can be a success without its concomitancy. Its origin traces back to the shelter and protection of the primitive man from weather and mishap.

The development of this pristine abode into a structural art, and its crude floral, armorial, and other adornments into a work of fine arts, is the result of the continuous upward progression, from simple to more complex types to higher and more complex structures calculated to ameliorate and elevate the status of the human race.

New necessities of the human family and the development of new building materials (iron, steel, brass, copper, concrete, cement, &c.) develop new constructions and new methods of construction. The highest perfection of this development constitutes the architecture of the respective era. Our modern period has produced numbers and greater varieties of new constructions than any previous one, but the development of new forms must be slow, owing to the time consumed in testing the qualities and suitability of the new materials, the delays encountered in obtaining them in proper quantity, and also to the tendency of the architect to cling to the venerable old forms in preference to the new. The unprejudiced eye must perceive that the classical "Modern architecture" and the "Renaissance" are no to-day than that between the "Renaissance" and the "Antique." This is a convincing proof that we are in the midst of an evolution which ere long will bring forth a new style, which will be the result of the necessities and the embodiment of the artistic ideas of the day.

Our age is a prosaic and eminently practical age. It will, therefore, be the predominating characteristic of the style. This modern style will obviously tend to be Perpendicular architecture; but, notwithstanding this, it will be independent of any existing style, and will be the result solely through the earnest efforts and endeavours of the profession.

"Forms are not invented; they grow, if we will, by them to do so, by cultivating and irrigating the soil. The elevator, have already possessed us of many advantages over former days, foremost among which are the saving in cost and time of the erection of high buildings, the availability of space, and minimising of the cost of commercial and manufacturing centres of our large cities.

Architects and students, eager to become conversant with the study of the forms of architecture, often confine themselves to the study of the forms of architecture and neglect all others. They select one style of architecture and neglect all others. They have the greatest number of votaries; they are simple, are carefully sorted, measured and labelled, and are easily obtained." The prospective practitioner, for a while, and soon concludes that they are the best for the purpose of his practice. Hence the great popularity of the Greek forms, and their resultant—the "Renaissance."

Thus, in the early days of this country, the architecture was Greek temples. Not only churches, but residences, railroad depôts, court-houses, libraries, houses, but also music and dancing halls, hostels, houses, and even livery stables, were Greek temples. They were large and small; built of stone, brick, or rough-cast walls. The simplicity of the simple temple structure seemed to adapt itself to the needs of the people and to the compass of the construction. The characteristics by which the exterior of the temple distinguished from any other one-cell structure—the peristyle, tympanum, entablature, column, pilaster, baluster, &c.—were copied from illustrated editions of libraries, and were freely used by the designer. Aesthetically viewed, the selection of the temple for the mosque of the Mohammedan, the synagogue of the Israelite, the cathedral of the Christian, or any other place recognised as a place of worship, for secular or religious purposes, must be unpleasant to the cultured mind and eminently bizarre.

The disgust of the thinking minds of the Middle Ages at the prevailing political, religious and social conditions, with the forms of art expressive of peculiar political conditions conditioned on rude force, oppression, superstition and personal greed, had finally terminated the upheaval of the Reformation and in the return to the

forms, which, with further developments, necessary to the new and complicated ideas of Christianity advanced state of social and political civilisation, Renaissance" like the "Antique," has fulfilled its and, like it, must yield to the law of evolution, upward progression, from simpler forms and so more complex structures, greater comforts and sanitary conditions. And yet, in full view of this, there are still many adherents to the forms, who steadfastly antagonise, or ignore, all styles of architecture, and retard the advent of a new style.

ly increased commercial, political and social our days with the people of all parts of the untold new archaeological and traditional treasures of the modern architect, which enrich his repertory as never before, and which will, when readjusted to our new constructions and to the materials, place him in a favourable condition to expectations of the time in which he lives without temple architecture.

out requirement of a successful competition for is "absolute freedom" from restrictions as to style of a structure. The requirements given programme, together with the dimensions of the ground, its shape and environments, and the structure, should constitute the list of restrictions. Divisions and subdivisions, grouping and material, disposition of the openings, but, more thought and form of the structure, should be entirely artistic feeling of the architect, resulting as they (ie) from the construction and composition of his due interference with the free development of an exception must prove a detriment to his design—a hindrance to the level of a fashion and a hindrance of evolution.

examined the site and studied the conditions im- programme, the architect next devotes himself to of the city, for the purpose of acquainting with the relative elevations of the various grounds public and private edifices of an imposing character ed. By this means alone can a correct idea be of proper height and form a structure should have ar locality, and with reference to the artistic silhouette of the city.

monumental structure in the country demands a the part of the architect with the topography and estics of the scenery which environs the site of such as lakes, rivers, cascades, creeks, moun- ags, woods, meadows, farms with tilled lands, hey are most essential in developing a form harmonious with, and appropriate to, the land- lect on the part of the architect to duly consider nents in his composition would eliminate the at which architectural construction cannot rise to "high art."

al effect and dignity of a monumental structure largely on the elevation and environments of the it. If a site has been selected which lacks the ize necessary for a suitable display of such a professional skill, ingenuity and experience of should be called into requisition to obliterate this shortcoming by an adequate increase of the structure, and thus to avert its dwarfing.

THE DRESDEN EXHIBITION.

ctural League of America held its annual con- in St. Louis on the 5th and 6th inst. The main of the convention was delivered by its president, Stymetz Lamb, a prominent artist of New York, retary of the New York Municipal Art Society. spoke on the Dresden Municipal Exhibition, ned early in the spring and has been running mmer months. He has just returned from re he made a careful study of the exhibition and icipal affairs in general.

as many things to learn from Germany in the icipal affairs, said Mr. Lamb in a recent inter- ible reporter.

s which perhaps more than any other appealed ere those relating to expansion of cities, trans- et paving and corporate care of art. The handicapped in many ways unknown to the n. Relics of Mediævalism, like moats and prejudices and customs, make the growth of a y peculiarly difficult problem to handle, and yet, these difficulties, Germany has solved many of problems in a most satisfactory way.

In the matter of transportation the United States is far behind German methods. Government control of railroads there makes it possible to obviate the evils of paralleling elevated, trolley and underground lines. Terminals and stations also are made works of art, instead of the unsightly encumbrances inflicted on the American city by private management.

The plan generally pursued in the larger cities is that of radiating roads from a common centre. Intercommunication is secured by circular or belt lines, connecting stations on the main lines. They are ordinarily trolley lines, and differ little from American systems except in their general attractiveness of street fixtures, &c.

A study of paving in German cities gives one an excellent opportunity not only for comparison, but of noting the most recent innovations. As yet no one material seems to have demonstrated marked superiority. The Belgian block, either of granite, sandstone, basalt or other stone, as locality may make most economical, is still a favourite and extensively used, although the wooden block has many advocates. Cement paving, combination blocks of slag and composite blocks are also in use. The secret of success in every instance, however, seems to depend upon the foundations rather than upon the material used on the surface. The most successful streets all have a concrete foundation of most permanent character, and it is therefore immaterial whether wood, brick or asphalt is used as the final layer. One advantage, however, in the use of the composite block is the possibility of varying the colour, which in large squares and open plazas is a distinct gain. It is interesting to note that this use of different colours in pavements is traceable to Roman influence, and that to-day the same tones are used as were employed by the Romans thousands of years ago.

But it is in the corporate care of art that America needs to study German methods. In every town in the empire there is evidenced a wonderful pride in public art. Their public buildings, parks and railroad stations even are made to stand for something artistic as well as useful.

"But is this not to be expected in a country as old as Germany?" he was asked. "There the problems of a newer country, where the cities are growing, are no longer troublesome."

That is where we need enlightenment again, he responded. The cities in Germany in the last twenty years have experienced a growth as rapid as anything you can point to in America. Furthermore, there they have had a great many obstacles to confront in the way of old-established customs and relics of Mediævalism, as, for instance, the old city walls, &c. The treatment of these latter makes an interesting study.

One of the surprising things to an American who studies the cities of a country like Germany is the fact that he finds our municipal problems are also theirs. We are inclined to think of Germany as old, and therefore settled. We excuse many things in our own cities on the plea that they are still engaged with the problems incident to their rapid growth. It is therefore somewhat surprising to learn that cities in Germany are growing with a rapidity equal to that of American cities, and it becomes interesting to study how they of the older country cope with the problems that we have been inclined to think were peculiarly ours.

To Americans, possibly, the most interesting and instructive exhibit in the recent Dresden Municipal Exhibition was that of "city plans," showing recent developments and improvements in the arrangement of city parks, streets, &c. Fortunately there were a few comparative plans showing cities as they existed at an earlier date, about 1870, as they exist to-day and as they are projected for the future. They show that these German cities have been growing not only with a rapidity equal to our own towns, but that, too, in the face of many handicaps not existing in our country. While we complain of the difficulties confronting us, we do not realise those confronting the older cities, with their Mediæval inheritances and the prejudices of established customs. Great praise is therefore due them for what has been accomplished.

All plans for expansion exhibited at the Dresden exhibition showed most clearly that none of the city governments were prepared for the recent enormous and inexplicable growth. All plans existing in 1870 were far inadequate to the demands of recent times. Many cities at that date still retained their walls, and were subj ct to many conditions now obsolete. In every case walls have been pierced or removed entirely to permit the necessary expansion to outlying districts. In many cases the space thus obtained has become the most beautiful section of the city.

Most pleasing as well as most instructive is a study of the ways in which the old walls have been modified to meet modern requirements. In some of the smaller cities they have been removed entirely, and the space absorbed by the regular street system; in others, but half the wall has been removed allowing the street system to extend on one side only and

retaining the other half for park space; in still others the entire space occupied by the walls has been reserved for parks and public buildings.

The most interesting solution of the problem perhaps is offered by Nuremberg, where the old picturesque walls are retained almost intact, but pierced at convenient intervals to permit the necessary intercommunication between the old city and the outlying districts. The walls form an almost continuous series of parks, parkways and promenades. The old moat is a beautiful flower garden. Restaurants and public gardens abound. Public buildings as well as important private dwellings, cluster near the wall, and the result is a most happy combination of the old with the new. A fast trolley-line circles the city on the outside of the walls, and gives the necessary intercommunication. Instead of there being buildings of an inferior character on the outside of the walls, strange to say, some of the very best are to be found there.

Not every city, however, is as fortunate in its solution of the wall problem as Nuremberg. Some cities, as Freiburg, have endeavoured to eliminate the walls and retain merely the entrance-gates or towers. While this may, perhaps, give greater immediate building space, the effect is far inferior to that obtained by such a treatment as carried out by Nuremberg. The towers are isolated and look unnatural and out of place.

In the exposition there were good opportunities also for studying building methods. Plans and models were shown. Nothing radically different from our own methods obtains, however, except as to the matter of limiting the height of the buildings. Private dwellings, tenements and workmen's cottages were shown in every conceivable development, and while not demonstrating anything strikingly new, were yet an evidence of the earnest effort on the part of every city to ameliorate the condition of the poor.

The handicrafts were not overlooked in the exhibits. Schools exist in every city for the proper training of the young, and work in every material is suitably encouraged. Museums are maintained with complete and exhaustive collections of the representative work of other countries, and no effort is spared to place before the rising generation complete information of the most improved methods employed in competing countries.

The exposition contained as well complete information on the question of sanitation and the improved methods of caring for cities. Interesting models, full size, of the drainage system and the disposal of waste, as now practised, were shown, and those interested could find complete tables of statistics showing density of population, prevalence of disease, death rates, &c.

The poor were not forgotten. The system of caring for the poor was shown in models. There were models of hospitals without number, and every detail, not only of the construction, but of the management was distinctly portrayed.

A special department was devoted to information in reference to schools and education. The school system was carefully explained and samples of the students' work shown. Here again we note the attention given to handicrafts and the insistence upon skilled workmanship. Classes exist in design, mechanical drawing, wood-carving, metalwork and lacemaking. These are classes that are not pretences, but practical preparatory schools for the factory, fitting the pupil upon graduation to take part with ease in that competitive industrial struggle that Germany is waging with the world at large.

The exposition embraced one main building in which were to be found comprehensive exhibits on transportation, expansion, public art, sanitation, schools and education, poor-houses and hospitals, banks and finances and statistics, and some twenty odd minor buildings, in which were to be found exhibits relating to machinery, street cars, street construction, methods of using gas, water and electricity, methods of cremation, automobiles, fire engines, samples of building materials, &c. Landscape gardening, flower culture, and even models of street fixtures, were exhibited as actual details in the general arrangement of the grounds. The minor buildings were filled with the exhibits of firms dealing in machinery and municipal supplies. These exhibitors were, however, well controlled, and forced to so display their goods as to make each exhibit a logical part of the whole. This arrangement enabled one in a very short time to get a thorough knowledge of what the exposition contained, and also to obtain information on any particular subject desired.

M. Bouvard, inspector-general of the Department of Architecture, Promenades and Plantations of Paris, has paid a visit to Brussels on the invitation of the King of the Belgians. He has also received the distinction of Grand Officer of the Order of SS. Maurice and Lazare from the King of Italy.

GENERAL.

The Emperor of Germany has presented amongst gifts to the Museum of Howard College, U.S., representing the Golden Gate of Freiburg Cathedral and the bazaar of Hildesheim Cathedral.

The Junior Institution of Engineers have awarded Institution premium to Mr. R. W. Neuman for a paper on "Design and Construction from a Contractor's Point of View."

Mr. Alfred J. Dunn has, on account of pressure, resigned his lectureship in building construction and design (elementary, advanced and honours) at the Birmingham Municipal School of Art. The committee have appointed in his successor Mr. Francis B. Andrews. Mr. Andrews is an experienced lecturer, and has received from the Royal Institute of British Architects one of the twelve "certificates of competency to act as building surveyor" issued by the Institute as the result of examinations held up to 1901.

Professor George de Thierry, the official designer of waterworks and navigation in Bremen, has been appointed to teach practical hydraulics in the Technical High School of Berlin.

The Foundation-stone of a new church in Tisbury, Wiltshire, was laid on Saturday. Messrs. Devereux are the contractors, and the architect is Mr. A. A. Heath.

The Brighton Corporation works committee have decided that application be made to the Local Government for sanction to borrow £12,938 for the purpose of coast defence.

The Westminster City Council have decided to refer to the Board of Trade that the Council are of opinion that the streets should be furnished with further powers, in order to give greater control over the breaking up of the streets within the jurisdiction of electric supply companies, and that a clause should be inserted in all orders granted by the Board, making it obligatory upon such companies to supply light and power for public buildings or for public lighting in the district at rates not greater than the lowest rates charged to their consumers.

Mr. W. Curtis Green will read a paper on Monday at the Liverpool Architectural Society on "Street Architecture, Formal or Irregular."

The Worthing Town Council are taking steps to plan for the erection of a new library on a site belonging to the Corporation, in connection with Mr. Carnegie's endowment of 5,000 £.

A Project has been arranged to provide work for the operatives of the building trades of Paris. It consists of repairs and alterations in several of the hospitals, and the construction of some new hospital buildings. The outlay is estimated at about 2,000,000 £ sterling.

Mr. John Lavery, R.S.A., has been awarded the gold medal in connection with the International Art Exhibition at Venice.

The Director of the Paris Opera House has decided to issue an illustrated programme for each performance, and the competition for the cover will take place. Designs are to be submitted before November 20. They will be exhibited publicly in a library, and then submitted to a jury of artists. The first prize will be 1,000 francs, the second 500 francs. An anticipated similar competition will be held every year.

An Interesting Discovery has just been made at Wilthorpe, Lincolnshire, in connection with the new Manchester to Wilmslow railway. Workmen have found portions of the old Bollin Mill, which had to be taken down to make way for the present line, sixty-four years ago. The hall was of considerable size, and the portions now found are considered by antiquaries to be as old as the parish church, which was erected in the thirteenth century ago. The remains of an ancient well have also been found. Further discoveries are expected. The site was formerly in the Booth and Trafford families, and tradition says that Anne Boleyn, one of the unfortunate wives of Henry VIII, was born there. An old Norman chapel is also supposed to have existed here.

The Bishop of Oxford on the 24th inst. attended the service at Little Marlow (Bucks) Church, to commemorate the completion of the restoration of the church, which has been carried out at a cost of about 1,000 £.

The Sanitary Institute will meet on December 10 at Leicester. There will be a discussion on "Flooding of the River Thames in London by Sewage" at the Parkes Memorial Lecture on December 9. The next congress will be held in Glasgow.

The Fifty Designs received in the Bromley Library competition will be on view at the borough offices, Poplar, on Friday, between the hours of 10 A.M. and 4 P.M. to October 31.

Mr. J. Martin Brooks, architect, eldest son of John James Brooks, the ecclesiastical architect, died on Saturday at his fiftieth year.

EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our list a VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

We will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders, and other particulars of Works in progress in which they are interested.

Contributors of signed articles and papers read in public must be held responsible for their contents.

Communications can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Readers are requested to make their communications brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

Great disappointment is frequently expressed at the non-acceptance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

Nov. 30.—The committee of Bray Pavilion and Gardens invite plans for proposed pavilion and winter garden at Bray. First prize, 30*l*.; second prize, 15*l*.; third prize, 10*l*.; with three prizes of 5*l*. 5*s*. each. Messrs. Frank Edw. Lee and P. Macdonnell, hon. secretaries, Town Hall, Bray.

Nov. 9.—Designs are invited for a new public library. Premiums of 50*l*., 30*l*. and 20*l*. will be paid to the first, second and third premiated designs respectively. Parap to Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Brighton and Hove Hospital for Women, 76 West Brighton.

Dec. 16.—The Lambeth Borough Council are erecting a public library, with residence for librarian, in the Hill ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for a public library, with residence for librarian, in the Hill ward of the borough to Mr. H. J. Smith, town clerk, Lambeth Town Hall, Kennington Green, by 12 noon on Dec. 16. General information as to the extent and the accommodation required in the proposed library can be obtained on application to the town clerk.

SCOTLAND.—Competitive plans are invited for the erection of a new infectious diseases hospital and a public library in Fraserburgh. Mr. William Alexander, burgh surveyor, Fraserburgh.

SCOTLAND.—Nov. 9.—Competitive plans for the erection of a tenement of shops and workmen's dwelling-houses on ground belonging to the Kilmarnock Corporation in Fore Street are invited. Premiums of £15 15*s*., £10 10*s*. and £5 5*s*. will be given for the sets of plans and certificate which may be adjudged first, second and third respectively. Mr. W. Middlemas, town clerk, Kilmarnock.

SCOTLAND.—Dec. 7.—The Elgin Landward School Board invite competitive plans and estimates for the erection of school buildings at New Elgin capable of accommodating about 340 pupils. Mr. Hugh Stewart, clerk to the Board, Elgin.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums of 100*l*., 50*l*. and 25*l*. will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough-engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20*l*., 10*l*. and 5*l*. will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WALES.—Competitive designs are invited for a pavilion to hold 10,000, to be erected at Rhyl for the purposes of the Royal National Eisteddfod of 1904. No prizes are offered. Messrs. Tilby & Jones, general secretaries, Town Hall, Rhyl.

WALES.—Nov. 9.—Competitive designs are invited for a public library to be erected in Evelyn Road, the total expenditure, including fixtures, not to exceed £2,000. A premium of £10 10*s* will be paid for the approved design. Mr. Samuel Jones, clerk, Old Road, Skewen, Neath.

CONTRACTS OPEN.

ACTON.—For about 70 rods of brickwork, labour only, at Acton. Messrs. Barnett & Brothie, 68 Salisbury Road, West Kilburn, N.W.

ASHTON-UNDER-LYNE.—For the erection of office and stable buildings at Victoria Works, Pitt Street, Hooley Hill. Messrs. Burton & Percival, architects, 150A Stamford Street, Ashton-under-Lyne.

TRADE NOTES.

THE Glanadda schools, Bangor, North Wales, are being warmed and ventilated by means of Shorland's patent Manchester stoves and grates, by Messrs. E. H. Shorland & Brother, of Manchester.

THE Newtown Free Library, Montgomery, has recently been fitted with the latest improved hot-water heating apparatus, by Messrs. John King, Ltd., engineers, Liverpool, employing their well-known "Rahnee" radiators.

A LARGE clock, with Cambridge chimes, has just been erected in Pen-y-fai Church, Glamorganshire, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements, and is similar to a clock erected a short time since in Baglan Church, Glamorganshire, by the same firm.

ELECTRIC NOTES.

MR. THOMAS BARTON, M.I.E.E., has been instructed to prepare a scheme for electric-lighting works at Clitheroe, in Lancashire.

MR. STEPHEN SELLON has resigned the position of chief engineer to the British Electric Traction Company, and has started in private practice at 36 Victoria Street, Westminster, S.W.

THE London County Council are making a number of temporary appointments at the present time—four civil engineering appointments with salaries about 5*l.* 5*s.* per week, and four with salaries up to 4*l.* 4*s.* per week; two surveyors at 5*l.* 5*s.* per week, and two mechanical draughtsmen at the same salary.

MR. WARDEN-STEVENS, of Connaught Mansions, Victoria Street, Westminster, S.W., the consulting engineer to the borough of Wednesbury, is prepared to receive tenders for electric wiring and fittings for the following public buildings:—The town hall, municipal offices, art gallery, public baths, public library and the electricity station.

THE Arbroath Town Council have agreed, on the recommendation of a special committee appointed recently to negotiate with private companies in regard to the installation of the electric light in the burgh, to accept the offer of the Empire Electric Light and Power Company, Ltd. The first

installation has to be completed by November, 1905, the effort is to be made by the company to complete it within a year from the date of agreement.

THE Wandsworth Borough Council are considering whether or not the Council shall agree to make a contribution of 65,000*l.* towards the cost of the widening of Streatham High Road, for the extension of the London County Council tramway from the present terminus at the Tate Lido, Streatham, to the county boundary at Norbury. The Council has on a previous occasion refused to make any contribution, but it is now proposed that the resolution embodying that refusal shall be rescinded, in view of the advantage which would accrue to ratepayers in the Streatham Ward if the proposed extension was carried out.

A NUMBER of local gentlemen interested in the improvement of Pitlochry as a health resort have taken up the question of introducing the electric light into the village and neighbourhood. It is understood that a scheme has been drawn up and very favourably reported on by an electrical expert. It is proposed that the necessary motive power be derived from the river Tummel, and the present estimate is that the new installation can be supplied at about half the cost of the gas, of 7*s.* 6*d.* per 1,000 cubic feet. Arrangements are being made for ascertaining as to what measure of support the proposal will accord the proposal.

VARIETIES.

ON Saturday last the Bishop of Llandaff consecrated a new church of St. David, Tynyrefail, which has cost 3,500*l.* to build.

THE Bishop of Winchester dedicated on the 20th inst. a spire which has been added to St. Paul's Church, Bromley, in memory of Queen Victoria, at a cost of 2,000*l.*

THE Roman Catholic Bishop of Northampton officiated at the opening of St. Etheldred's Church at Ely. The building has cost between 3,000*l.* and 4,000*l.*

ON the 23rd inst. Lord Avebury opened the new Cambridgeshire and County school, which has been erected at a cost (including freehold ground) of 10,200*l.*

A LINE of railway is contemplated to give direct communication between the east and west coasts, starting at

of the design for public baths which has been submitted by Mr. Alfred Saxon Snell, of London. They also recommend application to the Local Government Board for sanction to borrow 75,000*l.* to carry out the work. Upon another portion of the same area the new offices of the Mersey Docks and Harbour Board are to be built, and further space is to be devoted to the erection of blocks of Council property. Altogether a very significant improvement in this portion of the city is to be entered upon.

DR. R. J. REECE, M.D., Local Government Board inspector, held an inquiry at Burslem on Tuesday with respect to an application by the Town Council for sanction to borrow 13,000*l.* for the provision of an infectious diseases hospital, and 275*l.* for the provision of a disinfecting station and apparatus. With respect to the proposed loan of 275*l.* the town clerk stated that, in March last, Dr. Wheaton, an inspector of the Local Government Board, expressed surprise that the Corporation did not possess an efficient disinfecting apparatus, and suggested that they should take immediate steps with a view to providing one. The Town Council had accordingly decided to erect a disinfecting station. With reference to the loan of 13,000*l.*, it was explained that the Town Council were desirous of providing a new isolation hospital in the borough, on land at Stanfield. The Council were at present using the Bradwell sanatorium, in conjunction with the Wolstanton Rural District Council and the Tunstall Urban District Council. The Wolstanton authority had the sole management of the hospital, the other authorities paying their proportion of the expenses. Of the loans raised for the purposes of the hospital there was 1,820*l.* still outstanding, and Burslem was responsible for a proportion of that sum. It was believed, however, that the Corporation would be relieved of that responsibility by the other authorities on surrendering their interest in the hospital. In 1900 it was found necessary to provide additional accommodation, and the Council decided to build a new hospital of their own. The estimated cost of the site, buildings and furnishing was 13,000*l.*, which would involve an annual expenditure of 706*l.* if the money was borrowed for thirty years. The estimated cost of maintaining the hospital was 1,030*l.* a year. If they continued in conjunction with Wolstanton and Tunstall the annual cost to Burslem would be 1,413*l.* Mr. R. T. Longden explained the plans of the proposed new hospital, which he said would con-

tain forty beds and three convalescent wards, with necessary administrative accommodation. There was opposition.

BRILLIANT SIGNS.

AMONG the most attractive stands at the recent Brewster Distillers' Exhibition was the conspicuous one of the Brilliant Sign Company, Ltd., of 38 Gray's Inn Road, who have appointed official sign contractors to the Cape Town Exhibition 1904-05, and the rapid expansion of whose business necessitated their opening branch show-rooms in Sydney, N.S.W., and Auckland, N.Z. At this stand, which measured a frontage of 40 feet, were to be seen a large variety of tablets, incised fascias, stallplates, enamelled letters, glass, wood, and metal letters, &c., adapted to every department of advertisement and similar purpose. They were showing the new shape "Brilliant" letter, which has found favour with so many leading architects. This letter is made under "Brilliant" patents, and is stamped out of stout sheet copper and gilded with the purest quality English gold leaf. It is introduced to prove to the public that the Brilliant Sign Company are the inventors and pioneers of the "Brilliant" letter, and to supply the original and only perfect "Brilliant" letter in various shapes, styles and designs, and at a cost lower than the standard shape "Brilliant" letter, and lower even than the imitation "Brilliant" letter.

The company have made up a quantity to the order of Messrs. Worthingtons, Ltd., Messrs. Younger & Co., Ltd., and J. M. Hazlehurst, of Burton-on-Trent.

The new letter has been much admired for its shape and its brilliancy in gilding, and it can be used not only for mirror tablets, but for all kinds of fascias, stallplates, hanging signs, pier signs, window decoration. In fact, cannot, so to speak, put the letter out of its place, as when glass is employed the new "Brilliant" letter will be found undoubtedly the best advertising medium.

The firm have secured an order to send a large quantity of the letter to Natal, and no doubt there is a very bright future for it, as it has already shown itself to be most popular.

The manager of the Brilliant Sign Company informs that, *inter alia*, they have just recently secured the contract from Messrs. J. Lyons & Co. for the large metal lettering so much in evidence at all their depôts.

he amount of the debt. Mr. Thackeray could give
ation of the goods being ordered, and no bill had
red. He argued that the order as placed by Mr.
did not come within the scope of the partnership.
Honour said the case involved a very nice and correct
the law.

Woods said the partnership between himself and Mr.
was dissolved in July, and at that time he knew
all of that account. Upon the dissolution of part-
nership asked Mr. Thackeray for his keys, but he
to give them up until all outstanding accounts had
red. Upon that witness put a fresh lock on the
A fortnight after the dissolution witness received
not rendered" for the amount of the debt. Knowing
out it, he asked for particulars, and ascertained that
orders for which the money was owing had been
from Spring Vale Station to Mr. Bury, who had paid
eray for them as to 15l by settlement of the out-
account. As a firm Messrs. Woods & Thackeray had
t with Messrs. Dunkerley, although they had many
ified their goods. Mr. Thackeray had admitted his
liability in respect to the goods to witness.
ry, ironfounder, said that Mr. Thackeray owed him

15l. privately, and he had asked for payment many times. He
had the debt in mind when he ordered the iron goods from
Mr. Thackeray, and told him that the debt owing would be
taken into account on the settlement. He never saw anyone
other than Mr. Thackeray in the matter, and his transaction
was not with the firm.

His Honour decided in favour of the defendant, and upon
the application of Mr. F. Hindle, who represented the
defendant, costs were allowed against the plaintiff and Mr.
Thackeray.

THE INTERNATIONAL FIRE EXHIBITION.

THE International Fire Exhibition, organised under the
auspices of the British Fire Prevention Committee with the
view of arousing public interest in fire prevention and fire
protection generally, was closed on Saturday last, after a
duration of about six months from the opening by its president,
the Duke of Cambridge.

The Exhibition had as vice-presidents the Right Hon. the
Lord Mayor of London, the president of the National Fire
Brigades Union, and the chairman of the British Fire Pre-
vention Committee. It had an advisory council, numbering
over sixty members, a working advisory committee and
numerous sub-committees, the members throughout being
thoroughly representative of the interests involved.

The number of industrial exhibitors was 140, including
numerous firms from Austria, Belgium, France, Germany,
Holland, Italy, Scandinavia and the United States, and there
were also seventy general commercial exhibitors.

The loan exhibitors numbered some 400, who together
placed about 2,500 exhibits at the disposal of the Exhibition.
They included numerous Government and municipal depart-
ments, public institutions and fire service organisations from
all parts of the world.

At the instance of the British Fire Prevention Committee,
the Exhibition was visited by several hundred deputations from
public bodies, technical institutions and fire service organisa-
tions, nearly every British municipality of importance being
represented, and there were many visitors from the colonies
and abroad.

By far the majority of firemen in England visited the
Exhibition, many brigades sending their whole staff by sections
of fours and eights in turn. The National Fire Brigades
Union (under whose direct control the Fire Brigade Tourna-
ment was held) alone issued 55,850 day passes to firemen.

THE "CIL-REST" CASEMENT

WILLIAMS BROS. & CO.

SEMENTS, SASHES STAINED, GLASS, LEADED LIGHTS.

The fire brigade side of the "spectacle" in the Empress Theatre, which was presented over 300 times, was entirely in the hands of provincial firemen of the National Fire Brigades Union, under the chief officer of the Hampton Brigade, who organised a special brigade for the work of forty-three, all ranks.

The attendance at the Exhibition was fully in accordance with the expectations, considering the abnormal inclemency of the weather of the past season, whilst the number of spectators who visited the "fire spectacle" surpassed all predictions.

General interest in fire preventive and fire service matters throughout the United Kingdom was stimulated to a remarkable degree by the Exhibition, and an enormous amount of valuable instruction has been obtained from it by all those professionally concerned, as well as by a very considerable section of the public.

THE MODERN STEAM BOILER.*

Two hundred years ago in Newcomen's engine, which was little more than a superior kind of pump, the piston in the cylinder was made to descend by the pressure of the air on its upper surface, when a vacuum was formed beneath it, and this rising and falling was sufficient to make the beam move, which communicated with the other parts of the machine. One of James Watt's improvements was the substitution of steam instead of atmospheric pressure. The steam was admitted above the piston for that purpose, and the direct force of the atmosphere ceased to be of much avail. The packing of the piston in such a way as to render it steam-tight necessitated several months' constant study, and "pistons pressed by steam" would appear to stand fifth in the order of Watt's improvements.

Prior to Watt's time the boiler used for the generation of steam resembled an inverted frustum of a cone, and sometimes a cylindrical iron flue was carried through it longitudinally in order to increase the surface to be acted on by the heat. In course of time a cylindrical form was adopted for the boiler, and the furnace was placed in another cylinder inside in order that by being surrounded by water there would be no loss of

* "The Practical Physics of the Modern Steam Boiler." By Frederick J. Rowan, A.M.I.C.E., &c. With over 314 illustrations. (London: P. S. King & Son.)

heat through radiation. Then came tubular boilers, in which the steam was generated in pipes which communicated with a common steam chamber. But for a great many years this arrangement was not generally approved. Ordinary steam-power believed the tubes were liable to get out of order, and there was no wide demand for such high-pressure tubes as they were able to produce.

Of late a number of reasons have combined to bring the water-tube boiler into prominence. The principal ones are the necessity of enabling war vessels to attain a speed at one time would be thought impossible. What that means to stokers and engineers is a question not to be asked. Convenience is of little account when it is known that victory may depend on the efficiency of a boiler. The principle which John Stevens and William Fairbairn enunciated is peculiarly applicable in such cases, viz:—"A boiler should be so constructed that it shall not be liable to explosion, and a boiler should also be so constructed that should it explode through neglect and carelessness, inevitably here and there, with in the weak humanity which must be entrusted with that explosion does occur, the explosion shall be as dangerous." Those conditions are specially desirable in vessels of a fleet, but they are also demanded in marine engines, perhaps we might say in the majority of them, and the subject is deserving of all possible attention.

Mr. Frederick J. Rowan, who has gained a reputation as an expert, has in his last important volume devoted his attention mainly to the water-tube boiler. Avoiding subjects which are common to all classes of boilers, his aim is, "not so much to treat of how boilers are made as to consider on what lines they may be improved." He has received the aid not only of several other specialists but of manufacturers, and his work is therefore remarkable for its fulness of detail. The case is made out of those modern boilers, and the pages must compel operators of the system to be more careful in their allegations.

There is one advantage which tubes must possess which will be apparent to all who have no more than a general knowledge of metals. In the tubes the thickness of material has to resist strains is proportionately greater than in an ordinary cylindrical boiler. It has no ratio with respect to diameters. Mr. Rowan therefore invokes Wöhler's laws in regard to the behaviour of metals in use. For although they were established by experience in connection with railway structures they are no less applicable

of all varieties. They are as follows:—(1) Fracture produced by the continual repetition of oscillating stress of them much below the breaking stress. It is the effect of strain, defined by the extent of the oscillations, to produce fracture. (2) The absolute value of these stresses enters into the question so far that the greater the smaller are the differences which will finally produce fracture. Short of producing fracture (though close to the point of fracture), considerable changes in the structure of the metal are produced by the "fatigue." This should be borne in mind by all who use metals, for it is exemplified by examples on a very small scale. The degree of strength, however important, is not the advantage which tubes can claim. They are all in a spirit both philosophical and practical in this valuable book.

BIRKENHEAD TOWN HALL.

Birkenhead town hall tower, which two years ago last wrecked by fire, has been reconstructed and once again stands as a monument of municipal stateliness and a landmark for miles around. The completion of the work is to be marked by a ceremony in which the Mayor (Mrs. Morris) will play a leading part. When the question of rebuilding after the fire, a new design for the tower was recommended. It was a change met with a good deal of adverse criticism from various members of the Council and also by the public. But the appearance of the new tower has found great favour, and indeed is considered to be an improvement upon the former building. The ravages of the fire rendered it necessary to rebuild the lower portion of the tower beneath the original design. The new upper portion, which is in a more modern style, and now uniform with the rest of the building, consists of eight columns and entablature of the Doric order. The four angles are finished with massive carved lions, and the tower is surmounted with a steel spire covered with copper. The position of the clock is higher than in the former building. Over the clock are eight spandrels are carved with figures symbolical of the hours of time. A new and ingenious contrivance has

been introduced into the clock by means of which the four faces will in future be illuminated automatically, the time varying with the period of the year. The new tower has been made as fireproof as possible by the omission in the construction of all inflammable material and the introduction of concrete floors. The architect is Mr. Henry Hartley, F.R.I.B.A., Liverpool, and the contractors, Messrs. Thornton & Sons, Liverpool.

NORWICH MUNICIPAL OFFICES.

REPORTS have been prepared by the town clerk, city engineer and the medical officer of health on the sanitary defects existing at the municipal offices.

The town clerk states that though he considers his room the best in his office, yet in order to render it at all habitable he has continually to keep the windows open; otherwise he is afflicted with a severe headache. He attributes an illness of his little daughter from poisoned glands to the sanitary defects in the building, which she visited the day before her attack. The late Mr. Worrall was continually complaining of the bad smells in the office and of nausea, and was ill through it. The room he occupied was the worst in the office. Mr. McIlveen, the assistant town clerk, also has complained that his room is rarely ever free from a heavy offensive smell, emanating, he thinks, chiefly from the fish market, though at times it appears to arise partly from the lavatories. Other members of the staff have complained of the unbearable atmosphere in consequence of the obnoxious smells, which produce the most unpleasant sensations, even on occasions causing vomiting. Owing to the necessity of sitting in draughts from the windows and door, with the alternative of closing them and breathing foul air, the staff suffer from colds in the head, tooth-ache and sore throats. The whole of the staff are in unison on the subject. The town clerk asks whether, if the same state of affairs existed in connection with the property of a private individual, it would be allowed to continue. How much more should it be rectified in the home of the sanitary authority, which should be an example rather than a scandal?

The city engineer says that ever since his occupation of his office under the Corporation he has experienced nuisance and annoyance because of the proximity of the fish market to the municipal offices, and because of the storage of fruit, fish, &c. in the cellars connected therewith. He had received number-

less complaints from members of his staff and others coming to his office as to these nuisances, which are not due to any neglect as regards the cleaning of the public portion of the fish market. While the ordinary business of the fish market is a nuisance, and should be abolished from the neighbourhood of public offices, dwelling-houses and factories, the greatest annoyance arises from the fact that the tenants lock up fish, fruit, &c., in the shops and cellars, and, as a rule, are not careful to keep their premises clean. He reminds the committee of the fact that, with regard to the architectural assistant in Mr. Buchan's time, it was traced that the illness that caused his death arose from stenches from the fish market and cellars. The smells, he states, are not attributable to the drainage.

The medical officer of health repeats the recommendation he made soon after he came to Norwich, that the fish market should be removed, as the only step that would sensibly abate the nuisance. He says:—"It is difficult to express in words the intolerable smell which from time to time pervades the underground approaches to the fish market. It is an acrid, pungent odour, which gives rise at once to burning sensations in my own throat. If ever I get a sore throat, I find it aggravated by contact with fish-market air, and on at least three occasions I attribute the origin of a bad throat to that source. Few substances have greater efficacy as a throat irritant than decaying fish refuse; it is a fact that the incidence of diphtheria in this city shows the highest percentage amongst those exposed to this predisposing agent—decaying vegetable garbage ranking next. I have no hesitation in affirming, and in unequivocal terms, that the fish market in its existing situation is a danger to the health of the public." He also condemns the public urinals and closets near the offices. The use of the chimney-shafts to ventilate, as is done in the ground floor men's closets and urinals, means a serious liability for the escape of noxious vapours into rooms above the fireplaces which are in connection with the same chimney. Speaking generally, he has found throughout the offices not so much specific disease as a lowered vitality. Deficient lighting aggravates the evil. He had known three officials who have died from preventable diseases. He does not affirm that they contracted their actual diseases in the offices, but he has no hesitation in affirming that in each case the ailment was aided and abetted, in that their tissue resistance was lessened by the deleterious atmosphere. In a postscript he adds:—"On October 5 I received a notification of enteric fever with this

note written upon it by the notifying doctor (Dr. Reade):—"This patient appears to have contracted the disease while staying at the municipal buildings with her aunt, who is caretaker." From inquiries I have made I concur in this opinion.

BUILDING OVER SQUARES.

THE parks and open spaces committee of the County Council prepared a report on the threatened utilisation of certain areas of squares. The committee state how the Council purchased Ford Square and Sidney Square in Stepney, and their being immediately built upon, and paid practically building-land price to secure the gardens as public open spaces. This, however, it is explained, is a course that the Council is not likely to adopt in many cases, and the committee have been considering other means. The Council is reminded that there already exists power under the Open Spaces Act, 1906, for owners to hand over to the public their interests in certain gardens. In this way Lord Halifax transferred his interest in Nelson Square Garden, Blackfriars, to the Council. The Ecclesiastical Commissioners have promised that as soon as the remaining lease of the property shall expire, the garden of the Council in the Square shall be vested in the Council as a public open space for the benefit of the public. The committee expect that one of the principal livery companies of the City will make arrangements for two gardens in the eastern part of the county to be maintained for public use. On the other hand there is apparent a feeling particularly indicated in the case of a large square in the western part of London, which is advertised for sale by part of some owners to obtain building-land value for the earliest moment. The committee think, therefore, that legislation should be promoted with the object of preventing any square-garden in London, which has existed for two years or more, from being used for building purposes, unless it is done in the course of rearranging an estate, and the area is set aside as a garden. The Parliamentary Committee will be asked to advise in what form legislative action for this purpose might best be promoted next session.

Mr. Stuart Sankey, at the meeting on Tuesday last, pointed out the pressing character of the question, and referred to the fact that Edwardes Square, Kensington, was announced for sale by auction next month. He regretted the committee

ENGINEERING STANDARDS.

Engineering standards committee have issued a state-
 resolutions which they have adopted on the subject
 direct current pressures and standard frequencies:—
 uly stage in their deliberations the sub-committee
 the most advantageous method of approaching
 e, beset as it is with so many difficulties, would be
 int of view of these most affected, namely, the
 ps and of motors for power purposes. It was
 eered that the standard pressures to be suggested
 easured at the consumers' terminals as settled by
 present time there exist many different pressures
 the various lighting and power authorities. In
 great desirability of obviating this unsatisfactory
 as, it was deemed advisable to suggest the minimum
 standard pressures which would best meet present
 requirements and at the same time utilise to the
 the consumers' existing appliances.
 ceeful consideration it became evident to the sub-
 at the direct current pressures of 110, 220, 440 and
 ould best meet the requirements, because carcasses
 e standard pressures could be utilised for pressures

10 per cent. above or below the suggested standards without
 any alteration whatever in the castings or mechanical com-
 ponents, by merely altering the windings and excitation.

It is to be hoped that now these direct current pressures
 have been fixed as standards by the committee, they will in
 future be universally adopted by the engineers advising corpora-
 tions and others distributing electrical energy. In course of
 time the benefits to the electrical industry at large, which will
 certainly follow the adoption of these standard pressures, must
 become more and more apparent.

A circular was drafted embodying the suggestions of the
 sub-committee, and this was submitted first to the manu-
 facturers for their consideration, and secondly to the leading
 consulting engineers and users of motors.

The information so courteously placed at the disposal of the
 sub-committee by the consulting engineers and manufacturers
 was most carefully weighed and considered by the sub-com-
 mittee, and certain definite conclusions were arrived at, the
 circular being sent, in the first instance, to the manufacturers,
 as they were the people most directly interested. Replies were
 received from all the leading firms, who expressed themselves
 unanimously in favour of the recommendations of the sub-
 committee. The consulting engineers similarly gave their
 adherence to the proposals of the sub-committee.

Before coming to their final decision the sub-committee on
 generators, motors and transformers conferred with the sub-
 committee on electrical tramways, of which Mr. A. P. Trotter
 is chairman, and a joint meeting took place, with the
 result that the pressure of 500 volts, which most concerned the
 latter sub-committee, was agreed to, and in addition to the
 pressures already agreed to 600 volts was decided upon as the
 standard pressure for electrical railways.

The question of the adoption of standard frequencies,
 although of equal importance with that of standard pressures,
 was not surrounded with the same difficulties. It was, how-
 ever, deemed advisable to fix upon the standard frequencies at
 the earliest possible stage of the work, as no progress could be
 made in the standardisation of prime movers for driving alter-
 nate current machinery until such time as the frequencies had
 been settled upon. On this question there appeared to be a
 great preponderance in favour of frequencies of 25 and 50.
 The only point upon which any serious difference of opinion
 appeared to exist was the advisability of the adoption of a third
 frequency of 40 or 42, to enable rotary converters to be used to
 the fullest advantage. All the arguments in favour of this

Telephone 680 Hop. 1

third frequency were fully discussed, but after carefully weighing the pros and cons the sub-committee decided not to recommend the adoption of more than two frequencies, namely, 25 and 50.

The recommendations of the sub-committee were then submitted to the electrical plant committee, the publication committee, the main committee and the Board of Trade for their approval.

This having been obtained, it was deemed advisable in the interests of the electrical industry of the country that the findings on the questions of direct current pressures and frequencies should be published at an early date without waiting for the completion of the entire report to be issued at a later date.

The following are the resolutions on standard direct current pressures and standard frequencies:—

1. That the standard direct current pressures, measured at the consumers' terminals, be 110, 220, 440, 500 volts.

2. That the standard direct current pressures, measured at the terminals of the motors, be for tramways 500 volts, for railways 600 volts.

3. That 25 periods per second be the standard frequency for (a) systems involving conversion to direct current by means of rotary converters; (b) large power schemes over long distances; (c) three-phase railway work, where motor gearing and the inductive drop on the track rail have to be considered.

4. That 50 periods per second be the standard frequency for (a) mixed power and lighting on town supply mains; (b) ordinary factory power plant; (c) all medium size power plant where rotary converters are not employed.

The engineering standards committee have received a grant of 1,000% from the Government of India in recognition of the special work done by the committee for the Indian railways. The secretary of the committee, in forwarding a report on standard locomotives for Indian railways to the Secretary of State for India, stated that he was desired to point out "that, although the consulting engineers and manufacturers have placed their personal services, as well as those of their draughtsmen, &c., at the free disposal of the committee, the consideration and compilation of the resolutions arrived at by the committee, together with the necessary calculations and drawings, have involved great expense; this has been partially met by grants from the Board of Trade of 3,000% and from institutions supporting the committee. As therefore the sub-

ject of the present report is primarily applicable to the committee trust it may be possible for your Lordship to grant in aid of the work for this year, and beg to be 1,000%." To this letter a reply was received that the Secretary of State in Council had been pleased to sanction the grant of such a sum.

THE LONDON TRAFFIC COMMISSIONER AMERICA.

THE members of the Royal Commission on London Transport, delegated to inquire into the transport system of the United States as it affects crowded centres, and incidentally the housing problem, arrived in London on Saturday evening after an absence of five weeks.

The following account of their visit has been communicated to the *Times* by a correspondent:—

The sub-commission comprised the chairman of the commission (Sir David Barbour), Lord Ribblesdale, Sir Dickson-Poynder, Sir George Bartley, M.P., Mr. C. H. Gibb (general manager of the North-Eastern Railway), Mr. Lynden Macassey, the secretary. The objects of the commission were to inquire into the various means of transport existing in the principal cities of the United States, with their relative efficiencies from the public view, to ascertain the respective authorities from which franchises to rapid transit are granted in the principal States, to investigate the extent and nature of the control exercised by the carrying into effect of the powers granted by franchises or charters. The sub-commission arrived in New York on September 26, and were accorded "free entry" by the courtesy of the Secretary of the Treasury, Washington.

In New York the sub-commission opened their work. There the system of rapid transit consists of elevated railways, elevated railways, a subway (in course of construction), and the suburban sections of the main line entering the city. The street railways and elevated railways in Brooklyn belong to and are operated by the Brooklyn Transit Company. The street railways in the borough of Manhattan, which until 1898 was the City of New York, were owned and worked by the Interurban Rapid Transit Company. In the borough of Manhattan a subway some 20 miles

e construction of subways and elevated railways
e of the municipality. The board may also grant
private parties authorising the construction of a
e extension of an existing railway or railroad in or
y. The subway at present under construction
by Mr. Parsons, and is being constructed at the
e city by popular decision, following on a referen-
e citizens according to the Act of Parliament.
ing company is the Interborough Rapid Transit
which Mr. August Belmont is president, Mr.
vice-president, and part of the contract between
y and the Transit Commissioners is, by Act of
he operation of the subway for fifty years on a
to the interest on the municipal bonds issued for
ion of the subway, with 1 per cent. in addition as
nd. The Interborough Rapid Transit Company
l the elevated railways in Manhattan, and the
go work the Manhattan Elevated Railway in con-
the subway. An important feature of rapid transit
is the proposed electrification of the suburban
e New York Central and Hudson River Railroad,
hich in its entirety includes the building of an
e elevated railway over the existing tracks from the
al depôt throughout the suburban section, and the
nection of the system near the depôt with the sub-
extension of the Pennsylvania Road is from its
inus outside New York city to New Jersey, then
Hudson river by means of an electrically-
nel, and the further extension thereof across
ver to a junction with the Long Island Rail-
sub-commission inspected the methods of
ffice, especially those in operation during the
rs or at special points of congestion, and
e manner in which the subway is being constructed,

especially in thoroughfares where traffic is densest and there
are heavy underground works. In addition, Mr. Barclay
Parsons, Mr. Vreeland, the president of the Interurban Rapid
Transit Company, Mr. Winter, the president of the Brooklyn
Rapid Transit Company, Mr. Orr and Mr. Shepherd, the
counsel to the Transit Commissioners, attended before the sub-
commission at the Waldorf-Astoria Hotel and gave much
valuable information. The details of the New York Central
scheme and of the Pennsylvania extension scheme were
explained by Mr. W. J. Wilgus, the fifth vice-president of the
New York Central, and by Mr. Samuel Rea, the fourth vice-pre-
sident of the Pennsylvania Road, and by the kindness of Mr.
Newman and Mr. Cassat, the presidents of those respective
railroads, the sub-commission were put in possession of the
plans, specifications and all available data connected with the
schemes. In addition to information on purely traffic matters,
the sub-commission investigated the procedure of granting
franchises, and the character of the powers of controlling
thereover vested in or reserved to the State Board of Railroad
Commissioners, the Rapid Transit Commissioners and the
City Council.

From New York the sub-commission journeyed to Boston,
in Massachusetts. In Boston urban transit is provided by a
system of street railways, elevated railways and a subway, all
belonging or leased to and worked by the Boston Rapid
Transit Company. The subway was constructed by the
Boston Transit Commission, a body somewhat similar to the
Rapid Transit Railroad Commissioners of New York, at the
expense of the city, and leased to the company to work. The
subway is situated in the most congested districts of the city,
and is used by surface cars, which run into the subway on the
edge of the crowded locality, and by the trains of the Elevated
Railway, which forms a physical connection therewith. At the
Hotel Touraine, which the sub-commission made their head-
quarters, Mr. George C. Cucker and Mr. Howard C. Carson,
the chairman and engineer respectively of the Transit Com-
mission, furnished information as to the constitution, powers
and procedure of the commission and as to the construction of
the subway. From the Massachusetts Board of Railroad
Commissioners the sub-commission obtained a comprehensive
account of the system in Massachusetts of granting franchises
for railroads and railways, and of the control exercised by the
board over the subsequent working thereof. In regard to the
main-line railways entering Boston, the commission obtained
much valuable data from Messrs. Van Elten, Curtis & Tuttle,

more particularly as to the attitude adopted by those trunk-line companies in the matter of rapid transit

The sub-commission next proceeded to Washington, in which city there is an extensive and efficient system of street railways of the underground conduit type. They were received by the President of the United States, who evinced great interest in the matter of the inquiry. The Inter-State Commerce Commission, which is the possessor of perhaps the most complete library of railway literature in the world, generously placed their department at the service of the sub-commission and gave them much valuable information.

From Washington the sub-commission next proceeded to Philadelphia. There the requirements of urban transit are served by the extensive system of street railways belonging to the Philadelphia Rapid Transit Company, into which all the previously existing separate systems have lately been consolidated. To reduce the congestion in the central districts of the city, this company is now constructing a subway on the lines of the subways in New York and Boston. The Pennsylvania Railroad Company has of late made special inquiry into the matter of suburban traffic, on the result of which they have recently closed a number of suburban stations near their Broad Street terminus as affording a short-distance traffic the cost of handling which was out of all proportion to the revenue to be derived therefrom. The reasons for this policy the company placed before the sub-commission, and from that company and from the Philadelphia and Reading Railroad, the other main-line road entering Philadelphia, the commission derived much useful information relative to suburban railway passenger traffic.

From Philadelphia the sub-commission returned to New York, and there, before their departure for England, discussed with Captain Piper, of the New York Police, and with Mr. Robert de Forest, the tenement house commissioner, a number of questions relative to street traffic and the housing problem as affected by locomotion in the city of New York.

In addition to the cities mentioned above Mr. Macassey, in a preliminary journey of inquiry, visited some other cities. Among the latter, which the sub-commission themselves did not think necessary to visit, were Chicago, Detroit, Cleveland and Albany. In Chicago the whole conditions of urban transportation, which are now in a chaotic state, are under re-organisation at the hands of Mr. B. J. Arnold. In Detroit (Michigan), an important centre of inter-urban railways, communication between outlying country districts and the centre

of the city has been developed to a high degree of efficiency both by the extension of the city lines of the Detroit Railway Company as high-speed trolley lines outside the city and by the system in use of interchange of traffic between independent country lines and those of the city company. Interchange of traffic is claimed in the United States as an essential factor in rapid transit, and in Cleveland and in other cities similar systems of traffic interchange prevail.

The sub-commission were highly gratified by the able reception in the United States, and by the efforts of all connected with rapid transit in its various efforts to give them such information as they required. When it was not at the moment available, a special investigation was once ordered, and no trouble was spared to make the information as instructive and profitable as possible. Many kindnesses in the matter of transportation were shown them by the railway companies, who, in the quaint but expressive phrase, "took care" of them by placing private cars at their disposal for railway journeys, and by every one with whom they came in contact.

LAYING OF GAS MAINS.

IN the Kingstown police court, before Mr. Drury, a case heard in which the Gas Company were plaintiffs and the Dublin County Council were defendants. The Gas Company wished to open up the road known as Stillorgan Park Road for the purpose of laying gas mains and pipes, but the Council refused to approve of the plans selected by the Gas Company for laying the pipes, and the summons called on the Gas Company to attend before the magistrate and state their case. An existing difference, and the magistrate was to determine the plans according to which the road or street should be laid up and the depth at which the pipes should be laid.

Mr. Ronan, K.C., said the only question at issue between the parties was as to the depth and the mode of laying the pipes. In 1902 a serious litigation took place between the County Council and the Gas Company owing to injury by the gas mains being broken by the steam-roller of the County Council, and the witnesses of the County Council gave various depths at which the pipes should be laid, of which they should be laid as deep as 2½ feet. Mr. Collier, the Master of the Rolls was of opinion that the pipes

ay years ago at 9 inches was sufficiently deeply
en traffic. This was a case of a new main, and
l to decide was how it was to be properly made to
y by a steam-roller.

y : Yes; and we must also take into consideration
the steam-roller.

on : The heaviest roller we have is 15 tons.

n (continuing) said in this case the Gas Company
it the mains at a depth of 2 feet. Mr. Collon,
or, objected to this depth unless the Gas Company
ne County Council against any damage, or else to
at a depth of 3 feet. However, if the pipe was
the footpath it could be put at a depth of 2 feet.
iles of mains all over Dublin, and the depth was
inches, and until the introduction of the steam-
never had a break, and now 2 feet had been
safe in Dublin, and the traffic in the city was
t was on a country road.

consulting engineer at Westminster, stated, in
Ronan, that he had large experience in different
and of laying gas mains. Before the use of steam-
ins were laid at from 12 to 18 inches, but after
on of steam-rollers the mains were laid at 2 feet
at was to the satisfaction of the bodies in control
He was of opinion that 2 feet was an ample

y.
o Mr. Shannon, he said that if the mains he laid
were damaged he would hold the body in charge
responsible for the breakage. He would not
Council.

ng, chief engineer of the Edinburgh and Leith
tion, said his mains were laid at 2 feet, and they
ollers without doing any injury to the mains. His
that 2 feet deep would be perfectly safe, and he
uld be a waste of money to put the mains deeper.
on : Do you ever lay mains under a footpath?—
blic would not like the inconvenience of being
he use of the footpath while the mains would be
s of laying.

y : If they lived in Dublin they would not mind,
well used to that.

field, chief engineer of the Gas Company, stated
inion, 2 feet was deep enough to lay a main with
any roads in and about Dublin the depth is not
al those roads are steam-rolled. He had never

known of an injury from steam-rolling to a main laid 2 feet
deep.

To Mr. Shannon : They proposed to lay this pipe at
Stillorgan Park at a depth of 2 feet 5 inches, as that was the
depth of the old main. If the main was injured by a steam-
roller the County Council should pay for it, but he believed
that the main would be safe from injury at that depth of 2 feet
5 inches.

Is Mr. Collon, the county surveyor, to have any voice as to
the way the main should be laid?—I don't know.

Mr. Collon asked that the pipes should be laid on a 6-inch
bed of stiff clay when a rock was met?—We have never done
that.

Mr. Shannon pointed out that in the case before the Master
of the Rolls, it was decided that the old mains laid down by
the Gas Company thirty or forty years ago were properly laid,
inasmuch as they were laid deep enough to withstand the
traffic then on the roads before the introduction of steam-
rollers. The Master of the Rolls also said that the county
officer was the proper authority to see how the mains should be
laid. The Gas Company say that they would lay the mains at
a depth chosen by themselves rather than the depth suggested
by the county surveyor, and, in addition to doing that, they
were to hold the County Council responsible for injury to the
mains.

Mr. Collon, county surveyor, stated in reply to Mr. Shannon
that he considered that the main in question should be laid at
a depth of 3 feet. He asked the Gas Company to indemnify
the County Council for any damage to the mains if they were
laid at a depth of less than 3 feet. He thought the company
would jump at that offer, but it was refused. The pipes should
be better laid by the Gas Company, as their system of pipe-
laying was about the worst that could be carried out. There
was no proper care taken in the laying of their pipes, and if
there was there would be fewer disputes about these pipes.

Cross-examined by Mr. Ronan : Will you pledge your oath
that 2 feet is not reasonably safe?—I will not. It is reasonably
safe, but I want to safeguard the county against damage by
having the depth 3 feet. I say 2 feet would be sufficient if I
was engineer for the Gas Company.

Mr. Drury : What you mean is that you would not have any
hesitation in giving an indemnity at 2 feet deep?—I would not,
and if the pipes were properly laid I would have no hesitation
in giving an indemnity at a depth of 18 inches.

Mr. Drury : That is a very strong answer.

Mr. Drury said he had not the slightest doubt that the depth of 2 feet 5 inches mentioned in the plan was sufficient, and he made an order to that effect.

Mr. Ronan applied for costs.

Mr. Shannon did not think that the magistrate had power to give costs in this particular case.

Mr. Drury said he had and he awarded 10% costs.

EMPLOYERS AND WORKMEN IN THE IRON AND STEEL TRADES.

ON the 24th inst. the first meeting of the session in connection with the Staffordshire Iron and Steel Institute took place at the Institute, Dudley. Mr. W. Somers, in his presidential address, said a few words as to the best way to serve both masters and men. The first thing that every manager should realise was that men needed encouraging in the idea that it should be their aim and object to consider the employer's interest as identical with their own. Workmen would then know that it was their duty to get out as much work as possible, and that the work should be of the best quality. In return for this the manager would be on good terms with the men and would appreciate their endeavours by paying them good wages, always bearing in mind that the best workmen were the cheapest in the long run to the employer. A manager's duty was to be a proper medium between the employers and the employed, and to see no injustice on either side. He could safely say that their workmen to-day were much steadier and more sober than they were, say thirty years ago. There was no doubt that they were more intellectual and aimed at a higher standard, but there was certainly a lack of seriousness and a love of pleasure which was detrimental. This remark, he was afraid, applied to all classes. Many managers would doubtless be familiar with the great rush there was at midday on Saturday to attend football matches. There was, in fact, a general laxity in the work during the whole of Saturday morning, due, no doubt, to the fact that the prospect of the afternoon's sport was uppermost in the minds of the workmen. This was a want of seriousness. They did not find that this was the case abroad, where they were much impressed by the fact that the average workman spent his recreation time in educating himself thoroughly for whatever business he had entered. He did not wish to imply that men should have no pleasure or that the hours of labour should be increased, but that there was a need for more

interest and earnestness being shown whilst men were. We were apt to be too confident of our own superiority and to think that our neighbours abroad had no capabilities and advantages. On the contrary, they reaped the benefit of our experience, had educated themselves to a high state of efficiency, and their workmen all the advantages of modern science and of modern training and skilled in every detail. It was no longer employers spending enormous sums of money to reconstruct their works if the workmen did not also move forward times by putting more energy and earnestness into their work. He thought it was in the power of every manager to bring his men somewhat into line with regard to the matter, but so many of them wanted themselves more advanced in more mastery of detail and more thought for what was to happen in the future. Great Britain used to be the workshop of the world. What was it to-day? He did not think it had not prospered, but our pace was not quick enough in comparison with the rapid strides of other countries. There was no doubt there was a degree of foresight and industry amongst foreigners to-day which was not to be despised. It was the outcome of serious thought and earnest effort, and was bringing them to the front with startling rapidity. It must be met by us with the same serious thought and earnestness, and with a dogged determination that, come what may, we would hold our own. One of the difficulties we had in competing satisfactorily with foreign countries was a barrier of protective tariffs, but as that question was generally discussed throughout the country he would not enlarge upon it. It was certainly a question that required thoughtful consideration, and he hoped that the people would consider it without any political bias, but simply on the basis of loyalty, common sense, and what was the best for the country. The Railway monopoly was another great difficulty with which British manufacturers had to contend, and he was glad that the trade of this country would be materially helped if the State took over the railways. A comparison between the cost of carrying materials and goods with those of other countries showed results that were positively monstrous. In his opinion the only cure for this, so far as the Midlands were concerned, was a canal from Liverpool to London right through the shire.

Professor Turner proposed a vote of thanks to the speaker for his address, and the resolution was seconded by Mr. (vice-president) and carried.

The Architect,

THE WEEK.

always creditable to an Englishman when he insists on indicating his rights under French law, regardless of the expense or inconvenience which in consequence may arise to him. This is especially the case when it comes to a tenancy, for Frenchmen commonly say that there are no remedies for tenants' grievances. MR. WILLIAM CAS WRIGHT, who was the plaintiff in a case brought before the Tribunal Civil de la Seine on January 1, 1903, had a lease of an appartement on the fourth floor in the Meyerbeer at a rent of 4,000 francs. As usual, the conditions imposed were severe, and he accepted them, thinking that the other tenants of the mansion were similarly bound. He soon discovered that the appartement of his seemed to be a music-hall combined with a dancing academy. The street is near the Opera House, and the class of music performed could hardly be termed artistic. Part of the amusements consisted in striking the ground floor with sticks and hammers. Before a month had passed Mr. WRIGHT was obliged to call in the aid of a *huissier*, in order that he might testify to the annoyances. When the preparations were made for the proprietor, who is a viscount, as well as the other tenants, to be summoned before the Tribunal, the plaintiff, who as an Englishman did everything in the best style, engaged M. FELIX DECORI as advocate. After presenting the evidence on both sides, and taking a week for deliberation, the judge ordered the noisy occupant to pay MR. WRIGHT 40% with expenses. The proprietor should have been mulcted, for although he might not be responsible for the disturbances, he had in the person of the tenant a representative who should have endeavoured to secure a quiet possession for all the tenants. The case is interesting for another reason. Much has been said concerning the rigidity, the invulnerability and other excellences of the flooring in Paris houses. Mr. WRIGHT has found, to the great surprise of many other people, that they are not at least fire-proof. Indeed, we consider that much of the inconvenience suffered was due to their extreme sonority. That is a defect, or as POLONIUS says, "effect defective," requiring consideration in all cities where the flat system is employed.

ALTHOUGH Essex is one of the most interesting counties in England and is so close to London, there is no doubt that it has been made a victim of prejudice. It possesses a great variety of soils, and some of the most productive in an agricultural sense lie low. But many people suppose that the county mainly consists of unhealthy marshes. The growth of the Metropolis as well as other causes are gradually dispelling the old illusions about the flatness and insalubrity of the county. The people of Essex also are in many ways progressing; they are not backward, and a county of so much local interest certainly deserves more recognition than it has lately received. One indication of the modern efforts of Essex men to keep up with the times is to be found in the arrangement of a grand exhibition of art applied to manufactures, which will be held in the Shire Hall, Chelmsford, from December 1 to 5. The objects of the exhibition are (1) to stimulate the application of art to manufactures in all sections of the community; (2) to show the work produced by the students of the Chelmsford art school; and (3) to raise funds towards the equipment and completion of the new Chelmsford art buildings. The total net proceeds, after deducting expenses, will be handed over to the Chelmsford technical instruction committee for this purpose. Many of the elements which usually secure success will be combined. Besides an exhibition of art manufactures of various kinds, processes will be exhibited and demonstrated, and the students of the art classes will illustrate their competency in several forms. The committee favour is to suggest what is being done in the art school as elsewhere in the county, and in that way to show that Essex can produce something else besides corn and crops. Mr. C. H. BASKETT is the art director, and Mr. F. A. FAWKES, of the Red House, Chelmsford, has

undertaken the onerous duties of honorary secretary. The president of the exhibition is the Earl of WARWICK, who, with the Countess, will hold a reception of visitors on December 1. No efforts are being spared to insure successful results, and the anticipations of the committee will, we hope, be fully realised.

THE Commons and Footpaths Preservation Society have been successful in obtaining about 1,650*l.* from subscribers, in order to enable an action to be taken for the purpose of determining whether Sir EDMUND ANTROBUS has exceeded his rights as proprietor by enclosing Stonehenge with a barbed wire fence, by stopping some of the approaches and by exacting payment for admission to the ancient stones. The law of England upholds landlords' rights under conditions which often seem to be inequitable, and it is possible that Sir EDMUND ANTROBUS has done nothing which was not advised by his counsel. But the public, or rather a section of them, naturally wish to be assured whether so remarkable a monument, which was for so long a period visited without any restriction, can be considered as if it were an ordinary farm building of which the owner of the land had come into possession on the expiration of a lease. No one doubts the motives of Sir E. ANTROBUS in protecting the monument by a wire fence. But Stonehenge would be as well guarded if it were registered under the Ancient Monuments Act of 1883, when the Office of Works would have to take charge of it, while leaving the owner's rights intact. As there are eminent lawyers among the subscribers we may assume that a reasonable case can be made out on behalf of the Commons and Footpaths Preservation Society as representing the public, and the case will therefore excite wide attention. But we hope Sir EDMUND ANTROBUS will agree either to the registration of Stonehenge or the acceptance of a smaller sum for its purchase than was demanded.

It does not come with good grace on the part of water companies, who claim large sums on account of sinking funds and the like from the Water Board, to demur to a charge for "supervision" in connection with making good a roadway. The Westminster Borough Council claimed 89*l.* 9*s.* 8*d.* for expenses incurred in filling in, making good and maintaining in streets the pavement which had been broken open to lay or repair pipes. The Council had added 10 per cent. for supervision. The Company maintained that the Council could not in law make a charge for superintendence, but only for out-of-pocket expenses. The claim was to some extent made as compensation for the expenses incurred in keeping up repairs. Mr. BROS, the magistrate, decided that the Council were only entitled to charge for expenditure actually incurred, and could not add a charge based on averages. That could only be done by agreement. But it was to the interest of both parties that the work should be properly done, and therefore 10 per cent. had been added as in the nature of surveyor's expenses. Whether 10 per cent. was the right figure he could not say, but certainly something should be charged for this superintendence or "supervision." The Council are willing to accept the decision, but the Company are likely to appeal.

THE city of Berlin is now raising a loan of 228,000,000 marks, which will be mainly devoted to works of construction. Among the purposes already arranged are the enlargement of the gasworks and waterworks, improvements in market halls and abattoirs, electric tramways, bridges, orphanages, hospitals, lunatic asylum, penitentiaries, high schools, parks, &c. The rate of interest is to be 3½ per cent. Berlin must be considered as a city which is well administered, and at a low cost to the inhabitants. The co-operation of officials who are connected with the army and elected councillors brings more unanimity in the arrangements than would be expected. Although the country around is flat, the water supply owing to the elaborate filtering is adequate for all domestic purposes. The drainage, with the sewage farms in connection, are successful, and are often referred to as models for imitation. The annual expenditure is about 125 millions of marks, including education, police, aid to the poor, &c.

THE AMERICAN INSTITUTE OF ARCHITECTS.

A recent convention of the American Institute of Architects it would appear to be understood by the members that one subject is to be paramount. In the convention at Cleveland, held a few weeks ago, the importance of Rome as a place of study was uppermost. In the preceding convention at Washington the improvement of that city received most consideration. The offices of the Institute are in the old Octagon House, which was the residence and executive office of President MADISON when the White House was destroyed by British troops in 1814. It is, moreover, considered by some to be the best example of city residential architecture of the period existing in the United States. The property, which has 22,252 square feet in area, was acquired for 30,000 dollars, and a third of that sum has been already guaranteed by some of the members. It is wise to suggest the advantage arising from the presence of the American Institute of Architects by an endeavour to improve the political capital of the United States. But the effort has not been confined to log-rolling in lobbies. Lecturers provided with lantern slides illustrating the schemes of the Commission have been sent to the Institute Chapters in a great many cities. The result has been the creation of a national interest in the improvement of the capital, and we hope there is also a sense of indebtedness to architects for their public services. One of the consequences would seem to be that in Washington architects from other States have been called in to design buildings. A Philadelphian planned the municipal hospital, a Baltimore the pumping station, a Chicago architect the very important Union station, and a New York architect the bridge over Rock Creek.

There were subjects which although they might be regarded as subsidiary had a closer interest for architects. One was competition. Hitherto the Institute was not as a body favourable to competitions, for it is believed that the best results are to be attained without having recourse to such contests, and the standing committee on the subject adopt that view. But it is insisted there is one supremely important condition needed in every fair competition, which is the employment of professional assistance for the programme and the award. The assessor's task in America is more difficult than commonly happens in England. "Cuteness" is still rampant. One case is mentioned where a committee pledged themselves to leave the envelopes containing the names sealed up until a final selection was made. The resolve was not adhered to; an envelope was opened and the whole business settled without any consultation of the professional adviser. The Institute committee refer to the arrangement adopted to secure selected competitors for the Liverpool Cathedral by seeking photographs and drawings of work which the applicants had executed. They say, "From this position it is but a step to select an architect in the same way; in other words, to let the competitors submit for judgment not studies for the proposed building, but drawings or photographs of similar work which they have done, with such evidence as they wish, or the committee desire, as to their ability, and have competitions decided on the ground of past performance, which is, after all, a better guarantee to the client than a clever plan or a happy solution of a problem." The committee do not appear to realise that one of the advantages of the competition system is the opportunity afforded to young and able men who from the length of their studies or other causes may not have erected buildings of the class desired. A competition based on "past performance" would be restricted, and some of the finest of modern buildings in Europe would not exist if that practice had been observed.

Another report related to the schools of architecture which are found in different parts of the country. At the Massachusetts Institute of Technology there are between ninety-five and a hundred students. The standard is rising, but it attracts rather than repels. In the Illinois College of Engineering and Architecture there are forty-four students in the latter subject and eighteen in architectural engineering. The number seems small compared with the 497 students in the College of Engineering. That form of construction is known to be more prosperous than building, and it is supposed "that the average graduate of an engineering college prefers employment by a corporation

to establishing himself in a profession." The school of architecture at Columbia University has eighty-four students. Fine art has gained the upper hand, for the school was lately separated from the department of applied science and is now entirely independent. The principal of the architectural school at Pennsylvania has invited a group of practising architects to assist the regular staff in the subject of design, each member to give, during certain stages of a given period of work, his personal criticism to a student on a problem whose programme he has had to prepare. Eighty-six students attend the department of architecture at Harvard University. The number of students in Syracuse University was thirty-one. The Institute committee remark:—"A noticeable and very gratifying tendency in all schools of architecture is the development of post-graduate courses, and the increasing number of students who prolong their period of study to five or even six years." The Pennsylvania Academy of the Fine Arts have also established advanced courses of architecture which are carried on in the evening, and a open to candidates over twenty years of age who have sent at least three years in an office or in one of the specified schools of architecture. There are some scholarships enabling students to study art in Europe.

A subject which has given rise to much irritation among American practitioners is the designing of Government buildings. Successive administrations are eager to have a special department of architects, superintendents or other assistants as part of the civil service. The buildings obtained in that way are not always successful. Sometimes architects in private practice are called in to prepare designs, but the execution of the work is conducted by salaried officials. It is alleged that on those occasions much is done to discredit the practicability of the architects' drawings. A paper was read by Major SEVILL, of the corps of Engineers, who has had experience in the erection of public buildings. He is in favour of the arrangement we have just mentioned, viz. that the architect who prepares a design for a Government building should be in private practice, but that the erection of the building should be undertaken by Government engineer. The selection of the designs he would confide to three eminent private architects. The usual percentage would be paid, but the amount would be more liberal in reality, because many of the plans relating to engineering and structural design would be prepared by the constructive bureau, and fewer drawings would be required from the architects, and much shorter specifications.

In connection with this question, the latest arrangement for obtaining plans for school buildings in Boston was described. There is a school committee in the city having charge of the educational system, and they entrust all matters relating to design and construction to a school-house commission of three members, who possess absolute control of the buildings, of the architects elected to erect them, and of all the details relating to plans, specifications, &c. The head of the Commission is Mr. R. CIPSTON STURGIS, whose authority as an architect is recognised. Whenever a new building has to be erected or of the Boston architects is invited to prepare plans. The architect goes to the school commission, and the requirements are explained to him. Mr. STURGIS has already considered the subject, and he knows the opinions not only of architects, but of the school committee and other authorities about the work to be done. The area of the rooms, the size of the windows, the positions of doors, wardrobes and bookcases are all predetermined, and the aim is to attain as much efficiency as possible at the least cost. Mr. STURGIS has prepared a normal specification which is as brief as possible. Engineers are called in for heating and plumbing. The members not only advise the school committee, but, we are told, "go into the architects' offices where the drawings are in progress, and go over the details there, so that the architect making the plans for a school-house has the advantage of the best experts that they can employ, sent to his office by the city, to instruct and guide him; and the architect in adopting the suggestions of these experts knows that they will be accepted by the school-house commission." The same system, it is suggested, could be employed elsewhere, and it is claimed that no more rational or suitable way to obtain the best results can be devised.

England the belief in equality of skill among all classes of architects is so general and deep-rooted, it is doubtful whether any competition of the kind would be allowed to exert its influence.

There was another subject which was incidentally introduced before the convention, and which on another occasion is likely to be debated. An important competition was arranged, and one of the conditions was that the architects should express their willingness to give a bond not only for the faithful fulfilment of their work, but for completing the building in question for the sum assigned in the outlay. The New York Chapter came to the conclusion that the entering into such a bond was not professional conduct. But the matter was too important to be treated locally, and therefore it was brought under the notice of the congress.

It is not necessary for us to describe the efforts of the American Institute for the improvement of Washington; it is a question which, to be understood, would require knowledge of the district. In 1791, while the land was a forest, L'ENFANT, an engineer, under the direction of WASHINGTON and JEFFERSON, laid out a city with straight streets placed at right angles. The positions of public buildings were first marked, as well as squares and open spaces. The city has extended far beyond the original limits, and the intentions of the projectors were not respected. Washington is no longer a city of magnificent vistas. It is now proposed by a Commission to make arrangements by which great monuments can be erected and other works, which will be manifestations of Washington's importance as the capital of the United States. They would form objects which would determine the directions of new streets. A vast scheme which will take a long time to execute has been prepared. The convention came to the following resolution:—"That the American Institute of Architects respectfully urges upon the Senate and House of Representatives the importance of the adoption of the plans of the Commission for the improvement of the city of Washington as a whole." What is to be desired is that the American Legislature will endorse the views of the Commission and of the Institute of Architects.

THE USHER HALL GRIEVANCE.

It may be said to be a cheering sign to find that for once an architectural topic can bulk so largely in the public mind as actually to become a plank upon electioneering platforms, which happens to be the case in Edinburgh at the time of writing. Several aspirants for municipal honours have lately come before the electors, pledged in the event of their return to do their best to upset a decree of the Town Council to the effect that the Usher Hall, which, at last, is about to become a reality, shall be designed by the city works department in place of being opened for open competition. Naturally, the decision has created a great deal of feeling in both professional and lay circles, and certainly it is not a novelty that commends itself to general adoption as likely to make for efficiency. Whether it is the right course to adopt in the case of the Usher Hall is another matter, and a point upon which there is room for difference of opinion.

The whole question of the Usher Hall has been a thorny one in Edinburgh from the very outset. It is now seven years since Mr. ANDREW USHER, a prominent citizen, out of his public spirit and his love for music presented the city with a sum of 100,000*l.*, in order to provide a much-needed auditorium adequate to the musical wants of the people; and it is also seven years since the battle of the sites began, which has long outlasted the life of the "pious donor," and which was not even at an end when the Town Council took upon themselves powers to acquire a site in Atholl Crescent, for they subsequently ran away from their own decision in favour of yet another site, at present occupied by the Synod Hall.

For the Castle Terrace site, as it is called, they paid down 35,000*l.* of the bequest, leaving a balance of 65,000*l.* to depend upon the new building, a sum which represents the limit, for there is a strong feeling among the ratepayers, in spite of a general cry for economy, that the total outlay upon the scheme, the site included, must not exceed the

amount of Mr. USHER's gift. Accordingly it has been decided to practise thrift by utilising the present framework of the Synod Hall, but on the understanding that its façade, a cumbrous structure topped by cypolepean cannon balls of stone, shall be improved away.

The site and its treatment being fixed upon, the next step was to appoint an architect, and the Town Council were originally in favour of following the usual method by setting an open competition afoot. But after investigation they concluded that it would be wiser to entrust the designing a hall to the city architect's office, not only because an outsider might pooh-pooh the foundations and side walls of the old building, but chiefly because they could thus hope to keep a closer grip upon the expenditure.

Needless to say the decision has come as a surprise and a disappointment to the architects in the city; and the President of the Edinburgh Architectural Association has expressed the feelings of his professional brethren when he said that many Edinburgh architects, and doubtless others also, have been long looking forward to the unique opportunity of striving for the Usher Hall in the usual way. He pleads that such a competition, well carried out, would do more for architectural education among the entrants, whether successful or not, than years of academic teaching; and he claims that something is due to a profession which has done so much for the beauty of Edinburgh in the past—a view which did not fail to find an echo, be it said, in the Town Council itself. In other quarters it is being asked whether one of the finest sites in Edinburgh, a site in full view, in the centre of a noble terrace of buildings, without an equal in the city for picturesque situation, balance and skyline, whether this site ought to be handed over to the discretion of a department? Assuming the exterior beauty of the building to be a secondary consideration, it is also urged that in planning the interior all regard must be had to the decorative effect, and in the highest degree to the acoustics, of this house of music—the most difficult of problems, as appears from the fact that one of Edinburgh's finest halls is an acoustic failure, and a problem that demands special skill and science hardly to be expected with justice from a municipal department. In short, the consensus of opinion in professional circles is strongly in favour of allowing the work to become a subject of competition to be held under conditions like those which have succeeded in England.

From the æsthetic point of view, nothing could well be fairer; but there are other and weighty considerations beside. The ex-Lord Provost of the city, who is himself closely connected with the building trade, has said that an open competition would involve more delay than should be faced in view of the seven years during which the scheme has already been in abeyance; and he believes that there is "power and genius" enough in the city architect's office "to provide an elevation second to none in the kingdom." Further, the Usher Hall is apparently not to be the splendid pile of the visions of some who call for a contest open to the architectural talent of Edinburgh, of Scotland, of the world. There is not sufficient money for that; the Usher bequest is not to be exceeded by the fraction of a farthing; and for this reason alone the authorities are supposed to be well-advised in tightening the purse-strings by allotting the work to the officials of a department in which, it is only fair to say, there is no lack of ability.

Again, it is pointed out that the city of Edinburgh has been somewhat unfortunate in its past experience of architectural competitions. Thus, in 1887 fifty-six designs were obtained in a competition to erect new municipal buildings, a scheme which came to nothing. Since then and of late the civic premises have been largely and successfully remodelled; but in this case it was not the successful competitors who were appointed to do the actual work. In 1896 another competition was held in connection with the great "North Bridge buildings" undertaking, and two "promising juniors" were placed first in the award; but here again the work was deputed to other hands, a repetition of which policy has been seen in the instance of the county buildings lately completed. These precedents were costly to the city and not encouraging to architects, as those who are most eager to make the Usher Hall a subject of open competition must even admit; though they may plead on the other hand that when Mr. CARNEGIE gave

Edinburgh 50,000*l.* to provide a public library, a fine plan was secured in open contest, Mr. WATERHOUSE, R.A., being assessor, and the building was carried out, too, at a price within the sum assigned.

Of course, there are two sides and a grievance for every question, nor have we yet heard the last of the Usher Hall and its architect; but though the authorities are likely to cling to their idea of getting a home-made plan for the building, there are signs that something in the nature of a compromise between the parties will be effected by appointing a consulting architect who will act in conjunction with the local department.

PATTERN DESIGN.*

IN order to appreciate Mr. DAY's latest book, a reader would do well to compare it with "The Anatomy of Pattern," which was the first of what is now a rather numerous series of text-books. The older work is to the new what a geometrical basis is to an elaborate piece of ornament, for although there is a connection it is not to be traced without difficulty. It is creditable on Mr. DAY's part to endeavour to render his book as complete as possible, regardless of the trouble to himself. But in the change we have also a suggestion of modern practice. It was not entirely an advantage to reveal the mechanism which at all times and at all places was adopted by ornamentists. The Gothic artists made little mystery about their diapering or other surface decoration. In the majority of cases a worshipper in a church need not be distracted by endeavouring to discover the relationship between the elements of the ornament. The Moors, on the contrary, created mysteries. But we doubt whether any but the craftsmen were able to realise, like the ordinary visitor to the Sydenham Court after reading OWEN JONES's exposition, that by means of a diagonal and circular arrangement for basis it was possible to have very intricate ornament, which became more elaborate and astounding by making the lines grow out of a parent stem. By adopting straight lines only the abominable checks and plaids which, according to OWEN JONES, disfigured the human form became the result. But by correcting the straight or rectangular by the angular, and the angular by the curved, very subtle combinations could be arrived at.

Everybody may not be competent to design simple patterns, but all are in a position to criticise them. Women are now as able to pass severe judgments on the papering of the walls of a drawing-room as on the dresses of those who receive them in it. In this neurotic age it becomes almost impossible to avoid a sort of dissection of the pattern of wall-paper, and one often hears people complain of insomnia because they could not resist the temptation to discover the elements of the ornament in their bedroom. "Who has not suffered in his time," asks Mr. DAY, "from wall-paper or other patterns in which certain ill-defined but awkward stripes would thrust themselves upon his attention? A design which appears to be quite evenly distributed will run, when hung, into lines which slant in such a way as to give the impression that the walls are not true, or that the paper has been hung askew." That is a very common experience. There is, we fear, no remedy for it. Wisdom brings woe and knowledge care in room-papers, as in more important things. One consequence is that many people prefer to cover their walls with coloured papers that are patternless, or to employ the excellent distempers which are now available. Keepers of hotels and lodging-houses would do well to act in that way, especially in bedrooms. In the textiles employed for dresses or for curtains repetitions are not so injurious. But planes when covered with elaborate patterns often seem to mock the eyes which regard them. The lining paper introduced of late by Mr. DAY in his books is a flagrant example of useless perplexity, and is far less pleasing than the simple Japanese pattern which at one time was used.

Adopting the old principle that geometry is the basis of

all pattern, Mr. DAY treats in succession of the square, triangle, the octagon and the circle, and he concludes part of his book by saying "the limited variety of shapes upon which pattern is built is nowhere more plainly obvious than in the way in which, in the maze of design, we find ourselves, no matter on what path we set out, arriving and over again at precisely the same point." This describes such aids as dropping, turning and manipulation of elements. A very important chapter is devoted to pattern planning in relation to technique, and another to proving patterns. There are others on colour, but the expedients and invention. From the last we take the following passage:—

Inspiration comes to a man from without as well as from within; every competent designer, you may be sure, has an infinite number of studies both from nature and old work. But he does not work from them nor often refer to them except, perhaps, to refresh his memory by way of prelude to design. The sight of them before his eyes would be a hindrance to him. Spontaneity of design is only then possible when the idea, whencesoever derived, is, so to speak, fluid in a man's mind—so that what his eyes took in as a fact flows out from his finger-tips in the form of fancy. Neither is it possible to design straightaway from nature. A designer acquaints himself with natural form, natural colour, natural growth and so forth, especially with everything suggestive to him of ornament. In designing he uses not so much these as memories of them. Just so much of nature as comes to him at the moment, just that in nature which comes unbidden is to the pattern. The rest is overmuch. Ornament can digest no more, just as nature can digest no more. It is not so with suggestions from old work. A man has become so much a part of a man that he is no longer conscious whence he had it, does not realise that it is not of his own, that he may make use of. More than that, it is dangerous to borrow if he would keep alive in him the spark of design.

Inspiration, spontaneity, derivative suggestions, and so on, do not necessarily produce the most perfect result offhand. Mr. DAY shows by a number of examples how a motive which might be considered for the moment good of its kind can be modified in several ways with advantage. We see, too, in one case that a form which originally possessed piquancy, if nothing else, becomes after consideration and change "no more than a false start in design." BEAU BRUMMELL's laundress derived a good deal of her inspiration from the vast number of cravats which had to be employed before one could be tied in a way which would enable a great man to appear in Bond Street without any loss of reputation. Designers, like dandies, must not be allowed to spoil the good in seeking after the better. Indeed, it might be considered as the test of a genuinely happy thought if it can be converted into one that is happier. Mr. DAY does not pose as one of those artists whose pictures are guided by an angel. He reveals some of the secrets of his studio as if he did not mind people being told that he owed his success simply to his capacity for taking pains. One remarkable design of his own was particularly adapted for an embossed paper, showing great leaves and spirals growing into the forms of animals, is alleged to be only a freak of invention. Mr. DAY says, "creatures thrusting themselves upon the attention would be unpardonable in ornament. As giving a point and piquancy to a tangle of scrollery, they thrust themselves now and again." In this case the animals seem apposite enough. No one who studies nature is surprised when, on walking through rank grass in one of the English southern counties, a snake occasionally appears. It emphatically expresses the power of the soil and the Vegetable forms are living organisms, but when they become allied to animalism.

The designs express one characteristic of our age, and denote that the days of symbolism, like those of classicism, are gone. In that way we have broken with the traditions which went back to a remote age. With the exception of the Royal Arms of England, forming a panel, the designs, of which there are nearly 300, are mainly adaptations of leaves and flowers. We cannot therefore apply to modern ornamental forms what WILLIAM MORRIS said of the Egyptian diapers—that they are "symbols of the mysteries of nature and religion." The ambition of the time does not reach that height, and it is not clear how a figure of a beetle or a snake could elevate men's thoughts.

* *Pattern Design*: A Book for Students, Treating in a Practical Way of the Anatomy, Planning and Evolution of repeated Ornament. By Lewis F. Day. (London: B. T. Batsford.)

time. Pleasing forms must now be presented, and there is no longer protection for defects, because they are exposed to possess interest of some other kind and be suggestive of higher truths. The designer has therefore a harder task than his ancient predecessors. To be successful must captivate the attention of spectators, while simultaneously he knows that the interest in his work is only momentary. He must make his piece appear to have unity and avoid spottiness, while the details have to sustain unity. As he has to depend on repetition it is almost impossible to avoid monotony. Even the placid Dutchman found it necessary to make an effort to overcome monotony by applying colour in a freakish manner in their tapestries. The Japanese also seemingly applied a covering of gold as skilfully and as wildly.

It does not always happen that the rewriting of a book is successful. The motive force of the intellect appears to be unequal to such attempts. There can be no question of Mr. DAY's "Pattern Design" being superior in every way to his "Anatomy of Pattern." The latter can still be called a masterpiece, but in "Pattern Design" we have the results of a matured experience and of a longer and more varied practice in design. Mr. DAY makes no secret of his methods, and in the pages of the new book the student will find profitable instruction which is out of proportion with the small sum that has to be paid for it.

THE KING EDWARD VII'S SANATORIUM.

On Tuesday His Majesty King Edward VII. laid the foundation-stone of the Sanatorium for Tuberculosis at Henley Common, about four miles from Midhurst. When soon after the King's accession Sir Ernest Cassel presented 200,000*l.* he employed for some public or philanthropic purpose, His Majesty decided to devote the money to a sanatorium for sufferers from tuberculosis. An advisory committee was appointed to consider the arrangements. It consisted of Sir John Lubbock, Bart. (chairman), Sir Richard Douglas White, Bart., Sir Francis Laking, Bart., Sir Felix Semon, Sir Hann Weber, Dr. C. Theodore Williams, Lord Sandhurst, Colonel H. A. Lascelles and Sir Frederick Treves, Bart.; and Mr. Horton Smith and Dr. John F. H. Broadbent were appointed secretaries.

Invitations were issued for essays and plans. About one hundred and eighty were submitted. The first prize of 500*l.* was awarded to Dr. Arthur Latham, with whom was associated, the architect, Mr. William West. Dr. F. J. Wethered and Dr. C. Morland were the other prize winners. The proposals of successful essayists were described in *The Architect*. The next steps are described in the following address, which was read by Sir William Broadbent before the ceremony took place on Tuesday.

May it please your Majesty,—The advisory committee appointed by your Majesty to carry out your Majesty's gracious decision of providing for the open-air and sanatorium treatment of consumption occurring in the classes above the very poor but unable to meet the expense of prolonged residence in a sanatorium, desire humbly to express their satisfaction that the project has reached the stage which offers the occasion for your Majesty's presence here to-day.

The site, which after examination of many parts of the country they were able to secure, fulfils in their judgment every requirement for such an institution, and they trust that its advantages will be apparent to your Majesty even at this early stage of the year. The extent of land acquired is 151 acres, which was purchased from Lord Egmont. To the south it is level and covered by heather and bracken, while the northern higher part is well timbered by fine fir trees. The ground slopes gently to the south, affording a maximum of exposure to the sun; the soil is the lower greensand and the climate is particularly suitable.

The building will stand at the elevation of nearly 500 feet, and will command a view over the valley of the Rother to the Downs. It will be sheltered from the north and east by a gradual rise of the ground to a height of 630 feet, and by a belt of pine-woods, which will be laid out in walks suitable for graduated exercise which forms part of the treatment. To the west is an open common with fine views, which will be available to patients who are convalescent and capable of vigorous exercise. The plans and elevations of the sanatorium, designed by Mr. Percy Adams, the architect, have been submitted to your Majesty. In order that the best principles of construction and management as approved by the experience of existing sanatoria, and new suggestions in advance of these,

might be brought to bear upon the institution, your Majesty offered prizes of the value of 500*l.*, 200*l.* and 100*l.* respectively for the best essays and plans, and, with the same object, members of the committee and the architect visited sanatoria on the Continent and in this country. The part of the building to be occupied by the patients will be a long two-storey building. Each patient will have a separate room, and there will be a balcony upon which the patients can sit out, or upon which the bed, in case of need, can be wheeled. For the further enjoyment of open air there will be Liegehallen and shelters in the grounds. The total number of beds will be 100, and at your Majesty's suggestion accommodation has been provided for twelve well-to-do patients, so as not to shut out entirely the more wealthy classes from the special advantages which it is hoped will be afforded by the institution. Some delay has been occasioned by difficulties with regard to the water supply. According to the Geological Survey, water of excellent quality was to be found in the greensand underlying the site. This proved to be the case on boring, but the water was laden with extremely fine sand, which would have interfered with pumping and rendered the supply uncertain. It was, therefore, necessary to go elsewhere, and springs issuing from the same stratum of greensand to the north and capable of supplying 60,000 gallons a day have been secured by purchase from Lord Egmont. The water, collected as it emerges from the ground, is conveyed to a collecting reservoir near Henley Common and pumped up to a cistern holding 160,000 gallons at the highest point of the site, about 100 feet above the roof of the building. It will thus be available in case of fire as well as for the daily demand of the sanatorium, which is estimated at 20,000 gallons as a maximum. The committee desire to tender their humble thanks to your Majesty for the encouragement afforded them in their task, and for the interest manifested in the beneficent work placed under their supervision, a striking instance of which is given in your Majesty's presence here to-day. It is their earnest hope that the erection of which your Majesty now lays the foundation-stone may be worthy of the name it will, by your gracious permission, be honoured in bearing—The King Edward VII. Sanatorium.

The King, in his reply, said:—My lords and gentlemen,—It gives me great pleasure to come here to-day to lay the foundation-stone of my sanatorium for tuberculosis. When a generous donor, whom I regret I am not allowed publicly to thank, placed at my disposal a large sum of money for any philanthropic object which I might have in view, I at once decided to devote it to the erection of an open-air sanatorium, having been so greatly impressed with the immense benefit which institutions of this nature conferred on those suffering from pulmonary diseases. It is my hope that by these means the malady may be arrested in the case of not a few of those who will be treated in the institution; while I further trust that on their return home, by diffusing among their relatives and friends a knowledge of the infinite importance of fresh air and sunshine in maintaining health, the conditions under which in so many homes tuberculosis flourished will be sensibly diminished. I note with satisfaction that the site which my committee have secured fulfils all the essential requirements of a sanatorium; and I trust that the sandy soil, the southern aspect and the pine trees, which give protection from the north and the east, will assist in restoring health to the inmates of the institution. I am aware that this site has not been chosen without investigating many others, and I thank my committee, and especially among them Dr. Theodore Williams, for the many visits which they have paid to other possible sites in various parts of England. You have alluded to the difficulty experienced in obtaining a satisfactory supply of water and to the delay which has in consequence been caused in commencing the building of the institution. This was unavoidable, for without a proper supply of water an otherwise excellent site becomes valueless. I am glad now to know that through the ingenuity and skill of Mr. Brough Taylor all difficulties have been overcome, and that an ample supply of absolutely pure water has been obtained. I observed with satisfaction in driving here the condition of the road leading to the institution which has recently been constructed. The great rapidity with which this has been completed under the supervision of Messrs. John Aird & Sons is, I hope, an earnest of the way in which the building of the sanatorium itself will be pushed forward now that all preliminary difficulties have been overcome. You have alluded in general terms to the character of the building which will be erected. As you have rightly stated, it will be for the accommodation not of the very poor (they are already being provided for), but of those of slender means who are unable to meet the expenses of prolonged residence in private sanatoria. A certain number of beds will also be reserved for more wealthy patients. I am glad to know that, while no unnecessary comforts which will add to the well-being of the patients will be omitted, there will be a total absence of all luxury and of expenditure of money on superfluous appointments.

After the foundation-stone was laid, Mr. Percy Adams explained the plans to the King. The erection of the building will probably cost 60,000*l*. The contract for the foundations is in the hands of Messrs. Longley, of Crawley.

BRITISH SCHOOL AT ROME.

THE annual meeting of subscribers to the British School at Rome was held on Tuesday. Sir Archibald Geikie, F.R.S., was chairman. In the report for the session 1902-03 the committee expressed their great regret that Mr. Rushforth had, in consequence of ill-health, not found it possible to retain the directorship of the school. It was largely owing to Mr. Rushforth's scholarship, tact and ready courtesy that the school had won the position it held in Rome, and especially in the estimation of the other foreign schools. The committee had appointed in his place Mr. H. Stuart Jones, Fellow and tutor of Trinity College, Oxford, and considered themselves fortunate in having obtained the services of a director whose reputation both as scholar and teacher stood so high. Trinity College had elected Mr. Stuart Jones to a research Fellowship, a very welcome addition to the somewhat meagre stipend which the director at present received. The liberality of a friend of the school had enabled the committee to appoint, as assistant director for two years, Mr. Thomas Ashby, who had been a student at the school for the last two years, and for some time had discharged the duties of director. There had been four students during the past session. Mr. Ashby had continued his researches in the Campagna, and at the International Historical Congress he opened the first meeting of the archaeological section with a paper on an unpublished collection of drawings of monuments along the Via Appia, which would be published by the kindness of Mgr. Duchesne in the *Mélanges* of the French school. Mr. Cuthbert Blakiston continued his study of the fourth century A.D. He visited Dalmatia, and also examined Roman remains in Austria and Germany, but unfortunately ill-health had prevented him from getting the results of his work into form for publication. Mr. McIntyre came out for the first time with a bursary from the University of St. Andrews. His main work was the collation of the eleventh century M.S. of Plato in the Vatican, with the object of defining its relationship to the Vienna MS. known as "W." His collation had already been used in the new Oxford text of Plato now in course of publication. The fourth student was Mr. Webb, gold medallist and travelling student in architecture of the Royal Academy. Mr. Webb had for more than a year been resident in Italy, and had devoted special attention to the Palazzo Linotte, the Cancelleria and the Renaissance tombs in the churches. The second volume of the "Papers of the British School at Rome" was now in preparation, and would contain photographic reproductions of a volume of Roman studies by Andreas Coner, an artist of the beginning of the sixteenth century. Since the last report the library had steadily increased. Thanks to the liberality of Mr. Thompson-Yates, a complete copy of the "Corpus Inscriptionum Latinarum" had been secured. Dr. Steele had again presented a valuable collection of books, about one hundred volumes in all. The committee had also to acknowledge a second grant from the Oxford University Press and gifts of books from Dr. Hodgkin, Professor Pelham and others. Mr. Ashby, senior, presented to the library a valuable copy of Vasi's "Panorama of Rome." The most important purchases had been those of complete sets of the "Bullettino Comunale," and the "Notizie degli Scavi." The committee had accepted with great regret the resignation, rendered inevitable by his appointment as director of education in the West Riding of Yorkshire, of their hon. secretary, Mr. W. Loring. Mr. John ff. Baker-Penoyre, the librarian of the Hellenic Society, had been appointed secretary of both the schools. The receipts from subscriptions during the year amounted to 546*l*., as compared with 477*l* in the previous year. The total income for the year was 591*l*. The expenditure in England and at Rome amounted to 455*l*., leaving a surplus of 136*l*. The donations during the same period amounted to 362*l*., of which 200*l*., received from an anonymous donor, was specially earmarked for the stipend of an assistant director. The total result was an increase of 248*l* in the balance in hand. But the expenses still to be met were very heavy, and the future development of the school was likely to be seriously hampered unless a considerable addition was made to its resources.

Sir A. Geikie bore testimony to the value of the school, even at its present state of development, to the Englishman desirous of making researches in Rome or the Campagna. He also stated that he had found the topographical work in the first volume of the papers of the school to be indispensable for explorations round Rome, and touched briefly on the geology of the Alban Hills, as bearing on the early history of Rome.

Professor Pelham (president of Trinity College, Oxford) moved a vote of condolence with the Imperial German Archaeological Institute in Rome, the oldest of the archæo-

logical schools in Rome, upon the death of Professor Mommsen. Touching briefly on the career of Mommsen, he said that he knew no finer incident in the history of scholars than the arrival of Mommsen in Italy. He came as a young man, with a slender bursary, and tramped through all the provinces of Southern Italy, copying whatever Latin inscriptions he could find. When he had made a collection he succeeded in putting it through the press as the "Inscriptiones Regni Neapolitani Latine," that work became the model of the great "Corpus Inscriptionum Latinarum," now nearly completed. In late years his relations with this country had been strained, but that was now forgotten. It was pleasant to think that his last published letter he had held out a hand of friendship towards this country. Mommsen had always had a high regard for English scholarship. When a fund was established some 20 years back for the exploration of Asia Minor, Mommsen wrote a letter expressing appreciation of many "learned rovers," such as Leake, that England had sent out.

LONDON UNIVERSITY AND TECHNOLOGY.

ON Monday a lecture on "The Work and Aims of the London University" was delivered by Sir Arthur Rucker (the principal) at the London Institution. He began by stating that a modern university had to concern itself with teaching, with research and with technology. No one of these could be omitted, and he believed that they mutually supported and aided each other. The London University was bound by its statutes to organise, improve and extend higher education within a radius of 30 miles of the University buildings, the spirit in which this work was to be carried on was shown by the fact that it was authorised to give degrees for research and to establish new faculties of engineering, economics, political science, which was specifically stated to include commerce and industry. It started on this great task very sparsely equipped with funds. The Government gave them a dignified centre in the Imperial Institute buildings and 8,000*l*. a year which was carefully calculated to supply the actual needs of the University for the central staff and for carrying on the examinations, leaving the magnificent sum of 1,500*l*. yearly with which to improve, organise and extend higher education in London and 30 miles around. He did not grumble at this. No one was specially to blame. The fault did not lie with the Government officials, but with the English people, who in all matters connected with education, except elementary education, were ever asking that bricks should be made without supplying straw. However, the London County Council put aside an annual grant of 10,000*l*. for the University, and that had enabled it to start from the first as a teaching University. All that could be done with that sum, and without further expenditure, to provide ordinate teaching in the various faculties had been done. The results of the efforts which had been made were already telling upon the number of students in the University. Since 1870 the number of persons who had entered the University in a year had risen from 1,890 to 2,900, while in the intermediate examination the numbers had increased from 703 to 1,400. But, though much had been done, much remained to be done. It was essential, in carrying on the work, that the efforts of the University should at particular times be concentrated on particular objects, and at present three schemes had been proposed. For two of them larger resources had been accumulated, but not one of the schemes could be carried out until its resources had been augmented. The first of these was the incorporation of University College, which had offered to place its whole property at the disposal of the University and under its control. The University would thus be made at a stroke the greatest teaching body in London, and its position as a teaching University, and not as a mere agent between competing colleges, would be secured. In order to carry out this scheme 200,000*l*. was needed to make the college ready for incorporation. The Drapers' Company had given 30,000*l*. for the object, and altogether about 100,000*l*. had been raised. The scheme was delayed for the want of another 100,000*l*. amount. The second scheme was connected with the general medical schools of London. They were at present hampered by the necessity of providing education in subjects such as physics and chemistry, which could be equally well taught at a distance from a hospital, and they were anxious that the University should undertake the whole of that work. The proposal would co-ordinate teaching in London, and its beginning could be made if 100,000*l*. were provided. The third scheme was proposed by Lord Rosebery, who, as a member of the University were pleased to know, was still to remain their Chancellor. There was at present a unique opportunity for obtaining 4½ acres of land at South Kensington on the site consecrated by the late Prince Consort to science and art. Two colleges, the Royal College of Science and the Central Technical College were near at hand, and, if it were

able to secure the land, sufficient endowment and the creation of those institutions, a magnificent college of technology could be formed. Large sums had been promised by private donors for this purpose, and the County Council had voted 20,000*l.* a year as an endowment if certain reasonable conditions were fulfilled. It was understood that about 10*l.* more was needed to carry out this plan also. There had to have been some misconception as to the aims and objects of the promoters. It was intended that the new College of Technology should be in no way hostile to existing agencies for supplying education in science or technology. On the contrary, it was hoped that there would be the closest and mutual co-operation between them. It was also intended that the great technical societies, such as the Institutions of Civil, Mechanical and Electrical Engineers and others, should be called into counsel, and when the money was provided would help in deciding how it might be spent. It would probably be impossible to concentrate the whole of the technical teaching in technology on any one site, but it was impossible, and was in every way desirable, that there should be a centre round which other agencies could be grouped. The existing institutions at South Kensington, the neighbourhood of the scientific and technical museums of the Government and of the University itself made South Kensington the most appropriate site, and it might surely be hoped that the comparatively small sum now wanted to bring all existing agencies together would before long be found. Upon the carrying out of these schemes depended, among other things, whether the University should be in reality a great teaching body or not. The London University wanted the London University to take a considerable share in directing the allied forces of education against the common foe of ignorance. The action of the University College made it possible to accomplish this object in a very short period in the history of the University. He viewed with anxiety the events of the next few months. Should the scheme for incorporation fall through, which he did not think would be the case, the scheme for a teaching university in London would be thrown back half a century. It had not been wise to put forward schemes which, perhaps, could not be realised for a century, but the Senate had approved certain schemes, and these, he trusted, London would do all it could to help. Slowly but surely the colleges and teachers were drawing nearer together and nearer to the University. The great supporters of higher education in London had agreed to assist—the London County Council, Technical Education Board, the City companies and charities, private colleges, Trinity College and the Government itself. But the question still remained whether this great movement was to be a mere impulse frittered away by the various obstacles and difficulties which must necessarily be met with in carrying out the great scheme, or whether it should be something more than an impulse—a steady stream moving in the direction of making the London University one of the greatest universities of the Empire.

TESSERÆ.

Doorways.

WITH the Classical architects the doorway was always square-headed, either furnished with mere bordering mouldings or architrave mouldings as they are called, or else it was arranged as to give an appearance of construction, its being treated as pilasters with capitals and bases supporting the lintel, which is in this case often crowned with an entablature. To relieve the lintel from the weight of the mass above the Romans commonly turned an arch of construction, which is, of course, the effective head of the aperture, but they were ashamed of the artifice, and always concealed it under plaster or marble decoration of the wall. In the Middle Ages doorways, on the contrary, where this construction is used, it is always ostentatiously displayed, as in the usual doorways of Pisan churches, in which the mouldings and style decoration exhibit a very slight departure from the Classical. When the lintel is freed from the wall above it it is no longer called the transom, a term implying a stone, free above and below, is sustained only by its extremities and serves as a horizontal bond. Instead of the pilaster supporting the transom may be supported at each end by corbels, or may be left without any apparent support. The transom sometimes formed into a segmental arch; this is a favourite device at Siena, where a great number of doors may be seen decorated, and also occurs in the west door of the Eremitani at Padua. In the Gothic of our own side of the Alps the doorways are often divided by a pier which sustains arches and some- times, and in the Flamboyant style the transom is a very flat arch. The bisection of the doorway is not common in Italy, but occurs at S. Anastasia and S. Fermo Maggiore at Verona. Lastly, the transom is rarely found in England; perhaps the impulse it carried have led to its destruction.

Celling Paintings in England.

Verrio and La Guerre introduced the fashion of ceiling painting into England. They were well calculated for it; but Thornhill and Kneller wasted their time and talents upon such performances. Thornhill painted at Oxford the Ascension on the ceiling of Queen's College Chapel, and the "Resurrection vestita" of Archbishop Chicheley in pontificalibus. Verrio set the example in England, as Michel Angelo in Italy, of introducing real portraits under allegorical semblance, in which his absurdity was only exceeded by his malevolence. Of this circumstance there is a memorable instance at Windsor. Verrio has introduced a portrait of Lord Shaftesbury as the demon of sedition, and the housekeeper as a fury. Sebastian Ricci's brother dressed as a gentleman in the style of Charles II. is made a spectator of one of our Saviour's miracles, at Bulstrode. At Greenwich, Sir James Thornhill has habited King William in armour, with silk stockings and a flowing wig. He received 6,685*l.* for the whole work, at 3*l.* the square yard for the ceiling and 1*l.* for the side walls, which price was adjudged to him by a committee of artists in 1717. It was stated in his "Memorial" that Rubens had received 10*l.* a yard at Whitehall, and that Verrio at Windsor and Hampton Court had been paid 3*l.* 12*s.* a yard, besides many presents from the king. The Duke of Portland agreed to give Sebastian Ricci 1,000*l.* for three rooms only. Verrio was the only artist to whom Charles II. was liberal, and towards him he was profuse—but Verrio had impudence and wit.

George Clarke, LL.D.

One of the amateurs of architecture produced by Oxford was George Clarke of All Souls College, where the great luminary of architecture, Sir Christopher Wren, had likewise studied. Dr. Clarke was associated with Hawksmoor in the plan of the new quadrangle and Codrington's library for that society. The style is original, more like Gothic than Grecian, and though capricious and irregular in the extreme, the whole effect is far from displeasing. Hawksmoor universally mistook whim for genius, and a love of ornament for taste. But Dr. Clarke planned the library which completes the square of Peckwater at Christ Church, and which became the superb repository of Archbishop Wake's and Lord Orrery's books and of General Guise's pictures. It consists of one order of rich Corinthian columns of three-quarters, and considerable height and diameter. The idea of this manner was supplied by Bernini, who filled up with apartments the grand colonnade which remained of the Basilica of Antoninus at Rome, which is now the Dogana or custom-house. In Dr. Clarke's first plan he had placed a turret like that at Queen's College in the centre, the omission of which no one will regret. One great character was intended by the architect, which is that of magnificence; it was beyond his talents, and heaviness prevails. In the library, hall and chapel at Worcester College, which are due both to his munificence and his skill, there is a greater simplicity and more success. Yet the hall and chapel would have been more happily connected by a portico. As a private gentleman well versed in architecture he must yield, in all points, to Dr. Aldrich, but he had more science if less taste than his contemporary Lord Burlington. Dr. Clarke represented his university during fifteen sessions in Parliament. He was appointed one of the Lords of the Admiralty. He bequeathed his valuable collections of architecture to Worcester College, including his copy of Palladio with Inigo Jones's notes in Italian. Dr. Clarke died in 1736 in his seventy sixth year.

A Lecture will be delivered by Mr. Hugh Stannus, F.R.I.B.A., before the Society of Designers on Tuesday evening, the 17th inst., entitled "Ancient Architecture in Egypt," illustrated by lantern slides from photographs taken by Mr. Stannus.

The Corporation of London have given public notice that the by-laws dealing with the demolition of buildings will be submitted to the Local Government Board for confirmation on December 3. A copy of the proposed by-laws can be inspected at the Guildhall.

The Committee of the memorial to the late Archdeacon of Chichester (the Ven. F. J. Mount) resolved that "It is desirable that the screen removed in 1866 be, as far as possible, restored to its original state, omitting the gallery, and set up again behind the altar in the cathedral as a memorial to Archdeacon Mount." Mr. Somers Clarke will prepare the plan.

Mr. W. D. Jenkins, of Birmingham, at the recent examination to qualify for membership in the Society of Architects, obtained a special certificate of honours and the gold medal of the Society. He is the first to have attained this distinction, to obtain which it is necessary for the candidate to have passed in every subject of each section at one examination, and to have secured at least 80 per cent. of the obligatory marks.

NOTES AND COMMENTS.

PROBABLY there is no man living who would be able to say with any certainty how many rooms are to be found in the Palace of the Vatican. Attempts have been made to count them, but they all seem to have failed before coming to a conclusion. When it is remembered that there are over 200 staircases, the rooms they lead to must be puzzling from their variety. The outbreak of a fire on last Sunday evening must, therefore, have excited much commotion, for it was easy to imagine that if the fire spread there might be many people in out-of-the-way chambers who would have no hope of escape. The POPE evidently realised that the Vatican and its contents were property which he held in trust for the world and for posterity. Regardless of etiquette and personal considerations, he promptly applied to the secular authorities for firemen. The message was received in a corresponding spirit. Men and engines were at once despatched, and the operations continued until the conflagration was suppressed. Some documents are believed to have been destroyed, but so far as can be discovered at present, no work of art has suffered.

ONE body of men must have felt anxiety during the fire, viz. the Commission appointed by the late POPE to make arrangements for preserving the paintings by MICHEL ANGELO in the Sistine Chapel. LEO XIII. said at one time that there was no man living who was competent to touch a line of MICHEL ANGELO'S without injuring it. The POPE therefore wished to overcome if possible any necessity for restoring the figures. There is no doubt they have already suffered, but restoration in the ordinary sense of the word would be sacrilege. The late POPE accordingly appointed a Commission consisting of Professor SEITZ, who has charge of the wall-paintings of the Vatican, with MM. MANNUCCI, NOGARA, GALLI, GAI, BONI and others, to investigate all the causes likely to lead to injury to the figures. It was discovered that the timbers of the roof of the chapel were decayed and it will be necessary to remove them. Iron or steel beams will be substituted, and precautions adopted to render the roof as little liable to danger from fire as possible. The large photographs which have been taken of the paintings reveal that the surface has been injured in several places. Indeed, from the number of years which have elapsed, by which the figures are darkened, not even photographs can always show all the injuries to the surface. MICHEL ANGELO is generally supposed to have been one of the most serious of men; but, as became an Italian, he was fond of a practical joke. In order to cause alarm to BACCIO PINTELLI, the architect to the chapel, who considered his building to be enduring, the great artist painted a couple of cracks on the ceiling. The paintings have lasted for nearly four hundred years, and it would be a calamity if their destruction could not be resisted.

ILLUSTRATIONS.

CATHEDRAL STRIPS.—EXETER: ST. GABRIEL'S CHAPEL AND
END OF BISHOP OLDHAM'S CHANTRY.

ST. GABRIEL'S CHAPEL, with St. Mary Magdalene's, may be said to flank the lady chapel at Exeter on the north and south sides respectively. Bishop BRONSCOMBE, who held the see for twenty-three years (1257-80), selected St. Gabriel's Chapel as his burial place. It was therefore altered in character, and it is believed the chapel of St. Mary Magdalene was simultaneously restored. In 1301 it would appear that the two chapels were included in the painting "of the vaulting with gold, silver, azure and other colours." In the course of the restoration under Sir GILBERT SCOTT, the two chapels received much attention, and the vaulted roofs were coloured in accordance with the arrangement adopted in 1301. Some monuments which were innovations were removed, and two early piscinas were discovered. The south window in St. Gabriel's Chapel is a restoration; the east window, in which angels are introduced, may be considered as new.

NEW ESTATE OFFICE FOR THE EYRE ESTATE, 125 PARK
ROAD, N.W.

THIS building has been recently erected for the trustees of the Eyre estate, to take the place of an old building which had been used for the purpose, and which was

about to be pulled down. It contains on the ground floor a clerk's office and private room for the agent, with a room opening out of it, a waiting room and lavatory and w.c. In the basement are stores for books and papers, coals, &c., and on the upper floor caretaker's apartment. The materials used are, for the walls bright stock brick with red brick quoins, and dressings, and Portland cement cornice and strings, with sashes and frames painted and green slate roofs. The first design for the building was prepared by the late Mr. ELEY WHITE shortly before his death, but this was subsequently modified, and the design was finally carried out under the superintendence of Mr. H. O. CRESSWELL. The builder was Mr. B. E. NICHOLSON, of Lambeth.

BROADWAY BUILDINGS, READING.

THIS building is situated in the Station Road, Reading, in the best business position in the town and close to the railway stations. It was erected by Messrs. J. MORRIS & SON, architects, of Reading, in order to provide themselves with a suite of offices on the ground floor, sufficiently large for their requirements. Offices and rooms are also provided for several professional and business firms. The building contains 122 rooms. The upper storeys are divided into eleven residential flats. The front of the building is faced with majolica tiles and bricks, supplied by Mr. J. C. EDWARDS, of Reading, relieved with buff terra-cotta from CARTER & CO., of Dorset. The chimneys are faced with Mr. J. C. EDWARDS' buff bricks. The roofs are covered with local red tiles. The glazing of the skylights to the studios and drawing offices is by Messrs. W. E. RENDLE & CO., of London. The hot-water heating is by Messrs. RENTON, GIBSON & CO., of Liverpool and Reading. Messrs. CALLAS, SMITH & MAY, of Reading, have carried out the whole of the electrical wiring and fittings. Messrs. J. E. LUCAS & SONS, of Brockley, S.E., have supplied the electric passenger lift, which runs to all the floors in the building. Their lift is worthy of notice, as it is a recent invention, and combines the maximum of safety with a minimum of personal attention. An unskilled person, by pressing a button, can take the lift to any floor of the building, then, having entered the lift, he can, by pressing another button, travel to any floor. Mr. GEO. PILGRIM, of Reading, was the contractor and has satisfactorily carried out the whole of the work, including the fireproof floors and staircase.

The perspective drawing from which this illustration reproduced was made by Mr. H. F. WARING.

HAMBRO' SYNAGOGUE.

THE Hambro' Synagogue, which is one of the most important buildings this week, was erected by Messrs. COLEMAN & BROS., builders, of Bonwell Works, Morpeth Street, Ipswich, from drawings prepared by the architect, Mr. J. SOLOMON, F.R.I.B.A., of 55 New Broad Street, E.C.4. The cost of about 3,700/. There was formerly a synagogue of the same name in Church Court, Fenchurch Street, when this was removed it was arranged that a portion of the money which it realised should be devoted to building another synagogue where it was wanted, and accordingly the small building in our illustration was erected in a neighbourhood largely inhabited by Jews. The fittings of the building are of the simplest description, as all the rest of the building are of the simplest description. There is a gallery for ladies' accommodation, the sexes being apart, as is still usual in Jewish places of worship as it was in early Christian times. The main entrance, facing Union Street, Commercial Road East, is of red brick with red brick dressings and artificial stone carvings and ornaments. The heating work was done by Messrs. WONTNER, SMITH & GRAY, and is effective.

HOUSE AT ESHER.

THIS house is built of red brick walls, and sandstone dressings. The red tiles were used for the roofs. The half-timbered work and woodwork to porch is in oak, white rough-cast being used between the former timbers. The windows are all casements and are lead glazed. The floor of the house is covered with 12-inch by 12-inch red quarry tiles. The builder was Mr. E. D. HOBBS, of Thames Ditton, and Mr. A. JESSOP HARDWICK was the architect.

INSTITUTE OF BRITISH ARCHITECTS.

ing meeting for the session 1903-4 of the Institute of Architects was held on Monday evening last at 11, Great Street, W., Mr. Aston Webb, A.R.A., president, in

the presence of Mr. C. F. McKim (hon. secretary), in referring to the late Mr. H. W. Brewer, said the architectural profession in the country in general had sustained a great loss. He was a man of great research, who possessed high powers. His drawings were better known to the members of the profession, but they afforded enjoyment to his knowledge of Mediæval work in England, and Germany gave an interpretation of the works of the great masters, and showed the spirit which they all admired. A vote of condolence and sympathy was passed in the name of Mr. Brewer.

A list of the following members was also read:—Professor W. H. Corfield, M.D., elected honorary member in 1883, who died on August 26; Herbert Ford, elected member in 1870; A. J. Barlow, elected Associate 1880, and Brooks, elected Associate 1881.

The Secretary announced that at the statutory examination of the Institute on October 22 and 23 there were 12 candidates, of whom five passed. The successful candidates were Messrs. W. Godfrey Green, E. W. Lees, Arthur G. Perkins Stokes. These gentlemen were awarded official certificates of competency to act as district surveyors under the London Building Act.

Mr. David Jenkins, of Sparkhill, Birmingham, was awarded a certificate of competency to act as building surveyor for the authorities.

The President then delivered his

Opening Address.

On this second time it is my privilege as President to address you on matters of interest and importance in connection with the Institute. But first permit me to express my regret that all present have been able to take, since we last met, a change of air and scene so necessary for the due discharge of our work.

In the last twelve months there has not perhaps been much to chronicle. Our work is of a character that twelve months is but a short period. Changes have occurred which may have far-reaching effects both as regards our art and this Institute, and it is my duty to refer to some of them in my address this

year. As regards our membership, 97 new members have been elected during the year, and we have lost 55 by death or resignation. Of our new members, 26 are Fellows and 71 Associates. Of our old members, 13 Associates have been elected to the rank of Fellow. This is satisfactory as far as it goes, but you will know me that it does not go nearly far enough; and we must be content until this Institute includes among its members a number of reputable practising architects or, at any rate, until we are satisfied that we have thoroughly investigated and as far as is possible all reasons for this not being so. Matters concerning the affairs of this Institute, which have not yet been shortly be dealt with, is the question of the election of Fellows, which, under existing rules, can hardly be said to be the business of anybody. It is not very satisfactory to the members on account of its indefiniteness and uncertainty; and as so, I have reason to believe, to Associates, who, naturally, object to find admission to Fellowship less than entrance to Associateship. And yet it is by no means easy to devise a remedy for this state of things. It is my duty that everyone wishing to join the Institute must do so as an Associate, but under our charter everyone desirous of becoming an Associate must first pass an examination; but admittedly, many whom we should like to join us, on account of their age or standing, or want of leisure, could not be asked to submit themselves to the examination for Associateship.

Is this difficulty to be overcome? The only way that I see is to do as was done in the case of Associates, to require, say four or five years hence, after which, except in exceptional circumstances, entrance to Fellowship shall be through the Associateship is absolutely closed. At this would make the Fellowship somewhat more valuable, and would, in my opinion, rather than discourage membership. It was distinctly so in the case of the Associateship, and I believe would prove to be so in the higher grade.

If this were done, it would be necessary during the next period to open the doors to the Fellowship wider than at present, so that no reputable practising architect who joins us should be debarred from doing so. It is a question for the members of the Institute to settle, and the Council, I am sure, would be glad to

hear a full expression of opinion on a subject that must affect the future welfare of the Institute. I hope that an evening may be found during the session when this matter may be fully discussed.

One event of last session, that I hope may lead to good results, was the meeting of the presidents of the allied societies on the day after our annual dinner, when, together with our vice-presidents, past presidents, and myself, we informally discussed matters of interest, amongst these being the facilities for architectural education at present available in the various centres (especially in regard to the establishment of day schools), the question of the compulsory registration of architects, the admission to fellowship of presidents of allied societies and of members unanimously proposed by an allied society. No resolutions were moved, but valuable information was exchanged.

Another interesting event was the visit of Mr. C. F. McKim, of New York, to receive the royal gold medal. Mr. McKim brought with him a large number of illustrations of the work of himself and his colleagues, and has left behind him, I am sure, an enhanced opinion of the progress of architecture in America at its best, and a pleasant reminder of the public spirit which is alive in that great country to insure the beautifying and ennoblement of her cities. May I also add that Mr. McKim has left amongst those he met a very high appreciation of the man himself, his personality and a desire to see him some day again amongst us?

I have to thank you for the encouragement you gave, by your presence in goodly numbers, to my experiment of informal "At Homes." They afforded us an opportunity of seeing for the first time a large number of the working drawings, sketches and designs of two very distinguished architects, John Francis Bentley and William Eden Nesfield (which could only be shown in an informal way), and at the same time of bringing many professional friends together for a short time in friendly intercourse; and they have not, therefore, I hope, ended altogether in smoke. I propose to continue the experiment this session, and trust you will again contribute to their success by your presence. One evening I hope to have the drawings of another eminent architect, the late John Loughborough Pearson; and it has occurred to me that the exhibition, on another evening, of the water-colour sketches made by ourselves during our holidays might be of interest—painters of course being excluded on that occasion.

Another event in which this Institute has taken a keen interest is the acquisition of a permanent home by the Architectural Association.

It is a striking testimony to the high appreciation in which the work done by the Architectural Association is held that the Architectural Museum buildings and their contents should have been handed over to the Association as a free gift by the unanimous wish of the subscribers to the Museum, accompanied, I believe, by the full approval of all members of the profession.

But the Association have a serious work in hand to adapt the premises to their present and future requirements, involving them in an outlay far beyond the means at present at their disposal. Your Council felt sure they were interpreting your desire to show the interest of the Institute in the work and have voted a sum of 500*l.* towards the building fund.

The day-school so successfully started by the Association seems destined in its new premises to work almost a revolution in our architectural education (or want of it); but as I went through the spacious courts of the Ecole des Beaux-Arts the other day, with their full-size models of columns and entablatures, together with examples of Renaissance and Mediæval work, I said to myself the Architectural Association are only at the commencement of their work; they cannot stop, but must go on, and when they have completed their schools must complete and extend their museum, and we older architects must take care to see them through with it. It has been a pleasure to the Institute for many years to lend this room to the Association for their meetings, and we shall miss them when they go; but we hope often to have their presence amongst us, for we need the energy and initiative of the younger men.

In this connection I may briefly refer to the question of our own premises, mentioned in my last address. I then ventured to express my own opinion that this question of premises, though very important, could hardly be considered an immediately pressing one; and the question of a joint building has now been solved by the gift of premises to the Association. At the same time, your Council and officers have not lost sight of the matter, and it is possible they may have some proposals to lay before you in connection with this subject later in the session.

Another event must be noted, *i.e.* the adoption and issue of a form of conditions of contract, which has been accepted both by the Institute of Builders and ourselves. (It is some indication of the importance of this document, and the complicated nature of some of an architect's work outside his art, that this

result has taken some eight years to arrive at.) This contract, while recognising the absolute authority of the architect over the workmanship and materials used on the works, has defined, as far as is possible, the relative responsibilities and duties of the client, the architect and the contractor; and though it is, of course, too much to expect that any document could be drawn that would meet every case that may arise, we believe it will be found of great use to all engaged in building operations.

The last Council election was made the occasion of bringing before us again very prominently the question of the compulsory registration of architects, a subject which also made its appearance in the columns of the *Times*, and in the list of Bills which were presented to Parliament during last session.

As stated in a circular sent round to members of the profession, it is some sixteen years since this matter was first formally brought forward and a Bill prepared; but in reality the subject was mooted by members of the Institute as long ago as 1854, and brought up in subsequent years, without, however, any action being taken. I mention these dates to show that inaction on the part of this Institute has been deliberate and intentional, and does not arise from any want of due consideration of so important a matter.

For myself, I was honorary secretary of this Institute from 1889 to 1892, when the question of registration was brought most prominently forward, and thus became well acquainted with the details of the proposals and the arguments for and against them.

Those arguments appear to me to remain much the same to-day on both sides as they were then. Then, as now, there was a considerable body of opinion in favour of the proposal, and I certainly do not wish in any way to minimise the amount of it. Then, as now, there was a considerable body of opinion strongly against it, and under these circumstances I venture to say, gentlemen, the thing for the moment is outside the realm of practical politics, for any experienced politician will tell you that Parliament would never grant compulsory powers of the sort proposed except at the general request of the members of the profession interested, and at present there can be no doubt that the profession is sharply divided on the point.

I think I ought to say to you quite frankly, as your President, that personally I am not a supporter of the proposal at the present time, though I agree that the large body of opinion in favour of it cannot and must not be ignored. Evils there undoubtedly are which should be removed; but, personally, I would try every possible alternative before applying such drastic remedies as those proposed by this compulsory registration, which I believe must be repugnant to every artist, whether a supporter of the proposal or not.

I am well aware that there are a large number of architects, especially amongst those practising outside the metropolitan area, who are in favour of compulsory registration; but I find, amongst the leaders of our profession, those whose work we admire and on whose judgment we rely, that they are, as far as I know, almost to a man strongly against the proposal; and I say again therefore to myself, we should hopelessly divide the profession by pressing the proposal at the present time. Consideration it is bound to have, but acceptance is hardly likely to be obtained by putting a pistol at the head of the Institute and demanding registration or our life.

Remember, this proposal would not only register certain architects, but would decline to register others. A registration which gives one man a right to call himself an architect and refuses it to another is a very difficult and serious matter; and I must say I should be sorry myself to have to pronounce judgment, for while "A" may think "X" a good architect, "B" may not consider him an architect at all. Who then is to decide?

I think I clearly understand the grievance against which registration is proposed as a remedy. Put quite shortly it is this: an architect, let us say, in a country town is endeavouring to carry out artistic work and to uphold the honour of the profession; but he finds much of the work he considers should go to him taken up by others whom he knows are not artists in any sense of the word, and are untrammelled by any notions of honourable professional conduct, and have no right to be called architects at all. So he says let a law be passed that every man must pass a prescribed examination before he can call himself an architect, and then will the public be able to separate the sheep from the goats. I admit the grievance and sympathise most sincerely with my friend, but I doubt the wisdom or efficacy of the proposed remedy.

I would ask this question of those who favour registration. Is it proposed for the benefit of architecture or architects? I know they will say and believe it is for both.

Well, then, take the benefit to architecture first, as it should be taken. It will be admitted, I think, that good architects will do just as good architecture whether they are registered or not; it will therefore make no difference whatever to our best architecture. Our friend replies that may be so; still, it will prevent an enormous amount of bad architecture being

perpetrated throughout the country by incompetent men. I take leave to doubt this; I fear that when registration is compulsory, though you would register much ability, you would also register much inability. That is the danger. Our friend would find himself worse off than before. Our building (it cannot be called architecture) is now in the hands of speculating builders, auctioneers, &c., who very rarely are not now call themselves architects, and registration will affect them as far as I understand it. It is not now possible for them to be able to recover their charges as architects, but builders are not paid by fees, and they are not themselves architects. They will continue their work, perhaps even helped, for probably some of the men who are now speculating would work up and pass the examination, and their poor buildings under the full authority of a Government diploma, and we shall see on the "Estate Agent and Government Architect," and a host of other combinations. Will this improve our architecture, my friend?

Then, again, we have generally thought a man who has the right to call himself an architect acquires the right to build the buildings he has designed and whose erection he has intended. This is the test we ask of our own Fellowship. Compulsory registration would require that he should pass the "architect" by Government examination, probably after he has designed or superintended a single building. Is it putting the cart before the horse, and cheapening the value of the architect. We admit Associates by examination after seven years to elapse and evidence of actual building. Suppose a man becomes a Fellow. Suppose a man obtains the diploma and his buildings turn out unsatisfactory. What happens then? In fact, is it possible to decide on a man is an architect, or on the same evidence that honourable name?

Another difficulty is, What standard of architecture is to be fixed for the right of this Government diploma? It must apparently be the same for the practitioner in a country district as for our larger cities. Is that desirable?

Again, I would ask, sympathising as I do all the while with this grievance, is all this ticketing and docketing with our art? Protection is in the air, I know, and it is rash enough to express any opinion upon it. But I think that art has always been free. Let us not build a shackle it. An artist is born, not made; no one can answer him into the fold, only his work. He is constantly being told that doctors and lawyers have Government diplomas, and so ought we, and if we venture that painters, sculptors and engineers have none, we are told that has nothing to do with it; and if we are not painting, sculpture and engineering more than architecture, we are told that has nothing to do with it. Are not painting, sculpture and engineering more important to architecture than law or medicine? I have thought so.

Then, as regards its benefit to architects, we must say this diploma is essential in order to make the law. At the Institute examination, they say, is not sufficient, and we must therefore compel them to come. I only say again I do not think so. The lazy man who admits for this reason had far better remain outside. As regards the benefit to architects, I would ask you to consider that if this proposal were legalised to-morrow, the borough surveyor and surveyor, if members of the Institution of Civil Engineers or the Surveyors' Institution, would be exempted from all restrictions, and would continue to practice architecture precisely as they do at present; the architect would come to be looked upon more as a consultant, to be called in on very important work, and so a large part of the work, which is already being encroached upon, would finally slip away from him altogether. It would also be necessary that all those who call themselves architects at the time of the passing of the law, whatever their qualifications, would receive the Government diploma; so I am afraid our friend in the country will receive no relief in his lifetime.

The words of the memorial addressed to the Council in 1891 appear to me as true now as then:—"That the distinction between the architect and the builder, which is a fallacious distinction, even as a guide to the public and misleading as an example to the student." And further, that "no less than the public from bad design."

While saying this, I would like those who are in favour of the compulsory registration of architects to believe entirely in sympathy with every effort to raise the standard of architecture and the architect in this country, and to be very account that I have ventured to discuss this subject to some length this evening.

It seems to me we must first come to some agreement amongst ourselves as to the standard to be set up, and then it is to be tested, and until this is defined registration is useless and fallacious.

I am reminded of a story, you will probably have

Bishop of London at one of our dinners, of an evening over a wall and watching two underlings induce a tortoise to put his head out of his shell out some tempting bait, but without result; I don't quietly saying to those undergraduates, "Well, gentlemen, you had better try the other end," would venture to say to you, gentlemen, don't you had better try the other end? If, as I think, the probability of getting what we all want—a higher architecture by legislation at the present time—will be better to redouble our efforts to gain the raising the standard of architecture amongst us, encouraging the higher education of our young men, the superior attainments may make membership of the Institute a recognised qualification in the eyes of the public, I believe is the case already, to a great extent, but in the Colonies also?

Mr. R. in a very interesting address on registration, to question whether, when this Institute started its committees on art, literature, practice and science, it had added a fifth on education, and I think he was

everywhere the cry, and if this Institute is to be a prominent part in architectural education, it will have to depart, to some extent, from the position it has hitherto taken up to the present time.

At present we have been satisfied, and I think rightly so, in trying to arrive at and suggest a standard of education by means of our examinations, leaving the education of students to others. During the year your Council had laid before them for their consideration certain draft proposals on architectural education, by a body of well-known architects interested in this matter, not at present members of this Institute, but well-known names as Mr. Reginald Blomfield, Mr. Mervyn Macartney and Mr. Halsey. These proposals set forth the proposition that the system of articulated pupilage nor the training in art schools had proved satisfactory, and that of the two systems was desirable; that architecture at present suffers from want of organisation, taken up by a representative body of architects to constitute an Institute—which shall be accepted by the public as authoritative.

It has suggested a preliminary course of training in workshops, and a subsequent course in the office of an architect, an endeavour being made to co-ordinate into line existing institutions by the adoption, with these institutions, of a uniform system with such as this Institute at the head.

Regarding all details, which are, of course, important, the majority of the proposals, and, I believe, commended by the Council as not only a desirable proposal, but also a practicable one.

After having ascertained that the authors of these proposals are willing to assist the Institute in working out and appointing some of their number to act on a committee.

The Council have appointed an education committee amongst those outside the Institute who have been invited to join our deliberations are Sir Arthur Cooper of London University; Mr. T. G. Jackson, of the Royal Academy; Mr. Sidney Webb, L.C.C.; Mr. E. L. Rieu, of the Board of Education; and Mr. Basil Lubbock. While the authors of the draft proposals nominated Mr. Blomfield, Professor Lethaby, Mr. Halsey and Mr. Macartney.

The committee has met and discussed the matter, and, as a sub-committee, has drawn up and adopted a report, which is now under the consideration of the Council, and is therefore in a position to bring it before you, to be able to do so early in the course of the year.

We are encouraged to hope that we may be able to obtain the co-operation of the various teaching institutions in the scheme, and in course of time to have representatives to the chief cities of the kingdom.

We propose to constitute a Board of Architectural Education, upon which distinguished men interested in the subject, members of the Institute or not, its main duties being to act as an advisory board on the courses of architectural education in various schools and their examinations.

Some developments we hope to have the assistance of the various societies, and to offer facilities to their members to the advantages of these improved methods of education. The first and foremost we hope to unite in one great improvement of the education of our younger architects, to give them advantages we sorely miss ourselves.

It is just apologise for having detained you so long on these points on such an occasion as this, leaving me but little time to deal with architectural matters of interest.

It has seen some notable events in architectural

history—the opening of Truro Cathedral, completed in the course of fifteen years, with the exception of its western towers; the selection of a design for the new cathedral of Liverpool; the opening up of a large portion of the Strand improvement by the London County Council, and the erection of an important building on a portion of its site; the adoption of a design by the same body for the new Vauxhall Bridge; and the selection of a design for the great University at Cardiff. Further progress has been made with the great Government buildings in Whitehall and elsewhere, including, it is understood, the purchase of the remainder of the Great George Street site; while the Government have completed their great Post Office building at West Kensington.

The widening of London Bridge is in full progress, and the temporary covered footways on either side suggest what picturesque and welcome adjuncts they would be to our bridges. These, the most exposed portions of our roadways, cannot be crossed in wet and windy weather without great discomfort, which those covered ways would entirely obviate.

A note of warning greatly affecting London has been sounded during the last few days by the advertising for sale, for building purposes, three of the principal squares in Kensington, which, if carried out, would greatly interfere with the amenities and healthfulness of the royal borough; and if the same process were carried through London it is almost impossible to realise the havoc that would be wrought. Fancy Berkeley Square, Belgrave and Eaton Squares, Bloomsbury and Gordon Squares, and many others, all covered with huge blocks of flats. This, of course, is not likely to happen at present; but as long as they are in private hands it might happen at any time.

Gardens with the backs of houses looking upon them are not so vulnerable, as they are difficult of access and the houses themselves have considerable rights over them. I was myself offered the freehold of one of these gardens as a free gift some years ago, the owner being anxious to be free of its management and maintenance. But these gardens, as I pointed out last year, do not give to London what the squares do—a sight of grass, trees and sometimes flowers. True, they might be kept much better than they are and be made much brighter than they are, but as they are we are grateful for them. It has been suggested that Parliament should obtain some control over these open spaces, which would not interfere with landlords and frontagers' rights, beyond the disability of covering them with buildings; and we must earnestly hope that Parliament and the County Council will lay their heads together to this end.

It has been my good fortune to see Truro Cathedral since it was completed, and all who have done so will, I am sure, agree with me that the new nave is a noble addition to the building, and that, accepting the literal use of a previous style in which its designer was so thorough a master, the result is impressive and worthy of the great effort made by Cornishmen for its erection. The deflection of the main axis of the nave, some 6 feet, I believe, in a length of 300 feet, and mainly caused by the necessities of the site, lends, I cannot doubt, advantage to the general effect, both internally and externally. Externally one could wish the material had been entirely granite, but probably the cost of this would have been practically prohibitory.

Since last we met Liverpool has also decided upon a cathedral, designed on Mediaeval lines by a young man bearing an honoured name in the architectural world, whose success must be a matter of encouragement to young men, and demonstrates once again the immense opportunities opened to young architects of ability by the competition system. It does not come within my province at this stage to refer critically to the design, but I am sure you will join with me in wishing Mr. Gilbert Scott success in his great and responsible undertaking. The appointment of Mr. Bodley, one of the assessors, as joint architect with Mr. Scott to carry out the work is contrary to our "Suggestions," and must not be looked upon as a precedent. The circumstances were very exceptional. I understand it was done with the complete concurrence of Mr. Scott, and was only agreed to by Mr. Bodley after great pressure had been put upon him, and when it became evident that the award would otherwise be put aside.

While on the subject of our streets, we may be permitted to wonder what is to be the end of the forest trees planted on the verge of so many of our footways, delightful when young, but now they are up to the tops of our houses rather darkening and obstructing to the view of handsome buildings. The huge electric standards, also, now being planted down the centre of our streets, seem to require immediate attention, both as regards position, design, and the curious colour they are painted.

The visit of Mr. McKim last summer naturally brought into prominence American practice in matters connected with our art, and especially with the control exercised in America over public improvements, and he left in our library a book containing a report which deals with the improvement of Washington by laying it out on a large and comprehensive

scale. I commend a study of this book to all interested—and what architect is not?—in the laying out and improvement of our great cities.

This book recounts how a small body of experts were appointed to prepare and submit a general plan for the development of the entire park system of the district. This committee, I understand, virtually put aside their large and profitable private work for nearly a year and devoted their time and experience to the service of the nation, a sacrifice made without any pecuniary reward.

The committee consisted of two architects, Mr. Burnham and Mr. McKim, a leading sculptor, Mr. St. Gaudens, and Mr. Olmsted, whose name is identified with what is best in garden architecture in America.

For the proceedings of this committee I must refer you to their report, merely stating here that a short tour to the principal capitals of Europe was made, and then a comprehensive plan for the laying out of Washington was produced and laid down on the noblest and grandest lines fully illustrated by drawings and models.

The committee describe the realisation of the scheme as a stupendous task, much greater than any one generation can hope to accomplish, but they add that the hearty and intelligent co-operation with which the plans have been received by the officers of the Government, the committees of Congress and the public generally makes it practically certain that the development of the national capital will be prosecuted on the lines proposed.

Since this was written I understand a large sum has been voted, which will enable a substantial start to be made.

Again, at our annual dinner I ventured to give some particulars of a commission appointed under the charter of New York, composed of experts, who also act without fee or advice in all art matters in connection with New York.

This is carrying out to some extent the more complete system in existence in France, where the care of all public buildings in Paris is entrusted to (1) the Minister of Public Instruction and Fine Arts; (2) the Minister of Justice and Public Worship; (3) the Prefect of the Seine; and (4) the Prefect of Police. Each of these Ministers is advised by a council mainly formed of architects of distinction. The duties and constitution of these councils are very fully set out in a book by our late secretary, William H. White, entitled "Architecture and Public Buildings," published in 1884, which contains a great deal of most interesting information on this subject. It is under this direction that Paris as we see it to-day has been produced, and the same system is followed all over France. As the author says:—"None having an understanding of these matters can traverse Paris without feeling that the authority which initiates and controls the great works of architecture in that capital is a real and competent authority, to which the State turns for guidance and on whose judgment the Parisians rely."

Every public building throughout France, great or small, has an architect attached to it, and, where necessary, an assistant architect, who, commencing in some humble capacity at the Council of Civil Buildings, in due time is admitted as assistant to this board or council, which gives him right of presentation to a public building in course of construction, as subordinate to the architect who is carrying it out, spends his days on the works, and may rise, if he conducts himself well, to be assistant architect or joint architect to a building, and ultimately architect-in-chief. In course of time he is summoned to take the place of councillor on one of the various boards, and ultimately the Academy of Fine Arts, who educated him, will hear of him again, and finally elect him to their body.

Thus the State not only assists in providing an efficient system of architectural education, but also provides itself with an efficient body of trained architects to undertake its public buildings, all working on a well-defined tradition, and producing works of great excellence which we cannot but admire. I do not propose to compare these systems with the course adopted in this country, partly because you are all well aware what that is, and also because I am afraid the comparison could hardly be in favour of this country. Not that I mean for a moment that the French system in its entirety would be suitable here. It tends, no doubt, to a loss of individuality, which would hardly be tolerated here, for though we talk a good deal of working on traditional lines, I am not sure whether we have yet learnt the lesson of sinking our own individuality sufficiently to do so.

I have mentioned these systems in force in France and America to draw attention one more, as I ventured to do last year, to the pressing need there seems to be in Great Britain, and which I think most of us feel, for some authority to whom schemes of public improvements should be submitted, not necessarily for sanction, but for consultation and advice. The work could hardly be entrusted to any single individual, but there would surely be no difficulty in finding men of skill, taste and authority enough, and with patriotism enough, to form such a commission as that established in New York, and

on the same terms, if asked to do so by His Majesty's Government.

And how enormously such a body would strengthen the hands of the authorities carrying out great works; architects designing them; public confidence would be increased, and schemes would be executed which are either dropped altogether or carried through in a half-way as a compromise—a method desirable in all matters of concerns of life, but absolutely fatal where art is concerned. The essence of a work of art is its completeness; a compromise can find no place. I do not mean a high finish or elaboration, but the expression of a complete idea; take something away from it or add something to it and it is destroyed as a work of art, and the result is understood as regards painting and sculpture (few venture either to add to or take away from a finished work) is in no way understood or recognised as regards architecture. A house is designed to stand on a broad terrace, and is cut out and surprise expressed that the house does not was expected. A building is arranged with certain details which are entirely omitted, or in matters of detail are divided with bars giving scale to a building, and cut out.

But I have wandered from my subject, viz., to give some authority to whom to refer our public improvements and schemes. A case in point has lately arisen on the first raised by Mr. Hamo Thornycroft, on the eastern end of the Strand Improvement scheme. Those who have taken part in that controversy will acknowledge the consideration shown by the London County Council, first, by putting up boards to show the proposals; and, secondly, by inviting representatives of the Council to meet their committee and discuss the proposals, which we did with great advantage I believe. But now who is to decide on the merits of the plans? Would not the deliberate opinion of an independent body carry great weight with the public, who are willing enough to pay if assured they will thereby get something? Since these words were in print the Council has decided, and we have been officially informed of the opinion of the Council not one of the proposals is being carried out. I presume of their own adviser offers sufficient to justify the Council in incurring the great expense would be involved in increasing the already inadequate width of the portion of the thoroughfare in question; it appeared to many brought up to consider such a matter, opportunity is lost to London. Public bodies appear to consider that the point on which all matters of public improvement is finally to be settled is the one of cost. No good the suggestion, if it can be shown to cost too much, is doomed. In other countries, where land is generally equally costly, it is recognised that spaciousness and beauty bear interest to a city higher than gold, by increasing the dignity of its life, the pride of its citizens and the beauty that cannot fade. The decision may be right or wrong. My point is, and I speak with all respect, that we are not satisfied with the competency of the tribunal to decide on an important matter?

Then again the solution of the Vauxhall Bridge question, which dragged on for so long, and was so happily solved by the collaboration between engineer and architect, would have been still further greatly accelerated if there had been some such commission to which the matter had been referred.

Again, there is that most thorny question of the great new street from Holborn to the Strand. The committee of the London County Council paid us the honor of consulting us in the early stages, while the laying out of the street was under consideration, and also with regard to the designs, with every intention, we fully believe, of accepting the one through; but nothing has been done, and this, as we firmly believe, not from want of willingness of the committee and officials, but from want of public opinion of a generally recognised competency would have supplied.

Gentlemen, I venture to think the formation of such an authority should be advocated by this Institute, in connection with the public bodies concerned, and that finally it might be done to place this matter on a more permanent basis. The interest that architects naturally take in it, and London in particular, is my reason for bringing it forward.

The public are singularly apathetic in the matter. I have so long preached to them the beauty of old works, and have apparently taken our view and regard modern works with comparative indifference. They resent, and no doubt cases rightly, the least interference with ancient buildings, but treat with unconcern the vast modern changes which are taking place in our cities. The study of the past, invaluable for the student, essential for instruction, and refreshment for the mind, must not take the place—for us, at least—of the study of the present and future. Last century was spent by us

tion; let us now show the result of our studies and
ne in action and progress. Let us see that our
beautiful, as beautiful as we can make them, and
that tells of our time; not original, perhaps, but
ctive; let us see that they meet the present com-
irements, that they are well placed for sun and
wholesome, gladdening; that we put something
into them, in order that they may give out
o others, and let us remember how great
lity rests upon us architects in our work.
essing the Architectural Association, once said:—
ular importance and responsibility are attached
when you consider its permanence and the multi-
m it is addressed. We frequently are led by wise
sider what responsibility may sometimes attach
ch yet, the chance is, will be heard by few and
soon as heard. But none of your words will be
and none will be forgotten for five or six hundred
build well. You will talk to all who pass by . . .
e sympathies, those freaks of fancy, those jests in
copy mind after mind of utterly countless multi-
ter you are gone; you have not, like authors, to
hearing or to fear oblivion. Do but build large
carve boldly enough, and all the world will hear
not choose but look.”
en, resolve that we will go straight forward, adding
othing to the great story of our noble art.

ests of the ages at to-morrow's door,
hy shrink we? The long track behind us lies,
e lamps gleam, and the music throbs before
dding us enter; and I count him wise

INDSOR, who had been elected an honorary Asso-
posing a vote of thanks to the President for his
anked the Institute for the honour they had
on him in electing him a member. He said he
hesitated to address them further had the President
subject from a more technical point of view.
as made in the early part of the address to certain
h dealt with the administration of the Institute and
istration of architects, matters on which he (the
ld not express an opinion. Towards the end the
ferred to much which did not affect the Institute of
ilone, but which affected very deeply indeed the
ation of the kingdom, who had their own share in
atural work of the great towns and cities. The
of having some recognised body of competent
could be referred to, and who could advise those
ponsible for obtaining designs for the buildings in
was most important to the world in general. In-
been given of the proceedings in other countries, and
that the example of the United States was one of
cal importance. The Americans had proved that
ey need not apply to their Treasury for the
of any money in obtaining the advice which they
foremost architects and artists of America gladly
ir time and abilities freely to help the State in this
.. He did not doubt for one moment that the
tists in all branches in this country would not
give their services to the State in such honourable
don had suffered terribly in the past from the want
view of what the designs should be which should
chief architectural works and make the great city
.. He referred to a part of London which perhaps
under the jurisdiction of the Government, namely,
Surely they felt now that if the designs and the
ealing with Whitehall had from the very commence-
erection of the public offices been laid out on
s with really a fine scheme, a most magni-
roach to the Houses of Parliament would
made. The blame was surely not in any way
to the architects, but to those who had
them. He was in absolute sympathy with the
e President when he hoped that some such body of
persons should have a voice in laying-out on a large
treets and the buildings of London. He had no
ay anything beyond expressing his personal con-
ut if the views which the President had expressed
opinions of the Council and the Institute, as he
ey were, he would gladly undertake to lay them
Government. Reference had been made to the
the new University College at Cardiff, and it was a
portunity for him to say how deeply grateful he was to
chitects who had assisted them in South Wales to
igns for so important a structure. The pity was they
money enough as yet to erect one portion of the
out they hoped South Wales would soon provide
for the fulfilment of the whole scheme. With
the trees which had been planted in London

along the streets, a most important question was raised. What
was to be the future of forest trees when their growing in
streets tended to so much pruning out? The trees should be
subservient to the architecture, but it was impossible to grow
forest trees with branches as they listed; they were suitable in
open spaces and parks, but not generally as surroundings to
architectural buildings. Trees in London suffered from the
smoke; the hardest was the plane, and this made it the most
suitable for their streets. He had seen an anxious letter in the
newspapers that there was an idea that the Office of Works
and the Government were going to make a new road across
the Green Park which would sadly destroy the whole beauty
of the park. There was no intention whatever, so far as he
knew, to construct such a road. That would be a very im-
portant new work, which surely could not be carried out until
it was sufficiently considered by Parliament and by all London
people. There was no intention whatever, in connection with
the late Queen's memorial, to cut a new road across the park.

Mr. H. T. HARE, who seconded the vote of thanks, said it
was highly gratifying to hear the very sympathetic way in
which the President had referred to the work of the Archi-
tectural Association. The relations between the Institute and
the Association were becoming more and more intimate, and
now that they had the opportunity of removing to a new home
in Tufon Street, Westminster, they valued the more the
counsel and advice of the Institute. The educational work of
the Association appealed to all architects. They were
endeavouring to remedy by teaching in an architectural day-
school the training of young architects under the pupilage
system, and the new work promised to benefit the profession.

Mr. REGINALD BLOMFIELD supported the motion.

STREET ENGINEERING IN LIVERPOOL.

THE following evidence was given by Mr. J. A. Brodie,
city engineer of Liverpool, before the departmental com-
mittee on highways:—

How many miles of streets have you in Liverpool?—There
is at present within the city of Liverpool a length of 456 miles
of streets.

Under your direct control?—Yes.

Does the fact of your being city engineer mean that you are
road surveyor as well?—I am chief road surveyor as well. I
have an assistant who is also a road surveyor and does nothing
else. The city is divided into six divisions, each of which has
a competent road surveyor responsible to me for the road
surfaces in his district.

You employ your own labour for the work?—Yes. We
have a great number of workmen, probably about a thousand,
engaged in repairs and new street work.

The width of your streets is regulated by by-laws, is it
not?—Yes, that is so—the new streets.

And you have power by private Act to apportion the width
between roadway and footways?—Yes, so long as the combined
width is not less than the 36 feet which is the minimum width
of streets required by our by-laws.

Have you laid down any rule as to how the apportionment
should be done?—In the older portions there was 24 feet of
roadway and 6 feet on each side of footway. We have modified
that since we got our new powers, and have reduced the width
of roadway whilst increasing correspondingly the width of the
footways.

Do you think that 36 feet width sufficient?—I should very
much prefer to see it increased. With regard to new residential
streets of the poorest class, which are now required to be
36 feet in width, I consider it would be a distinct advantage if
the houses were required to be kept back to a distance of
24 feet from the central line of the streets; and if the street
works were reduced to 27 feet in width, the cost to the owner
of the abutting land would be about the same as if he were
required to provide a 36 feet wide street and execute the street
works over the whole width of 36 feet between buildings.

You would keep in the hands of the Corporation the power
to acquire the small gardens in front of the houses?—We are
usually able to arrange that mutually; where extra width is
required for traffic we pay for it. I am the more convinced of
the advantage of adopting the course now suggested, as I find
that under the by-laws at present regulating these matters in
Liverpool an area of land is more valuable, and can be sold at
a better price for the erection thereon of the smallest and
cheapest class of property than for the erection of a somewhat
better class of house, and it would be an advantage to the
public health if the by-laws were so modified that the population
per area would be approximately the same.

I don't quite understand that point. How is it that your
present by-laws bring about the result of the land being more
valuable for the erection of cheaper houses?—At present a
builder may build up to a street of 36 feet width, and the effect
is that he can get a very large number of houses on an acre.
In better class property the houses are usually set back from

the limit of the 36 feet street, and, therefore, you get a smaller number of houses on the acre. The net result in Liverpool is that land is more valuable for the small houses, which are built right up to the street line, than for the better class of houses set back.

They can put more houses in a given area?—Yes.

More rent is charged for semi-detached houses, or for a terrace row of houses, than for a commoner class of tenements, of course. People like to have little gardens in front of their houses?—From the point of view of the man selling land for building purposes, he is able at the present time to get a larger price for the building of the poorer class of houses, because he can get upon a given area a larger number of them.

Your suggestion, as I understand, only applies to new streets. You would not propose to set back the houses in the older part of the roads?—Oh, no; there would be no hope of that, but we can do that under a local Act where widening is necessary for street traffic purposes.

What you were speaking of refers, perhaps, more to public health than to highway law?—It does; but at the same time it has a bearing on highway law.

Do you suggest that in laying out new estates for building purposes care should be taken to see that the lines of all streets fit in with the general plan of roads likely to be required in the future?—Yes; I am of opinion that in connection with the laying-out of new estates for building purposes within the limits of a town greater general powers are required, so that the lines of all streets may be laid out with the object of accommodating the probable lines of traffic in the future, as against the present practice of laying out an area so as to obtain the greatest possible number of houses. In our local Act of last year we got powers enabling us to deal with that matter to some extent.

Had you not got that power already?—I mean, if a man presents you with a plan showing how he proposes to lay out his building estate, can you not prescribe how the roads ought to run?—No; he can make his roads as he likes, and he did so in Liverpool until we got our new powers. He might, and did, bring in an end of one street so that it overlapped the end of another street, on a cross-road, and there was practically no possibility of getting through traffic along the new streets when formed.

That can be settled by arrangement?—Yes, we have done it by arrangement sometimes, but my point is that such powers as we have now in Liverpool should become general.

With regard to the main road and main approaches to Liverpool, you are gradually widening them?—Yes, the main arterial roads and the main approaches to the city are gradually being widened to a minimum width of 60 feet under the powers of the Liverpool Improvement Act, 1867, section 34, which gives power to the Corporation to prescribe lines as follows:—"The Corporation from time to time may prescribe the line in which any house, building, or erection or any addition thereto respectively to be hereafter erected, fronting on or towards any street shall be erected, and the same shall be erected only in accordance with the lines so prescribed, and where the Corporation so require all or any part of the land between the lines so prescribed and the streets shall be added to the streets, and if the owner or any other person interested in the house, building, erection or addition sustain any damage, loss, or by reason of the house, building or erection being erected in accordance with the lines so prescribed, or by any of his land being so added to the street, the Corporation shall make compensation in that behalf. And failing agreement the compensation shall be ascertained, apportioned and recovered under the Lands Clauses Consolidation Act, 1845, as in cases of disputed compensation for lands." We have a fund out of which this can be done continuously without a separate formal inquiry in each case. We were authorised by our Act to borrow money, which is not yet exhausted.

Is it not a slow process?—Yes, it is an exceedingly slow and expensive process. I consider that in all main approach roads in the neighbourhood of Liverpool it should not be possible under the law for any houses to be erected in the future nearer to the centre line of the street than from 35 feet to 40 feet.

So as to give a street of 70 feet or 80 feet in width?—Yes, for the main approaches to Liverpool.

I understand you would like also to have some control outside your municipal area?—Yes. From experience gained in connection with the districts which have been added to Liverpool since the year 1895, I consider that a municipality such as Liverpool should have some control over the main approaches to the city for a distance of, say, from five to ten miles outside the city boundary, unless some general legislation is passed to regulate the building lines in main trunk thoroughfares. As an example I may quote the Aigburth Road, which passes through a district until lately governed by an Urban District Council. Though this road is a main approach to Liverpool without any break, the local Council just outside the city thought a widening to 54 feet quite sufficient, and the road was

widened accordingly over a portion of its length. The widening having last year been included in the city of Liverpool Corporation are of opinion that the road is not sufficient and are at present taking steps afresh to carry out widening at considerable expense.

That road is now under your own jurisdiction?—

But I understand your suggestion was that with main entrances and approaches outside your jurisdiction the city should have power to compel the Urban or Rural Sanitary Council to widen such roads?—If there had been so much of that sort we might have called the attention of the Corporation to the fact that in such a case as I have mentioned the width they proposed was not sufficient. I think it should be some sort of control or power of reference.

Up to the point where the road is 54 feet wide it is now to a width of 60 feet by the city, but the local authority would not make up the width there to 60 feet?—Yes.

Is it not about two miles long with a tramway?—Yes, the whole length there is a single line of tramway with two tracks.

Which must be doubled?—Yes, it will be absolutely necessary to convert it into a double line in the near future to meet the requirements of the traffic.

How much space do two lines of tramway take?—They must be 32 feet 6 inches between the kerbs. The footways must be narrowed correspondingly, but we think that in this sort the total width should be at least 60 feet. I think, however, that you would be able to get a double line of tramways in a street 54 feet wide between the houses.

You get them sometimes with much narrower roads by agreement with the frontagers.

Then this road that you have mentioned is really enough for a double line?—Yes, where widened.

But it is not all 54 feet in width?—No, only the narrow portion. The narrower portions are at present from 40 to 44 feet. It is only a small portion near the Liverpool end that is 54 feet in width, and we are now proposing to widen it to 60 feet throughout.

Does it not come to this, that up to the city boundary 60 feet, then for a short length of about half a mile it afterwards narrowing down to about 37 feet?—Yes.

As regards the roads connecting one large area with another, I understand you have a suggestion to make how they should be controlled?—I am of opinion that municipalities should have an important voice in the settlement of questions relating to roads which form near approaches to the city, and that, failing agreement between the municipalities, the authorities of the smaller districts or with the County Council there should be a power of appeal to a central authority with expert knowledge and special experience of roads or inter-communication. With regard to the main roads leading from Liverpool, these, generally speaking, are of a good character, though generally too narrow and having sharp corners.

Take the case of the road from Liverpool to Widnes. That is not a county main road, but it is one of the main approaches to Liverpool. The portion of it outside the city boundary is in very poor condition; I do not think it is a highway; at any rate, it is in bad condition, and the inconvenience between Widnes and Liverpool is undoubtedly put in a great measure by the inconvenience through the condition of that road.

How far is that from Liverpool?—I think it is about 17 or 18 miles.

How many authorities' jurisdiction does it pass through?—I think it passes through three altogether.

You say it is not a main road?—I do not think it is a main road for the purposes of the county; it is a main approach to Liverpool, parallel to the river.

Do you think such a matter might be dealt with by a committee consisting of representatives of Widnes, Liverpool, and the Lancashire County Council?—I am not sure, but I think it would be in favour of a joint committee.

Do you think there would be a difficulty about contribution?—Yes. I would prefer that the matter be referred to a central authority.

A central authority having power to levy upon Widnes and Liverpool a large part of the expense?—Yes, or other authorities, to take into account the question of the contribution.

It would not be right, would it, to ask the ratepayers of the rural districts between Widnes and Liverpool to pay a contribution for the through traffic?—No. It appears to me to be a national matter.

Is it not a matter between Liverpool and Widnes, and also the through traffic beyond these towns?

Have you much difficulty in the Liverpool district with the tramways blocking up the roads?—In Liverpool the tramway authority is also the tramway authority, and within the district a very serious difficulty has arisen.

Have you a suggestion to make as to how the line should be arranged so as to take other forms of traffic?—Yes, with regard to the question of main trunk roads.

consider that the tramway track on such a road constructed as to be available not only for cycles, but also for railway and motor vehicles; embody the advantages of the so-called plate-way projecting flanges.

Q—Yes, there was a proposition locally to divert traffic from Liverpool to the manufacturing districts by a by-pass road. Personally, I believe we will come to some agreement in that district ultimately.

Q—Can that the tramway lines should be laid in such a manner as to be able to carry railway traffic?—Yes. If I was a tramway authority between Liverpool and the manufacturing districts, I should advise them to put down their tramway in such a manner that it would take all three tracks; but meantime the tramways are in existence, and no question does not arise.

Q—As to constructing a highway which would go round the city and so divert traffic from the central part by a by-pass road, I understand you have a scheme?—I have a scheme which has been approved by the Corporation for roads in Liverpool. This scheme is based on the outskirts of Liverpool embodies my view that main roads should be in the future. In the case of the outskirts of Liverpool, it became necessary for the owner to lay out a certain portion of the estate so as to be practically parallel to the main road in the city. The owner was approached to see whether he would lay out more than the minimum required under the bye-law, and ultimately he decided to give the road a width of 24 feet, bringing it to a total, on condition that the city of Liverpool should give 24 feet from him and threw that into the street, making a total width 84 feet. That has been agreed to. The idea has developed still further, and the Corporation will be willing to pay interest and sinking fund on another 24 feet of road on certain conditions, viz. that the tramway line between the road and the city should be fenced off from the general slow traffic, and the trams could run the trams at a considerable speed on the road and cross-road. That scheme has been approved. I now produce plans of the scheme to the Corporation.

Q—Would you say that if you had proper powers this scheme could have been carried all round Liverpool. What do you mean by "proper powers"?—In this case we have done a certain arrangement. If we had powers by which such a scheme could be continued, apart from the question of happening to arrange with a particular landowner, I have no doubt it could be continued round the city.

Q—You should have power to acquire land from the owner?—I think a municipality such as Liverpool has power to construct main roads whilst the land is in agricultural, and at or about agricultural value. It is, of course, understood that where such roads approach built-up areas, the roads should be so arranged as to leave the urban district authorities the road necessary for distribution purposes. At present we have no powers which would take us up to the point I should like to see. None of our powers go beyond that.

Q—You had many actions against you for declaring land as being built upon?—We have not yet had a case.

Q—You got the Act last year?—Yes.

Q—Does Liverpool have exceptional powers. Your Act of 1902 gives you very elaborate powers?—Yes, the present Act has somewhat exceptional powers in the main thoroughfares and main approaches to the city under the Liverpool Corporation Act, 1902, as follows:—

Section 32.—Width of new streets in certain cases—

"In the opinion of the Corporation a new street will be a continuation of or means of communication with a main thoroughfare in the city, or a continuation of or means of communication with the city, the Corporation may, if they see fit, erect houses or other buildings intended to be erected in the street to be set back from the centre line thereof to a distance not exceeding 40 feet as they may see fit, and the Corporation shall thereupon make compensation to the owners of the land abutting upon the said new street in the amount which may be sustained by him or them if his or their being unable to build upon the land between the line of such new street and the line of the street erected or to be erected on either side thereof, and the amount of such compensation shall be determined by arbitration in the manner provided by the Lands Clauses Act, 1845."

"Provided always that the Corporation may, if they think fit, instead of paying the compensation under this section, agree with the owner or owners of the land referred to in the said section for the purchase of the said lands or any part or parts thereof."

Section 32.—Power of Corporation to convey portions of streets to adjoining owners—

"The Corporation may upon such terms as they think fit convey any portion of a public street to the owner of any land adjoining it for the purpose of obtaining a uniform line of frontage and of improving such street, and any moneys received by the Corporation from the owner under this section shall be applied in or towards repayment of moneys borrowed for street improvement purposes."

Section 34.—As to direction or position of new streets—

"If the Corporation disapprove of the proposed direction or position relatively to the nearest streets of any new street, as shown on the plan thereof deposited under any by-laws made, the Corporation, under the provisions of the Public Health Act 1875, and any Act amending or extending that Act, shall within thirty days after delivery or deposit of such plan to or at the offices of the city engineer, give notice to the person delivering or depositing such plan of the particulars of such disapproval, and of the requirements of the Corporation in respect of the direction or position as aforesaid of the proposed street, and in the event of such notice of disapproval being given, it shall not be lawful to begin to make or lay out the new street until an amended or new plan thereof has been delivered or deposited as aforesaid and approved by the Corporation."

"Provided that if within thirty days after receiving notice of the requirements of the Corporation, and before proceeding further in the matter, the person delivering or depositing such plan gives written notice to the Corporation, alleging that he will sustain loss or damage by the decision of the Corporation under this section and claiming compensation from the Corporation in respect thereof, the Corporation may either waive or insist on their requirements as they see fit, and in the latter event, any claim for compensation shall in default of agreement between such person and the Corporation be referred to and settled by arbitration in the manner provided by the Lands Clauses Consolidation Act, 1845. In any such reference the arbitrator or arbitrators and umpire shall have regard to any increased value which will in his or their opinion be given to any property of such owner by reason of the execution of the requirements of the Corporation, and any such reference may on application of either party to the reference be made a rule of His Majesty's High Court of Justice."

Section 35.—Buildings at corners of streets—

"The Corporation may require the corner of any new building at the corner of two streets to be rounded off or splayed off to the height of the first storey or to the full height of the building, and to such extent otherwise as they may determine, and for any loss which may be sustained through the exercise of the powers by this section conferred upon the Corporation they shall pay compensation in accordance with the provisions of the Lands Clauses Acts."

I see it is put in section 30 that "where in the opinion of the Corporation a new street will form a continuation of or means of communication with a main thoroughfare in the city, or approach to the city, the Corporation may," &c. Do not all streets communicate with the main thoroughfares in one way or another?—The expressions used are wide, but I think they were intended to be wide.

Q—How do you get more power under that clause than ordinary corporations have under their model building by-laws, which enable them to insist upon a road being as many feet wide as they like so long as they get the Local Government Board to assent?—It is generally not easy to get local authorities to assent to by-laws requiring very wide streets.

Q—The local authorities will not go in for such wide streets?—A by-law to authorise a street of 80 feet wide would probably not be passed by a local authority.

Q—The difference then is that you have powers of compensation under your private Act?—An authority with ordinary powers could not, except by agreement, have a street laid out wider than the maximum provided in their by-laws, whether they paid compensation or not. Our present by-laws provide for a minimum width of 36 feet, and there is no compensation paid up to that.

Q—You have powers under your Act to convey portions of the streets to adjoining owners?—Yes. That is valuable. Ordinarily speaking, when an improvement is a small one, we do not need to part with any of the land, but if we are cutting off corners, or dealing with a large improvement, a portion of the land is sometimes left which it is convenient to sell to the frontagers, and, of course, the money goes to the credit of the road improvement fund. That is on the give-and-take principle.

Q—There is no power in law ordinarily to give a title to bits of public road conveyed to private individuals?—That is so.

You have also taken powers to arrange the direction and position of new streets?—Yes, having regard to the general plan, and also to the traffic requirements of the district.

But you pay compensation under the clause if you damage anybody?—Yes.

I see you have also taken power in your Bill to round off corners. What is the point of that?—It is very important, at the corners of busy streets especially, that a man driving a vehicle should be able as he advances to see as far round the corner as possible; and also to provide in busy streets for people being able to turn the corner without having to do so exactly at right angles. We have power to splay the lower part of a corner building for such a purpose, and also to set it back as far as the first storey is concerned, the upper part of the building being allowed to project.

Have you something to say as to main roads forming the boundaries between districts?—Yes; where main roads form the boundaries between districts difficulties arise with regard to the question of proper maintenance of the roadway, and improvements of the separate lengths of roadway, and in some instances the authority of a small district cannot afford to pay the cost of its proportionate share of a street improvement, whilst the local authority of the larger district cannot see its way to spend money upon an improvement which possibly would be of very much greater advantage to the adjoining districts. In the Liverpool district this has in the past had the effect of leaving such boundary roads in an unsatisfactory condition. The creation of a joint or central authority, to whom appeal could be made, would tend to remedy this state of affairs.

Is it not better to take the boundary some distance beyond the possible buildings on one side of the road?—I would not like to make a general statement upon that subject, but it might be better for the maintenance of a good road surface if the road were under one authority.

How would you propose to deal with the maintenance of a road half of which belonged to a wealthy city and half to a rather poor rural district?—That is a case which might be referred to a central authority to say what should be done under the circumstances. Three separate authorities would seldom be able to come to an agreement.

Would you give one of the authorities power to construct and repair the whole of the road?—I think it could be arranged so far as repairs are concerned. In a case which I have in view it was arranged that each of the authorities should be responsible for a certain length of the road without reference to the actual boundary.

Have you any power in general law to do that?—No; but these things are sometimes done as a matter of mutual convenience. As a matter of law, we would have to maintain the road up to our city boundary.

Going back to the question of maintenance of roads where there are tramways, is it not the fact that very often the tramway companies contract to repair the roads?—Yes, under the Tramways Act the tramway authority is bound to maintain the surface of the road up to 18 inches beyond the outer rails.

Do you think that a good plan?—I think not, from the user of the road point of view. Where tramways exist in public roads I am of opinion that the street authority should not be allowed to transfer its responsibility for the maintenance of any portion of the road between buildings to a tramway undertaking, but that the maintenance of the whole width of the roadway should be placed in the hands of the road authority; the tramway authority, of course, paying the road authority the cost of the construction and maintenance of the road between tramway limits.

The tramway authority might reasonably claim some share of control over the outlay?—As tramways take up a considerable portion of the main roads, I think they ought to be willing to maintain their part of the roads in the best possible form.

You would not object to give them a right of appeal to a central authority?—No.

That is what I meant.—Tramway authorities, who are not paving or road-surface authorities, should not be allowed to take portions of public control of roads out of the hands of the road authority.

That is sometimes done to-day by arrangement?—Yes, in some cases. I would not object to the road authorities making such arrangements as they liked with a tramway company, provided the roads were well maintained.

With regard to the maintenance of roads from an economical point of view, I believe you lay considerable stress upon being able to repair a long length of road at one time?—Yes. I do my work with large gangs, including properly trained foremen and gangers, with men, in the case of macadam roads, who do nothing else but macadam. They go into a road with a complete set of plant and a number of steam rollers, which may be used either as steam rollers or as traction engines or scarifiers. These men work clean through the length of the road instead of doing it in short lengths. We find this secures two benefits; it keeps the gang of men together, and gets

through the work quickly, as well as reducing the cost and the number of complaints.

What length of road do you work at a time?—About three-quarters of a mile at a time can be done economically.

You think that the most economical method of administration is for the administrator to have a long length of road to administer?—Yes, sufficient to provide proper plant and adequate staff for the work in an economical manner, as well as to see that all the time the work is going on.

Have you always worked long lengths at a time?—For about three years past; but we find it the best system.

Have you any figures to show the saving secured by this system?—I have not dealt with it in detail from a financial view, but we consider that the cost of dealing with the surface of the road should be about 11d. per superficial yard, not making it merely a question of economy, but well to improve our road surfaces.

Still, you give it as your opinion that both on the economy and of efficiency it is better that there should be a large number of miles under the same authority?—Considerable lengths of road can be repaired at a time, and would apply the same reasoning to any other work. A sufficient amount of work to justify expensive plant and staff and adequate supervision.

The last portion of your intended evidence in which I am not sure that we can properly regard as a reference to this committee the subject of the material used in making roads, or your experiments with the oiling of macadam roads.—I feared that rather beyond the scope of your inquiry. May I explain that there were two points in view. One was experimenting with the object of providing a road surface similar to macadam, but of a more lasting nature, and economical. Shortly put, it is this:—The cost of a concrete slab, the working surface including labour embedded in the concrete after the style of the work that has been in experimental use in Liverpool for some time, with satisfactory results.

Speaking generally, do you think we must find a new class of road material?—I see great necessity for it. I think we should all try to get it, but that is not easy.

Not only on account of the extra weights that are to be carried, but also on account of the inconvenience of dust and mud?—Yes, dust and mud are two serious evils.

Which of course cost you a great deal of money to scavenge, and are besides a great nuisance to the public?—Yes, particularly to frontagers in macadam roads. In connection with that I have been experimenting with concrete, and have got satisfactory results from mixing a little of the water used for street watering purposes.

GENERAL.

The King has been giving sittings at St. James's Palace to an artist who is painting a portrait of His Majesty. It is understood that the scene of the picture is laid in the State apartments, which have recently been undergoing renovation.

The Competition for the memorial of the United States at Berne attracted 120 designs and models, of which 10 have been retained, and the authors are to take part in a competition. The first four designs were sent in by H. H. H. of Charlottenbourg, G. Morin of Berlin, Dubois & René Patouillaud and René de Saint-Exupéry. Each have been awarded 3,000 francs. M. Giuseppe Lugano, MM. Ignatius Taschner of Breslau and Munich, have received premiums of 1,500 francs.

M. Chartran's painting of the signing of the peace between the United States and Spain is destined to be hung in the White House, Washington. Mr. C. Frick, who painted the work, has presented it to the Government.

The Exhibition of Mr. Mortimer Menpes's drawings, etchings, dry-points and lithographs, by J. McNeill, will open at the Leicester Galleries, Leicester Square, on Monday next. The collection contains nearly 300 works, among which is the unique dry-point of "Whistler's Mother."

Mr. Alexander Blaikley, artist, whose death took place recently, was born in Glasgow in 1816. He was settled in London, where he was a frequent exhibitor of his portraits at the Royal Academy. The Grand Duchess of Russia, the Tsar Alexander II. of Russia, was one of his pupils. Amongst his oil portraits, one of Professor F. C. M. purchased by the late Mr. Gassiot for presentation to the Society.

EDITORIAL NOTICES.

the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our **VERY EMINENT BARRISTER**, who has undertaken a special study, and will be glad to answer queries in the columns of this paper any questions relating to the legal matters arising from the provisions of this Act. Our **LEGAL ADVISER** will further answer any legal question that may be of interest to our readers. All letters must be addressed "**LEGAL ADVISER**," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

We will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and particulars of Works in progress in which they are interested.

of signed articles and papers read in public must not be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Contributors are requested to make their communications as concise as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

disappointment is frequently expressed at the non-fulfilment of Contracts Open, Tenders, &c., it is particularly requested that information of this description be sent to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

Nov. 30.—The committee of Bray Pavilion and Gardens invite plans for proposed pavilion and winter garden. First prize, 30*l*; second prize, 15*l*; third prize, 10*l*; with three prizes of 5*l* 5*s* each. Messrs. Frank Lee and P. Macdonnell, hon. secretaries, Town Hall, Bray.

Nov. 9.—Designs are invited for a new public library, with residence for librarian, in the third ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for a public library, with residence for librarian, in the third ward of the borough to Mr. H. J. Smith, town clerk, Town Hall, Kennington Green, by 12 noon on Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Hove Hospital for Women, 76 West Hill, Brighton.

Dec. 16.—The Lambeth Borough Council are invited to send in designs for a public library, with residence for librarian, in the third ward of the borough to Mr. H. J. Smith, town clerk, Town Hall, Kennington Green, by 12 noon on Sept. 29 on receipt of 1 guinea, which will be returned on receipt of design. Mr. Leonard Holmes, hon. secretary, Hove Hospital for Women, 76 West Hill, Brighton.

SCOTLAND.—Nov. 9.—Competitive plans for the erection of a tenement of shops and workmen's dwelling-houses on ground belonging to the Kilmarnock Corporation in Fore Street are invited. Premiums of £15 15*s*, £10 10*s*. and £5 5*s*. will be given for the sets of plans and certificate which may be adjudged first, second and third respectively. Mr. W. Middlemas, town clerk, Kilmarnock.

SCOTLAND.—Dec. 7.—The Elgin Landward School Board invite competitive plans and estimates for the erection of school buildings at New Elgin capable of accommodating about 340 pupils. Mr. Hugh Stewart, clerk to the Board, Elgin.

SEELY OAK.—Dec. 7.—Competitive plans and designs are invited for public baths at Seely Oak, near Birmingham. Full particulars of the site for the proposed baths, limit of maximum expenditure, &c., with copies of sketch plans showing the accommodation required, &c., may be obtained on application to the Urban District Council's surveyor, Mr. A. W. Cross, 23 Valentine Road, King's Heath, near Birmingham.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums of 10*l*., 5*l*. and 25*l*. will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

TAMWORTH.—Nov. 14.—Designs are invited for a free public library. Premiums of 20*l*., 10*l*. and 5*l*. will be paid to those designs placed first, second and third respectively. Full particulars from Mr. John Matthews, town clerk, Bolebridge Street, Tamworth.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WALES.—Competitive designs are invited for a pavilion to hold 10,000, to be erected at Rhyl for the purposes of the Royal National Eisteddfod of 1904. No prizes are offered. Messrs. Tilby & Jones, general secretaries, Town Hall, Rhyl.

WALES.—Nov. 9.—Competitive designs are invited for a public library to be erected in Evelyn Road, the total expenditure, including fixtures, not to exceed £2,000. A premium of £10 10*s*. will be paid for the approved design. Mr. Samuel Jones, clerk, Old Road, Skewen, Neath.

WINDSOR.—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l*. returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

ALNWICK.—Nov. 9.—For the erection of a wooden foot-bridge over the burn on the footpath between East Field and Low Buston. Mr. H. W. Walton, clerk to the Rural District Council, Alnwick.

BIRKDALE.—Dec. 4.—For the erection of a hospital, with the necessary isolation houses, administration block and other outbuildings at Birkdale, Lancs. Mr. J. F. Keeley, clerk to the Urban District Council, Town Hall, Birkdale.

BOOTLE.—Nov. 18.—For the erection of a dwarf brick wall, stone coping and gate piers, and the supplying and fixing of wrought-iron railings and gates to enclose the Stanley Garden.

FULL LIST, and dates when they appeared,
of THE CATHEDRALS which have been
published on Application to The Publisher.

WALES.—Nov. 9.—For additions to the Nantyglo school, Aberystroth. Mr. R. L. Roberts, architect, Abercarn.

WALES.—Nov. 11.—For the erection of an organ chamber and other alterations and additions to Pembroke Terrace chapel, Cardiff. Mr. Thomas Thomas, accountant, 29 Queen Street, Cardiff.

WALES.—Nov. 11.—For the erection of twelve houses at Pen-y-coedcae. Mr. Alfred Bryant, architect, Midland Bank Buildings, Pontypridd.

WALES.—Nov. 16.—For the erection of a caretaker's house, with boundary wall and outbuildings, near the Council's offices at Ebbw Vale, and for alteration of the building formerly used as a pattern stores on the drill-ground into a fire brigade station. Mr. T. J. Thomas, town surveyor, District Council Offices, Ebbw Vale.

WALES.—Nov. 17.—For the erection of a gallery in the Richmond Road Baptist chapel, Pontnewydd. Mr. L. D. Jones, Cromwell Place, Pontnewydd.

WALLINGFORD.—Nov. 10.—For the erection of No. 1 (administration) block and a drainage scheme, &c., in connection with the isolation hospital. Mr. S. Couch-Johns, architect, Laud Chambers, Reading.

THE new drill hall, which has been provided for the 1st Creswell Company of the Boys' Brigade by the Duke of Portland and the Bolsover Company, Ltd., was opened on the 27th ult. It is an attractive structure facing the road, quite close to the admirably laid out model village, and was erected from plans prepared by Mr. Percy B. Houghton, of Chesterfield, by Mr. A. F. Houghton, of Mansfield. The estimated cost is 1,505 $\frac{1}{2}$ l. The hall is a fine building of brick with stone dressings. On the right-hand side of the entrance is the armoury and opposite is the kitchen. The hall itself is 65 feet long by 35 feet wide, very lofty and capable of providing seating accommodation for 450 persons. At the opposite end to the entrance is a stage with convenient ante-rooms. The front of the building is carried up to two storeys, the large upper room being for recreation purposes. The hall is fitted with gymnastic apparatus, and is lighted by electricity supplied from the colliery. The building is surmounted by a turret on which is a clock.

write that they always have a large stock of Frosterley marble,
and that at the present moment they are supplying it to the
new Roman Catholic church at Norwich.

ELECTRIC NOTES.

THE Penrith Urban District Council are considering the
question of the installation of electric light throughout the
town at a cost of 7,500l.

THE Saffron Walden Town Council have applied to the
Board of Trade for an order sanctioning them to supply elec-
tricity for public and private use.

LINCOLN'S INN CHAPEL, which has hitherto been lighted
by means of candles only (gas never having been introduced
there), has now had the electric light installed.

At a meeting of the Yardley District Council on Tuesday,
the sanitary, highways and public works committee recom-
mended the Council to apply to the Board of Trade for a pro-
visional order to enable them to supply electricity for public
and private purposes within the area of the district of Yardley,
and that Parliamentary solicitors be employed to act for the
Council in the matter. The area proposed to light with elec-
tricity was from the borough boundary on the Stratford Road
to College Road, and from the borough boundary to Greet
Bridge.

THE progress of the Clyde Valley Electric Supply Company
in the Middle Ward of Lanarkshire will be considerably
delayed by an accident which occurred at their power station
at Motherwell on the evening of the 29th ult. The buildings,
which are to be of girder-work chiefly, are in course of

NEW CATALOGUE FREE ON APPLICATION

construction by the Brandon Bridge Building Company, and shortly after the contractor's men ceased work on Thursday the whole structure fell with a crash to the ground, ironwork, covering an area of about a hundred yards by fifty, lying in a confused mass on the site. Fortunately no one was about at the time, and no one was injured, but the loss through delay and the damage done will be considerable. There was a strong wind blowing at the time, and to that is ascribed the accident, but it is pointed out that the building is in the vicinity of the undermined area, and it is conjectured that surface disturbance may have had not a little to do with the disaster.

BUILDING AND BUILDERS.

ACCORDING to the monthly report of the borough surveyor the cost of the widening of the Blackpool promenade up to the present is 114,867 $\frac{1}{2}$., the largest item in the bill being 42,125 $\frac{1}{2}$. for labour and carting.

ON the 31st ult. at the site of the new Methodist church in Kingstown, Ireland, seven foundation-stones were laid. The building which has just been pulled down was erected in 1836, and was very simple in character, while the edifice about to be raised is of a more substantial and ornate design, indicative of the flourishing condition of Methodism at this day in the premier township. The new church was designed by Mr. George F. Beckett, architect, and will cost about 4,500 $\frac{1}{2}$.

A STRIKE of structural ironworkers began on Saturday, October 31, throughout the United States. Ten thousand men are directly affected, and probably over 100,000 in other trades will be thrown out of employment. The object of the strike is to compel the New York house-builders to recognise the local Union No. 2, of which Mr. S. J. Parks, now on trial on a charge of extortion, is the walking delegate. The strike affects the largest cities east of St. Louis wherever members of the Employers' Association have contracts. Mr. Sam Parks, was the day previous convicted of extortion and of having accepted money to call off a strike.

AT Burnley the end of a row of houses in course of construction on the Cleveland estate, off Manchester Road, recently collapsed, partially burying a foreman named John Jacques, Patrick M'Ginty and William Morris, bricklayers. They were extricated from the debris and found to be suffering from severe shock and bruises. After receiving medical attention

they were removed home in cabs. The builders, Messrs. Nightingale Bros., state that the accident occurred through wet weather, the mortar not having had time to set. The men had miraculous escapes.

AT a recent meeting of the Birmingham Master Builders' Association, which was held for the purpose of considering what notices, if any, should be given to the operatives in several branches of the trade for revision of working rules, it was resolved that, notwithstanding the continuance of a depressed condition of the trade, which might warrant notices being given for reductions in the rates of wages, no notices should be given this year upon this point. In the case of the plasterers, however, it was decided, in view of the attitude of the National Association of Operative Plasterers in relation to master builders and master plasterers throughout the country having recently been so unsatisfactory, that notice should be given to the local branch of the Association to abolish all notices until the questions between the employers and the operatives were placed on a more satisfactory basis.

A SUB-COMMITTEE of the Manchester parks committee has had under consideration the suggestion that the Corporation should sell to the War Office 30 acres of Heaton Park, which to build a barracks, and give them the use of a portion of the park for training in such manner and at such times as will not interfere with the convenience of the general public. Already some 50 acres of the park are to be taken as part of the site of a reservoir for the water from Thirlmere, and some of the members of the committee are opposed to the policy of chopping off another big slice of it. It is suggested that the barracks could be provided on the Blackley estate of the Corporation, a barracks built there, and the troops could at suitable times practice in Heaton Park, which is not far away. The War Office has, however, it is understood, made a definite offer for the 30 acres of Heaton Park.

GRANGE U.F. church, Grangemouth, which was opened on the 29th ult., is designed in a severe type of English Gothic; it has very simple detail and little ornament except such as naturally arises from the design. The principal or longest front, in which is the main entrance, faces Grange Bank Road, along which it extends 126 feet. A square tower, about 70 feet high, is placed at the north end of this front, and the principal entrance is at the base of the tower. The entrance doorway is deeply recessed and is reached by a finely moulded Pointed archway leading into the vestibule.

WAPICTI

A SANITARY WASHABLE DISTEMPER OF BRITISH MANUFACTURE

church is divided into nave and side aisles by
nted arches on each side. At the pulpit end an
span divides the church from the organ chamber,
inued beyond the church. The ceiling is semi-
form, divided into bays by the main couples and
essed timber, which has been stained a dark oak
interior decoration is carried out in a simple
manner in subdued tones of soft green and
ed by bands of brighter colour. The seating and
stained myrtle green, with the woodwork of pulpit
ont in grey oak. The church will seat over 630
the hall in connection is seated for 400 people
o a large session-room, vestry, &c. The total cost
to be about 4,000*l*. The architect is Mr. John B.
asgow.

tion of providing a crematorium has for some time
he consideration of the sanitary committee of the
ration, who, however, left the matter to the
um-Burley burial board. This board proposes to
natorium in connection with their cemetery at
about four miles from the centre of the town, and
ernment Board inquiry has been held by Mr
h, of the Institute of Civil Engineers, at the
parochial institute. There was no opposition, and
was declared closed. The system that it is
adopt is a new one so far as this country is con-
sists of incineration by gas, the method chiefly
Great Britain being incineration by coke. The
e invention of M. E. A. Fradet, a member of a

Parisian firm of engineers, whose patent has been taken up at
Paris, Rheims, Rouen and other places. It is claimed for it
that it is both more cleanly and more economical than the coke
system, and that it does not necessitate the employment of
skilled labour. At Rouen a deputation from the Headingley
board witnessed a cremation which involved an outlay of only
3*s*. to 4*s*. in gas.

THE foundation-stone was laid on Saturday of the new
Church of the Ascension in Timbercroft Lane, on the borders
of Plumstead, a district which is being rapidly built upon. The
building, which will be put up in sections, is from the design
of Mr. A. E. Habershon, of Queen Street Place, E.C., Green's
End, Woolwich, and Erith, and will when finished be a welcome
ornament to the neighbourhood. The site of the new edifice
is a good one, with 40-foot roads on three sides of it. The
present portion includes three bays of the nave arcade and one
side aisle and a part of the chancel and vestry. When finished
the church will have one more bay to the nave arcade, a
second side aisle and two transepts, a narthex being under the
main west window. The exterior of the church is in stock
bricks with red brick and terra-cotta bands, the arches over
window and door openings being in alternate blocks of
Doulton's red and buff terra-cotta, while inside are red brick
arches to the nave resting on stone columns, and a red brick
chancel arch, the walling being in yellow brick with red brick
bands and ornamentation. The cost of the present portion
(with seating) will be about 2,500*l*. The builders are Messrs.
J. Dorey & Co., of Brentford.

DR. R. J. REECE attended the Education Offices at King's
Norton on Tuesday morning to hold an inquiry on behalf of
the Local Government Board into an application by the King's
Norton and Northfield Urban District Council, for sanction to
the borrowing of a sum of 5,000*l*. for the purpose of effecting
extensions to their hospital for the isolation of infectious
disease at West Heath. The Worcestershire County Council,
acting under the powers conferred upon them by the Infectious
Diseases Prevention Act, 1903, have required the district
authority to provide accommodation for the treatment of
diphtheria, scarlet fever so far being the only zymotic disease
treated there. The clerk to the Council (Mr. Edwin Docker)
explained that the Council had decided to erect a diphtheria
pavilion, containing twenty beds, at a cost of 1,249*l*, and
further, in view of the fact that there was no ward at the
hospital in which doubtful or suspected cases could be placed

under observation, the Council proposed to provide a special observation ward of twelve beds, at a cost of 1,240*l*. The County Council's suggestion that isolation accommodation for diphtheria should be provided arose in consequence of serious outbreaks of disease during the past two or three years. The balance of the amount was required for furnishing, heating and providing baths, the last-named item being one of 355*l*. There was no opposition to the application.

IMPORTANT additions are being made to the Post Office buildings at York, which will when completed give a building almost double the size of the present office. A larger public office providing a superficial area of 1,400 feet is to be formed, with a central entrance in Lendal, the new counter being 47 feet long, with new postmaster's and chief clerk's rooms adjoining. On the extension site overlooking the river an entirely new block of buildings is being erected, with a sorting hall on the ground floor having a superficial area of about 3,500 feet. In the basement of this block are arranged a large battery-room, truck shelter, linemen's-room and engineer's store, with heating chamber and lavatory accommodation. On the first floor, and immediately overlooking the river, retiring-rooms for postmen and sorting clerks have been provided. The elevation toward the river is executed in Weldon stone, and has been designed to harmonise with the adjoining city offices and Guildhall buildings. The building is erected on fireproof principles throughout, and the work is being carried out by Messrs. Williamson & Co., builders, of Nottingham, under Mr. W. T. Oldrieve, architect, of H.M. Office of Works, Westminster, the clerk of works representing him upon the building being Mr. J. Atkinson. It is anticipated that the work will be entirely completed early next year. The cost of the scheme will be considerably over 10,000*l*.

It has been found that King James's bridge across the Tweed at Berwick is in a condition demanding immediate attention. Regarding its safety, the Town Council have agreed to make certain temporary repairs, and to call in a competent bridge expert to make a thorough examination. The bridge took over twenty-four years to build, and was completed in 1634. It links England and Scotland. The Berwick Corporation receives an annual grant from the Crown for bridge maintenance.

VARIETIES.

EXTENSIVE alterations and improvements are to be carried out at the Earlswood Asylum, Redhill, Surrey.

THE Welsh slate trade is particularly brisk at the present time; a large number of additional men have been engaged at the Penrhyn quarries.

THE new hospital for women opened recently at Leeds upwards of 20,000*l*. The buildings are of brick with terra-cotta facings.

VERY considerable alterations and additions are shortly to be made at the Leeds General Infirmary, the estimated cost of which is about 100,000*l*.

THE North-Western Railway, through slackness of work at their works at Crewe, have reduced several hundred of their men to five days' work per week.

THE Local Government Board have given permission to the Gorton District Council to borrow 8,816*l*. for the purpose of erecting a dust-destructor.

THE Folkestone Town Council have received the sanction of the Local Government Board to borrow 14,950*l*. for the purchase of the land and the erection of a refuse-destructor.

MR. THOMAS WALKER, the engineer to the Croydon Borough Council, has retired from his position after thirty years' service. Croydon loses by this one of its most competent servants.

THE Penge Urban District Council have decided to borrow from the Public Works Loans Board, at interest of 3½ per cent. the sum of 10,908*l*. for the purpose of laying wood pavement on the Croydon and Beckenham Roads.

THE Croydon Council have accepted the design for the new chimney at the electricity works, the shaft to be constructed of specially moulded perforated bricks by the Alphonse Croydon Chimney Construction Company.

A COLLECTION of water-colour drawings by Turner, derived from private collections will be exhibited in Berlin at the galleries of the Berliner Sezession, which will be open to-morrow.

WORK is being rapidly pushed forward in connection with the re-erection of the danger buildings at the Royal Arsenal at Woolwich. In the construction of the new buildings precaution is to be taken to prevent the possibility of future accidents.

several years ago some property was purchased
e church, and upon a portion of this the new build-

ings have been erected. Provision has been made for two
classrooms, which on special occasions can be thrown into one
room. The building has cost 250*l.*

MAIDENHEAD BRIDGE has been freed from toll. The
bridge was re-erected in stone in 1772, an Act of Parliament
giving the Corporation power to raise by toll the cost, which
was 19,000*l.* Since then the tolls have yielded 120,000*l.*, and
in addition to the bridge possesses a valuable landed estate.
In the twelfth century the citizens of London raised a protest
against the levying of toll at Maidenhead both over and under
the bridge.

THE Perceval Memorial Church at Ealing, the foundation-
stone of which was laid on Saturday, commemorates Mr.
Spencer Perceval, who was shot in the House of Commons
when Prime Minister in 1812. The church will be in Early
Perpendicular style. The material externally will be of Stam-
ford stone, with rock-faced walling in dropped courses, and
internally the floor and chancel walls will be of marble, and
the stalls, pulpit and screen of fumed oak. The architect is
Mr. W. A. Pite.

ASTON'S branch free library at Aston Cross, near Birming-
ham, has been formally opened. The building, which is erected
with every consideration for convenience, provides a lending
department and reading-room, the latter department being at
the rear, in order to obviate the nuisance of the sound of street
traffic. The library has been erected without any cost to the
ratepayers, Messrs. E. & W. Ansell having presented the site
and Mr. Andrew Carnegie having given 2,000*l.* for the build-
ing, which has actually cost 1,900*l.*

THE Marylebone Borough Council will promote a Bill
next Session empowering the Council to borrow the necessary
money to purchase the Marylebone business of the Metro-
politan Electric Supply Company, Ltd., for the erection of
electricity works, to authorise an increase in the maximum
charge for the supply of electricity, and to alter the method of
charging. Power will also be taken to erect generating stations
in the district, to construct a short line of railway connecting
the generating station with the Great Central Railway and
carry out other necessary works.

THE Court of Common Council have been in com-
munication with the London County Council in reference
to proposed steps to be taken for the amendment of the
Building Acts. There has arisen some difference of opinion
between the two bodies, inasmuch as the streets committee had

asked the Council to be supplied with a rough draft of their Bill for their consideration, but the Council seemed to think it would be better that the committee should send a rough draft. Both bodies are anxious to make what improvements they can in the Building Acts for the protection of human life.

At Priorslee, Salop, on Saturday, a new chancel, which has been recently added to St. Peter's Church, was formally dedicated. The new addition to the church was designed by Mr. Dalgleish, architect, of Wellington. It is lighted by two pointed lancet windows on each side, and the east window has been improved by the addition of a circular light at the top, with the sacred "I.H.S." in the centre. The ceiling is of pitch-pine varnished, supported by a strong principal in the centre, from which is suspended a 25-light chandelier. In front of the Tipton memorial reredos is a carved oak communion table, with triplet panelled front. On each side of the chancel are two rows of seats for the choir.

On the 4th inst. the new church of All Saints, Elland, was dedicated by the Bishop of Wakefield in the presence of a large assembly. The new edifice is in the Early English style, and is designed to accommodate 800 adults. The general scheme for the church shows a nave 111 feet long and 29 feet wide, with a broad circular narthex at the west end, and this is divided into six bays. A lofty arch divides the nave from the chancel. The transepts are thrown out at two eastern bays of the nave, both on the north and south sides. That on the north side forms a kind of nave to the side chapel. This chapel will be of very great convenience for daily and special services, as it is designed to accommodate at least 80 adults, besides giving space to a small choir, and it is so arranged that it can be lighted and heated independently of the church. The roof is of the barrel or waggon form, a style somewhat unusual in Yorkshire, but excellent for acoustic and musical purposes.

The famous sculpture in stone on the walls of the ancient palace at Mashita, in Moab, on the Damascus-Mecca Railroad, has just been acquired by the German Emperor for the Berlin Museum as a present from the Sultan of Turkey. Professor Julius Euting, the well-known Arabian traveller, who has visited Mashita several times, recently drew the attention of the Emperor William to that very beautiful and rare sculpture by methods of photographs and drawings taken by him. His Imperial Majesty is said to have so much admired the design of the carving that, on ascertaining the feasibility of cutting off

the sculpture and transporting it to Germany, he asked the Sultan's permission to take away from the desert the coveted relic of Byzantine art for better preservation in the capital Germany. The Sultan at once acceded to the demand.

THE Winchcombe Rural District Council recently had an interesting discussion about the semi-parish church at Southgate de-la-Bere, near Cheltenham, the mansion adjoining having been the residence of the celebrated Earl of Ellenborough. The church is situated in a farmyard, and the only way to it through the farmyard. Its surroundings, therefore, are not of an ecclesiastical character, and the outside of the building plain; it is said that it was originally nothing but an agricultural barn. Entering the church, however, a stranger is perfectly astonished, as the decorations are very profuse, and there are many pictures, statuettes and ornaments displayed upon its walls and upon brackets set up in every corner and crevice. The solicitors to the estate have made application for the repair of the short bit of road through the farmyard to the church, but the surveyor said the road is not to be found on the parish award or map, neither was the church even marked there. Mr. Griffiths, the local councillor, said the rectors of Bishop's Cleeve had always officiated there every Sunday, and he thought the road should be repaired for the benefit of the public. Without evidence of liability, however, the survey was instructed not to do anything.

ACCORDING to the report and balance sheet presented to the directors of Drake & Gorham, Ltd., at the second annual general meeting of the company, it appears that, after payment of all charges, including bonuses due to staff, there remained a net profit of 16,327l. 6s. 3d., which with the sum 3,245l. 18s. 4d. brought forward from the previous year, makes a total of 19,573l. 4s. 7d., which it is proposed to appropriate as follows:—

By payment of a dividend at the rate of 8 per cent. per annum	£10,000 0 0
By carrying forward	9,573 4 7

£19,573 4 7

During the past twelve months the turnover has been considerably larger than in the previous year, and the increase in the number of houses and factories fitted with the Drake & Gorham standardised system of electric lighting and power has been amply maintained.

CORRESPONDENCE.

The Push Button in Lifts.

our issue of October 9 you have an article "Houses." In the course of this you quote from "City Apartments in Paris," by M. Jean Schopfer, regard to the provision in apartment houses in attachment to the lifts (or elevators) of a device the push-button device. The author speaks of it as a novelty, and you therefore append a notice which you properly say "the author apparently is not as to the development by the Otis Elevator automatic elevator service in the United States." There are many readers of your Journal who will be that the device in question is in use in this writer's long connection with the Otis Elevator in this country has made him thoroughly acquainted with its practice, and we beg to say that we are quite satisfied with its merits, and are furnishing where required, the device having all the features of excellence and described in your article.—Yours faithfully,

WM. AUG'S GIBSON, Chairman.

Tr House, 28 Fleet Street,
London, E.C. : October 12, 1903.

our issue of the 30th ult. gives a notice of the goods of the Brilliant Sign Co., Ltd., of Gray's Inn Road, W.C. in the course of certain letters as being "imitation brilliant signs," a large manufacturer of brilliant letters and signs, and the pioneer of popular prices in the market, would call your attention to the following facts. These signs came here originally from Niagara, U.S.A., and were there supplying the goods for the British market through their sole agents, the B. S. Co., Ltd. These signs are of the shape known generally as "segment corner," (more recently called "Segment corner," the "T" probably being too descriptive of their foreign origin) but they were of a shape suitable for a foreign market. I determined to produce an article, equal in quality, but differing in shape, so as to conform to the recognised standard of the home trade. As a proof that such a letter was preferable, my line of goods alone have increased by eight per cent. (800 per cent.), each year's output of which has been made entirely on

my own premises by British labour, showing a decided increase on the preceding year. A certain amount of skilled labour being required to effectively fix the brilliant letters as originally made, I invented and patented a new form of the letter (patent No. 23,409 of 1900), which I introduced under the name of the "Perfect Brilliant" letter, so simplifying this process that skilled labour is unnecessary. My patent, by the way, is the only existing British patent for brilliant letters in any form. The American patent, previously communicated, was abandoned soon after I commenced manufacturing these goods. Those who have followed the course of the advertising letter trade will remember the introduction of the enamelled copper letters from America in the "Boston Block" shape. On a firm of standing here placing a similar article on sale in the British shape the former were entirely superseded, proving indisputably that the public show a just appreciation of a home-made article, and will have it when obtainable.—Yours faithfully,

WM. G. PETHER.

Pether's Sign and Letter Works,
(Proprietor).

VACUUM AND AIR PUMPS.

IN *The Architect* of October 23 there was reference to the air-pump of Otto von Guericke, of whom a statue is to be erected in his native city Magdeburg. The old philosopher would be amazed if he could see the developments of his invention which are now manufactured by the Pulsometer Engineering Company. The Geryk vacuum-pump (Fleuss's patents), of which there are several varieties, has, since its introduction about ten years ago, found its way into all the civilised countries of the world for the laboratory and for industrial purposes. Previous to its introduction two methods only were in practical use:—(1) Mechanical pumps which could not be depended upon for producing a vacuum of less than one-tenth of an inch off perfect; (2) Mercury pumps of various descriptions, but from their nature slow in action.

The "Geryk" pump has the advantages of both types and the faults of neither. It produces a vacuum comparable with that obtained by the large Sprengel or other mercury pumps; and is infinitely more rapid in action.

GREEN & CO. (Ecclesfield), Ltd., ECCLESFIELD, near SHEFFIELD.

Being oil sealed and packed it is not dependent upon tight-fitting mechanical pistons for the attainment of its results, and consequently the excellence of the vacuum is not diminished by wear.

The power required to work it is exceedingly small. It is always ready for use, as the valves and pistons work in oil. It can be made in any size up to 100 or more cubic feet capacity per minute. The larger pumps give a vacuum in every respect equal to that obtained by the smaller sizes. It is not liable to be broken like a mercury pump. The saving of time by the use of the "Geryk" over a mercury pump is apparent when the relative capacities of each are considered. This enables scientific experiments to be carried out which would otherwise scarcely have been possible owing to their tediousness. The "Geryk" vacuum-pump has been exhibited by special request before the Royal Society and the Royal Institution of Great Britain. It is in universal use in incandescent-lamp factories for exhausting lamps, both alone and in conjunction with chemical processes; for flashing and for desiccating.

The laboratory pumps are being largely used for research work.

THE LATE PROFESSOR CORFIELD.

THE part of the "Journal of the Sanitary Institute" last issued contains a portrait and memoir of the late William Henry Corfield, M.D., who served as vice-president, chairman and treasurer of the Institute, besides rendering services in various other ways to sanitation. It is pointed out that he gave cordial support to the late Rogers Field in the reformation of house drainage and plumbing. The writer says:—

"Energetic as were the civil engineers, Rawlinson and Rogers Field, in demonstrating the evils of D-trap, cesspool and direct connection of waste pipes with foul drains, commonly found in dwellings of all classes from palace to cottage of former times, they might not have been able to move public opinion for the adoption of necessary but expensive remedies and to secure the education of those who had to carry out the work without the aid of a scholarly medical scientist of Dr. Corfield's weight and influence. That assistance fortunately was always ready at hand to press on the reform until the true principles of house drainage have become universally recognised, taught at the Parkes Museum and generally observed at the present time. The last occasion on

which he came to the Institute was on December 10, 1902, preside at a discussion on the testing of house drains."

The following interesting note of personal appreciation has been received from a member of Council of the Sanitary Institute who was frequently associated with Professor Corfield in his work:—

It was one of Dr. Corfield's notable characteristics that he was able with great promptitude to sift out of any matter before him the important issues from those which were only of secondary interest. He had an acutely logical mind, and deductions from the premises before him were nearly always acute and sound. It was this faculty which secured so much respect for his opinion, not only on professional matters but on the ordinary circumstances of everyday life, and which made his services to the Sanitary Institute, while serving on its Council and as chairman of its Council, of more than ordinary value. Corfield had in an eminent degree those business faculties which go to the making of a distinguished career in the commercial and many other walks of life, and his abilities were always placed freely at the disposal of those institutions with which he was associated.

Not less admirable were his powers of concentration and capacity for detail. It was always his great aim to be exact in his writings, his addresses and his lectures were characterised by a precision of statement, a clearness of style and the absence of anything in the nature of "padding," which rendered his literary productions of so much value to the student, and caused his speeches to be so highly appreciated by his audiences. He always made a point of verifying his references, and no trouble was spared in the effort to place before his readers or hearers that upon which they might absolutely rely as being correct, so far as human knowledge permitted.

Much of the pioneer work in any new science—and for the practical purposes of modern life hygiene may be regarded as a new science, and Corfield was undoubtedly a pioneer in some of its branches—is liable to be marred by statements which, accepted as correct at the time, have had their accuracy seriously impugned by later and more enlightened research. On a review of Corfield's work it may be said that it is notably free from this sort of blemish. He was always more content with the recording of facts than in the propounding of theories on insufficient foundations, and in consequence his teaching did not lead into by-paths where the right direction along the road of science so often becomes hopelessly involved and finally lost. He was essentially a teacher and a guide in his

principles; his common sense and his scientific training and men were his guides and his justification, and the result is his work has been eminently useful, and much of it is of lasting value.

Dr. Corfield was not, perhaps, a deep thinker, in the sense he ever made a profound study of the abstruse sociological problems connected with public health. It is not often that intellect which takes a delight in deep philosophical reasoning is combined with a mental attitude that recognises the importance of detail and a mental capacity for its practical application. The latter was Corfield's strong point. He was essentially a practical sanitarian, with little of the philosophic mer in his composition. It was the same in the studies of leisure time. What always interested him was the practical application of the laws of science, whether in the present or in the past. Roman aqueducts, ancient systems of sewerage, and most primitive forms of privy or water-closet, were to him more seductive studies to him than etiological speculations and theories. His researches into ancient sanitary methods have been published in various periodicals. They are interesting and fascinating studies, and exhibit the best qualities of the author in the subject of his predilection. The Council of the Sanitary Institute might very well consider the possibility of republishing these valuable brochures in a small form as a tribute to the memory of one of its founders. Their republication would undoubtedly give much pleasure to the Dr. Corfield's friends, associates and former pupils.

In his private life and amongst his friends and colleagues Dr. Corfield invariably exhibited that amiability of temper which is the essence of good-fellowship. He was a most interesting and entertaining companion, combining a wide knowledge of the world with a spirit of tolerance for the opinions of those who differed from him, and a frank and pleasant manner. He was always accessible and ready to give his advice and assistance, and he never set himself up on a pinnacle. To this he owed much of his popularity.

Dr. Corfield had been very much out of health for at least years before his death. His malady was at times of a very painful nature, but he always maintained his cheeriness and cheerful anticipations, and he showed but few signs of that depression which is so generally the accompaniment of a mortal illness. The Sanitary Institute, perhaps more than any other society with which Dr. Corfield was connected, has reason to mourn the death of one of its founders and most consistent workers.

COST OF LONDON SCHOOLS.

At last week's meeting of the London School Board, Sir Charles Elliot, speaking on a recommendation of the works committee that a tender amounting to 22,268*l.* for a school to accommodate 1,124 children, with drawing and science-rooms, be accepted, drew attention to the decrease of the cost of building during the past four years. If the cost of the school building were divided by the number of children for whom accommodation was provided the charge in 1901 amounted to 20*l.* per place. In 1902-03 it was 16*l.*, in 1903-04 16*l.*, while in two schools the figure per place had been as low as 13*l.* He desired to know whether the reduction in cost was on account of the building of the schools in three storeys, or whether it was due to the decrease in the cost of materials.

Mr. Lyulph Stanley promised that the matter should be investigated.

LONDON FIRE STATIONS.

The fire brigade committee of the London County Council recommend new stations in substitution of those at Watling Street, Knightsbridge and Shooter's Hill. The total cost is 115,500*l.*, comprising 63,500*l.* for Watling Street, 12,000*l.* at Shooter's Hill and 40,000*l.* for Knightsbridge.

The finance committee remark:—"The capital expenditure for fire brigade purposes has considerably increased during the last few years, the expenditure during each of the years 1900-01, 1901-02 and 1902-03 having been 86,958*l.*, 69,296*l.* and 77,258*l.* respectively, as compared with 20,671*l.*, 33,072*l.* and 22,458*l.* in the three years to March 31, 1892. On existing votes for fire brigade purposes there is at present an unspent balance of about 250,000*l.* (including 143,000*l.* out of the votes of 197,185*l.* and 25,000*l.* for provision of additional protection from fire passed by the Council on February 8, 1898 (page 133), and February 12, 1901 (page 183), respectively, and, in the event of the present proposals being adopted, the total commitments on capital account for fire brigade purposes will be increased to about 370,000*l.* The fire brigade committee inform us that they intend to spread this expenditure over several years, as in the ordinary course they provide for the building of about six stations in each year, those most urgently needed being taken up in turn. We are in communication with the fire brigade committee as to the desirability of equalising their expenditure

at Unions, Hospitals, Factories, Warehouses, Race Stands, and Private Houses.

as far as possible, and as to the means by which to effect this object during the years in which the heavy expenditure on the three fire stations now proposed (especially on the purchase of the sites) will fall. In conclusion, we would point out that it is for the Council to decide, after full consideration of the reasons set forth in the report of the fire brigade committee, whether the necessities of London with regard to protection from fire justify the proposed increase in the Council's capital commitments under this head."

THE LATE MR. J. B. HARDMAN.

WE greatly regret to record the death of Mr. John Bernard Hardman, the head of the well-known firm of John Hardman & Co., stained glass manufacturers and ecclesiastical metalworkers, of Birmingham, which occurred on Sunday at his residence, 130 Hagley Road. The deceased gentleman, says the *Birmingham Daily Post*, who, in addition to his business connection, was the most distinguished Roman Catholic layman in Birmingham and a public-spirited citizen, was only sixty years of age, but his health had been failing for about two years, following on a bad attack of influenza. Latterly he had suffered from heart trouble and other complications, and for the last month or so he had been confined to his house.

Mr. Hardman was born on May 5, 1843, at St. John's, Hunters Lane, Handsworth. His father, Mr. John Hardman, was of a Roman Catholic family which originally belonged to Lytham-in-the-Fylde, Lancashire. James Hardman, of this family, removed to Birmingham in the middle of the eighteenth century, his son, the first John Hardman of local fame, entering into the manufacture of buttons and medals, and founding a highly successful business. The late Mr. J. B. Hardman's father forming an acquaintance with the elder Pugin, became enthusiastically interested in the Gothic revival connected with the accessories of religious worship, and in 1838 he founded the ecclesiastical metalworks, to which in 1845 he added the manufacture of stained glass. For many years he was in daily communication with Pugin, and was associated with him in the establishment of a studio of Christian art at Ramsgate, where were produced the cartoons for church windows which were carried out in Birmingham. John Bernard Hardman received his education at St. Mary's College, Oscott, at the Oratory, Edgbaston, and at the Catholic University of Dublin. He was at the latter

seat of learning in 1863, when the failing health of his father compelled him to give up his studies to return to Birmingham, where in a short time, upon his father's death, he became a partner in the ecclesiastical art business then carried on at Newhall Hill. Mr. Hardman brought to bear a cultivated taste and a high degree of commercial aptitude, and with partners, Mr. William Powell and Mr. J. H. Powell, the traditions of the establishment were maintained and its connections widely extended. In 1883 a separate manufactory metalwork was established in King Edward's Road, where the business was carried on under the title of Hardman, Powell & Co. The fame of Messrs. Hardman's productions became very widespread, and it may safely be affirmed that there are few of the principal churches in the country, either Roman Catholic or Anglican, which have not some piece of work—window, lectern, memorial brass, or altar vessels—from the establishments.

A man of singularly unassuming demeanour, Mr. Hardman nevertheless took his share in the public affairs of the city. In 1876 he became a member of the Board of Management of the General Hospital, and last year was appointed chairman of the body. He was also for four years a member of the committee of the General Dispensary. In 1874 Mr. Hardman was invited by the British Commissioners of the International Exhibition at Vienna to act as English juror for exhibits in art metalwork and jewellery, and for these services he with other jurors received the honour of being made a Chevalier of the Order of Franz Josef of Austria. Mr. Hardman was a Conservative politician, but never associated himself with the party organisation. A vacancy occurred in the municipal representation of St. Mary's Ward in February, 1879, through the resignation of Councillor Kneebone, and all parties were gratified when it was announced that Mr. Hardman had consented to allow himself to be put in nomination as a non-political candidate. He was returned without opposition, and was three times re-elected unopposed. In the Council he gave steady support to those progressive developments to which Birmingham owes so much, but which ultimately were attended with some measure of reaction. In November, 1895, Mr. N. M. Hennessy came on in opposition, and Mr. Hardman was unseated. He did not again seek to enter the Council. Mr. Hardman was a member of the estates committee throughout his association with the Council, and in 1883 and 1884 he was its chairman. For some years he was a member of the lunatic asylums committee and was chairman of the sub-committee which supervised the

gement of the Winson Green establishment. Having actively connected with the old School of Design, Mr. man was, upon the school being taken over by the Cor-on, made a member of the new museums and school of committee. He took very great and practical interest in work, and it may be recalled that about the time that his action with the Council ceased he gave an interesting ss to the students at the central school. Mr. Hardman also a member of the art gallery purchase committee, to scharge of whose trust he was able to render valuable ance. For a short period he was a member of the free ies committee, and he was also chosen as a member of 's Trust, upon which he served as bailiff in 1886. One 's last public services was as a member of the Lord 's committee for arranging the local celebration of the s Coronation.

NEW CHURCH AT SANDIWAY.

new church of St. John the Evangelist at Sandiway was lly opened on the 26th ult. Completed save for the on of the spire on the tower, the edifice is alike orna-l and comfortable. The church consists in plan of nave, porch, chancel, organ chamber and vestry on the south. The whole is built of mottled red sandstone from the Crosses quarries, near Frodsham. The interior is of led stone; the roofs and ceiling and the chancel are of a solid character, and are executed in oak. The nave and el fittings are in brown ash; the organ case and fittings sacarium are of oak, the former richly carved, and on ont is embellished with sculptured angels holding a deep , with the words from the Benedicite, "O let the earth the Lord; yea, let it praise Him and magnify Him ver." The floor of the sacarium is of vari-coloured es, the sedilia and credence on the south side being carried ith architectural effect. The altar rails are of ornamental ight-iron capped with oak rail. The frontals of the altar and orsal are of richly ornamented needlework. The ornaments altar are the gift of Mrs. Park-Yates, to the memory of e late husband, Capt. Park-Yates (for many years Master e Cheshire Hounds, who formerly resided at Sandiway), est window of three lights is filled with painted glass, the ts being "Faith," "Hope" and "Charity." The window aced here by the ladies connected with the hunt. The

east window, and also two windows in the west end and one in the tower over the font, are filled with stained glass. The latter represents the baptism of Our Lord by St. John. The church is heated by hot water and the lighting by acetylene gas, by separate cell generator (the work of Messrs. Kerr & Stewart, Manchester), and the gift of Mr. E. L. Clarke. The brass eagle lectern is to be used also as pulpit until the latter is provided. The exterior roof is covered by small Westmor-land green slates, and on the north side of the chancel is a sculptured niche with the patron saint of the church, St. John the Evangelist, and also on the angle near it are the arms of the bishopric. The churchyard is enclosed on the side next the high road with a substantial wall and stone lych-gate, having gates of oak with appropriate ironwork. The work has been carried out by Messrs Beckett & Co. as general con-tractors, and the masonry by Mr. John Palmer, of Frodsham; the chancel and other fittings by Messrs. W. & F. Brown & Co., of Chester, and the organ case by Mr. H. F. Thomas, the architect being Mr. Douglas, of Chester.

TOTHILL STREET, WESTMINSTER.

THE historical records and buildings committee of the London County Council have received a petition from owners and occupiers of premises in Tothill Street and the Broadway, Westminster, asking that those two thoroughfares may be incorporated with and under the name of the Broad Sanctuary, and the houses and premises numbered consecutively between the Westminster Hospital and Queen Anne's Mansions. They have also had before them a letter from Mr. Perks, M.P., forwarding a petition from owners and lessees of property in Tothill Street in favour of the proposal. The reasons advanced by the petitioners are briefly:—(1) That during recent years the character of the thoroughfare has entirely changed: (2) that Tothill Street and Broadway form a natural continuation of Broad Sanctuary, and that it is inadvisable to have three names for a short length of thoroughfare where one would suffice; and (3) that the name Tothill is but imperfectly connected with the history of the locality. To assist them in their consideration of the matter the committee have had the advantage of a detailed report from Mr. Gomme, the clerk of the Council, upon the historical associations bound up with the names of Tothill Street and Broad Sanctuary. The main con-

clusions of this report are as follows:—Tothill Street, although possibly outside the actual area of Tothill Fields, from which it derives its name, probably formed one of the boundaries of that area, and is thus legitimately entitled to the designation. It has, moreover, borne that name for about seven centuries. The name possesses associations of the highest antiquarian and historical interest, bearing witness, as it does, to the former existence in the locality of a toothill, or "look-out hill," the names of many of which are scattered over the country, the particular one in question having possibly been the site of the folk-moot at Westminster. Having regard to these considerations, the committee are of opinion that the name Tothill Street, which the thoroughfare has borne from very early times, is one that should not be altered for other than the very strongest reasons, and they cannot admit that such reasons have been adduced. There was, further, no evidence that the privilege of "sanctuary" attached to the Abbey precincts ever extended further west than the limits of the present "Broad Sanctuary." They accordingly recommend that the request of the petitioners be not acceded to.

THE HOUSING QUESTION IN LIVERPOOL.

THE Liverpool Corporation may be congratulated on their spirited action in relation to the housing of the labouring classes difficulty as exemplified in Hornby Street area scheme, which was inaugurated on Wednesday last by Her Royal Highness Princess Louise (Duchess of Argyll), who on that day laid the foundation-stone. The Hornby Street area, which comprises Hornby Street, Tatlock Street and Raymond Street, was acquired by the Corporation as an "unhealthy area" under the powers of the Housing of the Working Classes Act, 1890. The medical officer of health (Dr. Hope) reporting on Hornby Street and Upper Mann Street (which will subsequently be taken in hand by the Corporation), said that "both are unhealthy areas, are both characterised by unusual prevalence of sickness of all kinds, and their rates of sickness and mortality, as compared with those of the rest of the city, are excessive."

The Hornby Street area contains 26,025 square yards. The total number of insanitary houses acquired is 511, in addition to which there are 23 sanitary houses, making a total of 534. The population of the insanitary houses is 2,431, and by the terms of the Local Government Board's provisional

orders confirmation (Housing of the Working Classes Act, 1902) the Corporation are required to provide accommodation for the area for the number of persons dispossessed. The new dwellings comprise 23 blocks, or 445 dwellings, which it is estimated will accommodate 2,446 persons. There are 48 four-roomed dwellings, 270 three-roomed dwellings, 90 two-roomed dwellings and 36 one-roomed dwellings, a keeper's house, 7 shops and a recreation ground containing about 1,755 square yards. In Hornby Street the new dwellings are set back from the present line of street, so that for a considerable portion of the length of this street the width between the main line of new dwellings will be 70 feet. Each house is provided with a separate w.-c., and also with a separate scullery. The buildings as a whole are three storeys in height, each living-room containing at least 150 superficial feet, the principal bedroom 100 superficial feet, the second bedroom 100 superficial feet, and the third bedroom, where one is provided, between 80 and 100 superficial feet. The average height of the rooms is 9 feet clear. The materials used in the construction are local brick with red brick dressings, buff terra-cotta being sparingly used, and only in the entrances. All the staircases are lined with glazed bricks, the roofs slated, and the floors constructed with small iron joists with coke breeze concrete, the floor boards being nailed direct on to same. The ashes are discharged into bins by means of shoots at the back, and are collected daily by carts.

The first portion of the scheme has involved the demolition of 145 houses, and it is interesting to note that 71 per cent of those tenants have availed themselves of accommodation provided by the Corporation in the immediate neighbourhood. The new dwellings on the site of this demolished area will contain 138 houses, and it is proposed that when the first portion is completed another portion will be demolished and the dispossessed tenants from such portion will occupy the new houses now in course of erection. In this manner it is thought that the whole scheme can be carried out in three portions. The contractors for the first portion are Messrs. Joshua Henshaw & Sons, of Chatham Street, the amount of the contract being 23,382*l*. The estimated cost of carrying out the scheme in its entirety is 150,000*l*. The Local Government Board are now considering the terms upon which the Corporation shall be allowed to borrow the money, and it is hoped that, having regard to the increased period allowed by the Housing of the Working Classes Act, 1903, the Board will allow eight years for the repayment of the loan for the purchase of the

and sixty years for the repayment of the loan for the erection of the buildings. With regard to the rent, it is stated that if the one-roomed dwellings are let at 2s. per week, the two-roomed at 3s. per week, the three-roomed at 4s., the four-roomed at 5s., and taking the estimated value of land for dwelling-house purposes, the scheme will return 10 per cent. net. When this (Hornby Street) scheme and other schemes in operation are completed it is estimated that the Corporation will have provided 1,697 tenements, which will be rented exclusively by those who have been dispossessed by the operation of the Corporation in demolishing insanitary premises.

SOCIETY OF ENGINEERS.

A meeting of the Society of Engineers held at the Royal Institute of Service Institution, Whitehall, on Monday evening, November 2, Mr. J. Patten Barber, president, in the chair, was read on "The Bacterial Treatment of Sewage," by George Thudichum, F.I.C., F.C.S., and of which the following is an extract:—

The author prefaced his remarks by stating that the extensive experiments which had been carried out during the seven or eight years by various authorities had yielded results very gratifying to those who had first introduced bacterial methods. The principle that sewage could, in the majority of cases, be purified by biological means alone is now found practically universal acceptance, that being endorsed by the interim report of the Royal Commission now pending. He pointed out that, that being so, there was no longer any need to argue as to principle, but the best methods of application might still be discussed with advantage. The two main points which were still being argued were (1) the relative merits of the anaerobic or septic, compared with the aerobic or coarse-grain contact system; (2) the various ways of applying the effluent from the preliminary treatment to the finishing filters.

The author then proceeded to discuss the first point, and in setting out the arguments pro and con at some length he fully gave it as his opinion that the anaerobic process was in accordance with the teachings of nature and, moreover, possessed certain specific advantages over its rival, such as the averaging of the sewage flow; the greater ease with which regular periodic working of the filters could be obtained;

the absence of trouble from loss of water capacity through deposition of solids; and the easier and cheaper cleansing if necessary.

The necessity for covering a septic tank was then dealt with, the author stating that he thought it desirable, since it prevented disturbance of the bacterially active scum, avoided risk of nuisance and enabled use to be made of the gases evolved during the putrefactive process, as was actually done at Exeter. As regarded the question of the best method of applying the primary effluent to the secondary beds, the author hesitated to express an opinion, since excellent results had been obtained by either method, and the evidence available was not yet sufficient to enable a definite verdict to be arrived at.

The author then discussed the question of sea outfalls, and the possibilities of pollution of shell fish by sewage or sewage effluent. He thought that in some cases the standard demanded was too high, and suggested that reasonable safety was all that should be asked for, since absolute safety was practically unattainable. The author concluded by pointing out how the present methods of sewage treatment had been gradually built up, tracing the growth of the so-called Sutton system from its early commencement to its maturity.

ENGINEERING AND SCIENTIFIC ASSOCIATION OF IRELAND.

An ordinary meeting of the Association was held on Monday, the 26th ult., at 9 Merrion Row, Stephen's Green, the chair being occupied by Mr. John Holliday, vice-president.

Letters of apology were read from Monsignor Molloy, Colonel Plunkett, Sir Horace Plunkett, and others.

The following were elected into the Association as members:—Messrs. Alder, H. C. Brett, Sir Charles A. Cameron, C.B.; A. Campbell, A. Dickson, H. T. Radley, A. Hamilton, George Hanlon, S. Hill, W. Hoult, W. Medcalf, H. Milling, F. G. Sheffield and A. R. Wayte. As Associates:—Messrs. D. Anderson, J. Merriman, A. Ponton.

Professor W. E. Lilly, M.A., M.I.C.E.I., member, read a paper on "The Relation of Engineering and Science," in the course of which, after a brief review of the engineering works of the ancients, and the mischievous effect of the fallacy of a double system of natural laws, he referred to the marvellous progress of the industrial arts and science during the last

Grams, "DISTEND, LONDON."

century, and emphasised the necessity for a liberal education, more especially for those engaged in engineering and science. He said the Universities had now established schools for training in engineering and science, and given facilities for research that were undreamt of in the past. The engineering laboratory of Trinity College, with which he had the honour of being connected, had now been in operation for nearly a year, and experiments on the strength of the materials of construction and other tests had been carried out. He illustrated his remarks by showing specimens of the materials used, and some of the results of the experiments which had been carried out. The practising engineer had not, as a rule, time or plant for carrying out such tests, and often had to rely upon the maker's test that the material was up to the required standard. The laboratory had been thrown open to the profession to allow of such tests being made, and many practical tests of various kinds were at present being carried out on the plant installed there. The relation of engineering and science was closely connected with the objects and aims of the Engineering and Scientific Association of Ireland. There were many kindred institutions, the membership being, as a rule, confined to those specialising in the various branches of engineering and science, but an Association such as that, whose members were of various professions and occupations, appealed to a larger circle, and had a more general interest. From the zeal shown by the members in promoting its welfare he augured well for its continued existence and its usefulness, and hoped it would develop into an Association of which all Irishmen might be proud.

A demonstration and discussion followed, and the thanks of the meeting having been conveyed to Professor Lilly for his able paper, the proceedings terminated.

MANCHESTER IMPROVEMENTS.

A REPORT which has been made to the improvement and buildings committee of the Manchester Corporation by the city surveyor shows that vacant or residue land to a total value of 335,881*l.* was sold during the ten years 1894 to 1903, that sum including 35,360*l.* received for vacant land transferred to other committees of the Corporation. Of this property 295,347*l.* worth was disposed of by private treaty and 40,000*l.* worth by public auction. Properties have been purchased by the committee at a cost of 134,231*l.* in Hanging Ditch, Cannon

Street, Great Ducie Street, Factory Lane, Rochdale Road, the value of the residue not required for street improvements estimated approximately at 112,243*l.* This sum, when revivied together with the value of the residue land resulting from Ardwick and other improvements, will be brought into annual account on March 31 next.

The estimated value of the residue land now in possession of the committee is approximately 190,000*l.* During the period under review the surplus lands of the committee were offered for sale on two occasions only. In December 1898, when forty-two plots of land, of the total estimated value of 282,200*l.* were offered for sale, twelve lots were sold and realised 30,000*l.* The second sale took place on March 20, 1901, when property to the value of 1,034*l.* was sold. Twenty-two lots, valued at 80,000*l.*, were offered, and only one lot was disposed of at auction.

After reviewing the method of procedure in these matters by the authorities of the county of London, the City of London, Glasgow, Liverpool, Birmingham, Sheffield and Bristol, the city surveyor says a balance of opinion in other towns is shown to be in favour of offering all property for disposal by public auction, whether it be for sale outright or on chief, or sub-lease only to lease for a period of years. The sale of Corporation property by public auction, when properly advertised and conducted under suitable conditions, has everything in its favour, and is free from the objections that can be advanced against the disposal of public property by private treaty without giving the ratepayers and the public generally the option of purchase. The city surveyor suggests for the consideration of the committee the advisability of periodically holding a sale by public auction of all property in the committee have for disposal; determining as soon as possible after each property has been acquired upon the method of disposing of the residue—namely, whether by sale on chief, or by lease for a period of years; and providing copies of conditions of sale, with plans and other necessary particulars relating thereto, immediately after the committee have determined upon the method of disposal, such particulars, with the probable date of the next sale of property, to be available for the information of intending purchasers.

The report was submitted to the committee, which was last of the municipal year, and consideration of it was deferred until a future day. Councillor J. R. Wilson, as chairman, and the Lord Mayor, as deputy-chairman, were thanked for their services in the past year.

The Architect.

THE WEEK.

lancholy end of the life of SILVANUS TREVAIL by hand suggests the evil of over-exertion which is mon in our time. As a busy architect and member of public bodies in Cornwall there was enough to his attention. But Mr. TREVAIL was induced to a prominent part in what may be called the politics of session. With as much ardour as if he were entirely championed the project of registration of architects, involved more worry and anxiety than the preparation for a large building. Mr. TREVAIL also advocated for the transformation of London, which would have even more powerful influence than was supposed GEORGES HAUSMANN when he adapted Paris for its use by cavalry charges and artillery operations in revolution. Mr. TREVAIL wished, moreover, to go on in other directions, and his failure to obtain the Institute Council revealed how he was feared for his force. He was confident of success, and defeat he became a different man. There could be no question of his possessing an unusual amount of energy and the precipitancy with which he turned it to himself is the more to be regretted. Mr. TREVAIL was to be a strong man who could be useful in his position for several years to come. He rendered many services to his fellow Cornishmen, which were gratefully acknowledged. But his success made him believe he was under still wider responsibility. He endeavoured to hold a commanding position in London without realising the entail, and as London did not yield to a first despair with its consequences led to the tragedy of

collection of etchings and dry-points belonging to the late TIMMER MENPES which can be seen in Messrs. PHILLIPS'S galleries is to be considered as representative of the late Mr. WHISTLER'S work at one period. It does not, therefore, exemplify all the moods of the artist. The etchings belong to a later time, and although they are prized by WHISTLER, they will not do much for the reputation hereafter. Mr. MENPES claims that his work is absolutely unique in their perfection, and belongs to a middle period, when WHISTLER'S best work was in course of production. A man with such dexterous hands and which were rarely in repose, could always find something for strokes in his plates, and Mr. MENPES says, "I printed he worked, engraving on the plate itself the process of printing." The various states—there are a dozen of *Irving as Philip of Spain*—are revelations of curious individuality that prized its simplest and would not accept suggestions, but yet was impelled towards changing. It is evident also that he wished to make the mechanical process of printing an aid to variety. Much interest will also be taken in etchings which are touched up with Indian ink or wash, and in some instances with extreme care. It is also that he often preferred French or Dutch to Japanese. From its peculiar character the exhibition cannot be considered as supplanting any other of its kind, but are to have only partial revelations of WHISTLER.

any exhibition of portraiture will find much that is interesting in the exhibition of the Society of Portrait Painters in the National Gallery. The collection of modern mezzotints, and engravings to be seen on the walls of the gallery could by themselves form a useful display and one which would be improved if the photographic reproductions were eliminated. Many of the oil-paintings are of the highest quality. Mr. ORCHARDSON'S *Sir David Stewart of Bantry* is a Provost of Aberdeen, although a daring experiment in colour and pink, dwarfs the magistrate. The late Mr. BURTON was not a good subject, and allowances should be made if MILLAIS'S portrait does not meet the usual standard. Nor are Mr. WATTS'S two portraits of ladies entirely satisfactory. It is not unlikely

that the majority of visitors will find most interest in the foreign contributions. Professor VON LENBACH'S *The late Right Hon. W. E. Gladstone* is a really creditable performance; the strong features are excellently rendered, but they are hardly suggestive of that tendency to smiling which was the Minister's characteristic. Señor ZULOAGA'S *Gallito et sa Famille* must be destined to be hung on some very big wall. As so often happens with Spanish painters, the subjects have not the average amount of national beauty, defects are defiantly displayed. The late BENJAMIN CONSTANT'S *Lord Savile*, although showing a sportsman with his dog and his gun, is happily not reminiscent of France. Another deceased artist, Mr. WHISTLER, is represented by a full length in a red robe with a black boa, entitled *Rouge et Noir; L'Eventail*. It suggests the certainty of the painter's process, for there is no experimenting. We can realise what he intended from what we see. The busts are interesting. Seven out of the thirteen are by the late ONSLOW FORD; two are by M. RODIN, and are more effective than some of his full-sized figures.

As long as the Public Health Act is unrepealed we suppose it will be impossible to determine what is a "drain" and a "sewer"; whether they are identical or entirely different in character. But by a process which is certain, if very slow, the Courts are gradually classifying the conductors of refuse in such a way that the want of precision in the Act will cease to be an evil. For instance, on Saturday the Court of Appeal decided that an open drain at the side of a road could be sometimes brought within the purview of the Act, because in the definition of "sewer," the words "drains of every description" are employed. The plaintiff, who lived in Milbrook Road, Dinas Powis, sought an injunction to restrain the local district council from permitting noxious matter to remain in a drain which ran by the road, and he claimed damages because of expenses incurred during the illness of his daughter, which arose from the state of the drain. When the case was heard at the Cardiff Assizes, Mr. Justice PHILLIMORE considered the drain was a sewer which the defendants should keep clean, and he awarded 30*l.* damages. The Local Board appealed. Their Lordships held that the drain received the rain-water from the roofs and the surface water of the curtilages, and conveyed both to the gratings of a sewer, which carried the water away. It was different from an agricultural drain, which might not be a sewer. Mr. Justice PHILLIMORE was right in holding it to be a sewer, although in other cases a similar drain might be different.

ANY reputation which ARY-SCHEFFER is likely to enjoy will, except among a few, depend on the interest of the engravings after his pictures. His *Christus Consolator*, *The Temptation of Christ*, *Mignon*, *St. Augustine* and *Monica*, *Faust* and *Marguerite*, are known everywhere by means of the plates from them. It was therefore fitting that those who wished to conserve his memory should have endowed the Academy of Fine Arts with a sufficient sum to enable a prize of 4,000 francs to be occasionally bestowed for the best engraving made by a living artist. ARY-SCHEFFER died in 1858, but the prize was awarded for the first time on October 31 of the present year. The recipient is M. JULES JACQUET, a professor at the Ecole des Beaux-Arts, and the work selected is the fine engraving "1807," after MEISSONIER. There will be no questioning the justice of the decision. ARY-SCHEFFER was of German nationality, but when very young he went to Paris and began the study of art. He became a friend of the sons and daughters of LOUIS PHILIPPE, and from them received several commissions. His pictures from scenes by GOETHE, BYRON and DANTE helped the Romanticists. After the fall of the ORLEANS dynasty he began to paint religious subjects. His colouring was never satisfactory, and was often ridiculed by HENRI HEINE. Among his portraits is one of CHARLES DICKENS, who considered the painter as "a most noble fellow," but said the portrait did not look at all like, and if he saw it in a gallery would not have supposed he was the original. There is an interesting biography of SCHEFFER in English by Mrs. GROTE.

A PROJECT OF FLAXMAN'S.

IT is inevitable for every sensitive artist to be desirous, at one time at least in his career, to express the colossal. Poets and musicians, equally with architects, painters and sculptors, have had the same ambition to produce works which are not to be measured by the ordinary scales. Nature does not fail to inspire them by a variety of examples. The Egyptian sculptors may never have come near mountains, but they were acquainted with vastness in plains and deserts which exercised a like effect. It sometimes happens that littleness suggests its opposite, and an artist can be bounded, like HAMLET, in a nutshell, and yet count himself a king of infinite space.

Nor is it requisite to be a man of vigorous physique in order to be ambitious to undertake colossal works. MICHEL ANGELO probably felt some affinity with his brawny sibyls and prophets. But what is to be said about JOHN FLAXMAN? He was a weakling from his birth, and it was owing to his incompetence to share in children's games that his infancy and boyhood were spent in contemplating the models and plaster casts in his father's shop in New Street, Covent Garden. Yet FLAXMAN was fascinated by the colossal. In his lectures he dwells upon colossal statues as if they formed a necessary rather than an exceptional division of the sculptor's art. He evidently looked forward to a time when more should be known through the aid of gems and coins about the appearance of ancient examples. The 60-ft. statue of the *Zeus* of Elis was affirmed by him to be renowned "not for stupendous magnitude alone, but more for awful majesty and sublime beauty; it was adorned with all the charms poetic vision could bestow, embodied by labours which have been the wonder and the school of all succeeding ages." FLAXMAN dwells on the details of the *Colossus* of Rhodes with the simple belief of a compiler of a book of wonders. He tells us that "when lying on the ground this work appeared miraculous. Few were able to embrace the thumbs, and the fingers were larger than many statues. Vast caverns yawned in the broken limbs, and within were seen great masses of stone, by whose weight it was supported. Twelve years were employed in the execution of it, and the cost 300 talents, about 60,000*l.* English."

About the time he was elected an Academician, or 1800, he was not satisfied with pondering over the difference between London and Rhodes, the latter possessing, as he said, besides the *Colossus*, a hundred other huge statues. He resolved to seek an opportunity to erect a figure which would be, in his own words, "the noblest monument of national glory in the world." The *Colossus* of Rhodes was 105 feet high; the *Zeus* of PHIDIAS was a seated figure 60 feet high, and might therefore when standing be supposed to be 72 feet; the *Zeus* of LYSIPPUS, which was placed before the theatre of POMPEY in Rome, was 60 feet; but the *Britannia Triumphant* which FLAXMAN contemplated, with its pedestal and basement, would have a height of 230 feet.

That height did not mark the limit of FLAXMAN'S power. He would, we imagine, have considered himself equal to undertaking a much larger figure. But the Committee for Raising a Naval Pillar or Monument had proposed 230 feet as the measurement of the architectural or sculptural work for which designs were invited.

FLAXMAN, in sending his design for a colossal figure, accompanied it with a letter in which he endeavoured to prove the superiority of that class of memorial to any other. If an obelisk were adopted it would be necessary, he said, as in the case of all imitations of ancient architecture, that its principles and character should be preserved. The height of the Egyptian obelisk, according to him, "is in general about ten times the breadth of its base, which, being mounted on a pedestal and plinth, the whole height could not be less than 12 diameters—a proportion much too slender for that strength and permanence which the monument in question should present. Besides, the character of the obelisk is so simple no ornament seems capable of being harmoniously united with it, excepting the hieroglyphics with which it was charged by the Egyptians."

The triumphal arch he thought to be liable to objections. First, it could not well be covered with bas-reliefs representing the engagements it was intended to celebrate, like the ancient arches, because sculpture did

not represent shipping with effect—and the great British victories were naval—but chiefly because the arch, consistently with a beautiful proportion, could not be raised sufficiently high to make a distant stately object. The column FLAXMAN considered to be preferable to the arch and the obelisk. It made a high and striking object with greater bulk and firmness than the obelisk; it was simpler than the arch and could be surmounted, surrounded and defended by such statues, trophies and architectural forms as the portraits of the heroes, the spoils of the conquered and the records of the national prowess required, thus making one great, harmonious and magnificent position. It was possible also to have the meta of a circus, the figure of a temple or a pharos, but they were not equal to the column. All were, however, inferior to the colossal statue, which might be built by the same kind of labour and with the same durability as a column, and have its proper or desired accompaniments, and in these respects would probably not be more expensive than the column.

The memorial which was desirable should, in the opinion of the sculptor, "be worthy of the grandeur of the country and the mighty objects it is intended to perpetuate, and should be a decided proof of the excellence of our artists, the skill of our mechanics and builders, and in all respects a fitting memorial of the magnanimity, virtue and wisdom of the country." As regards the expense, FLAXMAN mentions that the memorial of the Fire of London cost 14,500*l.*, a sum that would be equivalent to 29,000*l.* or 30,000*l.* at the beginning of the nineteenth century. "Surely," he says, "the spirit of the nation will feel that a memorial of such great singular blessings it enjoys, its wealth, its power, its unrivalled naval prowess, neither should nor could be equalled at the same expense as was extracted from wretchedness to perpetuate the remembrance of calamity." Doubtless the expense of the Monument would not, he maintained, be excessive. The sum of 50,000*l.* could, according to FLAXMAN, be obtained by 200,000 subscriptions of 5*l.* each, or 1,000,000 shilling subscriptions. As there were 12,000 parishes in the kingdom the money could be collected in a manner neither burdensome nor disagreeable.

The site he suggested was the summit of Greenwich Hill, for there "the gradation of scenery from the Thames rising with the fine architecture and porticoes of the naval hospital of the country, continued with the ground of woods and connected by the Observatory, such a finish, would afford a sublimity of prospect to be equalled in any other place."

It is needless to mention that neither FLAXMAN'S project nor any of the artists' in the same competition was accepted. The national memorial committee was chosen from time to time, and it was proposed to have the monument commemorative of military as well as naval triumphs, in the end the column and its immediate surroundings at Trafalgar Square were the indirect results of all the vain efforts.

Whether FLAXMAN would be equal to the undertaking of so colossal a work is doubtful. Evidently he recognized that a great part of the interior of the figure could be built up in courses by ordinary masons. If so, there would be some analogy between it and the statue of *Enlightening the World*, which the traveller from New York sees when his steamer is about to enter New York. As is well known, the interior of the latter is made of a complicated system of girders designed by EIFFEL, and having bolted to them a large number of copper plates beaten out to the shape required for the draped figure. It cannot be said that FLAXMAN was successful with the statue of the men who took part in the French war. He was not a master of proportion, or, rather, he adopted a system of production which led to defects in that quality. His work was worked from models larger than half size. Errors were consequently exaggerated. The statue of Earl Fitzroy St. Paul's was so shapeless after completion, it was necessary for FLAXMAN to spend months in operating on it with a chisel, and it is still lumpish in appearance. He was likely to change his system for the *Triumphant Britannia*, and, indeed, his model would hardly be more than a model of the full size. Towards the close of his life he employed large models, and the benefit derived from them is not

St. Michael, which is generally estimated to be his important work. It was impossible to record of him that he enjoyed the patronage he merited, and on that account his studio was never in the best of CUNNINGHAM, in describing a visit to the sculptor, that in the studio in Buckingham Street, Fitzroy, "there was but one chair and a small barrel, which he sat on, with a board laid over it. On the former he reclined and occupied the latter himself, having removed a white black cat, who seemed to consider the act as his own."

It must be admitted, however, there were some possibilities in favour of the work being successful. FLAXMAN was making for personifications and beings in whose representation imagination could exercise some power. His *Nelson* therefore might be superior to his *Nelson*, though one was an abstraction and the other a true hero. His maxims was that whatever was produced from rules and rules, even if the manual labour be most perfect, is nothing but a mechanical exercise. He did not in sentiment, and as at the time Britannia was being more than a figure on coins to him, as to other men, the realisation of his design might have given the world a new aspect of that genius he undoubtedly had. In later times we are less disposed in England to look at the colossal. In Germany, on the other hand, the memorials of the war of 1870 are unusually large, and sites for them are well chosen, and in consequence seem to be advantageous.

PRINCE BISHOP AND TRADING.*

The archiepiscopal city of Olmütz, in Moravia, is beyond the ordinary circular tours of Englishmen and travellers from Western regions. It has a population of about 22,000, of whom a third are Czechs and two-thirds Germans. The people brew, distil, manufacture starch, sugar, &c. It was once fortified, and was thus sustained a siege by FREDERICK THE GREAT. Its rulers and inhabitants have lost faith in that kind of defence. The fortifications are now transformed into parks and public gardens. The siege of 1758 has done for Olmütz the distinction of being made the subject of a slight but graphic sketch by THOMAS CARLYLE, in the main outlines continues to be true of the city. He tells us that "Olmütz is an ancient, pleasant city in the Plains of Mähren, romantic, indistinct to the English mind, with domes, with steeples eminent in its size, has its prince archbishop and ecclesiastic" with much else which need not be repeated here. The prince archbishop and some of the ecclesiastical form our theme. The race of prince archbishops is almost extinct. England for many years possessed one whom who was among the most powerful of the class. Now who survive are looked on as types of rulers of little relation to our time. What they do and how they differ from bishops who are not princes unless in an historical sense not many care to inquire. In a very few cases they are likely to be found in histories alone. On account we desire to bring before our readers an action and defence of the prelate who holds so distinguished a position in Olmütz. The ecclesiastical affairs of the principality are as vague to the English mind as they were in the middle of the eighteenth century. But the prince is to be drawn from the volume before us is that ecclesiastical prince is an inexhaustible subject for mention in newspapers, and he is charged with expending large sums on purposes which do not bring much credit to Moravians, Austrians or the world in general. It is to be alleged that in the barrack-like palace the numerous inhabitants have no occupation more profitable than that of killing time, feeding well and talking. The prelate seems to be engrossed by ecclesiastical duties which are so multifarious he can have little leisure for the simplest diversions. It is, however, no concern

of ours to describe the extent of his zeal as an ecclesiastic. We have only to consider the prince as a steward of valuable property; and, in fact, to regard him as a survival of the great prelates who in various parts of Europe during the Mediaeval period were praised or blamed as the critic judged them to be liberal or stingy in their expenditure.

We learn in the first place that in our time, and we imagine the same rule was always observed, the prince bishops are not invariably selected from scions of noble families. THEODORE KOHN, who is the prince archbishop of Olmütz, is the son of humble peasants. Indeed, his name suggests the weakness of his parents. It was intended he should bear a different one, but at his baptism the curate preferred to call him THEODORE, a change which would not be made in the case of a family with any influence. He was born in March 1845, and, like other poor children, from an early age he had to look after the cows in the meadows around Breznice. But he was too sensitive to be efficient in goading oxen when they were working in the fields. His father, who looked after the agriculture, was dissatisfied with his weakness, while the mother was content. His family was in such poverty, many sacrifices had to be endured to obtain for him the education that would qualify him for entering an ecclesiastical seminary. He was ordained priest in 1871, and between that year and April 1892, when he was elected prince archbishop, he passed through the various grades of the hierarchy with as much expedition as if he had been born in the purple. As his predecessor was the Cardinal FÜRSTENBERG, who gained distinction in Austria, it was no easy task to discharge his high office with similar dignity and vigour.

It is not stated how large are the revenue and contributions a prince bishop can obtain in Olmütz. But in his first year of office the new archbishop, it is said, expended from his privy purse in works of charity, promotion of societies, construction and repair of churches, and bourses for students, the sum of 84,544 florins, or, say, 7,000/. That average has been exceeded, for in nine years the total expenditure amounted to 896,562 florins, or about 75,000/. During the same period the department administering the property of the archbishopric disbursed for ecclesiastical purposes 322,310 florins. It has been alleged that his motives in laying out so much money were egoistical. But it is not clear what personal advantage can accrue to an individual, or how his vanity can be gratified by such works as erecting residences for employés, planting forests, draining, land improvement, roadmaking and much else, of which the profit will be mainly experienced long after the prelate has passed from life. In the year 1901 no less than 258,245 florins were laid out on new buildings, conservations and repairs, and in the eight preceding years of his occupancy of the episcopal chair the outlay under similar heads was 1,652,851 florins.

The churches of Moravia are not always remarkable as works of art, if we may judge from the illustrations given in the "Facta Loquuntur," but they appear to be in sound condition. The archbishop not only generously gives aid to the upholding and amelioration of buildings, but he has founded societies of which the members are expected to adopt the same aims. In four years 196 of those guilds were constituted, and they have collected large sums of money which will be expended on building. Some critics are offended because the archbishop believes it is one of the duties of his office to encourage art. We see engravings of altar vessels in gold and silver, lamps, covers for service books, statuary, altars, &c., which have been specially executed on his commissions. Most of the examples were costly, but in having them executed the prince archbishop is only preserving a tradition almost as ancient as Christianity itself. The see possesses a palace at Olmütz, and it can hardly be deemed an offence if the decorations are preserved and continued in a becoming style, or if the prince's portrait assumes the grandeur of those of its predecessors.

One important part of the archiepiscopal estate consists of forests. It is perhaps excusable if occasionally there is some indefiniteness about the extent of property of that kind. One of the first acts of the archbishop was to have a cadastral survey prepared, on which the various subdivisions should be shown. It was also necessary to establish an administrative bureau in which everything

* *Facta Loquuntur: ou Dix Années d'Activité Épiscopale.* Par François Botek et A. Kleiber. (Paris: F. A. Brockhaus; Olmütz, 1902.)

connected with planting and the cutting down of trees should be accurately noted. The sawing of the timber was accomplished by old-fashioned hydraulic machines; several steam saw-mills now execute the work. The removal of timber was a slow process. Roads have been formed and facilities arranged for transport. It was necessary also to improve rivers and streams, to drain land, to introduce cattle, to set up a dairy, and to execute other works described in detail in the volume.

It might not be considered extraordinary if some high secular official were sent to the property and could arrange for a profitable administration of forests and lands. But at Olmütz the work to western critics must appear remarkable when it is found the organiser is an ecclesiastic. Readers of "Wallenstein" will recall the complaints made by some of the officers about the inconvenience which arose through priests and monks having charge of various divisions of the War Department. A cavalry general related how—

Zuletzt, da schickten sie mir einen Capuziner,
Ich dacht' es war' um meiner Sünden willen!

or, in other words, a capuchin was to arrange with him about the horses he required. At Olmütz we can still discern some of the features of a system which was carried to excess at the court of FERDINAND II. The chapter and other leading ecclesiastics of the diocese co-operate with the archbishop in the management of the diocesan estates, and in that way gain experience which they are afterwards able to turn to account in many ways. If, as in the Middle Ages, it became necessary to carry out immense architectural works we presume the prince archbishop and his advisers would feel no hesitation in assuming the responsibility. Whether such a mode of conducting business is economical is not manifest from the "Facta Loquuntur." The best intentions may inspire all the outlay, and it may be for the public good to have estates, forests, tillage and cattle managed in the way described, but it would be more satisfactory if the defence of the system had been verified by secular experts. It seems incompatible that anyone who has such onerous duties imposed on him as an ecclesiastical superior should combine with them the kind of business for which a long course of training in secular affairs is supposed to be necessary. APOLLO feeding the flocks of ADMETUS was not more of an incongruity. The attacks of the journals may be unfounded, but to those living at a distance, at least, something more is required to refute them than particulars of a devotional life and extracts from account books. The inability to realise the necessities of the case is enough to suggest that the defence has not been prepared in the manner which a court of law would recommend.

THE LATE MR. S. TREVAIL.

ON Saturday last Mr. Silvanus Trevail, of Truro, who was a prominent architect in Cornwall, committed suicide by shooting himself in the lavatory of a railway carriage while on his way to attend the funeral of his uncle at Luxulyan.

The inquest was formally commenced on the same day, and was resumed on Monday in the Bodmin Guildhall. The following account is derived from the *Western Morning News*:—

Mr. R. P. Edyvean, the coroner, said they were met that evening to inquire into the cause of death of a gentleman well known to all of them, and well known throughout the county. He did not think they could find out much more than they already knew from the very graphic accounts in the morning's papers. He could not help saying, however, they were holding this inquiry in respect of one who by unaided and untiring industry and ability had raised himself from the comparatively obscure position of an architect in a small country town to the top of his profession. Whatever he took in hand he did with all his heart and soul, and that he succeeded there could not be the slightest doubt. Unfortunately his ability caused so many calls upon his time that he was afraid that was the cause of the unfortunate occurrence. He did not think the jury would have any doubt after hearing the evidence that the poor man's mind was quite unhinged, and that the pressure of business worries had brought about the sad result. They had hoped deceased would have lived for many years and have continued to be a proud ornament to the county. He knew deceased very well, and his death was a great shock to him. After reviewing the main facts, the coroner remarked that he did not think the jury would have any difficulty in coming to

the conclusion that deceased was not responsible for his act when he committed the deed.

Mr. Alfred J. Cornelius said he was Mr. Trevail's assistant, and had been with him for seven years. He never seen a revolver in his office or in his hand. He last deceased just before he left by the 11.40 train from Truro Saturday. He seemed very much worried and as if his mind were thoroughly unhinged. In fact, he had been so for two or four days before. His state of mind would have been plain only to those around him. Until the architects' dinner in last deceased seemed all right, and was very cheerful, but on his return to Truro he divulged to witness that he was much worried over his business affairs. From that time to his death he was in the same state of mind, and had only a few out of doors about a dozen times during that period. Deceased appeared to be suspicious, and would sometimes say he was lost and was dying.

The Coroner: I suppose he was a very hard-working man and worked night and day?—He worked hard before the architects' dinner, but had not done so since then. He had been unfit.

Then you date his going down the hill from the time of the architects' dinner?—Yes; in fact, he did not like to be out of doors.

Continuing, witness said he tried to cheer deceased, but however, always looked upon the black side of everything.

Do you know anything that should cause him worry?—Witness: Purely business affairs.

By the Foreman: Deceased never passed any remark to lead him to think he would commit suicide. Had he known deceased carried a revolver he would have been on his guard as he would have been in peril of his life, as would others around.

By Jurymen: He had not spoken to deceased's relatives about him as he was not insane and talked perfectly sensibly. He believed his relatives all knew his worries, and, in fact, he made frequent visits to him. Deceased left Truro on Saturday to attend his uncle's funeral. He must have got the revolver before witness saw him off in the cab to go to the station. He did not go out earlier that morning. He had not been on his journey during the week to the knowledge of witness.

The Coroner said for a man of the disposition of Mr. Trevail to suddenly exclude himself from contact with fellow-men pointed in itself to something being wrong. There seemed to be no doubt that business worries and pressures wholly unhinged the poor man's mind, and that at the time the act he was totally irresponsible. He therefore apprehended the jury would return a verdict to the effect that the deceased committed suicide by shooting himself with a revolver while temporarily insane.

The jury concurred with the coroner, and returned a verdict accordingly.

Mr. Silvanus Trevail, says the *Western Morning News* was born at Luxulyan in 1851, and came from a very old Cornish family that was known locally in the Norman and Plantagenet periods. He was educated by Dr. Drake, at Ledrah House, St. Austell, and took honours in mathematics, drawing and constitutional history in the university local examinations, whilst he also won the style of Associate of the Institute of British Architects, and for two years he held the high office of President of the Society of Architects of the United Kingdom. The Royal Institute of British Architects in 1878, selected works by Mr. Trevail to represent British architecture in the Paris Exhibition of that year, and for the Sydney and Melbourne Exhibitions of the two following years where he was the recipient of international medals and

s. He acted as architect for various public bodies, and a majority of the Board schools in Cornwall, as well as several of those in Devon, were built from designs in his skilled hands. There are also banks, churches, mansions, hotels, libraries, technical schools and hospitals which were built from his designs, and among these may be mentioned the Devon and Cornwall Banks at Truro, Falmouth and Newquay; the Cornish Banks at Helston, St. Columb and Newquay; the Post-office at Truro; the Board schools at Fowey, Mevagissey, St. Ives, Falmouth and in Oxford Street, Plymouth; the Passmore Public Libraries at Truro, Hayle, Camborne, Bodmin and Launceston; the library and hospital at East Ham; and the Public Library and Technical Schools at Newton Abbot. A splendid block of buildings known as the Central Technical Schools for Cornwall, at Truro, were also from his designs, and a perspective view of the school found a place on the wall in the Royal Academy exhibition of 1898. In hotels, Mr. Trevail's best known works were the Pendennis hotel, Falmouth; Carbis Bay hotel, St. Ives; the Housel Bay hotel, Lizard; the Atlantic and Headland hotels, Newquay; King Arthur's Castle hotel, Tintagel. The residence of Edward Hain, M.P., Treloyhan, St. Ives, is an excellent example of his work, whilst for churches those of Nanpean and St. Cross may be mentioned. Mr. Trevail's largest work was the addition to the Cornwall County Lunatic Asylum at Bodmin, which he was superintending up to the time of his death.

Having thoroughly at heart the welfare of his native county, Mr. Trevail, of course, took a prominent part in public life. In connection with this work, although his manners were not generally acceptable to some, yet there is no doubt that in all things he was well-meaning and desired to do his best for his county. He went to reside at Truro in the seventies, first attracted notice by gratuitously designing and superintending the erection of the series of triumphal arches and city decorations erected in honour of the visit of His Majesty King Edward, who, as Duke of Cornwall, in 1880, laid the foundation-stone of the cathedral. In consequence of the part he showed in the affairs of the city he was returned as councillor for the Eastern Ward, which position he held up to the time of his death, having been returned at the head of the poll on seven occasions. In 1894-95 Mr. Trevail was unanimously elected mayor, and during his year of office, an extremely successful one, he had the honour of entertaining the Lord Mayor of Liverpool at Truro. His mayoralty was marked by the establishment of the public library and technical schools. Mr. Trevail was also a justice of the peace for Truro. He had made the subject of local government a special study, and was one of the first members of the County Council, being elected for the Eastern Division of Truro, without opposition, on the formation of the county authority. He was a valuable member of that body, being one of the finance committee and chairman of the sanitary committee. In connection with the latter he did excellent work, "leading a sanitary crusade throughout the county, enhancing its attractions as a health and holiday resort to such an extent that thousands now visit the county annually who hitherto had elsewhere." He resigned his seat on the County Council, at two re-elections, when he accepted the County Asylum Commission. In 1894 Mr. Trevail made a great effort to bring the second great trunk line of railway through Cornwall, but succeeded to the extent of procuring the rejection by the House of Commons of a "Blocking Bill" upon its third reading after it had passed the committee stage, an achievement unprecedented in Parliamentary history. For this and other county services he was the recipient, at the hands of the Lieutenant, the Earl of Mount Edgcumbe, of a service medal, valued at 500 guineas, and subscribed for by upwards of 50 persons throughout the county. Mr. Trevail had travelled a great deal, having visited the principal cities of Europe and America. Whatever he took in hand he carried out in doing thoroughly, and this was one of his chief characteristics. A man of undoubted ability and possessed of great determination, he has done good work for his city and county. The deceased gentleman was a Churchman, and although at one time an ardent Liberal in politics, yet was a supporter of Sir Edwin Durning-Lawrence, Bart., the Liberal member for the Truro-Helston Division. Mr. Trevail was a bachelor. His parents only pre-deceased him within two years, and to their honour he gave the magnificent gift of a peal of bells to his old parish church of Luxulyan, the ceremony in connection with which took place thirteen months ago.

The Liverpool Architectural Society will hold its third ordinary meeting of the fifty-sixth session at 13 Harrington Street, on Monday next, November 16, when a paper will be read by Mr. H. Chatfield Clarke on "The Bill for Altering the Law of Ancient Lights."

HORTON AND WRAYSBURY.*

IT will be within the memory of members present that this ramble to Horton and Wraybury was to have taken place on June 20 last. It was at the time when the excessive supply of liquid nourishment vouchsafed by generous clouds to an ungrateful and complaining earth was strenuously competing with the Deluge of history. A note to the Vicar of Wraybury brought the kindly intimation that the roads were all under water two days before our proposed ramble, and on the day before I received a telegram to say that they were still impassable.

Leaving you to reflect upon the mutability of human affairs and the pertinacity of Athenæum rambles, one passes to the consideration of the beautiful neighbourhood which is no longer under water. Here we are on the borders of Middlesex, and I had originally intended to commence at Colnbrook in that county, and bring you thence to Horton and Wraybury. But there were difficulties, not floods, in the way, and the interesting old coaching town of Colnbrook will provide us with a future feast. From Colnbrook in the direction of London as far as Hounslow and Hanwell there is one vast flat plain unrelieved by the merest hillock, and sparsely clad with trees and shrubs. But at Horton this uninteresting flatness is exchanged for a far more pleasing aspect of natural beauty, and the hills and woods on the Surrey side of the river appear—Cooper's Hill, Virginia Water and St. Ann's Hill lend variety to the landscape, which is further beautified by a vignette of Windsor Castle. The whole scene is one of great pastoral beauty, and the thoughtful man who has read his Milton cannot fail to see how deeply the poet had drawn inspiration from that nature whose presence is here revealed.

Upon a plain blue slab on the floor of the chancel of Horton Church you may read, "Heare lyeth the Body of Sara Milton, the wife of John Milton, who died the 3d of April, 1637." This was the poet's mother. John Milton shares with Shakespeare and Dante, by common consent, the foremost place in the rank of poets. Born in Bread Street, Cheapside, on December 9, 1608, he entered St. Paul's School in 1620, proceeded to Cambridge in 1625, graduated B.A. in 1629 and M.A. in 1632, and in the latter year came to Horton, where his father had retired in part from business, and here the first-fruits of his genius were manifested—

How soon hath time, the subtle thief of youth,
Stolen on his wing my three-and-twentieth year,

and, asking himself in the same sonnet how he shall spend his life, he affirms that—

It shall be still . . .
if I have grace to use it so,
As ever in my great taskmaster's eye.

The influence of the pastoral charm of this Buckinghamshire village upon Milton was evidently a deep one, and we have the poet's own impressions in a college composition, probably written at the time he proceeded to his M.A. degree, in which he "calls to witness the groves and rivers and the beloved village elms under which in the last past summer I remember having had supreme delight with the Muses, when I too, among rural scenes and remote forest, seemed as if I could have grown and vegetated through a hidden eternity." Buckinghamshire is the county of the nightingale, and had you been here in the time of the floods you would probably have heard him as Milton heard him 270 years ago, when he apostrophised him in one of his beautiful sonnets:—

O nightingale, that on yon bloomy spray
Warbl'st at eve, when all the woods are still,
Thou with fresh hope the lover's heart doth fill,
While the jolly hours lead on propitious May.

John Milton's time at Horton appears to have been the happiest of his life, filled up as it was with classical reading, the while his imagination formed the outline and his industry and scholarship filled in the detail of some of his earlier poems. These, written at Horton, were the "Sonnet to the Nightingale," already mentioned, "L'Allegro," "Il Penseroso," "Arcades," "Comus," and "Lycidas." Each of them reveals the influence of his pastoral surroundings, as in "L'Allegro" he declaims against the pessimist—

Hence, loathed melancholy of Cerberus,
and invites him to join the genius loci

And trip it as ye go
On the light fantastic toe,
And in thy right hand lead with thee
The mountain nymph, sweet Liberty.

* A paper read by Mr. Theophilus Pitt, F.C.S., before the members of the Upper Norwood Athenæum.

How great is the privilege to us to gaze upon these scenes with the poet's own impressions and thoughts in our minds. It is like reading English history on the sites and amid the scenes where the events have happened, a privilege which often comes in the way of our Society. What impressions, then, had Milton of the venerable structure which still stands in Horton as it did 700 years and more ago? Alas! none that we know of. He was not indifferent to the beauty of English architectural remains—

But let my due feet never fail
To walk the studious cloysters pale,
And love the high embowed roof,
With antic pillars massy proof,
And storied windows richly dight,
Cast a dim religious light.

And the burial of his mother in Horton Church some six months before he left England shows that he had some part in the religious life of the parish; but one wonders what were the conditions at this time, a century after the final repudiation of the Papal authority, when the Puritans were at the height of their power. Did Milton think at all of all that the five centuries of the existence of his parish church meant? His classical scholarship was of the first order, his Biblical knowledge was no less great, but of the parish, the diocese, the province, he seems to have known nothing, and so, rightly, left them alone. Here we must part with John Milton until we meet with him again at Chalfont St. Giles.

The very impressive church of Horton, dedicated in honour of St. Michael, stands in a large churchyard, kept with more than usual care, as befits its position and purpose. The churchyard contains some of the ancient yew trees which are somewhat plentiful in the neighbourhood. The church contains

HORTON CHURCH.

work of the four periods of English architecture, Norman, Early English, Decorated and Perpendicular. The door within the north porch is a very beautiful and well-preserved specimen of work in the first-mentioned style, with double chevron moulding. There is no tympanum with relief-carved subjects such as may be seen in many score of churches in the country; there is a unique collection of drawings of such tympani in the Guildhall at the present time. The church consists of chancel, nave, north aisle and a small chapel on the south, western tower with a short turret at one angle and two porches. The nave arcade is Early English, with cylindrical shafts, and the body of the church is Perpendicular. The font is a plain Norman structure. There are interesting bricks of some antiquity and unusual size in the wall adjoining the churchyard. Horton in Domesday Book is Hortone, in Erlai hundred, held by Gilbert de Gand and others, and had been held by a vassal of Ulf's, who "could not give or sell it without leave."

Wraysbury is a picturesque village on the Thames, and is evidently a site of some antiquity. Its church, dedicated in honour of St. Andrew, was rebuilt in 1862, but it contains the chancel and nave arcades of the older church. The tower and spire were added in 1871; the old spire was of wood and was over the nave, and the doorway in the north aisle is a copy of that of the old church. The vicar, the Rev. L. F. Hake, has very kindly tabulated the chief points of interest:—(1) The font, (2) a fine piece of carving round the pews in the south aisle, (3) the Jacobean pulpit, (4) a brass with canopy in the centre of the chancel, the Stonor brass, 1512, (6) doorway and window built up in the north wall of the chancel, to be seen also in the vestry, (7) a portion of illuminated leather formerly part of an altar-piece.

The Stonor brass above mentioned is interesting in that it represents a youth named Stonor habited in what is probably

the dress of an Eton scholar, consisting of a long gown with girdle and edged with fur, fastened over on to the right side, and having tight sleeves. He wears a cap with a broad lappet passing under the chin, and from the back a streamer.

WRAYSBURY CHURCH.

floats gracefully below the shoulders. There are other examples of scholastic habit to be seen at Headbourne Worth, Hants, where there is a brass to John Kent, scholar of Winchester College, and at Little Ilford, Essex, where Thomas Heron, a schoolboy, who died at the age of fourteen, is represented with his penner and inkhorn suspended at the girdle.

The church also contains mural monuments to the Stonor, Hassell, Harcourt and Gyll families, and in the churchyard on the north side are several extra-mural tablets to members of

COTTAGE AT WRAYSBURY.

Harcourt family. The lych-gate is good work of the thirteenth century, and is engraved in Lipscomb's "History of Wiltshire." Traysbury is called Weresberie in Domesday Book, an eleventh-century editor of which explains that by it is meant Traysbury. The manor was held by Robert Gernon at the time of the Survey, and it answered for twenty hides, had the pannage for hogs, and was in the hundred of Stoches. The quotations from Milton are from the edition of 1673, and for Tho. Dring at the Blew Anchor, next Mitre Court, against Fetter Lane, in Fleet Street. The illustrations are from photographs kindly lent by the Rev. Arthur Fearon, Esq., and Mr. T. C. Thatcher.

TESSERÆ.

Development of English Gothic.

In this country the successive changes in style have been partly imported, partly national. The early Norman was the distinct importation of a style ready-made, but its subsequent developments in this country were the joint product of Englishmen and Normans. The Transitional style has been shown to have at first grown naturally out of this Anglo-Norman development, and to have been in England to a great extent English. Yet later on this English transition style was largely influenced by unquestionably French elements. The style of the first half of the thirteenth century may be said to be distinctly English, being distinguished definitely from that of France by the feature, if not wholly, at least mainly English, of the round abacused capital. About the middle of the thirteenth century a great French element came in, which in a degree transformed the style—the traceried window. This when once established again began to develop itself somewhat differently from its prototypes in France, and was all along differentiated from them by being united constantly with the round capital, whereas in France the angular abacus was still predominant. The later middle pointed in this country was not only wholly English in feeling and invention, but it at a later date seems to have become the source from which the French (possibly during the English wars) developed their Flamboyant style. It may be always remembered, was not cotermporary with the flowing style, but arose in France just when the style of the flowing line may be supposed to have suggested it had been reshaped in England. The next great change in this country was the very reverse of the cotermporary change in France, while in one country the geometrical arrangement of tracery had continued to prevail at the same time that the flowing lines were universal in the other, the latter seem to have been adopted in France just when in England there was a sort of revulsion against them, showing itself in the adoption of the straight and vertical line as the leading element of tracery. This was in its earlier days clearly an aim at regaining the firmness and strength of character which had been lost during the reign of the flowing line. Elegance was sacrificed to strength of character, a mellifluous poetry of style to stern unbending prose. There is doubtless a noble simplicity and strength of character in the earlier Perpendicular style. Westminster Hall, the remodelled nave of Winchester Cathedral, the choir of York Minster, cannot fail to prove this, but the how or other artistic interest seems greatly lost. We feel we have passed out of that series of phases, growing one out of another, which give so delightful a charm to the study of the earlier styles, and to have entered upon a wholly new era—one destined to produce innumerable and noble buildings, yet one which has emerged from the region of romance and entered the region of mere unadorned history.

The German Pfahlgraben.

The great Roman station of Saalburg was the chief of all Roman military posts along the line of the Taunus. And beyond it we reach the real limit of the Roman power in the regions. The Pfahlgraben, the dyke drawn in an irregular shape from the Lahn to the Main, answers to the massive walls made by the Romans in our own island to defend the fully subdued and organised province against the incursions of the unsubdued natives. But as a mere structure of earth, a vallum and not a murus, it is not an object to be compared with the stately bulwark of stone with which—according to Dr. Merivale, in the latest days of their power—the Imperial people fenced in the smaller extent of their dominion in Britain. In the immediate neighbourhood of Saalburg the Pfahlgraben itself is not a very striking object of great height and almost covered with brushwood, it is easily passed over by anyone who was not specially looking for it. Save for its lying so near to works the nature of which cannot be mistaken, it might easily escape notice altogether, or it might be taken for some fence of a far less

ancient and dignified kind. But about the fortress whose remains rise above it, about the Saalburg itself, there can be no mistake whatever. The walls nowhere rise much above the foundations; there is nothing standing up, like the vast Roman buildings at Trier, like the mighty walls of Anderida, or even like the smaller fragments at York, Lincoln and Leicester. Yet no one can raise any question as to what the building was or who the people were who reared it. The Saalburg is the camp of the conqueror, pitched there to guard the furthest outposts of his dominion. It was the chief of the Roman stations along the Taunus range, looking backward on the land which Rome had brought more or less thoroughly under her dominion, and looking forward on the land which she did not venture to claim as her own, but which still remained the undisputed heritage of the free German. Between him and herself she had drawn a line to be at once a boundary and a bulwark, and the spot to which we have carried ourselves in fact or in thought is the greatest and strongest of the posts by which that bulwark was to be guarded. The look-out from the Saalburg over the Pfahlgraben which lies beneath it is still a look-out on a wild and free land which shows but few signs of man's works or dwellings. As we trace out the length and breadth of the fortress, its walls, its gates, the hall of its prætorium, the places within and without its walls set apart for the various purposes of Roman military life, it needs no great flight of imagination again to people them with those who, seventeen or eighteen hundred years back, guarded that fortress against the assaults of men of our own blood and speech who were striving to win back the land which the stranger had rent from them. We see the site of the altars where, on the soil whence the worshipper of Thunder and Woden had been driven, prayers and incense went up to the Jupiter of the Roman Capitol, to Mars the father of Rome, and to Venus the mother of her Cæsars. We trace out the ground once covered by the tents of the legionaries gathered around the central dwelling of their Imperator. We look forth from thence on the wide expanse beyond the boundary wall, and we think with what feelings our kinsfolk on the yet unconquered soil may have now and then heard an echo of the sounds, or caught a distant glimpse of the scenes, which went on daily within the bulwark which told that the whole land of their forefathers was no longer theirs. They saw, spreading its wings in their native sky, the proud badge of Rome's dominion, the eagle of Marius and Cæsar, and they looked not forward to the day when they themselves should be the heirs of Rome's titles and Rome's dominion, when the Roman eagle should become the badge of German rule, and when the Tiber should welcome as Roman Cæsar whatever king might be chosen on the banks of the liberated Rhine.

Mythology in Modern Art.

The paganism of Italy was so real a thing in the days of Leo X. and Raphael, Lorenzo dei Medici and Ficino, that it was hardly going beyond the living sympathies of the time to represent and enjoy the gods and goddesses of the Farnesina, the Aurora of the Ludovisi, the Sibyls of the Sistine. Charon ferries the souls into hell with most religious solemnity in the Campo Santo of Pisa; Virgil was almost as living a friend to Dante as the hero of "In Memoriam" to Tennyson; it was after all but a revival of the deities which the nation had once believed in. But we are too far off in thought in these days, naturally, intellectually and physically. Nymphs look but cold abstractions in the Royal Academy, they shiver in our climate; our northern nations do not dream of such like in the woods, they are unnatural here, and while we go dead against the feeling of the nation we cannot make national works. The nude will always affront the sense of right of the homely middle and lower classes: this feeling is inextricably bound up with what is really good in their lives, and it is no use appealing to them by such means. There is something in modern civilisation so essentially different from that of the Greek that we never can regard such matters with the same eyes. Every human passion, sentiment and power were in his view equally divine: there was nothing to him either immoral or displeasing in the depicting of any human appetite. Ours may be a lower civilisation in this—we will not dispute about terms. Our delicacy may be real indelicacy in the matter, but its existence is a fact. The world has drunk deeply of the knowledge of good and evil, and cannot return to its childlike nakedness of expression, even if (which we deny) it were desirable. That a certain number of works of classic beauty should be "invented," as the Italians call it, for the educated minority who care for them and can understand them; that (Enones should be written and processions in honour of Greek myths should be painted, is good. There is room for all. But let the poets and painters do so as a pastime, not as their life's work, knowing that Homer and Dante and Phidias and Raphael were not grown thus, and indeed could not have produced an article so purely of culture and abstraction, instead of being inspired by the faith of their people, and in return raising and ennobling that faith.

NOTES AND COMMENTS.

WE have more than once referred to the difficulties awaiting county councillors who, under the new Education Act, are responsible for the maintenance of school buildings. As a rule the draughtsmen of such measures are indifferent to subjects relating to construction, and the various professional societies would scorn to meddle with such humble affairs. It is easy to say let the county authorities be responsible, but the real question is what officers will have to perform the work? Will the extra labour be cast upon officers having other duties without receiving additional pay, or are new officers to be appointed? It deserves to be remembered that at the present time unusual attention is given to public roads, and it is generally admitted that the county surveyors cannot cope with all their duties. To increase their labours is not desirable in the public interest. An indication of the problem was afforded on Tuesday at the meeting of the East Sussex Council. It was proposed to increase the salary of the surveyor from 500*l.* to 600*l.* a year, and to engage an extra assistant. Nothing was mentioned at first about the surveyor having to supervise 170 school buildings which had been taken over by the education committee. It was no doubt considered that so large a number of buildings would be only a trifling increase to the surveyor's responsibilities. Some of the members of the County Council protested against such a mixture of business, and maintained that the time had arrived for the appointment of a county architect whose task would be to look after buildings. The Chairman, however, said that with an architect and an engineer there would be not only very great expense, but considerable friction. Eventually it was decided to increase the surveyor's salary, and to leave the important question of his duties to further consideration. The position of county councils is, no doubt, embarrassing. All over the country school boards were afraid to obtain reports from architects on the state of their buildings. By shirking repairs the schools have suffered, and county councils now find themselves saddled with the duty of upholding structures which are in an unsatisfactory condition. To suppose that a county surveyor whilst rushing through his examination of roads can at a glance or by a short visit discover all the defects, and the best way of remedying them, is certainly a most uneconomical method of having buildings restored.

THE death was announced on the 6th inst. of LUDWIG PASSINI, the painter. He was then in Venice. As he was a member of the Academies of Berlin, Vienna and Venice, his international position is suggested. His family belonged to Italy. He was born in Vienna seventy-one years ago, and he was accepted as one of the most delightful masters of the Berlin school. Whilst so many of the artists around him were making great efforts to discover some new regions for painting, PASSINI was satisfied to find his subjects in the streets and churches of Italy. His works gave delight, if it were only by their contrast with those which were to be found in the same exhibition. Moreover, his scenes were accepted as if they were records of an Italy that was quickly passing away and deserved to be preserved. There was no painter who had more thoroughly studied Italian childhood in its poverty and merriment, and especially in the form of little boys in attendance at the altar or who sang church anthems in the language of their forefathers, but which was unknown to them. Over every scene there was a magic by which they gained a peculiar character that was discernible amid a multitude of pictures.

WHEN M. HUYSMANS published his "La Cathédrale" we described the book. The author did more for the cathedral of Chartres than Sir WALTER SCOTT for the Glasgow or VICTOR HUGO for the Paris building. Indeed it might be said that the interest of the reader is attracted by the great Gothic work rather than by any of the human characters who are brought into connection with it. Since the book was written M. HUYSMANS has lost his habitation in a Benedictine monastery, for he shared in the ejection of the monks. But he has not given up his interest in cathedrals. He lately visited Cologne, but as he did not realise how extensively the military spirit prevails in all parts of Germany, he was surprised to find that in ex-

amining the building he had to submit to regulations, that he could not remain beyond a certain time in one spot, and that conversation was prohibited. His artistic sensibility revolted at the modernity of the interior, and only by visit to Strasburg was it restored. The latter, although now belongs to the German empire, remains in nearly the same state as when it was a French historic monument. The touchiness of Frenchmen is increased when they come under German control. But much is to be said in favour of the regulations imposed in German churches. A great many tourists—and unhappily Englishmen are not to be excepted—do not manifest much of a reverential spirit when they visit the old buildings. The indifference is annoying to natives, and it is right that steps should be taken to restrain it.

OVER sixty volumes of *L'Art* have been published, but we doubt if in the whole collection there has been a more remarkable number than that for October. WATTEAU works are scarce in most public galleries, including the Louvre. In Madrid there are two, and of one of them *Le Contrat de Mariage*, a very large etching by M. GIROUX is presented. The scene is supposed to take place in wood, and the plate shows an appreciation of WATTEAU style as well as a mastery of light and shade. The work is worth a year's subscription. There are several other plates some representing exquisite examples of woodwork, tapestry, and other decoration. The illustrations from the "Prometheus" of AESCHYLUS by DAVID D'ANGERS, the sculptor, deserve comparing with those by JOHN FLAXMAN. The French artist represents the Titan as displaying more self-control. Other plates recall the age of the Grand Monarque. A couple of poems by M. CHAPMAN, a Canadian, suggest the love of France which prevails in the colony. Altogether the number is a remarkable example of enterprise.

ILLUSTRATIONS.

CATHEDRAL SERIES.—EXETER: NORTH TRANSEPT AND CLOCK
THERE must have been much inconvenience in determining the time for church services before clock were invented. Hour glasses were the only means to fix the succession of the hours, but common people were not likely to possess such aids or to have them synchronise with those employed by the clergy. Church bells in those days were indispensable in order to summon the people. As an early example of a clock that of Exeter is now of exceptional interest. JOHN BRITTON says it was constructed on the now exploded principle of astronomy which regarded the earth as the centre of the universe, and it shows the hour of the day and the age of the moon. On the face or dial, which is about 7 feet in diameter, are two circles, one marked from 1 to 30 for the moon's age; the other figured from 1 to 12 twice over for the hours. In the centre is fixed a semi-globe representing the earth round which a smaller ball, the moon, painted half white and half black, revolves monthly, and by turning upon its axis shows the various phases of the luminary which represents. Between the two circles is a third ball, representing the sun, with a fleur-de lis, which points to the hours as it daily revolves round the earth. Some additional works were added in the year 1760 to show the minutes, which are painted in a circle over the ancient dial. From the Patent Rolls of the 11th of EDWARD II. it is evident there was a clock in this church in 1317. The next mention is in the Fabric Roll of 1372-73 in which some expenses concerning the clock occur, and that the latter was the very machine illustrated may be inferred from a remarkable entry in the Roll of 1376-77, in which the sum of 11*9s.* 9*d.* is set down within three months for expenses "circa Camera in boreali turre pro Horologio quod vocatur de novo construendam." The whole charge in that Roll, novæ Camerae pro Horologio, is 10*l.* 6*s.* 5*d.* The rude, though strong, workmanship of the present clock, its general design, and the appearance of antiquity it possesses, seem to connect themselves with the above reign.

THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. H. T. Hare, president, in the chair.

The following were elected as members:—Messrs. H. A. Woodington, W. G. Huxley, A. C. Lee, J. P. n and H. P. Burke-Downing were unanimously re-elected members.

F. C. EDEN read the following paper, written by Mr. Nicholson, who was unable to attend:—

Modern Churches.

Modern church design may be said to have been evolved in the century which has just ended. Owing to a variety of causes church building was at a standstill in England in the death of Queen Anne and the end of the eighteenth century. It is conceded, even by those who disagree with Mr. Pugin's opinion of the Georges, that the influence of the American Court was not such as to foster an enthusiastic churchmanship. Moreover, during the greater part of the eighteenth century the nation was engaged in a life and death struggle with the French monarchy, the American colonists, and afterwards with Napoleon. The population was almost stationary, the old churches sufficed for all requirements. If they fell into disrepair, they were patched up; if they were considered draughty and cold ceilings were made, and partitions and galleries were built; if they fell or were burnt down they were either left in ruins or else rebuilt in the best possible fashion. In London and some other large towns a few new churches were built; generally these were parish churches, financed by the ground landlords and supported by means of pew rents.

St. Peter's Church in Vere Street and Berkeley Chapel, Bristol, may be taken as typical of the ecclesiastical ideas of the middle of the eighteenth century, plain, substantial, brick buildings with round-headed windows and ugly belfries, their style reminiscent of St. James's, Piccadilly, or St. Martin's-in-the-Fields.

The Church of England was roused to activity by the preaching of the Wesleys and the influence of the Tractarians, and after the final overthrow of Napoleon, the prosperity of the nation has steadily increased. The growth of cosmopolitanism has led to the toleration of all forms of religion. Dissent is no longer looked upon as an ecclesiastical nuisance; Dissenters and Freethinkers are no longer treated as heretics, and consequently an immense amount of building has been undertaken by the Church and other religious bodies in the past century.

A few churches that were built or enlarged between the French Revolution and the Great Rebellion were generally of debased character, such as is met with in many Oxford colleges. In 1818, when Sir George Jones, who introduced Italian models after his travels on the Continent, built the church of St. Katherine in the Strand, and the chapel at Lincoln's Inn somewhat after the old manner. After the Restoration, however, Charles II. and his Court had grown accustomed to foreign fashions during his exile abroad, and the wits and critics of the period regarded Gothic architecture as a barbarous anachronism. The prevailing style of the end of the seventeenth century became the school of Wren. Side by side with this, however, lingered on the remains of the old Gothic tradition, which had never entirely died out in the remoter country districts, which was in some few instances revived under the patronage of the old-fashioned divines of the school of Laud and his followers. Thus we find Bishop Hackett restoring the ruined abbey of Lichfield, and rebuilding its central steeple upon new lines. Again, two of Wren's City churches and four of his country churches are of Gothic character; so, too, is his work at Westminster Abbey. At Oxford, Tom Tower and Hawksmoor's All Souls are certainly more Gothic than Classic, and the nave and tower of the church at Warwick, built in the reign of one Sir William Wilson. The churches of Exeter, Bath and Falmouth, the spires at Higham Ferrers and Stratford-on-Avon are familiar examples of Gothic work of the seventeenth and eighteenth centuries.

In the closing years of the eighteenth century, the period may be taken as the starting-point of modern Church architecture. It was the age of the Greek revival in architecture. The first descendant of the school of Wren was Sir William Chambers, who was also one of the earliest of revivalists, for on his return from his travels in China he built the Pagoda at Kew in imitation of Chinese work. The belfries and towers remaining in front of several houses in Bloomsbury, some summer-houses in suburban gardens and the lacquered grandfather's clocks are almost the only remains of the once popular craze that was introduced by the style of the Adam Brothers was the vernacular

architecture of the day. Based to a certain extent upon Anglo-Classical traditions, the Adam school had introduced a certain playfulness into the design of domestic buildings, united with a perhaps excessive degree of refinement in architectural and decorative details, these details, though of Classical origin, being treated in a novel and thoroughly artistic manner.

The publications of the Adams themselves and of Stuart and other writers brought into fashion the more literal reproduction of Classical architecture, both of Greek and Roman character. But meanwhile other influences were making way among a large class of people. In the first quarter of the eighteenth century the *Gentleman's Magazine* was established. This publication soon became the recognised chronicle of matters of antiquarian interest. Even the earlier numbers contain occasional descriptions of Mediaeval buildings; the later volumes of the eighteenth century and the earlier ones of the nineteenth are full of entertaining criticisms of contemporary architecture, and the publication continued to treat of similar subjects until 1865 or thereabouts. The influence of the *Gentleman's Magazine* was distinctly in favour of a revival of Gothic architecture.

The first person who had seriously attempted this was probably the architect Essex, since Horace Walpole's performances can hardly be taken seriously. Essex was employed at Ely, where he refitted the choir of the cathedral; at Lincoln, where he rebuilt one of the north-eastern transept chapels in a very correct imitation of thirteenth-century work, and also set up the canopied reredos to the high altar; and at Cambridge, where he designed the reredos of King's College Chapel.

At the end of the eighteenth century there also flourished a certain clever Italian modeller, one Bernasconi, whose attention was turned to the study of Gothic ornament. He was employed in refitting the choir of Southwell Minster, where he set up stone canopies to the stalls, the details being carried out in a hard cement or stucco. Both the design and the workmanship were admirable, and since these fittings were unique of their kind, it seems a pity that they were destroyed in the recent restoration of the cathedral. The canopies of the return stalls have been preserved; they are partly fourteenth-century work, but were extensively restored by Bernasconi. The same artist restored the former reredos at Westminster Abbey and made that in the Beauchamp Chapel at Warwick. He may also have worked under Wyatt at Oxford and elsewhere. The Wyatts, father and son, had a large practice at the beginning of the last century. Their name has become a by-word on account of the sins they committed in the name of restoration, but much of their work is effective if somewhat theatrical in character, as at Fonthill and Windsor, and in the remodelling of New College Chapel.

The early Gothic revivalists were not, however, numerous nor influential, the style which most commended itself to the critics of the Regency and the reign of George IV. being that of literal Classical revival. Soane, Decimus Burton and Wilkins were leaders in this movement, while the Wyatts and Nash frequently worked in the same style, which was adopted in most of the numerous London churches that were built in the years immediately following the battle of Waterloo.

In the year 1818 Parliament unanimously voted a million of money for church building in London and other growing cities. A favourite ecclesiastical architect of the day was a certain F. Bedford, who designed many churches in the South of London, of which St. John's, Waterloo Road, may be taken as a typical example; a large, plain, square room, fitted up with pews and galleries, with a portico at one end and a belfry on the ridge. Merciless criticisms of some of the churches appeared in the *Gentleman's Magazine* over the signature E. I. C. This critic was, however, generous enough in his remarks on some of the better work that was being done at this time by Cockerell, Barry and Savage. Three churches were built at the expense of the ratepayers in St. Pancras by Henry Inwood. The new parish church is too well known to need description. It was designed in 1819 after the model of the Erechtheum, the steeple being adapted from the Tower of the Winds. In spite of the absurdity of the general design, the church is well worth studying for its excellent workmanship and the refinement of some of its details. The interior of the apse is decidedly fine and original. The two other churches in St. Pancras by the same architect are inferior to the parish church: that in Regent Square is a rather ornate Greek Ionic building, somewhat on the same lines as the last; the other, in Somers Town, is a dismal piece of Gothic work in white brick.

The most remarkable Classical church of this period was Cockerell's Hanover Chapel in Regent Street, which stood on the site of Salvati's shop. The recent destruction of this charming building seems most deplorable, although the new church in Davies Street, which was to replace it, is one of our best and most interesting modern buildings. The design recalled that of Hawksmoor's church in Lombard Street; it was a square church with twin belfries. Hawksmoor's square nave had, however, a square lantern and flat roof; Cockerell's

was covered with a dome. It also possessed a portico projecting across the pavement of Regent Street and an annexe at the west end. The entrances were under the portico, at the east end of the church right and left of the altar, which was backed with a high reredos forming the front of the organ loft. The supports of the dome were arranged like those at St. Mary Woolnoth, but the interior of Cockerell's building was disfigured by a double tier of galleries. In later years the liturgical arrangement of the church had been altered, and a chancel formed at the west end opposite the entrance. The exterior was very effective, with its dome and two towers, and the portico was not spoiled with an ugly pepper-pot steeple set astride its pediment.

Marylebone Church, completed in the year 1818 from designs by Thomas Hardwick at a cost of 60,000*l.*, has a pretty steeple bestriding the ridge of a rather fine portico. The combination of these two features is incongruous, but the effect of the building is good owing to the weathering of the Portland stone of which it is built. The original arrangements of the interior were quite unprecedented: two tiers of galleries, and the altar backed with a divided organ, the centre of which enclosed a large transparency by Benjamin West. John Nash's well-known church in Langham Place is an oblong basilica, arranged more or less in accordance with eighteenth-century traditions. The west end has a round tower, with an effective Roman Ionic peristyle and Corinthian columns round the belfry. It is finished with a tall, sharp spire, 146 feet high, a striking if peculiar feature, and the church is most admirably placed at a turn of the street.

Soane's churches at Walworth and Marylebone, St. Peter's, Eaton Square, by Hakewill, and a church in Bermondsey by Savage, are all of revived Greek character, and better than the general run of the work done at the time, each of them showing some attempt to evolve a type of building suited to the needs of the age, instead of a blind reproduction of temple forms.

The Gothic tradition, as we have seen, had hardly become totally extinct before attempts began to be made to apply Mediaeval details to modern buildings. Churches more or less Gothic in character were built in London and elsewhere. Such are St. Dunstan's-in-the-East, designed by Lang, the architect of the Custom House, about the year 1820; and St. Dunstan's, Fleet Street, by Shaw, the architect of Christ's Hospital, about 1825, an octagonal nave with an effective tower and openwork lantern.

Amongst the Commissioners' churches, two—by Sir Charles Barry and James Savage, at Islington—were singled out for special praise by E. I. C., the critic who has been mentioned in connection with the *Gentleman's Magazine*. These are large brick buildings of Perpendicular character, pewed and galleried like the Classic churches of the period, built with embattled parapets and square towers or octagonal belfries. Similar churches were built at Edinburgh and in several provincial towns, such as Liverpool and Brighton, and places in the Potteries district. The best of this class of churches was that of St. Luke, at Chelsea, by James Savage, a building of considerable size, with a pinnacled west tower. The nave of this church is groined in Bath stone, and has flying buttresses very scientifically designed, and though the building is not at all massive, it appears to have stood very well. Taking into account the difficulties which its designer must have had to face, it cannot be denied that his work does him great credit.

The liturgical arrangements of all these churches were bad, and their architectural detail was generally tame when it was not altogether ungraceful. Yet, as a general rule, they were honestly and soundly constructed, and sometimes they have an appearance of size and stateliness which is lacking in much of the work of succeeding generations.

The Tractarian movement, the writings of Pugin and the rebuilding of the Palace of Westminster, combined in the encouragement of the Gothic revival in the second quarter of the nineteenth century. Owing to the growth of religious toleration testified to by the repeal of various laws directed against the Roman Catholics and Protestant Dissenters, perhaps also owing to the rise of an easy-going latitudinarianism in the National Church, Gothic architecture ceased to be looked upon with suspicion, or regarded as a badge of Popery. The Tractarians taught the importance of the sacraments, and their successors restored the observance of many ceremonies which had fallen into disuse in previous generations. As a natural consequence, the preaching places which had hitherto sufficed for them ceased to satisfy the requirements of the majority of Churchmen. The modern type of church arrangement was thus gradually evolved during the reign of Queen Victoria, and, with very few exceptions, existing buildings were altered in such a way as to make them conform to the prevailing fashion.

The churches built at the beginning of the nineteenth century are mostly to be found in populous towns, but after the year 1837 numbers of new churches were built in country places and many of the old village churches were restored; the

attention of architects was thus diverted to the picturesque qualities which belong especially to this class of building.

A prominent early Victorian architect was Edward Blore, who restored Lambeth Palace and refitted the choir of Westminster and Peterborough. There exist several churches from his hand, some of them in a starved Early English style, others imitated from the Romanesque churches of the Rhine provinces. Christ Church, Watney Street, Stepney, and the chapel of St. Mark's College, Chelsea, are examples belonging to the last-mentioned class. These buildings are, as a rule, built of white brick, with cement or Bath-stone dressings, and they are characterised by a singular combination of pretentiousness and meanness. The style, fortunately, found admirers, and after isolated attempts to reproduce Norman work, or, as in the case of Wilton Church, basilican arrangements, the fashionable church architects of the middle of the last century settled down to a style imitated from English Decorated work, using Early English, which was supposed to bear being starved, for cheap jobs.

Considerable improvements were at this period introduced in the liturgical arrangements of churches—galleries and pews were generally abolished, chancels were formed, and more space was provided about the altars.

Like most good people who are very much in earnest, the Gothic Revivalists often went too far. They built too hastily and too cheaply, they restored too energetically. Some of their work is already ruinous after only half a century's wear and tear; yet it is hardly fair to blame the individual architects for this, since they were obliged to supply a growing demand at a very low cost, and if one man declined a commission a rival would always be found ready to step into his shoes. It is instructive in this connection to compare the cost of a few churches built at different periods during the last century:—

Date.	Church.	Architect.	Cost.	P. Sittings.
1813 <i>a</i>	Marylebone Church.	Hardwick.	60,000	2
1822 <i>b</i>	St. Pancras Church.	Inwood.	76,000	3
1824 <i>b</i>	St. Luke's, Chelsea.	Savage.	20,000	1
1825	Hanover Chapel.	Cockerell.	16,000	1
1846	Trinity, Paddington.	Cundy.	14,000	
1846	St. Saviour's, Leeds.	Derick.	20,000	
1854	Newport, I.W.	Dawkes.	11,000	
1854	Doncaster Church.	Scott.	40,000	2
1870	Cork Cathedral.	Burges.	100,000	
1890	Trinity, Chelsea.	Sedding.	20,000 <i>c</i>	1

(a) Begun. (b) Consecrated. (c) Bath stone.
(d) With tower. (e) Shell.

And it must be remembered *that the older examples generally had galleries, a fact which makes the discrepancy between them and the later buildings in respect of cost and accommodation the more remarkable.

The cheapness of churches built in the fifties may be partly accounted for by the growth of the railways and partly by the fact that church designs were then generally based upon rural and parochial models. The choice of this type minimised constructive difficulties and made it possible to cover a considerable space in a very economical fashion. As a result, churches of this age are seldom of a really imposing or dignified character.

Pugin set the fashion of spires and open timber roofs, neither of which features can be made effective in a cheap church. Pugin's own works invariably possess distinction of character, notably his churches at Birmingham and Chelsea, the convent at Alton, the churches at Rugby and Ramsbury, and his work at the Houses of Parliament.

The first of these, St. Chad's, Birmingham, built at a very commencement of the reign of Victoria, is a masterpiece of design, exceedingly bold in conception. Its tall nave and aisles are covered with a great unbroken slant roof, carried by graceful arcades. The transepts are shallow and the choir an apse and is flanked with chapels. Its stained glass, its woodwork and much of its metalwork are both rich and dignified in effect. Externally, it is very severe and simple, with brick walls and slate roof. The hipped roofs of the transepts somewhat recall Flemish work. The western spires are rather small in scale, neither turrets nor steeples, but the sculptured west doorway is charming. The frontispiece of Pugin's "Apology" shows this church with a central spire, which was never carried out.

The style which Pugin could handle impressively was the successful when imitated by his contemporaries. Innumerable churches were built in large towns and their suburbs in the forties, fifties and sixties, as well as in country places. The ideal materials of this age were Kentish rag, with Bath stone dressings. The style was generally Decorated, the roofs were steep open ones, with plaster between skimpy varnished rafters, floors were laid in red and black tiles, pews were

bed deal, organs were at first placed in west galleries, later on in chancel aisles or organ chambers. Their pipes were gaily illuminated. Arcaded dados under the east windows did duty for reredos, and the fashionable glaziers Hardman and Wailes, though a few enamel transparencies were imported from abroad. It is needless to quote examples to illustrate this dismal, though perhaps inevitable, picture in the annals of modern ecclesiology. It must not, however, be forgotten that some good work was done at this time. Scott's church at Camberwell, for instance, with its fine steeple and its long chancel, is solidly built and of good work, though internally the effect is spoiled by the galleries. A fine Roman Catholic church in Stepney was built about the same time from the designs of one Wardell; and away in India, the cathedral, the university buildings and numerous houses in the city of Sydney were being carried out under the eye of Blackett in a bold and vigorous Perpendicular style, somewhat reminiscent of the work of Wykeham. Meanwhile, the Ecclesiological Society, the moving spirit of which was Beresford Hope, was steadily influencing the architects of the day. Beginning by insisting upon a literal reproduction of old forms as a necessary preparatory process, the aim of these enthusiasts was to bring about the development of a new and living vernacular architecture based upon old models.

Since the Ecclesiological Society and its individual members possessed considerable influence in the selection of architects to carry out church work, their opinions naturally carried great weight. Scott and Brandon, the architect of the great Church in St. Pancras, were to a certain degree in sympathy with the views of this Society, but less so than Butterfield and Street. Carpenter's opportunities were few, but his fine church in Munster Square is sufficient evidence of his ability, and an unexecuted design of his for a church at Colombo is quite remarkable as an original attempt to adapt Gothic to a hot climate. Slater, who had to partner with Carpenter, Ferrey, Withers, Dawkes, and Brandon, Teulon and Christian were all popular church builders in the fifties and sixties. But the work of Butterfield and Street was far ahead of that of their contemporaries, and its superiority quite justifies the patronage they received from the Ecclesiological Society. All Saints, Margaret Street, Butterfield's first great work, was designed so long ago as 1845, and is a marvellous production for its date. The fine details of this church, and the completeness and thoughtfulness of its details, stamp its designer as an artist of real

talent. Whatever may be thought of some of the details of Butterfield's work, there can be nothing but admiration felt for his insistence upon principles, and for the thoroughness with which he worked. When he built All Saints, Margaret Street, he laid down certain rules of his own, and from those rules he never deviated at any period of his long career. Although no two of his works are alike, every one of them exhibits the same peculiarities, a complete mastery of proportion and scale, an insistence upon sound construction and accurate workmanship, and upon a certain definite standard of liturgical ornament. His architectural detail was invariably based upon purely English models. He made a frank use of modern materials and modern constructive expedients, and always insisted upon the inclusion of every detail of ornament and structure as part and parcel of the architect's scheme, determined by him at the very outset of an undertaking. Perhaps Butterfield's greatest success was his remodelling of the school at Rugby, where, with most unpromising materials, and on a cramped site, he succeeded in producing a more dignified chapel than is possessed by any of the English schools, hardly excepting even Eton or Winchester. The mention of the last-named building, however, is the fact that Butterfield's restoration work is less commendable than his original designs, at any rate if it be considered an axiom that the restorer should efface his own personality in his work. Butterfield had few followers, but the work of George Edmund Street had a very strong influence upon his contemporaries. Like Butterfield, Street remained true to Gothic motives, though in the middle of his career he was very much influenced by the beauties of French and Italian models. His constructive ability was hardly equal to Butterfield's, but, like him, he insisted upon sound building upon adherence to a standard of liturgical arrangement in all his works.

Gilbert Scott, in his career of forty years' duration, did more than any architect to influence the taste of the nation. Beginning at first in correct English Decorated style, his later designs are often somewhat French in character, though he went to the same length as Street or Burges in these respects. Posterity will perhaps judge him upon the merits of his numerous restorations which he carried out. This is hardly his memory; he may have made mistakes sometimes, when we look at St. Alban's, at Chichester and at Southwark cathedrals, and at many continental churches, we may

well be thankful that he was, at any rate, more conservative and modest than most of the architects of his time.

Burges did not carry out very much important church work besides Cork Cathedral and the excellent restorations at Waltham Abbey. His church of St. Faith at Stoke Newington is, however, interesting as being arranged upon distinctly modern lines. It consists of a wide nave with an apse and a coved ceiling and broad lancet windows, below which runs an arcaded passage aisle, the general disposition recalling the Bishop's Chapel at Rheims, and the detail being French in character. Burges's fine church at Limehouse, with its simple saddleback tower, is less well known.

The churches built by James Brooks in North London are designed in an early and severe manner, solidly built and of fine proportion. Two of these, St. Chad's and St. Columba's, at Haggerston, are cruciform buildings, the latter with a low tower over its chancel, and are distinctly impressive, although, like much of this architect's work, rather cold and uninteresting in detail. Brooks's churches are roomy and well arranged for modern requirements, and their architect frequently introduced vaulting over the whole or a part of the buildings carried out by him.

The late John L. Pearson's large town churches are a class by themselves. Beginning with the pretty but rather tame building in Bessborough Gardens, in correct Middle-pointed style, he was next employed at St. Peter's, Vauxhall, an apsidal brick church of French character, vaulted throughout. He afterwards settled down into a distinct manner of his own, which is exemplified at Kilburn and Red Lion Square, at Croydon, Norwood, Liverpool and Bournemouth, and which culminated in the cathedral at Truro. These churches are all vaulted throughout, and designed with great constructive skill, the area of the supports being reduced to the least possible limits. Their plans are often ingeniously arranged to fit an irregular site, their detail is severe and of strictly English origin, but they vary considerably in general design. Perhaps the individual features of these churches may be considered unduly small in scale, and their effect is rather toy-like in consequence of this, yet the various parts are always in agreeable proportion with one another, and are refined in themselves. In later life both Brooks and Pearson carried out work of Decorated and Perpendicular character, but their chief successes were attained when they were working in earlier styles.

A contemporary of these was the late Sir Arthur Blomfield, some of whose earlier churches deserve attention on account of their frank modernity, iron columns and galleries being freely introduced. The remodelling of Quebec Chapel, near the Marble Arch, was carried out from Blomfield's designs, and St. Barnabas, Oxford, was built by him in a plain round arched style, mainly of concrete. His later work was usually of Perpendicular character.

Little important church work was done at the end of the nineteenth century, and most of it was entrusted either to the architects just mentioned or to living artists of unquestioned ability. The younger Gilbert Scott and John Sedding, though their opportunities were few, certainly founded a school of imitators if not of followers. The former, with Messrs. Bodley & Garner and others, evolved a refined modification of late Gothic work, which is seen at its best in large town churches. Sedding, with an intimate knowledge of old work, was nevertheless frankly modern in his ideals. Each of his buildings marks a fresh phase of his versatile powers. The earliest and most complete of his churches, that at Bournemouth, has a nave and chancel with very slender arches opening into a north aisle, a stone rood-screen and reredos, and a western tower, the detail being late Decorated, and all the accessories of the church very complete. Cardiff, Hayle, Falmouth and Highgate are great, simple, hall-like churches, with narrow aisles and no chancel arches, their detail based upon early models, and their interiors invariably characterised by a remarkable sense of spaciousness. At Truro Sedding followed the old Cornish type. At Clerkenwell the work is Renaissance, steel stanchions and girders being enclosed in concrete columns and entablatures. Holy Trinity, Chelsea, is a wide, hall-like church, with widely spaced and massive piers, and, as is well known, it was intended to give eminent painters and sculptors a free hand in its internal decoration under the general guidance of the architect. The last church which Sedding designed was built after his death at Ealing by his successor, Mr. H. Wilson. Here the supports are unusually far apart, and the piers carry wide and low segmental arches. There is no clerestory, but galleries are formed over the flat ceilings of the aisles, with three triforium arches in each bay of the nave. The nave is lighted by a huge west window with traceried buttresses, suggested, perhaps, by those at Gloucester. Sedding, like Pugin, was a most versatile designer. His woodwork is unrivalled in fancy and refinement; his embroidery, glasswork and metalwork are full of interest, and always designed in strict accordance with the nature of the material used.

To some extent J. Bentley's work resembled that of Sedding, though it was founded more strictly upon precedent. In his

last and most important church he was compelled to follow archaic and foreign models, and he attained a result which bids fair to be honoured with the sincerest form of flattery.

During recent years many good, bad and indifferent churches have been built, many styles have been imitated, and many mannerisms developed only to be forgotten. One is therefore led to the conclusion that architectural style is no longer a question of mouldings and traceries in these days of cosmopolitanism and railways.

A building may be unmistakably modern whatever may be the shape of its windows or its pillars, the disposition of its parts, or the materials of which it is constructed. Hence there is little advantage in discussing questions of style, which, after all, must be left to the discretion of the individual designer.

Unintelligent plagiarism of eccentricities should, however, be deprecated. Thus, a fashion has lately arisen for bisecting traceried windows with clumsy mullions running up to the arch apex, a device calculated to cause the stonework to be fractured in the event of any settlement. Another latter-day freak is the boldly buttressed tower, abruptly cut off at the top without any cornice or other architectural finish, and sometimes capped with a temporary-looking, shed-like roof or with a stunted dome.

As regards ornament, it goes without saying that it should not be used unless it is the best of its kind. This means that good diaperwork is better than bad figurework; whitewash is better than commonplace decoration, and plain windows to be preferred to tinted cathedral glazing, and, indeed, to most stained glass. Brick and stone are better than tawdry polished granite, and good wovenwork than ordinary church embroideries.

Architecturally, the great invention of recent years is the cheap church. The cheap church of fifty years ago was ornate, but shoddily built. Twenty years ago economy was effected by building substantial and fairly complex churches of the cheapest and ugliest materials, red and yellow brick, fitting them up with varnished deal furniture, and stunting their general proportions. Where funds are limited it seems better to adopt an economical plan from the outset, discarding chancel arches and complexities of roofing, and spending the available funds upon sound building, and some degree of finish in the details. Sedding's churches at Falmouth and Ealing are capital examples of economical planning. Though solidly built, and of good scale and proportion and interesting detail, the cost of these churches worked out at about 6*z*. a foot, and 9*z*., or less, per sitting. Economy may be effected by avoiding undue multiplication of parts, and by disposing the section of the church in such fashion as to secure an agreeable proportion in each of its alleys without undue expenditure of material.

The unit by which the eye measures the size of a church is the width of the nave bays. If these are unduly wide, and the scale is not restored by some device such as a subdivision of the bays, the church looks shorter than it really is. We must all have noticed how the adoption of sexpartite vaulting shortens an interior. On the other hand, if the features are too small, the church will look toy-like. The best dimensions seem to vary between 15 and 25 feet, according to the size of the church. An agreeable proportion between height and width can generally be secured, whatever the size of the church, by the adjustment of the relative widths of nave and aisles. Thus, if a church be 60 feet across and its nave 30 feet wide, the wall plates must be, let us say, 40 feet from the floor, in order to secure agreeable proportions. If, however, the nave be reduced to 21 feet in width and the aisles proportionately increased, the wall plates need only be 28 feet from the floor in order to obtain the same proportion as before. Unless ample funds are available it seems a mistake to attempt a clerestory, because a one-storey building looks much higher in proportion than one in which the height is subdivided into pier arch and clerestory. It is generally possible to obtain a sufficiently tall arcade to give dignity to the interior of a one-storeyed church, and if the aisle roofs are flat or span ones like the old west-country churches, a dignified range of windows can be contrived in the aisle walls. Where clerestories are attempted in small churches, it is desirable that there should be a considerable difference in scale between aisle and clerestory. Thus the clerestory may be subordinated to the aisle, as was commonly done in fifteenth-century parish churches, or, on the other hand, the clerestory may dominate the design, like that at Malvern Abbey. The cheapest known form of church is that in which a single large slant roof covers both the nave and the aisles. If this plan must be adopted for the sake of economy, it is still possible to secure good scale in the central alley by using bold arcades and large end windows. In these cases the aisles must, of course, be sacrificed, and their windows must be small, perhaps square-headed. Good hints for the treatment of such churches may be gathered from the villages churches in the timber districts of England, and from some French work. The detail of such buildings should, of course, be simple; and the extent to which simplicity may be carried without sacrifice of dignity may best be learned from a study of old work.

A small and cheap, but most successful, village church was built some years ago by Mr. Harrison Townsend in a Surrey hamlet. Its plan is without aisles, a simple nave and sanctuary with shallow transepts and a small chancel enclosed with screen-work. The roof is low-pitched and covered with pantiles, the eaves project boldly, a simple bell-cot stands over the sanctuary arch. The ceiling is a Welsh groin, springing some 5 feet from the floor, and there are a range of plain, round-headed windows on each side, a large western doorway, and a recessed sanctuary cleverly lighted from the roof. There is boldness and distinction about this little church which is quite unusual to find in the generality of modern work, and the cost worked out, I believe, at not more than 3*z*. or 4*z*. a sitting.

Although, as has been indicated, it is possible, and of a legitimate, to exercise parsimony in adjusting the proportions of the cross section of a church, it must not be forgotten that actual height is a thing in itself most desirable. Although lack of height can be neutralised by skilful disposition of resources at the architect's disposal, it is a very false economy to attempt to save money by crowding the floor space of a church. The planning of altar, font, seats and so forth is determined by the average sizes of the human body, and the requirements of the Incorporated Church Building Society may be taken as defining an irreducible minimum in these respects. A sanctuary should be roomy, not less than one, or in large churches, two bays in length. Unless there is ample space steps should not be multiplied, narrow and crowded steps being both dangerous and undignified, especially at the altar. Altar rails should be placed upon a single step, and the approaches and return gangways should be broad and direct.

The wider that pews can be spaced the better. If the space is cramped it is better to introduce galleries than to crowd the floor space. Pews seem preferable to fixed rows of chairs, which are ugly and rickety, but there seems no good reason why a part of the church should not be pewed and the rest of the floor left open and used only for movable chairs, as is often the case abroad. The usual English system is possibly answerable for keeping the very poor away from church from a feeling of shyness at having to sit alongside of well-dressed people in a public place.

Roomy vestibules, screened off from the body of a church and fitted with swing doors, greatly add to its convenience and comfort, and may be advantageously introduced, even though they may necessitate the building of western galleries. Vestries and accessory buildings are too generally cramped in modern churches, but a detailed discussion of these matters is unnecessary, since they have been dealt with in a thoroughly practical and sensible fashion in Mr. Micklethwaite's excellent little book upon modern parish churches.

As regards the position for the choir and the organ, it is important that these should not be placed too far apart, nor at a long distance from the altar in an English church, because large portions of the prayer-book services take the form of verse and response between priest and people. The conventional plan of treating the musical parts of the services independent of the ritual—for instance, the performance of organ solos or anthems during the canon of the mass—does not seem likely to commend itself to English ideas. Except, therefore, in a very short church, there are objections to placing the organ and choir in a west gallery, though, if the church can be two organs, the larger instrument should certainly be placed at the end of the nave or of one of the transepts, where sufficient height is available to allow the larger pipes to speak properly. The common custom of placing the choir in a chancel generally works fairly well, and it seems a pity to abandon it for the mere sake of novelty. But in some very large and long churches, and in cases where there is a low and narrow chancel arch, the singers are best placed in the nave or in galleries facing each other, like those at Milan and St. Anastasia, Verona and Exeter Cathedral. These minor galleries may be used with a west-end organ. The best arrangement must, however, be determined by so many circumstances that it is not possible to lay down a general rule for the placing of the organ and choir. The Italian plan of putting them behind the altar would not commend itself to English ideas, although it is a suitable arrangement where, as in monastic churches, the choir is entirely composed of clergy. A choir of laymen and boys placed facing the communicants at the altar rails would be a cause of distraction to many people, and this, therefore, would be an objectionable arrangement in a modern parish church.

Chapels are convenient, indeed, almost necessary adjuncts to parish churches of any size. A chapel should be conveniently placed with regard to the entrance doors of the church, and should have an entrance of its own, and its heating and lighting arrangements should, if possible, be self-contained. Only two steps are necessary at a side altar, the footpace and the communion step, as side altars are only used for plain celebrations.

The traditional position of an English church tower is upon the main axis of the church, either at the west end or upon the crossing. But there may often be circumstances that suggest

ne other position as best for the tower, such as the side of nave or the chancel; and in such cases it is often possible to obtain fine internal effects by a judicious contrast of the massive supports of the tower with the lighter piers and arches of the rest of the church, as is done in the fifteenth-century church of St. Mary Steps, at Exeter. The internal treatment of the tower is one of the great chances open to the church architect, and this feature has been handled in a remarkably masterly way by Butterfield at St. Alban's, Holborn, at Stoke Newington and at Rugby. Some suggestive tower interiors are occasionally met with in small ancient churches, such as Wodeaton and Minster Lovell, near Oxford. And the seventeenth-century Brittany steeples, which are structurally towers ended inside out, deserve study as being less costly than ordinary towers, and far more effective than mere bell-cots.

Should it fall to our lot to design cathedrals or large collegiate churches, we should, I think, unless we have very good reasons to the contrary, place the towers and dispose the main parts of the building in a regular and monumental fashion, and very doubtful whether a happier grouping can be desired than in the traditional English combination of a large central lantern with smaller belfries at the west end. The requisites of a modern cathedral are a nave sufficiently spacious for a large congregation, and a choir roomy enough for the cathedral staff, the senior clergy of the diocese. The cathedral must contain an official chair of the bishop, and it should dominate a group of diocesan buildings such as the chapter-house, the congress hall, the diocesan offices, the music school, and so forth. Many Mediaeval cathedrals and abbeys have been more or less successfully adapted for modern use, but it will be admitted that a new cathedral should not follow old monastic models in a literal fashion. The ideals of the French cathedral of the thirteenth century as exemplified at Paris and Bourges, have more in common with modern requirements than monastic churches of our own forefathers. The plans of French cathedrals are unbroken rectangles, with apses and ambles and galleries all round; the choir and altar being in the middle and in full view of the laity, who were admitted to the nave, the aisles, the ambulatories and the galleries. This appears to be an ideal arrangement for a great national church, and possesses advantages that are lacking in the later French cathedrals, with their innumerable private chapels, and in our monasteries with their long, narrow plans and closely-screened choir. The cathedral builders of the future should surely employ the fullest use of modern constructive facilities and engineering skill in order to enclose great unbroken floor spaces with structures that shall be stable, fireproof, durable and fireproof. The great crossing space at St. Paul's has enabled the Chapter to make their church in a certain sense the religious centre of the British Empire. An ordinary Gothic church is not suitable for great national or civic functions; hence the makeshift expedients that are necessary when Westminster Abbey is used for coronations or thanksgiving services.

It has not been possible in this paper to discuss the special structural problems that have to be faced by the church architect, nor to treat of the details of architectural ornament, of sculpture, of painting or of stained glass. A knowledge of all these matters is especially necessary for the church architect, and the shoddiness and commercialism are more offensive, if not more immoral, in church work than they are in buildings designed to gratify the luxurious tastes of individuals or the vanity of secular corporations. Thirty or forty years ago the average architect, imitating the mannerisms of the leaders of the Gothic revival, tricked out his wall surfaces in patterned brickwork, or left them in rough rubblework pointed with black mortar; set up columns of polished granite and laid the floors with shiny tiles; designed gabled screens and reredoses, filled our churches with garish and ill-drawn glass and with mechanical tailor's metalwork. All this was supposed to constitute a glorious school of architecture. We, who are ready enough to laugh at the work of the sixties and seventies, must take heed lest, in our craving for originality, we should turn the rule of future critics against ourselves. And since originality is not to be obtained by a mere jumbling together of several old features of different origins in a new building, the surest way to architectural progress would seem to be that we should acquire a thorough knowledge of construction and design, that we should study nature and avoid conscious eclecticism either of old or of contemporary work, and that we should thoroughly master the conditions of every problem presented for our solution, and endeavour to work out that solution in the simplest and the most unostentatious fashion we can discover.

Mr. E. PRIOLEAU WARREN, who moved a vote of thanks to the author of the paper, said the subject had been treated in a scholarly manner, and showed a mastery of details expressed in the feeling of an artist. In dealing with the design of a church the architect was on more difficult ground than when designing other buildings. The problems could always be solved by common sense, but with regard to modern church

building, in many cases the common-sense aspect had been very much lost sight of. Features were introduced without their being necessary, and whether they were constructionally required or not, such as dividing the chancel by an arch. Precedent was too closely followed in the designs. Under modern conditions the work could be conceived as a whole, whereas in old churches it was not so. The parish church grew up by additions for spaciousness, and the constructive divisions were necessary. Mr. Nicholson said that in building a church where economy had to be followed it was wise not to have a chancel arch. This was especially true if there was a restriction to length, and the effect, too, was more dignified. It was a curious fact that above a certain size of church it became rapidly easier as the size increased to build economically. A church was relatively much cheaper to build than a municipal building or a factory. With regard to materials simplicity should be observed, and it was not necessary to have much stone. An interior could be carried out entirely in brick, an introduction of stone often giving a patchy effect. The mere use of plaster could suggest stateliness, an example being found in the churches in southern countries, where the arches on square soffits were often plainly finished in plaster, and the work suggested a reasonable and economical treatment for the modern cheap church. Of course, where expense permitted, it was more admirable to have a stone interior than a plaster one, but so long, however, as the plaster seen was not too smooth and smartly rendered, but kept with surface, a good result could be obtained in a simple manner.

Mr. A. NEEDHAM WILSON, who seconded the vote of thanks, suggested that the modern tendency of ecclesiastical designing should be towards vastness and comfortable accommodation, the work of the artist, carver and glazier helping to develop in the worshipper feelings of awe and reverence.

Mr. G. H. FELLOWES PRYNNE supported the motion.

THE PRESIDENT, in conclusion, said the problem of building a church was one which stood by itself and called for quite different qualifications in the architect than the more civil work. The style of design did not matter much, since a man might think eloquently either in a Gothic or Classic structure, for if the essential qualities were there they would appeal to everyone, but the work to express these qualities must be conceived by an architect with an earnest sense of devotion and religious feeling.

ST. BARTHOLOMEW'S HOSPITAL.

THE General Court of Governors have agreed to the following resolutions, which were proposed by Mr. Charles Alfred Cripps, K.C., M.P., and seconded by Sir William S. Church, president of the Royal College of Physicians, and carried with only one dissentient, viz. :—

1. That this Court desires to record its unqualified satisfaction that the Mansion House committee, after impartial and exhaustive inquiry, have come to the following conclusions, viz. :—

(a) That it is impossible, in the public interest, to remove the hospital from its present site.

(b) That the additions to and rearrangement and improvement of the existing buildings, as proposed by the Governors, are absolutely necessary for continued efficiency in the treatment of patients, and for bringing the hospital in all departments up to the standard of modern sanitary and scientific requirements.

(c) That an appeal to the public to supply the cost of the requisite new buildings and improvements is fully justified, it having been shown to be impossible for the hospital to provide the same out of its own resources.

(d) That the reputation and character of the hospital have been fully vindicated, and that its administration has been conducted in a wise and enlightened spirit, with due regard to economy and to the best interests of the patients.

2. That the Court begs to offer to the gentlemen who served on the Mansion House committee its cordial thanks for the large amount of time and the great attention bestowed by them on all matters connected with their inquiry.

3. That, in the general scheme of rebuilding, provision be made for (a) additional operating theatres; (b) new casualty and out-patient departments; (c) new nurses' home; (d) new quarters for the resident medical and surgical staff; (e) an isolation block and other new ward blocks, to supply the place of those to be demolished; (f) new mortuary, post-mortem rooms and pathological department; (g) internal structural rearrangement of the east, west and south wings of the hospital.

4. That the house committee, with power to add to their number, be requested to determine, after consultation with the medical staff, by which of the several plans submitted by the architects, subject to such modifications as from time to time appear desirable, provision for the foregoing purposes can best be secured; but that it be an instruction to the house com-

mittee to carry out the recommendation of the Mansion House committee as regards the out-patient department, as shown on Plan No. 6 laid before that committee.

5. That the first block to be built be the new casualty and out-patient departments; dispensary, &c., and the new operating theatres; that the nurses' home be next built; and that the remaining blocks be built in such order as, having regard to their relative urgency, may be considered most expedient and convenient for the general work of the hospital.

6. That the medical staff be consulted from time to time on all details that affect the sanitary arrangements, the treatment of the patients or the interests of the medical school.

7. That the treasurer and almoners be authorised to make arrangements from time to time for the temporary use of such of the Christ's Hospital buildings as may be necessary for carrying on the work of the hospital. Also that they be given authority to make any provision they may think proper for officers and servants whose present quarters are destroyed or interfered with thereby.

8. That application be made to Parliament in the ensuing session for power to the Governors to use, for the purposes of the hospital in connection with the proposed new buildings and improvements, the site of the church of St. Bartholomew the Less and the burial-ground adjoining within the hospital precincts, and for the union for ecclesiastical purposes of the parish of St. Bartholomew the Less with the adjacent parish of St. Bartholomew the Great.

9. That, after the Lord Mayor elect has entered upon office, the treasurer and almoners do wait upon him with a request from this General Court of Governors that, at some convenient date, he will convene a meeting of the citizens for the purpose of raising the requisite funds for the new buildings and improvements needed.

HITTITES AND ETRUSCANS.

THE following letter from Major Conder, R.E., who was for several years engaged in the exploration of Palestine, appeared in the *Times* :—

Having read with much interest the letter of October 27, in your columns, on the connection between the Hittites, Hyksos and Etruscans, I venture to send a few remarks on the literature of the question, which is one that I have often been permitted to discuss in your columns.

The ideas advocated are by no means new. As early as 1874 the late Dr. Isaac Taylor, in his remarkable volume on "Etruscan Researches," pointed out the Mongol character of the Etruscan language. His argument, from the numerals especially, is one which ought to convince philologists, and many known Etruscan words compare with the vocabulary of the Mongol language of Mesopotamia, usually called the Akkadian. The Etruscan title Tarkon compares (as Dr. Taylor notes) with the Turkish title Tarkhan, to which we may add that the latter word is a common element in the names of Hittite chiefs. Taylor also alludes to the Mongol type of the Etruscans and to their art. The *tutulus* and the *Calceus repandus* of Etruscan pictures are the same as the conical cap and the so-called Turkish shoe of the Hittites, but the latter was also worn by the Hebrews, according to the black obelisk of Shalmaneser.

As regards the Hyksos, whom I know Dr. Taylor to have referred to the same Mongol origin, the question is more difficult from lack of evidence, the main reason for holding this opinion being the worship of Sutekh common to Hyksos and Hittites. It should, however, not be overlooked that the Egyptian dictionary contains at least 100 words which do not appear to be either Egyptian or Semitic, but which are found also in the Akkadian vocabulary. This is one indication of a Mongol influence in Egypt which is most probably to be ascribed to the Hyksos. The Men, or Minyans, who ruled in Egypt at this period, came from near Assyria, as Dr. Brugsch has shown, and appear to have been connected with the Mongol Minyans near Lake Van, whose King Dusratta wrote to the Pharaohs in the fifteenth century B.C.

There can also, I think, be no doubt that the syllabic signs found on foreign pottery in Egypt belong to the same system used in Cyprus and in Crete, which had its origin in the so-called "Hittite" hieroglyphics.

The whole subject of the Hittite, or Mongolic influence on the West is discussed in the *Edinburgh Review* for July 1901, in a paper called "Greece and Asia," much on the lines followed by the letter published in the *Times* of October 28, and many yet more striking comparisons will be there found. As regards the Mongol character of the Hittites themselves, Sir Henry Rawlinson and Dr. Birch were convinced that many tribes of Syria and of Asia Minor were of this race, to which the Akkadians of Mesopotamia also most certainly belonged. But if the Hittites were Mongols it is only natural to suppose that their language also was Mongolic, and that the key to its

interpretation is to be found in the Akkadian. Attempts to assign arbitrary values to the Hittite emblems, ignoring the known sounds of the Cypriote syllabary, and not defining even the class of the language or making use of any comparative methods, can never carry conviction to the minds of scholars.

Your correspondents are no doubt correct in speaking of a Hittite "Confederacy" rather than of an empire. The Hittites were only one of the leading tribes of such confederacy of Mongol chiefs. But Dr. Flinders Petrie, on the other hand, is certainly right in denying that the Amu of the Beni Hassan pictures (who were Edomites) are to be reckoned with the Hittites. As to the horned head-dress, however, it is curious that he should regard it as Western, when it so constantly appears on Babylonian bas-reliefs, and on Akkadian seals in Mesopotamia. The close connection of the Hittites with Babylon has been shown, yet more clearly of late, by the discovery *in situ* of a fine Hittite text and bas-relief at Babylon itself. As to the date of Hittite emigration to Syria, we have no evidence that it may not have occurred before 2000 B.C., and it was clearly accomplished not long after. Dr. Cheyne regards the Southern Hittites as "non-existent," but says nothing of the discovery at Lachish, in the south of Palestine, of a seal which bears Hittite signs together with Egyptian, and which, by its position in the ruins, appears to be as old as the time of the eighteenth Egyptian dynasty. If the king of Kadesh, conquered by Thothmes III. at Megiddo in the sixteenth century B.C. was a Hittite, as appears probable, since Kadesh on Orontes (now Kades) was the objective of his campaigns, and was certainly a Hittite capital, we have also evidence of the presence of Hittites far south before the exodus; and there appears to be no sound reason for questioning the existence of Hittites in the south, as stated in Genesis.

The discussion is of interest to me, because the view put forward from the University of Liverpool is that which I proposed in the *Times* in 1887, long before De Cara had written anything on the subject, and which I have been allowed, from time to time, to advocate ever since in your columns. The evidence of the texts found by Chantre in Cappadocia, to the same effect, was published by you on October 10 and October 24, 1899; and the bearing of the question on the decipherment of the Cretan texts on April 16, 1901. The letter which you have now published is entirely in accord with the view which I have advocated in my volume on the "Hittites and their Language," published by Messrs. Blackwood in 1898. There can, to my mind, be no doubt (especially since the discovery of a Hittite text at Babylon), that this important tribe belonged to the same Mongol race which (as Akkadians) first became civilised in Mesopotamia, and spread to Cappadocia, Ionia and Egypt; that their language also was Mongolic, and that the Etruscans, who reached Italy from Lydia, were an offshoot of the same energetic stock.

THE CAMPANILE OF ST. MARK'S.

A CORRESPONDENT of the *Scotsman* in Venice, who has carefully followed the efforts to erect a new campanile, in his last communication refers to the laying of the first stone of the new campanile of St. Mark's on the foundations of the old campanile, when no excavation had been made round these foundations to ascertain what their state was under the level of the Piazza of St. Mark's. When that excavation was made in order to broaden those foundations, it was discovered that they were not below ground what they were above it. Their condition was discovered to be such that they could not be built upon. The stones were loose, as the lime had been washed away from between them, and these stones themselves were laid irregularly, apparently in water. The result was that the architect Beltrami, who had charge of the work, hastily threw it all up, and left Venice. Since then it has been at a standstill. At last, however, it has been resumed, not that anything quite definite has been yet settled by the five architects who have taken the place of Beltrami, but their hope is that they may be able to go on without either taking the old foundations entirely away or building on them as they are. As, in any case, the foundations must be enlarged, that work is being proceeded with. The old foundations cover 255 square metres; the three metre broad trench that has been dug round them contains 275 square metres, which would make the enlarged foundations to cover 525 square metres. This trench has been carried four metres below the level of the Piazza, so that its bottom is on a level with the tops of the piles and the two platforms of wood on which the old foundations are placed. But before anything can be done the mucky, wet bottom of the trench must be made firm and solid. This is being done now by the driving in of larch piles, strong tree trunks, 4 metres long, and sharpened at one end. They are not being driven in touching each other, as was done in preparing for the foundations, of palaces in olden times, but intervals are left between them to be filled in with cement. As

is, 4,000 piles will be required. Four battering-rams are in use, and the work of driving goes on apace. In bygone times the strokes of the battering-rams were tuned to the music of popular songs that described the work being done. This has been prohibited, as complaints have been made to the authorities that the singing gave annoyance and attracted crowds. Still, as the men must sing to regulate the pull up and the drop of the iron ram, which weighs 230 kilogrammes, they do it almost as an undertone. Some of the lines of the song are such as these:—"Up to the cupola and down to the sea;" "It's gone, seek its companion, where there's neither sun nor moon." It is a pity that anything so characteristic of Venice should be modified. It is losing its old character fast enough.

When these piles are driven home, and the platforms of oak laid on them, then pieces of the old foundations will be removed, and the new platforms of oak properly joined to the old, and the foundations also solidly united. The hope is that this may suffice, and thus the shame of having to take all down and begin to build new foundations altogether be avoided. However, all depends on what the partial removals of the old foundations may reveal. Several months must elapse before the pile-driving is completed and the time come to touch the new work. During these last ten days of high tides and heavy rains it was found almost impossible to keep the trench clear of water, and indeed the pile-driving was frequently interrupted.

GLASGOW ARCHITECTURAL ASSOCIATION.

At the second ordinary meeting of the Glasgow Architectural Association, held in the rooms, Pitt Street, Glasgow, on Friday last, a paper was read by Mr. C. Ernest Elcock, entitled "Through York with a Camera." The audience was taken on an extensive tour through the old city. The cathedral, the minster, came in for a large share of attention, the lecturer rapidly sketching its rise from about the middle of the seventh century to the present day. Some good slides of portions of the streets and houses not usually photographed were also shown, not omitting the "Bars," or ancient gates, of the city, which are in a remarkably good state of preservation. In the course of the paper the lecturer made several pointed allusions to the imitative and "slavish copying of antique detail," which is unfortunately the prevailing style of much of present-day architecture. In closing, he strongly encouraged all his hearers to endeavour to express in their work the customs and requirements of modern life, not cloaking their buildings with an architecture which belonged to other climatic conditions and needs, but erecting buildings instinct with the life and vigour of our own times, yet free from the outrageous torturing of material which is supposed by some eccentric individuals to be the acme in architectural design.

PRESERVATION OF ANCIENT MONUMENTS IN INDIA.

A RESOLUTION of the Government of India directs that in future the annual reports of the purely departmental work of the archaeological surveys shall be distinct from the reports of the progress of archaeological research in India. The latter are in future to be prepared with the aim of supplying the public and students of archaeology with interesting and readable accounts of the archaeological work being done in the country year by year. In the words of the resolution, they are to contain clear and accurate accounts of the works of restoration and preservation of important buildings and sites of excavations and fresh discoveries, and will be illustrated. They will also give a *résumé* of the epigraphical, numismatic, exploratory and other work of the department compiled from special reports of the provincial surveyors and from personal observation. The preparation of drawings should continue slowly and methodically, and they should be given to the public as soon as they are ready, but the free use of the more economical process of photography is inculcated for the illustrative work of the archaeological survey. "Whenever scaffolding is erected to carry out repairs to a building the opportunity should be taken to photograph any architectural details which would otherwise be inaccessible to the camera. A complete series of photographs should also be made of both the exterior and interior of buildings selected for extensive repairs before the work of conservation is commenced. In the case of structures of a perishable nature or in an advanced stage of decay, it is specially desirable that complete photographic illustrations should be obtained without delay. It should further be the aim of the department to make its photographs freely available to students of archaeology, for which purpose a catalogue of them should be published periodically." As to the preservation of ancient monuments, the Government does not think that this work is sufficiently attended to at present;

and accordingly, rules are laid down requiring the surveyors to advise on conservation and restoration within their districts, as well as to make lists of the ancient monuments there, and to assist and supervise the officers of public works in the task of repairing and preserving them. In respect to ancient sites, local Governments are desired to permit no excavations except by thoroughly competent persons, and to disturb ancient sites only under the supervision of the local archaeological surveyor.

USHER HALL, EDINBURGH.

A PUBLIC meeting of citizens "who consider that competitive plans should be invited for the construction of the Usher Hall," was held on the 6th inst. Sir Colin G. Macrae presided.

The Chairman said it was certainly of the utmost importance that the desire of Mr. Usher should be carried out to the best of the ability of those in charge of the matter. There were sufficient reasons why the proposal of the Town Council should not be adhered to. He would be the very last man to say one word in disparagement of the city architect. He had no doubt that the city architect discharged his duties with efficiency and ability, and certainly to the satisfaction of his employers. If it had been a case of erecting a police station or a fire station, or some work within the natural administration of the Town Council, there could have been no question raised, but when it came to the matter of the Usher Hall they got on exceptional ground. It was of the utmost importance that the building erected should be one that would adorn and beautify and not discredit the city. It was a most important matter, if they wished to encourage the talent and genius of a country, that public works should not be confined to officials. He quoted what happened in the case of the Scott Monument, which was the work of an obscure and little known architect, who was successful out of fifty-four competitors. The Town Council, he thought, would do well to reconsider the resolution they had come to, and possibly to withdraw it.

Mr. Will. C. Smith, K.C., moved "That this meeting of citizens strongly disapproves of the proposal of the Town Council to entrust the preparation of the plans for the Usher Hall to the city architect, and urges that competitive plans be invited therefor; and that an independent assessor of undoubted standing be appointed to adjudicate upon them." He said the resolution had not been brought forward in any spirit of criticism or depreciation of the works department. He did not know what experience either Mr. Morham or Mr. Williamson had in the designing of a large public hall such as was now proposed to be erected in Edinburgh, but he was quite sure that if the work were entrusted to either of them they would get their best efforts in the matter; but the principle of the resolution was that this was the business not of a temporary body like the Town Council, it was the business of the citizens of Edinburgh who were to enjoy the hall in all time to come. If Mr. Usher's gift were used wisely his good example might possibly be followed by others. The site was one of the most interesting and beautiful in the city, and upon the wise use of it would depend whether they added to the beauty of the city, or, possibly, impaired it for ever. However excellent the city architect's department might be, why on earth should the citizens of Edinburgh in this matter confine themselves to one source of inspiration and ideas?

Professor Baldwin Brown, who seconded the resolution, said that as a matter of fact competitions for designs had recently led to no very satisfactory result, but that was because the honourable understanding upon which these competitions were based and intended to be carried on had not been fully accomplished. The game had not been played according to the rules. It was not a perfect system, and a committee of the Institute of British Architects were considering whether it could be improved; but he did not know any other system which gave any young and untried architect his chance. The site was in a magnificent situation, but it was obvious that it did not offer an opportunity such as it would if the building were on the open Meadows. At any rate, there was a façade to Castle Terrace, in full view of a considerable part of Princes Street. If it were only that, he would feel pretty confident in handing over the work to the excellent architects in the office of the works department of the city, because in these matters they had a tradition in Edinburgh. He did not think any architect could go very far wrong if he followed the Edinburgh tradition in monumental façade, but they had to consider the interior, where questions of colour, wall-painting, and decoration and material had to be considered. The public taste and artists' opportunities had very much advanced. They wanted an architect of genius who would set the fashion for the future, who would show what it was possible to do in an interior with the use of the comparatively new material which was now available. With all possible respect to the works department he should not like to say that there was there either genius or

originality. He did not think genius and originality were in their place in the Town Council or in any department of it. As a matter of principle they should express the opinion that in a matter of that kind, which lay entirely outside the routine work of the Town Council, the members of the architectural profession generally should have their chance of showing what they were capable of doing.

Mr. John Sanderson said he had many conversations with the late Mr. Usher on the subject of the hall, and he knew Mr. Usher's feeling was that there should be open competition for the design. On one occasion Mr. Usher promised a young architect that when the plans came to be prepared he should get a chance of competing.

The resolution was unanimously adopted.

LEEDS ARCHITECTURAL SOCIETY.

AT the annual meeting of the Leeds and Yorkshire Architectural Society, Mr. Butler Wilson, the president, in the chair, Mr. H. S. Chorley (hon. secretary) presented the twenty-eighth report, which is a detailed account of the proceedings of the Society for the past eighteen months. The aggregate membership, it appears, is 141, namely, thirty-one honorary members, sixty-one members and forty-four associates, as against a membership of 137 at the date of the last report, showing an increase of four. The Council express regret that Mr. C. R. Chorley, one of the oldest members of the Society and a past president, has resigned his membership on account of his leaving Yorkshire on his retirement from business. Regret is also expressed at the resignation of Mr. J. Tweedale, and at the death of Mr. E. Birchall, also a past president. At the preliminary and intermediate R.I.B.A. examinations for the North-Eastern Division of the country, in June and November, twenty-one candidates presented themselves. The competition among the associates for the prizes offered by the Society was keener and more enthusiastic than in the immediate previous years, and the work submitted was judged to be of a better and more even quality than had been the case in the three previous years. The silver medal and prize of 5 guineas given by the President for the best measured drawing of any ecclesiastical or domestic building erected anterior to 1800 A.D., was awarded to Mr. Martin Shaw Briggs for measured drawings of Swinsty Hall, Yorkshire. A special prize of 3 guineas was awarded to Mr. P. A. Horrocks for measured drawings of Hall & the Wood, Bolton; the prize of 3 guineas for the best design of an entrance-lodge and gateway to Mr. Ralph Thorp; the prize of 2 guineas for the best essay on "Modern Street Facades in Leeds" to Mr. Martin Shaw Briggs, and the sketching prize of 3 guineas to Mr. J. C. Procter. The Council report that no further steps have been taken to create a chair of architecture at the Yorkshire College.

Mention is made in the report of the Council's active interest in the proposed laying-out of Victoria Square, and also in the improvement of City Square. In regard to the former it is pointed out that the first essential is the enlargement of the square on its southern side, the present area being totally inadequate to receive any architectural treatment which would be in scale with the town hall. In regard to City Square, the President formed one of a deputation from the Society to the improvements committee, and asked that a new frontage line at the south-west corner between Wellington Street and Quebec Street should be adopted corresponding to and exactly repeating the building line of the Standard Assurance buildings on the opposite side of the square, and also that the building to be erected on the vacant ground should harmonise, and as far as possible correspond in outline and skyline with the Standard Assurance buildings. It is satisfactory to record that this suggestion has been adopted. The Council express their gratitude for the valuable collection of architectural works bequeathed to the Society by the late Mr. E. Birchall, and notify that steps are being taken to deposit the Society's library with the City Library authorities for better security and supervision.

The report was adopted on the motion of Mr. G. F. Bowman, seconded by Mr. R. P. Oglesby.

Mr. W. H. Thorp (hon. treasurer) read the statement of accounts, which showed a balance in hand at the end of the financial year of 95*l.* 5*s.* 2*d.*, as compared with 96*l.* 8*s.* 1*d.* the previous year.

The balance-sheet was adopted on the motion of Mr. H. Perkin.

Dr. Charles Waldstein is now delivering a short course of four lectures at the University of London, South Kensington, under the University Extension Board. He will deal with the excavations in Greece since 1870. Dr. Waldstein has undertaken to supplement the lectures by one on "The Art of Praxiteles" some time early in the new year.

GENERAL.

The King is about to present to the British Museum and the Victoria and Albert Museum a great many objects and books which belonged to Queen Victoria, including sculptured slabs and a version of the "Book of the Dead."

The Housing Committee of the London County Council are responsible for 4,363 tenements, accommodating 22,222 persons. The number of tenements unlet at present are 116. The total rent last year was 81,000*l.* The amount unrecovered was 103*l.*

The Institute of Builders announce that a lecture entitled "A Comparison of English and American Methods in the Erection of Buildings" will be given by Mr. C. Heathcote, of Manchester, in the hall of the Society of Arts on December 1.

A Statue of the Saviour, about 17 feet high, sent from Denmark, has been erected on the right of the steps of the approach to the Royal Mausoleum at Frogmore, near Windsor Castle, at the expense of Queen Alexandra, in memory of Queen Victoria.

A New Church in the Early English style of architecture, designed to accommodate 450 worshippers, was dedicated last week at Elland, in Yorkshire. The scheme has cost about 12,000*l.*, and when completed the total outlay will have been 15,000*l.* Towards this sum a loan has been raised by the rector among the parishioners at 4 per cent. on his own responsibility.

The Benedictine Abbey of St. Mary Buckfast, which is situated in the valley of the Upper Dart, has narrowly escaped destruction by fire. The abbey was founded before the Conquest. It was suppressed at the time of the dissolution of the monasteries by Henry VIII, but came into possession of the Benedictines again some twenty-three years since.

The Central Society of French Architects will give on December 9 a ball for the benefit of the charitable funds of the Society and of the Society of Fraternal Assistance of French Architects.

The Church of St. John, Leeds, built in 1631-33, the finest ecclesiastical building of the city, has been reopened after restoration at a cost of 1,500*l.*

The Bibliothèque St. Geneviève, which is opposite the Panthéon, was one of the first buildings in Paris in which iron was employed architecturally. When it was proposed to introduce electric light there was some hesitation. M. Henri Beau, the electrician, has been able to convince M. Dufrasse, the architect, about safety, and the installation will soon be commenced.

M. Roukhomovski, the son of the Russian artist who prepared the tiara of Saitapharnes recently in the Louvre, has become a pupil of the Ecole des Beaux-Arts. His two brothers are likely to imitate him.

The London County Council have adopted the recommendation of the main drainage committee that the expenditure of a sum not exceeding 291,000*l.* should be sanctioned in respect to the construction of a second section of the proposed new sewers between the Crossness outfall and the Plumstead railway station, and that the work should be carried out without the intervention of a contractor, and that the drawings, specifications and estimates should be referred to the works committee for that purpose.

M. Verlet, the sculptor, has prepared a model of the statue of Prince Henry of Orleans, which is to be erected in the French colony of Indo-China.

The Liverpool Cathedral Committee have decided to proceed, in the first instance, with the main fabric of the building, including the choir and the cross of the transepts. This part of the building will accommodate a congregation of 3,500, and the cost will approximate to 240,000*l.* The superficial area to be occupied by the cathedral when completed will, it is said, exceed that of any similar building in Great Britain. It is hoped His Majesty will be able to lay the foundation-stone in the spring.

Beethoven's House in Vienna, the last he occupied, is to be demolished. Photographs of the rooms will be sent to various museums.

Viscount Portman, Lord Howard de Walden and the Borough Council are alike engaged in an effort to solve the problem of decently housing the working-classes in Marylebone at reasonable rents. Lord Portman has already completed blocks of artisans' dwellings in Queen Street, on his estate, and Lord Howard de Walden is providing similar accommodation in St. John's Wood. Jointly with the London County Council the local municipal authority is about to clear the insanitary Devonshire Place area, in preparation for the erection of improved industrial dwellings thereon; and, under part 3 of the Housing of the Working Classes Act, the Council will become the owners and managers of a block of artisans' dwellings to be built on a site already acquired in John Street.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BRAY.—Nov. 30.—The committee of Bray Pavilion and Water Gardens invite plans for proposed pavilion and winter gardens at Bray. First prize, 30*l.*; second prize, 15*l.*; third prize, 10*l.*; with three prizes of 5*l.* 5*s.* each. Messrs. Frank Snell, Edw. Lee and P. Macdonnell, hon. secretaries, Town Hall, Bray.

LONDON.—Dec. 16.—The Lambeth Borough Council are about to erect a public library, with residence for librarian, in the Herne Hill ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for plans for a public library, with residence for librarian, in the Herne Hill ward of the borough to Mr. H. J. Smith, town clerk, Lambeth Town Hall, Kennington Green, by 12 noon on December 16. General information as to the extent and nature of the accommodation required in the proposed library residence can be obtained on application to the town clerk.

SCOTLAND.—Dec. 7.—The Elgin Landward School Board invite competitive plans and estimates for the erection of school buildings at New Elgin capable of accommodating about 340 pupils. Mr. Hugh Stewart, clerk to the Board, Elgin.

SELY OAK.—Dec. 7.—Competitive plans and designs are invited for public baths at Selly Oak, near Birmingham. Full particulars of the site for the proposed baths, limit of maximum expenditure, &c., with copies of sketch plans showing the accommodation required, &c., may be obtained on application to the Urban District Council's surveyor, Mr. A. W. Cross, 23 Valentine Road, King's Heath, near Birmingham.

SUNDERLAND.—Nov. 21.—Designs are invited for proposed additions and alterations to the town hall. Premiums 100*l.*, 50*l.* and 25*l.* will be offered for the first, second and third designs respectively. Mr. John W. Moncur, borough engineer, Town Hall, Sunderland.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WINDSOR.—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l.* returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

SERIOUS FIRES.

THE close of the past week has once more demonstrated the absolute need of the use of fireproof materials in the erection of not only public buildings, but also all workshops and manufacturing, and for this reason we would urge upon architects the absolute necessity for using fireproof material in the erection of these buildings. In cases where building owners have been misguided enough, and still are, to erect important premises without the assistance of a qualified architect, great responsibility is being incurred. The Building Act partially offers protection, but quite inadequately. The fires which have so disastrously broken out last week at Glasgow, in the Euston Road and the Bethnal Green Road, London, and also at Accrington, have been one more warning of the unprotected state of many of our works and factories. We do not wish here to recommend any particular material, but a perusal of our advertisement pages for the past month will suggest so many materials of service in this respect.

BUILDING AND BUILDERS.

CONTRACT for steel tram rails, which it is estimated will come 90,000l., is one of the requirements of the London City Council. Tenders will be shortly invited.

NEW Primitive Methodist premises, to cost 3,000l., are to be built in Memorial Road, Walkden, to supersede a mission-school.

THE Hon. Mrs. Meynell Ingram has contributed 30,000l. towards the cost of a new church and vicarage at Holbeck. Halifax laid the corner-stone of the edifice on the 7th

THE memorial-stone of a new Masonic Temple which is being erected in Cadzow Street, Hamilton, N.B., at a cost of 7,000l., and is now nearing completion, was laid on Friday last.

THE designs for the new Waldorf hotel, and the two theatres to be erected in Aldwych, the new thoroughfare from the Strand to Holborn, have met with the approval of the London City Council.

MR. F. W. M. KING, architect, has been re-elected for the first time to represent South Norwood on the Croydon Council. This represents some fourteen years' service, part of

which has been spent as chairman of some of the most important committees of the borough.

A NEW Presbyterian church is shortly to be built at Croydon. For that purpose freehold land was purchased some two years back, and temporary buildings erected. Last week a bazaar was opened by the Right Hon. C. T. Ritchie for the purpose of providing the necessary funds.

THE foundation-stone of the new town hall at High Wycombe was laid last week. The hall, which will cost about 11,000l., will be the largest public building in Buckinghamshire. The site is in Queen Victoria Road, which Earl Carrington recently constructed in commemoration of Her late Majesty's reign.

THE Urmston District Council have confirmed a resolution of the general purposes committee to the effect that Messrs. Hopwood (chairman), Hill and Scholfield be a sub-committee to inquire into the question of the provision of new Council offices for the district and report to a future meeting as to how and when such premises can be erected.

MR. W. H. LEVER is building a new Congregational church at Port Sunlight at a cost of 25,000l. An important reservation in the trust deed is that, in the event of the premises ever being required by Mr. Lever's firm for business purposes, he will repurchase them at a sum of not less than 50,000l., which shall be expended by the trustees upon similar property on another site in the same town.

FOR three months a young woman, Mrs. Earl F. Boutwell, kept her sex a secret from her friends at Niagara Falls, and masqueraded the while in male attire. She worked as a carpenter with her husband, who gave his name as E. F. Bell. They secured a job to put up a verandah at the Central Hotel, and performed the contract very creditably. The disguised woman, we learn, was smooth of tongue, good-looking and very popular.

A NEW Wesleyan school is in course of erection at Carrville, Durham, the foundation-stone laying ceremony taking place on the 31st ult. The building will cost about 400l. It adjoins the chapel on the high side of the village, and will accommodate 300 children. Communication will be obtained with the chapel by means of folding doors, and on Sundays and other occasions when required the room will be utilised as a vestry. The work is being carried out by Messrs. Draper & Sons, contractors, of Leamside, from plans by Mr. J. Gradon, of Durham.

THE PASTEUR FILTER

At the annual meeting of the Hanley Town Council, the town clerk stated that he had received a communication from the postal authorities to the effect that the plans of the Hanley new post office had been considered by the Postmaster-general and had now been approved. The contract drawings were well in hand, and it was hoped that they should be able to make a commencement with the work at an early date. The original plans, he said, were on a much larger scale than those which had now been adopted.

THE foundation-stone was laid last week of a new church for Broadheath, Worcester, for which great need has arisen owing to the rapid increase of the congregation, which has hitherto worshipped in a small chapel of ease erected in 1836. The new building, which is estimated to cost about 3,050*l.*, will consist of a nave, chancel, tower at the west end, and an ambulatory on the south side, which will afford an easy means for extension. Seating accommodation will be afforded for 210 people.

THE erection of the first section of Christ Church, Whaley Bridge, which will be a chapel-of-ease to Chapel-en-le-Frith parish church, is progressing, and it has just been decided to add a spire to the present structure. It is expected to be complete by Easter next year. Another new church for the Peak district is shortly to be built within three minutes' walk of Chinley station. Land for the site has been purchased, and is situate in the parish of Chapel-en-le-Frith. It will be designated St. John's Church.

VARIETIES.

MR. ARTHUR WALMISLEY, engineer, of 9 Victoria Street, S.W., has been elected Mayor of Dover.

THE Free Public Library, Stoke Newington, is being altered and enlarged. Mr. Sidney G. Goss, of Broad Street Buildings, E.C., is the architect.

THE new Wesleyan Methodist church and Sunday schools erected on a site adjoining the new County Council's buildings in Old Elvet, at a cost of about 11,000*l.*, were opened on the 28th ult.

A MONUMENT to the late Cardinal Vaughan is to be erected in Westminster Cathedral, and a committee, of which

the Duke of Norfolk has consented to be president, has been formed to carry out the arrangement.

THE Chancery Lane Safe Deposit Company desire to caution their numerous clients against unauthorised persons who apply for the renewal of policies under their key registration system. All the company's agents are furnished with official credentials and receipts.

THE British Chamber of Commerce in Paris has decided to form an Anglo-French Club, with suitable premises for the purpose in both London and Paris. The object is to bring into closer touch the manufacturers and merchants of the two nations.

THE new school which has recently been erected by the London School Board in Kingsgate Road, Hampstead, opened for the admission of children on Monday last. The building, which has cost over 17,700*l.*, provides accommodation for 452 boys and girls.

A REPRESENTATIVE meeting of commercial travellers at Leicester recently passed a resolution in favour of such change in our present fiscal policy as would secure for Great Britain a freer and fairer system of trading than at present exists. A similar meeting and resolution was passed at Portsmouth last week.

THE American company which is building the railway from Guayaquil, Ecuador, to Quito, has opened the station at Guamate, at an elevation of 10,000 feet, and 126 miles from Guayaquil. The most difficult part of the work on the railway has now been accomplished. With the exception of Lhasa, Thibet, Quito, in Ecuador, is the only capital in the world to this day can only be reached for a considerable part of the journey from the sea on mule-back.

MESSRS. SILK, WILSON & SONS, of Manchester, have constructed an excellent model of the Assouan Dam, which is intended for the forthcoming St. Louis Exhibition. The model was prepared at the request of Sir Benjamin Baker, the engineer, and Sir John Aird, the contractor. Its dimensions are 16 ft. by 4 feet, and as it is built exactly to scale it affords a splendid idea of the magnitude of the engineering feat which has been so satisfactorily completed. The model has been constructed with a careful eye to accuracy, both of detail and of colour, one of the engineers having visited Manchester for the express purpose of supplying all the necessary information.

AT Wreton, near Pickering, Yorks, on the 28th ult. a considerable number of Wesleyan Methodists attended the dedication of the chapel which they have recently had renovated.

BRITISH MANUFACTURE

HIGH-CLASS ENAMELS

For all DECORATIVE WORK.

"O" QUALITY

FOR INSIDE USE.

"INDIAN" QUALITY

FOR OUTSIDE USE.

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c., directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.

EASY FLOW AND MANIPULATION UNDER THE BRUSH.

ENORMOUS COVERING PROPERTIES.

USED SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

ASPINALL'S ENAMEL, Ltd. New Cross, London, S.E.

ILLUSTRATIONS.

OTHER OFFICES.

hoolroom has been built at the south end of the chapel to
mmodate about fifty scholars, there having, up to this
been no accommodation of the sort, and it will also be
as a vestry. The interior of the chapel has been re-
orged, new pews have been provided and a well-designed
um has been erected at the south side of the building. A
porch at the entrance on the north side gives an improved
arance to the exterior.

HE Benedictine Abbey of St. Mary Buckfast, which is
ted in the valley of the Upper Dart, narrowly escaped
uction by fire on Wednesday, Nov. 4. The stable and
r outbuildings contiguous to the church were burned down,
had it not been for the prompt assistance rendered by the
brigade belonging to an adjoining woollen factory, it is
eaved that the whole of the buildings would have been
royed. The abbey dates far back in English history, being
ded before the Conquest. It was suppressed at the time
e dissolution of the monasteries by Henry VIII., but came
possession of the Benedictines again some twenty-three
s since. Under the guidance of the Lord Abbot, the
ks are rebuilding a portion of the ancient monastery at
siderable cost.

AT Caersws last week Mr. Jones, of Trewythen, laid the
stone of the handsome village hall which has been erected
cost of close upon 2,000*l.*, and later, his sister, Miss Jones,
Brynhaflen, unlocked the front doors and declared the
ding open. The hall, which is the joint gift of Mr. and
s Jones, occupies a large piece of land, given by another
er, Mrs. Davies, of Plas Dinam, in close proximity to the

main street of the village. The hall has a handsome frontage,
and bears some resemblance to the Byzantine style of archi-
tecture; it contains a fine suite of rooms, the main hall,
which includes a gallery at one end and a platform at
the other, being 70 feet long by 32 feet and 25 feet
high. This room is flanked on the left by a commodious
reading-room and the right by a games-room, while at
the north end there are the usual cloak-rooms, and at the
south end the usual offices and tea-making-rooms. The outer
walls are of Sweeney brick and the front elevation is of Ruabon
brick with freestone dressings. The hall is well lighted by
means of a dozen or more windows of cathedral glass, a
number of hanging lamps being available for evening meetings.
A number of artistically-designed open fire-grates are provided
for heating purposes. The boundary wall is also of Ruabon
brick, and is surmounted by some handsome wrought-iron
railings, designed by the architect, Mr. Parke, of Newtown.
The building is well furnished with pitch-pine convertible seats
and desks; in fact, it is lacking in nothing, and the villagers
are to be congratulated on the possession of one of the finest,
if not the finest, village hall in Wales.

THE report of the Bishop of Manchester's Commission for
the provision of sites and buildings for churches and mission-
rooms in the five rural deaneries of Manchester and Salford
was prepared for, but not presented to, the Diocesan Confer-
ence. New subscriptions to the amount of 835*l.* had been
received since January, including a further liberal donation of
500*l.* from Mr. C. J. Heywood. The following amount was
paid in grants for sites and buildings in the year 1903:—
St. Hilda (site) 300*l.*, ditto (portion of 300*l.* grant, church),
50*l.*; St. Werburgh, Chorlton-cum-Hardy (church), 100*l.*;
St. James, Gorton (part of 50*l.* grant, site), 37*l.* 12*s.* 6*d.*;
St. Mark, Levenshulme (site), 50*l.*; St. Agnes, North
Reddish (site), 150*l.*; total 687*l.* 12*s.* 6*d.* A loan of 100*l.*
has also been made to the parish of St. James, Gorton,
towards the purchase of a site. Grants promised condi-
tionally and not yet paid are as follows:—St. Philip,
Bradford Road, for mission-room, 200*l.*; St. Hilda, Old
Trafford, church, 250*l.*; St. Cuthbert, Trafford Park, site,
1,200*l.*; St. James, Gorton, balance (site), 12*l.* 7*s.* 6*d.*; total,
1,662*l.* 7*s.* 6*d.* The present estimated deficiency in the fund is
900*l.* New parishes are to be formed at once. St. Philip,
Gorton, out of the parish of St. James; Holy Trinity, Fails-
worth, out of the parish of St. John; and St. Saviour's, Cheet-

ham, out of St. Alban and the Cathedral district. New parishes are to be formed in Newton Heath and Levenshulme, and for the former the Dean and Chapter have given a site for a church and rectory. In consequence of the bishop's resignation the duties of the Commission terminated at the close of the end of October. During the past seven years seventeen new districts have been formed on the recommendation of the Bishop's Commission, and seven others also recommended by the Commission are waiting formal sanction of the Ecclesiastical Commissioners.

ELECTRIC NOTE.

THE Marylebone Borough Council instead of (as at first proposed) seeking fresh Parliamentary powers enabling the Borough Council of Marylebone to complete the purchase of the local property of the Metropolitan Electric Supply Company, a course already decided upon as "expedient," will probably appoint a committee "to confer with the company with a view to an arrangement being arrived at to remove the present deadlock." The position is that, according to legal ruling, the Borough Council cannot raise the money to buy until they are the electric-lighting authority, and they cannot become that authority until they have bought. It is proposed to apply to Parliament to cut this Gordian knot and empower the Council to raise the requisite money of a million and a quarter. On the other hand, a minority are opposed under the circumstances to the completion of purchase.

TRADE NOTES.

MESSRS. R. WAYGOOD & CO., LTD., of Falmouth Road, London, S.E., inform us that they have removed their Glasgow address to 116 Hope Street, the premises of the Liverpool and London and Globe Insurance Company, where three of their electric passenger lifts have been fitted.

It may be of interest to architects to learn that the Sprague Elevator Company of New York have recently completed negotiations with the Metropolitan Engineering Association, of 4 Queen Victoria Street, E.C., for the sole representation of their interests in the British Empire and Europe. The splendid work which the forty-eight Sprague elevators installed in the

Central London Railway are doing is generally known, and Sprague elevators now embody the very latest improvements in lift construction.

MESSRS. WILLIAM POTTS & SONS, church clock manufacturers, Leeds and Newcastle-on-Tyne, have received instructions to fix a Cambridge quarter-chime clock with two external dials at Killamarsch Church, Derbyshire. They are also completing a new church clock for Newcastle-on-Tyne Corporation at Christ Church, Shieldfield, Newcastle, and have just finished a large clock with two dials for Colonel Hope Edwards, J.P., Netley Hall, near Shrewsbury. All the above are from L. Grimthorpe's plans, for whom they have made clocks for half a century.

THE British Uralite Company, Ltd., of 50 Cannon Street, have received the following testimonial from Messrs. H. Baird & Sons, Ltd., maltsters and hop merchants, of Glasgow:—"Dear Sirs,—Regarding our recent fire at Springburn maltings, we have very much pleasure in stating that we were in connection with this a very practical demonstration of the value of Uralite as a protection against fire. In one particular instance we had a 5-horse motor which was placed right in the centre of the building which was burned. We had taken the precaution of having this carefully cased round with Uralite and then covered with Uralite, and it was found that after the fire was over the box and motor were absolutely intact, without the slightest injury by fire having been done.—For H. BAIRD & SONS, LTD. (signed), MONTAGU M. W. BAIRD, managing director."

NEW CATALOGUES.

A BROCHURE from the Fram Fireproof Flooring Co., Trafford Park, Manchester, contains handsome illustrations of the numerous important public and other buildings in which this method of fireproof construction has been adopted. Many of our readers are aware, this system of fireproof flooring is not only totally different from any form of construction hitherto in use, but also possesses entirely new and distinctive merits of its own. One of its great advantages is the extreme rapidity with which the floors can be laid and the immediate use to which they can be put, there being no occasion to wait for concrete drying, owing to blocks being supplied perfectly dry. The "Fram" arch block floors are constructed with ordinary rolled steel joists, placed at certain distances apart, and

these the "Fram" arch blocks are laid. It is claimed they have been designed to give the greatest possible that can be obtained in a concrete floor, and that they have been introduced into the market, subjected to severe tests to establish their practical as well as their carrying capacity, the blocks, we are informed, actually sustained a load of over 34 tons on the square before giving way. "Fram" arch blocks were first introduced by Mr. Rud. A. Stoffert, of Glasgow and Edinburgh, and were so successful and largely adopted by architects that the manufacture has been gradually extended and in various parts of the country, including Manchester, Newcastle and London, where already a considerable amount of work has been done. The Fram Fireproof Flooring, among other recent work, just completed the new flooring in the alterations of the Lyceum, Bold Street, Liverpool.

The Safety Lift and Elevator Company (M. T. Medley & Co.), of Albert Works, Rolt Street, Deptford, we have received and have got up illustrated catalogue wherein are described various kinds of lifts of which the firm are manufacturers, which range from the simplest dinner lift to the most elaborate passenger elevator or that for the carriage of the goods. In the manufacture of the various lifts every care is taken to make each part simple and strong. Cages and lifts are manufactured expressly for the firm of special design suggested by a long experience. Guides are of well-selected timber, braced together, and of a special construction conducive to silent working.

Messrs. HAYWARD BROS. & ECKSTEIN, LTD., of Union Works, Borough, are sending out a new catalogue, also illustrating casements, sashes, collapsible gates, fireproof doors, and all these various goods a large selection will be found, and the catalogue gives in most cases dimensions and will be found very useful by architects and others, and will be sent on application.

EDITHWESTON STONE.

Edithweston, though situate just within the parish of Edithweston (Rutland), from which it derives its name, is part of the same hill, and lies very close to and on the same level as the old Ketton quarries. Thus it is not

surprising that this stone is in every way a reproduction of the famous "Ketton" which was quarried many years ago, and which has been proved by time to be worthy of the confidence placed in its remarkable qualities by those who specified its use.

Edithweston stone possesses these valuable features:—It is easily worked when quarried, but becomes very hard after a short exposure to the weather, and combines exceptional durability with a very pleasing colour. Its oolitic grain is very fine and distinct, enabling the stone to be worked to a very sharp "arris," which it will retain, thereby making it a desirable material for the monumentalist as well as for the builder.

It has been used for many important buildings, among which may be found the following:—London City and Midland Bank, Peterborough; new cemetery chapel, Leicester; Midland Counties Bank, Peterborough; hospital for infectious diseases, Leicester; London City and Midland Bank, Nuneaton; Barclay & Co.'s Bank, Peterborough; Kettering free library; additions to Angel hotel, &c., Peterborough; Tower of London (repairs); Burghley House, Stamford (new chimney, gables and repairs), originally built with other stone; restoration of Earl Manvers's church, Thoresby Park, and numerous other churches, originally built with other stone; the Prince Christian Victor Memorial, Windsor.

It is satisfactory to note that almost any quantity can be supplied at short notice and at a very reasonable price. It is being largely used for church building work, for which its features specially recommend it. The proprietors are Messrs. Woodforde & Wing, 37 St. Peter's Street, Stamford.

SANITARY INSPECTORS' ASSOCIATION.

At a meeting of this Association held at the Carpenters' Hall on Saturday, Mr. L. Young, chief sanitary inspector of Battersea, delivered the annual address. He expressed the hope that, at an early date, the obstacles in the way of there being one sanitary inspectors' association only for England and Wales would be overcome, and he added that Sir James Crichton-Browne had consented, at the unanimous wish of the council, to be their president for the ensuing year. The important question of the practical training of candidates for the office of sanitary inspector had, for several years, engaged the attention of the Association, but without, he regretted to

say, any very encouraging results. At the Sanitary Institute's Congress at Bradford, last July, he suggested that the only satisfactory remedy for the present state of affairs was the recognition by the Local Government Board of the appointment of assistant inspectors. While still of the same opinion, he considered there was also an excellent opportunity for this Association to show its interest in promoting the cause of public health, and improving their status as sanitary inspectors, either by instituting, on its own account, a system of technical and practical training, or by uniting itself for this purpose with the present recognised teaching bodies. The percentage of persons appointed to the office of inspector who entered upon their duties only partly fitted for the work was in this respect considerable. The Council had appealed in vain for representation upon the Examination Board of Inspectors, and also upon that of the Sanitary Institute; but, so far as he was aware, they had never asked the first-named body to appoint a member of this Association as one of its examiners. He had not lost hope that even upon the examination board they might ultimately secure representation, but, as a stepping-stone, they must first take up their position in the training of candidates and secure the appointment of some of their most experienced inspectors as examiners for the Sanitary Inspectors' Examination Board and Sanitary Institute. Referring to the Public Health Bill, he understood it was again to be introduced in the next session of Parliament, and he appealed to all present to do their utmost to induce members of Parliament to support the measure. Among the matters which ought at no distant date to receive the attention of the Association was the proposed amendment of the by-laws under the Public Health (London) Act, and the probable amendment of the London Building Act, both by the London County Council.

A NEW LUNATIC ASYLUM FOR YORKSHIRE.

THE York City Corporation are erecting a lunatic asylum at a cost of some 92,000/. It will be situated in the Naburn Road, just outside Fulford. The land purchased by the Corporation as a site comprises 156 acres on the east side of Naburn Road, between Captain Key's Fulford estate and Mr. Harrison's Naburn Lodge estate, and before speaking of the progress that has been made up to the present time, it may be

as well to outline the scheme that has been decided upon which is not generally known by the public. The main wings will cover an area of about 240 yards by 147 yards, the nearest point of the asylum itself being about 100 yards from the road, and access will be gained by a drive. A lodge will be built at the entrance to the drive, and further along the right of the drive, will be the medical superintendent's house, and the chapel will be on the other side. The buildings proper will comprise several large blocks, the centre being the assistant medical officer's block, with wards for male and female patients on either side. The blocks will include wards and quarters for three descriptions of patients—sick and infirm, recent and acute, and epileptic and chronic, with day-rooms, dormitories and some single rooms, as well as accommodation for attendants. In the rear of the assistant medical officers' block and occupying the corner of the site, will be the administrative building. Then there will be the dining and recreation halls, and the various mess-rooms, laundries and other departments necessary to a large establishment. Nearly the whole of the buildings will be in communication by corridors. The administrative parts of the isolation block, which will be 200 yards distant from the ward blocks, will be a permanent building of iron, while the patients' wards of the isolation block will be of galvanised iron.

THE ITALIAN VISIT.

THE City Corporation have decided upon an elaborate scheme of decoration, specially designed by Messrs. Defries & Sons Ltd, for the City streets on the occasion of the reception of the King and Queen of Italy. The whole line of route will be decorated, extending from the east side of Gray's Inn Road and including Holborn Circus and Holborn Viaduct, to the entrance to the City boundary at Gray's Inn Road, increased by the granite obelisks bearing the City arms, there will be erected large floral obelisks, carrying Florentine shields of the arms of Italy and the City. Immediately in front of the fire-station in the centre of the road will be a handsome pedestal surmounted with real chrysanthemums, palms, flowers &c. Special care will be taken in decorating Cheapside, an entirely new scheme of decoration having been prepared for the purpose. Venetian masts will be conspicuous in the absence. A prominent feature in Cheapside will be

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX

The above article is now being manufactured in large quantities for Greenhouse Sashes, Public-houses and other heavy work. The Manufacturers would be it for its strength, and the large amount of weight on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the trade to their Imperial Patent Flax Sash Lines, they are now making six qualities, all of which are strongly recommended, as they have given unequalled satisfaction to the trade for now over One Hundred Years. Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the IMPERIAL PATENT BLIND LINES, which are prior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Factors and Wholesale Houses in town and country. N.B.—Please note that all our goods, as advertised, are labelled either inside or outside with our "The Anchor."

VOLUME LXIX. OF THE ARCHITECT
Handsomely bound in Cloth, Gilt Lettered, Imperial Buildings, Ludgate Circus, E.C.

Painted banners, supported by Venetian streamers 60 feet hanging in graceful festoons, and being caught up to the rings on either side. Whole series of tapestry banners lining the arms of Italy and appropriate mottoes in Italian be exhibited in the same street. Other prominent points the novel features of decoration will be exhibited will be at statue, the junction of Cheapside and King Street, King Street and the Guildhall Yard, Holborn Bars and the crossingresham Street. It is expected that the City will present a rayer and more artistic appearance than it ever has on ous occasions when it has been decorated. Many of the features have been carried out at the suggestion of ount Horncastle, the Chief Commoner, and chairman of special committee deputed to settle upon the decorations of City streets.

THE SIMPLON TUNNEL.

EW weeks ago an alarming telegram appeared in the don papers, says a correspondent of the *Times*, to the t that in consequence of hot springs having been entered in the tunnel the heat was insupportable, and probably the work would have to be abandoned. The er of this telegram little knew of the skill, the persever- and the ready resource of the able engineers directing this t work when he despatched his message. Difficulties of ommon kind have been encountered, but they are all in ess of being solved and satisfactorily solved. The total length of tunnel will be $12\frac{1}{2}$ miles, of which ance $6\frac{1}{2}$ miles have been penetrated on the north or Brigue , $4\frac{1}{2}$ miles on the south or Italian side, leaving only $1\frac{1}{2}$ mile to be executed. Owing to the great height of the mountain ve the tunnel—some 6,000 feet—the pressure is great, and temperature of the rocks and springs of water correspond- y high. The greatest heat which has been encountered is degs. Fahr., but it is now falling as the tunnel progresses hward, and at the present time is 126 degs. Fahr. Were water to be allowed to fall on the workmen, injury would ult. But the very simple expedient is adopted of diluting it a cold water from the hydraulic mains, thus reducing its perature to a comfortable and harmless point. In order to cool the air in which the men are working, an irable system is adopted by which a large volume of fresh cooled by means of high-pressure water spray to some

20 deg. to 25 deg. Fahr. below the tunnel temperature, is sent right up to the working face.

This point in other tunnels is generally foul and oppressive to a degree, but in the case of the Simplon is cool and fresh, and it is due to these excellent precautions that no sickness exists amongst the men. The use of the Brandt drill immediately suppresses all dust, and there has not been a single case of miners' phthisis, although some 3,000 men have been at work for five years.

The advance galleries from Brigue have now passed both the summit of the tunnel and the frontier line between Switzerland and Italy; they are now on the descending gradient, to meet the workmen coming up the corresponding ascending gradient from the south end of the tunnel.

The monthly progress of the northern and southern ends of the advance galleries added together approximates to a quarter of a mile, and consequently it is anticipated that if no further or greater difficulties present themselves a junction will be effected in May or June 1904, with a maximum error in direction of 7 or 8 inches, and trains will be run through by the end of that year.

The organisation of the entire work is beyond praise, and is carried on with military precision. The humane arrangements for the welfare of the men have been described in a former communication, but there is one thing which very forcibly impresses itself on the attention of all visitors, and that is the enthusiasm and alacrity with which the men carry on the work.

In England, unfortunately, many working men are misled by the idea that the quantity of work to be done by the entire nation is a fixed amount, and that therefore no man must do more than he can avoid in order to leave work for others to do; the result being that great waste, both of time and money, occurs, and the cost of work is unduly enhanced. This effectually prevents many enterprises from being entered upon which would give ample employment to all who desire it. The workmen in this tunnel labour under no such delusion, and know that if this work be accomplished quickly, well and economically, other great tunnels will be undertaken. The day of 24 hours is divided into three shifts of eight hours each of actual work, and no man stops work until the corresponding man of the succeeding shift steps into his place. It was most interesting to observe that even the drills did not stop for a second—the incoming men stepped up into their places, laid hold of the various handles and valves before the outgoing men

let go, and the drilling proceeded without intermission. Whatever additional time is required for the train-loads of men to reach the centre of the Alps is allowed for in the time table, as also for the outgoing men to reach the open air, the net result being that eight hours of effective work at the face of the tunnel are secured. The men receive full wages for the eight hours, also a certain payment for time in going and returning, and a bonus in addition if the progress be good.

INSTITUTION OF ELECTRICAL ENGINEERS.

THE second annual dinner of the Glasgow local section of the Institution of Electrical Engineers took place in the Grand Hotel, Glasgow, on the 4th inst. Mr. W. A. Chamen, electrical engineer to the Glasgow Corporation, president of the section, occupied the chair, and he was supported by Messrs. Henry A. Mavor and John M. M. Munro. The loyal and patriotic toasts having been honoured, ex-Provost Wood proposed in felicitous terms the "Lord Provost and Corporation of Glasgow." The Lord Provost, who had a very enthusiastic greeting, acknowledged the toast. We lived, he said, in an electric age, and going on to speak of the electric cars, he remarked on the transformation they had made in Glasgow life. They had resulted in the growth of districts on the outer circumference of the city, and had thus contributed something to the physical well-being of the community. Their rapid transit along the street was a sort of material embodiment of the onward march of the day. We owed that condition of things to the electrical engineer. But his lordship looked to far greater development in the conditions of city life from electrical science. There was, for example, the smoke problem. At times our city was rendered gloomy and oppressive owing to the smoke nuisance, but that evil was, he thought, on the verge of solution. Indeed, he said confidently that the smoke problem ought not to exist; science had demonstrated that it could be settled. The Corporation had taken an onward step in one department of it—the domestic pollution of the atmosphere. They had reduced the rate for heating purposes to the power rate. But more might be done. His Lordship had been told that in the blast-furnaces which fringed the city were hundreds of thousands of power going to waste in the air that could supply electrical energy for heating purposes. If such improvements were carried out the more desirable would the city become as a dwelling-place, and the more, therefore, could its commercial

potentialities be increased. He was a short-visioned man added his Lordship, who complained of the cost. There was an expenditure that could be wise and prudent if it purchased for every citizen what he could not purchase for himself as an individual, and in that region of municipal enterprise his Lordship would ever be found in the ranks of those who advocated advancement.

Mr. W. R. Copland proposed "The Institution of Electrical Engineers," and the toast was acknowledged by Mr. Robert Kaye Gray. He testified to the favour with which the parent institution viewed the development of the local sections. He claimed for the profession of electrical engineers that it was well equipped as any other profession in Great Britain. Other divisions of engineering had to contend against certain disadvantages. It was difficult for those older bodies to free themselves from past practice. Glasgow, he continued, was the cradle of the electrical industry. In this connection he referred to the work of Lord Kelvin, who, he said, had been able to continue his service in various spheres.

Mr. W. G. McMillan, secretary of the Institution, proposed the "Glasgow Local Section." He put the local sections in the relation of colonies to the parent institution, adding that the latter was anxious to do its duty to keep the colonies together, and to assist them in every way. Thus electrical engineers would be banded together in all countries, and the interests of the profession advanced. The Glasgow local section he ranked as one of the strongest in the country; and was that surprising when they remembered the distinguished men who had been connected with it. Among these he mentioned Lord Kelvin, who was the first president of the section and he paid also a warm tribute to Mr. Chamen, the present occupant of the chair. The work of the section was economically and excellently done, and that it was so was due in large measure to the services rendered by Mr. Tidd, the secretary.

Mr. Chamen, who replied, agreed that the local sections of the parent institution were somewhat in the position of the colonies and the mother country, but he pointed out that the work of the sections differed in some respects from that of the parent institution. There were in the sections a large number of the members of a less highly technical kind, and it became the duty therefore of the local sections to encourage the reading of papers of a less technical character than those printed in the Proceedings of the Institution. But if the local sections did no more than keep the members together and

le them with pleasant evenings, where over a smoke and of coffee they could discuss matters of professional st, they would accomplish a great deal in the way of ag the outlying branches of the great Institution together ncouraging young men to join the sections. This con- d the speech making. Between the speeches songs were r- buted by members of the company, and a very enjoyable eng was passed.

THE SURVEYORS' INSTITUTION.

ALBERT BUCK, president of the Institution, delivered his ng address on Monday evening. One of the subjects which he dealt with were public roads. He could not, he said, thinking that the country was on the eve of great changes. he purposes of haulage, the horse seemed doomed to dis- ur, as in the early railway times, when his days were held numbered. The motor and the traction-engine were e to take possession of our highways, most of which, le enough for traffic of ordinary speed or weight, were ill-adapted for the swifter and heavier forms of locomotion e were apparently imminent. Many of the roads would e to be increased in width. Awkward corners would have rounded off, gradients made easier and road surfaces im- ed. The evidence given before the departmental com- e on "Highway Authorities and Administration," nited by the Local Government Board, emphasised the nence of this question and of the demand for the con- tion of relieving roads at points where the traffic had ne, or threatened to become, so congested as to render oads impossible for the lighter kinds of vehicles. The mileage of main roads in this country (exclusive of those rised in the county boroughs) was 26,598 miles, of which e were 3,819 miles in the urban districts, and consequently e sole control of the urban authorities, and 22,779 miles e rural districts under the control of rural district councils. consequence there was no uniformity of administration o probability of conjoint action. The great North Road London to Edinburgh, for instance, was divided for nistrative purposes among seventy-two authorities who, o possible assumption, would be likely to co-operate for purpose of widening or improving that great artery of e. One was forced to the conclusion that the committee e right in their suggestion that the great highways should

be removed from the control of the present subordinate authorities, and placed under the jurisdiction of county high- way boards, and that certain highways which were of more than county importance should be declared to be "national" roads, maintainable out of Imperial funds. Except by the re- introduction of the system of tolls, which would be intolerable, there seemed no way of meeting a demand for new trunk roads but by the expenditure of Imperial funds or by the imposition of the abandoned "van and wheel tax," to which so much exception was taken when it was proposed as a feature of the Budget some years ago. They were told that there were already 10,000 motor cars on the roads (to say nothing of traction engines), and that 10,000 more were in course of con- struction in this country. If this were so, and he had no doubt it was the case, the improvement and widening of the roads must soon form the subject of comprehensive legislation, for the problem had already become acute in suburban districts, and would rapidly become so all over the country.

THE RAILWAY HARBOUR OF TROON.

THE interests of most of the railway companies are deeply bound up with shipping, and within recent years quite a number of them have not only acquired fleets of passenger- steamers, but are now (says the *Scotsman*) going in for cargo- boats and harbours as well. As far as the first and last-named are concerned, the Glasgow and South-Western Company is no exception. In August 1901 a Bill promoted by the company passed the House of Lords as an unopposed measure, and the harbour of Troon, which had been the property of the succe- sive Dukes of Portland for ninety-six years—having been purchased by William Henry Bentinck, the fourth Duke of Portland, in 1805, from Colonel William Fullarton, the last of a line of Fullarton lairds which could be traced back unb- oken for nearly 600 years—went out of the hands of William John Arthur Cavendish Bentinck, sixth Duke of Portland (the present Duke, who succeeded to it in 1879), into the possession of the Glasgow and South-Western Railway Company. The purchase price was 167,500*l.*, with a toll on exports and imports of $\frac{1}{2}$ *d.* per ton for the first 100,000 tons exceeding 700,000 tons, and after that a toll of $\frac{1}{4}$ *d.* per ton over 800,000 tons. Troon Harbour, which is the safest and most accessible of any of the Ayrshire ports, is formed at the extremity of a

rocky promontory which extends fully a mile into the sea. The rock, before it was touched by art, could be approached by large merchant vessels so near as to enable a crew to land by a plank. Within this creek, sheltered from every wind except the north-west, with ten feet of water at lowest ebb tides, there was ample space for a whole fleet. In the smuggling days many a French and Dutch lugger and Highland wherrie was familiar with this canny cove. From the time of the formation of the harbour up till the year 1870 all the ballast—in those leisurely days taken out in wheelbarrows, the men who did the work also acting as pilots—that came in vessels from all parts of the world was utilised in the making of ground where nothing but rocks previously existed, and in forming a large bank, which stretches along the north-western part of the promontory in the vicinity of the harbour. The Ballast Bank, as it is called, is now a popular promenade, unsurpassed in the west of Scotland, and with attractions equal to the famous Hoe at Plymouth. It is about 700 yards in length, 60 feet above sea-level and from 20 to 30 yards broad. Seats are placed upon its grassy top at suitable distances and along the massive stone wall which, extending from end to end of its base, protects it from the ravages of winter storms, and also serves as a lower promenade. Towards the close of the sixteenth century, when the Clyde between Dumbarton and the city could only float a few smacks, Glasgow sought to purchase the embayed marine space embraced by the bold curvature forming the far-famed natural harbour of Troon and circumjacent property for the erection of quays. One of the Fullartons of those days refused the site, because he thought the making of a pier would have the effect of raising the price of butter and eggs, which he might have occasion to use in his family. A successor, however, who had more public spirit and appreciation of his own interests, obtained a charter from Queen Anne, dated Windsor Castle, August 5, 1707 (exactly a hundred years before anything was actually done), "constituting the port of Troon a free seaport and harbour, with power to lift anchorage and other customs." Colonel William Fullarton, who was born (1754) at Fullarton House, Troon—now the residence of Sir Matthew Arthur, Bart.—and who, during the French war, raised a regiment known as Fullarton's Light Horse and was afterwards Governor of Trinidad, applied to Parliament for sanction to proceed with a great scheme, including a canal from Kilmarnock to Troon, for the development of the place, when—fatal obstacle—means failed him. He was constrained by circumstances in 1805 to sell the

property of his fathers to the fourth Duke of Portland, years previously. The Duke had married Henrietta, daughter of General Scott, through whom he came into possession of the Kilmarnock estates, and a strong incentive to the purchase of Troon was that it was an excellent place for the formation of a harbour as an outlet for the produce from these estates. Three years after taking possession of the Duke commenced a series of vigorous operations, including the erection of a pier 800 feet long nearly at right angles to the rock, to render the place fully available for commerce. The Kilmarnock and Troon Railway—the first in Scotland—was constructed almost concurrently with the harbour, at a cost of 50,000*l.* The company was promoted by the Duke and consisted of the landlords of the different estates through which the railway passed. It was leased from them by the Glasgow and South-Western Railway Company, but became the absolute property of the latter a few years ago. The engine constructed by Stephenson to order after the "Kilmarnock" model was made for the Duke of Portland in 1812 for use upon this tramroad or railway, ten miles long, extending from Kilmarnock to Troon Harbour. Until the advent of steam power the 30-cwt. capacity coal waggons were drawn by horses (mostly supplied by farmers) all the way from the collieries right into the loading hurries, each horse, of which there were quite a number, pulling four waggon-load. The extensive coal-fields the Duke wrought himself, under the management of Mr. Guthrie, a daughter of whom married Lord Oranmore and Browne, whose son still retains the Guthrie's estate of The Mount and other properties in Kilmarnock. These coal-fields were latterly wrought exclusively by Messrs. Archibald Finnie & Sons, of Kilmarnock. But the enterprise of "the good old Duke," the patron of Troon, did not stop here, for, having got the harbour and tramway made, with his ample resources he then started a shipbuilding yard and built vessels to carry the coal to Ireland. These were brigs of small dimensions, and bore names chiefly of a local character. The older people can remember the *Barassie*, *Beattock*, *Cessnock*, *Dundoon*, *Galston*, *Good Intent*, *Kilmarnock* and *Tarbolton*. The Duke, besides, was a yachtsman, and built a number of yachts amongst them being the fore-and-aft schooner *Crown*, a flyer for himself. He also built the *Pantaloon*, a square-rigger of about 300 tons, which he presented to the Government. The historic harbour of Troon, which is now part of the Glasgow and South-Western Railway undertaking, is of

le extent. The outer harbour has a water area of as, with a depth ranging from 23 feet at high tide to at low tide, and has 4,140 feet of quayage. There is tidal dock, hewn out of the solid rock, with an entrance wide and a depth over the sill at high water of 19 feet. The wall of the dock is 1,100 feet long, and as there is a longside of 20 feet at low water, large vessels are afloat at all stages of the tide. The first steam crane that was used for the shipment of coal in Scotland was erected in the forties at the dock by Messrs. John Yule & Co., of Glasgow. It was worked by a stationary engine with shafting and clutch. There are two graving docks, the larger, opened by the Duke of Portland in June 1899, and which cost 25,000^l, is 365 feet long, 48 feet wide, with a depth of water over the sill at ordinary tides of 16 feet 6 inches; while the smaller dock is 111 feet long and 37 feet wide, with 11 feet of water. Both docks are equipped with modern appliances for the speedy and efficient handling of ships. The inner harbour extends to the east, and is used for the wintering of vessels and storing of cargo. The harbour is provided with seven 30-ton loading cranes, each capable of dealing with 150 to 200 tons of coal or iron, and nine ballast cranes, which can each discharge 100 tons per hour. Since the harbour was taken over the Government have substituted a new tug steamer, specially built for the purpose, for use at Troon, and they are at present expending £100,000 on rebuilding the quay walls, raising the crane foundations, erecting a new 50-ton crane for heavier traffic at the north end, lengthening by 70 feet the ballast quay, and superseding the horse haulage of waggons from the quay to the cranes by the introduction of hydraulic capstans. The chief imports consist of iron ore and limestone. Large quantities of timber, both home and foreign, also enter the harbour. The exports comprise coal, pig-iron, and general merchandise. The districts chiefly served include the coalfields of Hurlford, Galston and Caprington, the ironworks of Dalrymple, Lugar, Muirkirk, Eglinton and Glengarnock, and the extensive ironworks and collieries of Lanark. Within the harbour area is situated the extensive yard of the Glasgow Shipbuilding Company, Ltd., employing five or six hundred men. This yard comprises five launching slips, which have scarcely ever been empty since the yard was leased in 1870. Over one hundred vessels have been launched, many of them magnificent specimens of naval architecture. Close at hand is the sleeper saw-mill, with slip in the inner harbour, of Messrs. Alex. Bruce & Co., who import sleeper blocks in large

quantities from Russia and cut, adze, bore and creosote them on the premises, afterwards despatching them to all quarters. Messrs. Adam Wilson & Son also carry on a large timber trade at the Harbour Sawmills. The managers of the harbour under the Duke of Portland were Mr. John Wilson, Mr. William Wilson, C.E. (son of the foregoing), Captain M'Innes, Captain Maynard, Captain Boland, Mr. James Wood and his son, Mr. Adam Wood. The harbour is now managed from the head offices in Glasgow, and is therefore under the direct supervision of Mr. David Cooper, the general manager, and Mr. Henry Evans, the goods manager, the local superintendent being Mr. William Frew.

With the development of the mineral resources of the immediate neighbourhood, coupled with the well-known efficiency of the Glasgow and South-Western Railway Company's management, a new lease of prosperity may be looked for at this well-situated, safe, and historic harbour.

STAFFORDSHIRE IRON AND STEEL INSTITUTE.

ON Saturday evening Mr. Walter Macfarlane, of Wednesbury, addressing a meeting of the above Institute at Dudley, delivered a lecture entitled "British Improvements in Iron and Steel Making." Mr. Walter Somers (president) occupied the chair. Mr. Macfarlane said that in regard to iron and steel making we were in a good position at present in many respects, and the future was full of hope. The latest advance in pig-iron making had been made by Mr. J. W. Foster, of Darlaston, who was the inventor of a new arrangement for water-cooling the tuyeres. The modern system of hoisting was American, but the fundamental feature of the new method was the travelling skip, which was in use in the famous Low Moor Ironworks a century ago. British iron castings were stronger to-day than formerly, and that district had done its share in carrying forward the improvements. Professor Turner had done work which had won the approval of practical American authorities in iron-founding. In regard to high-blast pig-iron, involving a change in puddling, he would remind them that Mr. Joseph Hall, of Tipton, had made a lasting reputation as the chief pioneer of the new method, which was known as "pig boiling." He hoped something might be done to mark their appreciation of his genius and generalship. In making alloy steels the Britisher had carried his name high. There were certain specialties of British make in the iron trade which continued to

be unsurpassed. The good qualities of cold-blast Staffordshire pig-iron were appreciated abroad as well as at home, and nothing the world over could beat Staffordshire "treble best" for certain purposes, whilst Yorkshire iron still held its own. Metallurgy as a science had its origin in Britain, and Dr. Percy's work on the subject was the best which any metallurgical authority had given to the world. The question was, "How do we stand now?" In regard to men we stood, he maintained, in a leading position. They had heard much of the superior scientific training of the foreigner, but what, he asked, had been the practical outcome of it all? Much theoretical research with the microscope in examining the structure of iron had been done abroad, but nothing had been done in this direction which could be said to be epoch-making. From first to last in the latest scientific advances we had held our own, and still maintained it. No country competing with us could show such a galaxy of iron and steel men of high reputation, and we had an unsurpassed metallurgical record. How much more we might have accomplished with superior education no mortal could tell. All the newest British improvements had been effected by men who had been carefully trained in theoretical knowledge, and if we were to continue our supremacy as a "brainy" nation we must encourage the best educational system. Technical education was making substantial progress amongst us, and was being on all hands more and more highly appreciated, and in every respect the outlook was decidedly encouraging. There was, it was true, a huge amount of apathetic humanity, but there was also an increasing number of earnest technical students. In regard to the supply of the raw material it was only natural that, in a comparatively small country like this, which for a very long period had been the abode of an iron-producing people, a shortage must be expected. We raised over 12,000,000 tons of iron ore per annum, and imported about 5,000,000 tons. From north to south of the adjoining Continent, however, British enterprise and capital were being brought to bear to insure a continued supply of iron ore. Despite the lamentations of our backwardness in industrial competition, they found that not only did this country lead the way in the production of power-gas on a large scale, but we had to-day the largest steel foundry in the world, the largest steel mill in the world, and the most powerful steel press, which was in the Park Head Works, at Glasgow, and was capable of exerting a pressure of 12,000 tons. In the matter of conveying minerals we were awake, and he was

pleased to say that two of the largest railway companies had last begun to run larger trucks. In respect of improved blowing engines at blast furnaces, there was an important extension of British works. Eleven new blowing engines had been supplied to Midland works in recent years by one firm. Much progress had also been made with the use of charging machines for reheating purposes and rapid strides were being made in electric installations for machinery in steelworks, whilst the Benjamin Talbot and Bertrand Tiel processes were found to be their best developments in British works. Taking quality of other points into consideration, there was every reason to believe that plates were being rolled cheaper in the West of Scotland to-day than in America, even with the large output of American mills. Taking unit for unit, our machinery was distinctly better designed than that in America. In conclusion he said he hoped they would see with him that there was cause to be of good cheer.

Professor Turner said that they as Britishers were proud of the record they had in the iron and steel trades in the last 100 or 150 years. At the same time, they must remember that other people had done a great deal. There was no doubt that they could measure the progress of civilisation of a nation or district by the progress made in metallurgical industries. Whilst he was proud of what we had done in the past, he thought it would be very unwise to shut our eyes to what was being done abroad. When they considered that we were making about 8,000,000 tons of pig-iron in a year, and that in America they were making 20,000,000 tons, it was pretty obvious that however large and well equipped our works were, their works were larger and better equipped. One of the remarkable characteristics of the American was his faculty of taking hold of an idea and improving upon it. In regard to Mr. Macfarlane's lecture, he should like to point out that Mr. Talbot came from that district and was a member of the Institute. Some of the ideas which Mr. Talbot had embodied in his process were obtained in discussion on papers which were read in that room some ten or twelve years ago.

Mr. Tucker referred to the large quantities of ore which were irretrievably lost through careless minding, and Mr. Kirk thought that one of the reasons we did not make the same progress as in America was the lack of co-operation on the part of our workmen.

Messrs. T. Ashton, W. Brooks (vice-president), M. Macfarlane and R. Edwards also took part in the discussion, and a vote of thanks to Mr. Macfarlane concluded the proceedings.

THE WEEK.

discoveries of M. HOMOLLE at Delphi will appear remarkable if we remember the condition to which a city was reduced. The ancient name was Delphi and the town which occupied the site was known as Delphion. When DODWELL visited the place at the end of the nineteenth century the inhabitants were few, and travellers were so rare, he was regarded as a curiosity. He says:—"They were so much pleased with the fact that every one begged a little bit, and it is difficult to describe the surprise which they manifested when I made use of indiarubber to efface some pencil lines. The children ran away, and said I was the devil." DODWELL impatiently sought the site of the Temple of Apollo, which, as PAUSANIAS said, stood near a theatre, and ought to be easily identified, as theatres were hewn out of the solid rock; but he could discover no positive traces of temple or theatre. "The temple of Apollo," he said, "must be sought for among the humble cottages of Castri." At a distance, near the village, he saw some ancient foundations which he conjectured to be those of the lesche which contained the painted *polygnatus*. Delphi, we are told, was plundered long before the reign of NERO, who carried off 500 statues from the temple. Yet PAUSANIAS was able to find 137 which still remained, and he refers to a great number of others. According to LUCIAN, gifts were sent to Delphi by other peoples besides the Greeks, and he mentions the Phrygians, Lydians, Persians, Assyrians, Romans, Italians and even the Hyperboreans. Indeed, the temple of Apollo was supposed to be an international shrine, a "commune humani generis oraculum." It was not as circular, but the French explorations do not support that theory, and on a coin it is represented as a temple with six columns on the sides and two in the front. Some have thought that the *Apollo Belvedere* is a copy of a bronze statue which stood in the temple. What DODWELL was the general absence of marble fragments, though it must have been largely employed. He found that "several curiosities are no doubt buried in the village, though the soil in general is so thin and stony that great masses cannot be concealed beneath the surface." The French have been able not only to determine the site of the temple but of the theatre, the lesche, the altar, several treasuries, the gates, the Sacred Way and the rock of Apollo.

Apparently nothing can be perfect in this world, it would be unwise to assert that in most things there are no errors. In constructive works they may escape notice. The motion of an engine or a watch is its performance of a function. If the motion is irregular or is suspended, the watch or engine is defective. It does not matter whether the maker holds, or the sum paid to him, or the difficulty of discovering the defect, the irregularity or the suspension is sufficient evidence of imperfection. A house is not perfect if it is of a larger number of pieces than an ordinary house, but there is no such definite test as can be applied to them. A building may be tottering through its foundations for a great number of years, and both owners and occupiers be unaware of the fact. It often happens that new houses are surrendered to the public as complete whilst accessories will be omitted which that is often incredible. The practice of charging a part of the contract amount for a certain time before the house is completed, and that there may be oversights with builders who have not had a long experience. The house is examined by one or more experts without discerning the shortcomings. What we have stated is common to all buildings, and yet it often happens that when judges are annoyed by contrary statements they come to a decision that witnesses on one or other side, or it may be both, are acting dishonestly. A week ago the excellent magistrate at Westminster, de-
hear expert witnesses who were prepared to give

evidence as to whether a certain large building was or was not adapted to serve as a common lodging-house. Mr. SHEIL is reported to have remarked:—"Any one who had been at the Bar for any length of time knew how to appreciate scientific and expert testimony at its proper value. All one had to do was to pay people on one side or the other. They would flatly contradict each other for the sides who retained them." Some years ago an outburst of that kind was quite familiar to those accustomed to attend the Court of the late Vice-Chancellor MALINS. But it was supposed to arise from natural irritability. If there are certain defects in a building which are apparent to a sharp-sighted witness, why should he be forced to conceal them because a respectable but careless or dim-eyed witness on the other side has advanced the contrary? Some witnesses take what is called a broad view of things, and are indifferent to trifles; while others realise that minor defects often grow into serious dangers. It is only necessary to compare the evidence given by medical men with that of architects or surveyors, and it will be found that a universal rule prevails, and that creation's noblest work has its apparent and concealed defects just like a cheap suburban villa. The fault is not with the witnesses, but with the thing examined, and a judge should allow to witnesses in cases relating to the constitution of men and of buildings the right to differ, because it is unavoidable.

THE church of St. Thomas-a-Becket at Winchelsea is by some authorities declared to be the most important example of the Geometrical period in the diocese of Chichester. It is picturesque within as well as without, and the tombs of the ALARDS, who were admirals of the Cinque Ports in the fourteenth century, are exceedingly interesting. The figures resemble those seen in the Temple Church, London. It is now proposed to repair the building, a work which will cost 7,000*l.*; but as it is to be done under the direction of Mr. MICKLETHWAITE, there need be no apprehension of the introduction of incongruities. The works that call for immediate attention are the repair of the roofs and fabric; the removal of a wall inside the church which now cuts in two one of the monuments; the restoration of the original vestry, the walls of which still exist; the repair and preservation of the monuments and their canopies. All old work is to be carefully preserved, new being substituted for the old only in those places where the old has perished or is no longer able to perform the work it has to do. The nave at one time extended all along the churchyard, and what we see is no more than a part of a great building, viz. the chancel and its aisles. Altogether it is a church which appeals to lovers of Mediæval architecture beyond the limits of the parish or of Sussex.

ROBERT BURNS was never above taking a hint from another poet, and his dialogue between the Auld Brig and the New Brig of Ayr is likely to have been inspired by one between the Plainstones and Causeway of FERGUSON. It would be more correct to say that the dialogue is between "The Sprites that owe the Brigs of Ayr preside." The poem was composed at a time when he was suffering great depression, and when his friends were endeavouring to obtain for him an appointment in the Excise. The Kilmarnock edition of his poems had appeared, but he had not as yet made his visit to Edinburgh where his genius was recognised. BURNS contrasts very fairly the characteristics of the Mediæval and the later architecture which he had seen. But the effect of his poem was to keep the old bridge standing. Nearly 120 years have elapsed since the dialogue was written, and again the bridge is exhibiting signs of decay. The Society for the Protection of Ancient Buildings has appealed to the Ayr Town Council to be expeditious in carrying out the works that are necessary. That was no more than one of those formal acts which seem to be intended to show that the Society has still some life in it. The Council did not need such a reminder. Before receiving the letter a special sub-committee had been appointed to deal with the subject, and, indeed, any Scottish burgh would under the circumstances preserve so interesting a memorial.

THE SCOTTISH BOARD OF MANUFACTURES.

THE different treatment which Scotland received from the English Government, if compared with Ireland, was explained by THOMAS CARLYLE as arising from the presence of a hero in one country and the absence of such an exemplar in the other. "If," he said, "the union with England be, in fact, one of Scotland's chief blessings, we thank WALLACE withal that it was not the chief curse. Scotland is not Ireland: no, because brave men rose there and said, 'Behold, ye must not tread us down like slaves, and ye shall not—and cannot!'" The inconsistencies of legislation in respect of trade would by themselves bear out his argument. A number of measures were passed from time to time to prevent any increase of the woollen manufacture in Ireland. Wool was allowed to be exported in a raw state to England, but in the form of cloth it could only be smuggled to France and Spain. The result is that even at the present time it seems impossible to revive the industry, and the greater part of what is known as Irish frieze is, we believe, produced in Germany. In the Treaty of Union between Scotland and England it was agreed that a sum of 2,000*l.* per annum should be applied for the space of seven years towards encouraging and promoting the manufacture of coarse wool in certain counties of Scotland. That sum, which now appears so insignificant, was the foundation of the Board of Manufactures, an important body that, in addition to supporting various industries, has exercised vast influence over the fine arts in Scotland. It is not necessary that we should explain the development of the Board. The first effort was, however, made as far back as 1760, when a drawing academy for manufactures was established in Edinburgh, which has had an interesting history. The Board also acquired in course of time the maintenance and management of the National Gallery and the National Portrait Gallery. The Applied Art School, recently opened mainly through the exertions of Sir R. ROWAND ANDERSON, was affiliated to the School of Art. The Board also exercises control not only over the buildings used for those institutions, but also over the restored Dunblane Cathedral.

There can be no question concerning the excellent work which the Board has done. Before South Kensington introduced its malign system into Edinburgh nearly every Scottish painter from WILKIE to ORCHARDSON had received his training in the Board's art school. But in our time every official body must sooner or later be subjected to scrutiny, and the Board of Manufactures was not to be exempted. Last year a departmental committee was appointed to inquire into the constitution, powers and duties of the Board, with special reference to the administration of the grants made by Parliament for purposes of art in Edinburgh, and to report whether and in what way such administration may be improved. The members consisted of Mr. A. AKERS-DOUGLAS, M.P., Sir JOHN STIRLING-MAXWELL, M.P., Sir WALTER ARMSTRONG, Sir KENNETH JOHN MACKENZIE and Mr. THOMAS RYBURN BUCHANAN.

The Board of Manufactures is composed at present of twenty-four members, nearly all of whom are nobles, baronets or lairds, and there are four vacancies. There used to be two or three representatives of the Royal Scottish Academy on the Board, but since Sir GEORGE REID resigned there is no artist among the members. Recollecting the important influence the Board is supposed to exercise over art, the deficiency is serious. The committee declare that from their own observation, apart from the evidence, the composition of the Board is unsatisfactory. It is too unwieldy a body, the members are not selected with sufficient consideration and their responsibility is indefinite. The National Gallery and National Portrait Gallery are, it is alleged, mismanaged in consequence. The School of Art has ceased to be a success. There has been friction between the Board and the Royal Scottish Academy. But what probably was the most grievous fault on the part of the Board in the eyes of a departmental committee composed of Scotsmen, is that more demands were not made for money from the Treasury. It is considered that grants should have been obtained for the purchase of pictures, and that the hesitation to put forward the claims "amounts to a dereliction of duty in a Board to which the art interests of Scotland were confided."

Undoubtedly a praiseworthy spirit of economy has

marked the action of the Board throughout its history. The Act, as we have said, allowed 2,000*l.* a year. Much money was for some years permitted to accumulate, and in 1817 the surplus reached the sum of 75,000*l.*, including money derived from the sale of ground. Out of this the Royal Institution was erected at a cost of 40,000*l.* Then when powers were obtained to found a National Gallery the Board paid 20,000*l.* towards the building, 3,500*l.* towards the acquisition of the site. Later it was contributed towards the formation of the National Portrait Gallery, and at the present time the Board's income is 36,481*l.* It should also be allowed that the Board is not narrow minded in dealing with what might easily be regarded as rival institutions. For instance, the School of Applied Art could be presumed to be an opponent of the Board's School of Art. Yet in the address delivered on opening by Sir R. ROWAND ANDERSON he was allowed to announce:—"I am glad to say that our hopes of support from the Board have been fully realised. They are now at our aid in the form of accommodation, rent free, and in administering and carrying out the work of the school."

It should not be forgotten that the Board could not resist the influence of circumstances any more than other institutions which have been modified from time to time throughout Great Britain. It was impossible to resist the power of South Kensington. King COLE, with the support of his back, would have annihilated a Board supposed to be legally concerned with woollen manufacture only, if it showed any opposition to his will. The character of the school was altered, and instead of being a historic academy it became merely one among the provincial schools of the Science and Art Department. More remarkable is, that at a time when this school was believed to be devoted to fine art it was more useful in supplying designs for manufactures than when it was part of a system that was supposed to keep the industrial art alone. As evidence of the failure of the South Kensington system, the Scotch Education Department having now the control of art schools are endeavouring to effect changes in order to accomplish the purpose for which the Science and Art School was unfitted.

In other cases inquired into it is obvious that the institutions fostered by the Board have outgrown their original proportions. The buildings, which at their erection were considered to be suitable, are now circumscribed or ill adapted to their use on various accounts. But elsewhere official buildings are altered as necessary without bringing any discredit on those in charge of them. The Art School is without a side light, which was not thought indispensable in old days. The Royal Institution erected by the Board has become too limited in dimensions. The library of the Royal Society has increased and there is a larger attendance at meetings, more accommodation being therefore required. The National Gallery is overcrowded. The Royal Scottish Academy did not establish a life school until after 1850, and as a symmetrical Classic building does not allow of additions, a room over the portico in the front of the building was assigned for the purpose. Necessarily it is "stuffy, small and quite inadequate." There are far more works of art to be exhibited each year and the wall space which was sufficient half a century ago will not serve in our time. The Board, as we have mentioned, aided in establishing a National Portrait Gallery. But there are no funds for its support. The Society of Antiquaries and the Royal Geographical Society are societies that they are not treated equally well with similar societies; but this arises from the influence of tradition. Both societies have grown, and naturally they should be liberally dealt with by the Exchequer. The Board of Manufactures contains an excess of amateurs. But of the witnesses, a designer, said, the members are a biased class of men, perfectly liberal-minded; and if they had been sufficiently or properly reported to, they would have seen where errors were taking place, and would have had the courage, I have no doubt, of their opinions, not to be supposed that the departmental committee discovered anything that can be considered in the least discreditable to the Board. The original purpose of the body is no longer sought after. The efforts of the Board to have the money applied to the

of a technical school will meet with little support. In consequence of the change, the pliancy of the Board in the endeavour to meet new conditions have been remarkable. At the departmental committee have arrived at the conclusion that a radical change is necessary. It is proposed to reconstitute the Board of Manufactures, to reduce numbers, and to transform it into a Board of Trustees. There are to be only fifteen members. The President is to be a member of the Royal Scottish Academy, and there is to be an artist, and there are to be two other Academicians, who are not to follow the same branch of art as the President. The Royal Society, the Society of Antiquaries, the Council and the University of Edinburgh are each to have a representative. The remaining eight members are to be appointed by the Secretary of Scotland. The term of office is to be eight years, and the members to be eligible for re-election. The duties of the Board are to be the administration and management of its accumulated funds, the application of its income from all sources, so far as not specifically disposed of under these recommendations, to such purposes as in the Trustees' opinion would be conducive to the advancement of art in Scotland. Further, the Board will exercise a general supervision over the ultimate control of the National Gallery and the National Portrait Gallery. They are also to continue to maintain Dunblane Cathedral. A new School of Art, as far as possible is to be on the same lines as the Glasgow school, is recommended to be established. It is suggested that the Applied Art School promoted by Sir JAMES ANDERSON should be incorporated with the new school, but remain as long as possible under his control. The constitution of the National Gallery should be assimilated to those of London and Dublin, and an application made for a grant in aid of the purchase of pictures. The recommendations apply to the Portrait Gallery. The donation or acquisition of a new National Gallery, as suggested by Mr. HONEYMAN, is declared to be essential. The endowment of Trustees will contribute 20,000*l.* from the accumulated funds towards its cost. The whole of the building, which is now partly occupied by the National Gallery and partly by the Royal Scottish Academy, is then to be handed over to the Royal Scottish Academy to be used by that body exclusively for art purposes, such as exhibitions of works of art and art education. The Academy, it is said, must fairly be bound at such times as they were not holding their own exhibitions to allow the Society of Scottish Artists and the Scottish Water Colour Society to hold exhibitions in the building. A grant towards the cost of maintenance and upkeep of the building should be made by the Treasury. In return the Academy should convey to the nation the whole of those works of art at present lent and exhibited in the National Gallery and the National Portrait Gallery. The Society of Antiquaries is also to receive in a permanent grant of 200*l.* a year for the purchase of antiquities and 200*l.* a year for the increase of salaries of the museum staff. The historic grant of 2,000*l.* per annum, which by Article XV. of the Treaty of Union, 1706, was to be applied towards encouraging and promoting the manufacture of coarse wool within those shires which produce wool; and that the first 2,000*l.* sterling be paid at Martinmas next, and so yearly at Martinmas, during the years aforesaid, and afterwards the same shall be wholly applied towards the encouraging and promoting the fisheries and such other manufactures and improvements in Scotland as may most conduce to the general good of the United Kingdom," is to be transferred to the consolidated fund. We suppose money advanced under similar exalted circumstances must be supposed to be lying fallow or applied to some other beneficent purpose. But it would be premature for taxpayers rejoiced at the change. Scotland loses 2,000*l.* at the very least the expenditure contemplated will amount to 4,200*l.*, which the departmental committee consider "a moderate demand and one eminently justified by the evidence laid before us." The question, however, is, whether the greater part of the money be expended in Scotland or in Edinburgh alone? At the present time an impartial observer would say the most promising place, through having that mysterious influence which is like good air, is not Edinburgh but Glasgow. It would not be unreasonable

to speak of a Glasgow school. It is no creation of yesterday, for it has been in existence for more than half a century, but officially the commercial capital had to give way to the official capital. Glasgow has been self-reliant, for the greater part of the funds required for the erection of a School of Art has been obtained locally. No doubt for the support of the school as an institution having buildings and masters, and liability for varied expenses, the management is willing to accept contributions from officials. But that school is only one of the agencies at work and through which satisfactory results are obtained. In proposing the Glasgow school for a model the departmental committee are suggesting more self-reliance than was witnessed heretofore in Edinburgh. In that city people have become habituated to look up to the Board of Manufactures as if it were a nursing mother, and there was disappointment because the funds were not equal to all demands. The late reports would, however, appear to indicate that the Edinburgh students are more eager than formerly to take advantage of any opportunities offered to them, and the alterations proposed may therefore lead to the success which is to be desired.

ASIA MINOR AND GREECE.

THE boundaries of the modern States of Europe are so rigidly determined and interference with them is so serious a crime, it is easy to understand why it should be imagined that in ancient days a similar condition of things prevailed. It was impossible to fix divisions with any definiteness unless nature had provided landmarks in the form of mountains, rivers or streams. In the case of small seas there were many contests about lines of demarcation. Anyone who will glance at a map of Greece can see how often claims were likely to arise for possession of cities along the coast of Asia Minor, ranging from *Ærnos* on the north by the plains of Troy to *Halicarnassus* on the south. There is no doubt the Greeks, who were not indisposed to fighting by sea, gained a footing in Asia even if they had no ancient rights to the territory.

One of the consequences has been that, seeing buildings in various parts of Asia Minor which exhibited a close relationship to those in Greece, it was supposed by some authorities that the course of art, like that of empire, was westwards, and that Greek architecture was derived from Asia. On the other hand, if *HERODOTUS* and some early writers are to be credited, the Greeks founded settlements along the coast and erected buildings many of which exceeded in size those which are found in the cities of the islands.

Up to the end of the seventeenth century Western Europeans avoided Asia Minor. Greece itself, in spite of all its historical associations, was an unknown region. There were fewer advantages awaiting those who ventured to visit the lands on the east side of the *Ægean*. Occasionally an English merchant who found himself in *Smyrna* was tempted to make excursions along the coast, but they never extended to any great distance northwards or southwards, and the inland journey seemed more hazardous. *Pococke* was, it is believed, the first Englishman who by pen and pencil endeavoured to suggest there were ruins worth notice. But his description of his travels is not as satisfactory as is desirable. The accounts given were, however, sufficient to excite interest among amateurs in England, and in 1764 the Society of Dilettanti sent out an expedition under the direction of *Dr. Chandler*, and including *Revett* the architect and *Pars* the painter among the staff, in order to prepare descriptions and illustrations of the ruins of *Ionia*. Another expedition was subsequently despatched by the Society under *Sir William Gell*. *John Peter Gandy*, afterwards known as *Deering*, who was a member of Parliament and architect for *Exeter Hall* and other buildings in London, with *Mr. F. Bedford*, also an architect, were members. Among the places visited by them was *Cnidus*, but they had not sufficient means to undertake excavations. The third volume of the "*Ionian Antiquities* and the unedited *Antiquities of Attica*" represented labours of the expedition. About the same time *Captain Beaufort*, R.N., who was a great

geographer, prepared a chart of the coast line showing some of the cities to be found in the neighbourhood. Colonel LEAKE was also a traveller who extended knowledge on the subject, and he had the benefit of some of C. R. COCKERELL'S observations. The necessities of ecclesiastical history were not without their influence in prompting a desire to gain information respecting lands mentioned in the early apostolic records. ARUNDEL, who was British chaplain at Smyrna, for that purpose made several excursions. There were geological problems which also incited HAMILTON and STRICKLAND to undertake explorations. Sir CHARLES FELLOWES'S journeys enriched the British Museum with the Xanthian marbles, and various other travellers were able to convince people that Asia Minor was a less dangerous part of the world than was generally presumed.

The interest aroused by the fruits of Lycian expeditions of FELLOWES inspired the authorities of the British Museum to exert their influence in securing more examples from Asia Minor. The appointment of a vice-consul at Mytilene was obtained for CHARLES NEWTON in order that he might occupy a position that would facilitate his explorations. Lord STRATFORD DE REDCLIFFE was then omnipotent in Constantinople, and he was enthusiastic in promoting the enterprise. NEWTON was ambitious to ascertain where the sepulchre of MAUSOLUS was erected, and came to the conclusion that the site must have been at Budrum, which is on the shore of the Gulf of Cos. In 1855 he visited that place, and he saw enough to warrant him in applying to the home authorities for assistance. A frigate was sent to him with a party of Royal Engineers under Lieutenant MURDOCH SMITH. The operations were commenced, and before long NEWTON was able not only to reveal the plan of the monument but to unearth the pieces of the colossal sculpture which are now to be seen in the British Museum. The figures will convince any sceptic that the descriptions of the old writers which were supposed to be entirely drawn from their imagination were not exaggerated. At the end of 1857 CHARLES NEWTON went to Cnidus. Fortunately he was possessed of the means which were not at GELL'S disposal. He made excavations on the site of the Lion Tomb, the Temple of Venus and the lower theatre. He was happy also in obtaining the services of a most able lieutenant in RICHARD POPPLEWELL PULLAN, the architect, who found the great lion we now see in the British Museum. Evidently Cnidus was a place that deserved to be represented in D Iphi. NEWTON also was most successful at Branchidæ, and was able to secure the seated figures which once lined the Sacred Way.

The Society of Dilettanti were, in consequence of so much success, contemplating the equipment of a third expedition, which would continue the work of CHANDLER and GELL. Mr. PULLAN was requested to undertake the preliminary arrangements. He was able to complete the exploration of the Temple of Bacchus at Teos, the Temple of Apollo Smintheus in the Troad, the Temple of Minerva at Priene and the Temple of Apollo Branchidæ at Miletus. In the course of his journey he "visited the whole coast northward to the Troad from the point that had been reached by Mr. NEWTON; and in this manner from the Gulf of Mendelee to Cape Lectum, on the north side of the Gulf of Adrymitrum, completed a survey of the coasts of Caria, Ionia and Æolia, where we know the finest buildings erected by the Greek colonists formerly existed." Mr. PULLAN was then instructed by the Dilettanti Society to excavate the site of the Temple of Bacchus at Teos. It was not a large structure; the interior dimensions were 31'15 feet by 19'85 feet; the wall was 3'8 feet thick; the columns were Corinthian of Greek character. Several fragments of the architrave were found, but no frieze. A bluish marble obtained in a quarry about three miles from the site was used for the building. Outside the town walls were the remains of a small Roman temple, with cornice, frieze and architrave from one block of stone. There was also a square building, apparently a mausoleum. Parts of a rich Corinthian frieze were found, but no traces of columns and pilasters. The core of the building was of rag-stone, the casing of white marble.

In the period of about forty years which has elapsed since NEWTON, SMITH and PULLAN were engaged in explorations the interest attached to Asia Minor has widened.

The proceedings of the Geographical, Hellenic and Archæological Societies testify to the increased number of travellers who have been attracted to Western Asia. The Americans also have exhibited their usual energy in endeavouring to clear the historic darkness which has enshrouded that part of the world. It is needless to say that there, as elsewhere, the Germans have obtained materials for learned investigations. But in revealing the buildings no people have done more than the French. They have some right to precedence, for it was a Frenchman, PAUL LUCAS, who was the first to suggest to modern Europe that Asia Minor was not to be regarded as the beginning of the Arabian desert. For men who have given so much attention to Classic art as the French architects, the buildings which are in the vicinity of the Ægean must exercise a fascination. It is not always easy to estimate the action and reaction between Ionia and Greece. But whenever Greek architects found themselves in Asia Minor, they appeared to consider they were entitled to show a liberty denied them in their own cities. In proportions, planning, ornamentation, we see variations which must have shocked Greek purists. Whether these variations can always be approved by the logic of architecture we need not inquire. But there is no doubt that imagination was allowed fuller play on the eastern than on the western side of the Ægean. What is novel and always an improvement, and we might suppose that the luxuriant architecture of Rome was inspired by the buildings in which efforts are made to combine characteristics belonging to different races and different periods.

THE ROYAL ACADEMY AND SLADE SCHOOLS

AMONG the witnesses who gave evidence before a departmental committee appointed to inquire into the administration of the Board of Manufactures (Scotland) Mr. Ernest Crofts, R.A., keeper of the Royal Academy, and Professor Frederick Brown, of the Slade School, University College, London. They described the systems adopted in respective schools:—

Mr. Ernest Crofts, R.A.

Mr. A. Akers-Douglas, M.P., Chairman: Will you explain to the committee kindly the constitution of the Royal Academy schools?—As I am not a very good speaker, if I leave this to you and regulations of the Academy schools with you, perhaps that will make it clearer.

Certainly, if you will put it in?—That contains the rules and regulations, and also the management of the schools, except that I might explain one or two terms. I don't understand what a "visitor" means?

In the ordinary sense?—I meant in the academic sense. Yes, I think so.—No visitor is a Royal Academician or associate of the Royal Academy. The masters and the teachers are paid officials, and not members of the Royal Academy, and I am the only official who is a Royal Academician in the schools.

You are the keeper?—Yes; my duties are just to see that the schools and give instruction in what we call an elementary school, which is really not an elementary school as our students, when they come to the Academy, are highly trained.

You do not admit any one who is not highly trained?—In old days the Academy did train students. There was no other place, but now there are such excellent institutions outside, and they receive good training there.

Where do they come from?—South Kensington, where?—All over England and Scotland; we have them in all parts. We think our duty only consists in training the students who are likely to become artists—not technical.

Can you tell us at all the average numbers attending your school?—About 160, that is, including architects and painters and sculptors, male and female.

You have got, of course, ample accommodation for that number?—Yes, a fair accommodation. Of course the schools are not what we should like them to be, but of course the middle and centre of London, and the space is so small that it is an impossibility.

Where are they?—Piccadilly, at the back of the Academy, and they are very much hampered in light by the galleries and them. Our lighting is not so good as the South Kensington schools.

You find considerable difficulty, I understand, from sources with regard to light—the want of light hampers them. Yes; the schools are good enough, but in the dark they are more subject to fogs, I think, in Piccadilly than the

th Kensington. Then we have in the summer a good deal reflected light from the buildings at the back—the schools on the ground floor. They really ought to have been built re the galleries are—higher up; and then we should have ded the reflection of the London University which is at the k. I might say our system of teaching is very bewildering the ordinary student, because each month he receives ruction from a different professor. A Royal Academician gives instruction for one month at a time, and can only instruction once in the year; consequently to a student is not a very capable student, it is most bewildering, but clever one I think it has its advantages.

You have the probationers as well as students, have you?—The probationers are those we admit from their draw-; but then we have to test them because, of course, they get gradually coached up to make very good drawings out-; and, of course, a great deal has been the influence of the ter, and that we have to test.

You have to make them draw?—We have to make them in the Academy; of course there may be a little undue stance outside

s that a preliminary stage to the student? Does everyone ce as a probationary student?—Yes; everyone

And he has to pass?—If he does not pass, we reject him

gether. And if he passes?—Then he enters in the lower school, re he has practically to go through again what he had e outside the school.

With regard to the course of study?—That is very similar e course of study in all art schools, chiefly antique to start , and painting from still life, and then to attend the A demy lectures, which are lectures on anatomy and painting chemistry, as far as it touches on painting. Then when asses the examination he is passed up into what is really a upper school, where he still continues drawing from life, also three days in the week painting from the living model. en he has passed that examination successfully he is passed the upper school, where it is nothing but painting all the and drawing from the nude models in the evening.

Then you have various competitions for prizes and medals? es, I have brought you lists. Annually we have a great y prizes, and biennially we have a gold-medal year, and scholarship of 200*l.* for the painters and 200*l.* for the ptors. It would be as well if I left this document with you. What fund produces that?—That comes out of the Academy ; we receive nothing from anybody.

You receive no grant whatever from Imperial sources?— ; what we did have was the grant of the site—at least, on ase.

I wished to make it clear; that is all.—Yes, we have no ts at all, and the galleries the Academy itself built.

The Academy has never had any grant at all since its idation?—I am not so certain that it did not have 300*l.* in rge III's reign.

Since then it has had nothing at all?—That is so.

As I understand, really the only thing you have from ernment is the site?—Yes.

And the old building of Burlington House?—Yes.

You have that on a long lease?—Yes.

Free entirely?—No, I think there is a peppercorn rent. are on a different footing to the other societies.

Do you pay rates and taxes?—Yes.

And do all repairs?—Yes, everything.

The Royal Academy built all the galleries?—Yes.

Out of their own funds?—Yes; and, of course, the schools free.

Have your funds come largely from bequests?—Some e bequests and some from the exhibitions—mostly from the bitions.

Mostly from receipts at the exhibition?—Yes; we have many bequests from elsewhere, and Turner medals and larships which are awarded to the students.

You do not contribute anything towards the other part?—

And you have free use of the courtyard?—Yes.

It does not belong to you?—No.

There have been suggestions for covering it in. You could do that?—No; our property ceases with the wall and front r.

Were alterations made in the entrance not very long ago? ot recently; not within the last ten years.

I think the entrance to the Academy building has been ed?—I thought you meant the entrance to the schools, to Diploma gallery. There was one doorway, a doorway h led into the Diploma gallery. That was bricked up, and you have to go in the main entrance.

Was that done by the Royal Academy?—Yes.

At their own expense?—Yes.

What does the school cost you; were you going to tell us

?—That, I am afraid, is rather out of my province; but we I be very glad to let you know.

Have you any idea, roughly?—I really should not like to say. That is more the Treasury's business. I am never on that.

Do the students pay fees?—Nothing at all.

It is absolutely free?—Absolutely free. The only thing we expect them to bring are their easels, but even those they do not bring, as we have many left, bequeathed by forme students.

Does the Academician in charge for the month come every day?—No, three days a week. He may come every day if he likes, but three or four times a week is thought to be enough.

Can you tell us the distribution of work between the permanent teachers, the salaried teachers and the visitors? You have a professor of painting, have you not, and a professor of drawing, and so on?—The professor of painting literally takes no part in the school. He simply delivers six lectures

I did not mean the Royal Academician; I meant Stannus?—He was in the modelling, but he is no longer there.

How do you distribute the work between those paid officials and the visitors?—In the upper school the visitors do all the work. It is only in the lower school the teachers do any duty.

The students in the upper school only get the advice of the visitors?—Yes.

There are no teachers there?—Except myself. When the visitors are ill I undertake those duties, but only in the absence of the visitor.

Is there a school of sculpture as well?—Yes, and architecture.

I suppose the visitor does not have anything to do with the lower school?—Nothing at all.

The visitors do the upper school?—Yes, and the paid masters do the under school.

Have you painting and architecture in the lower and upper schools?—Yes. You will find that very well stated in this book.

Will that give an account of the course of teaching?—Yes, it tells you everything. It does not give you the names of the masters, that is the only thing.

You say your probationers are already almost as high as any other school of art in the country can take them?—Yes, really they are very capable when they come there.

What you do is to give them?—The very highest polish—at least it is supposed to be the highest polish—an artist can have. Amongst the various visitors he is sure to meet one who is in sympathy with his style, and that is the advantage of the Academy teaching.

And, of course, the good they do each other?—Yes, amongst themselves too.

Can you give us an account of the accommodation, or plan, or anything by which we could tell the space you require for your 160 students?—I could get our architect to send you a rough one.

We should be glad to have it?—Should I ask Mr. Spiers to come?

We are going to sit for another two days.

I think it would be very valuable to know that. I think a sketch plan would be quite enough?—Yes.

Also showing the mode of lighting. It is a slanting light, is it not?—Yes.

The whole of it is a slanting light, is it not?—Yes, there is hardly any top light; in fact, we have none.

How long do the students stay?—That is all in the book.

It is a regular course?—Yes, five years altogether. Of course they can be sent away at the end of the first three years if they do not show proficiency.

Are the numbers limited?—No. We could still take more students than we have got.

Have you room for more?—Yes. And then there is no compulsion on their attendance: they attend very much as they like, except those that have scholarships, and these we keep a check upon. But otherwise it is very much like a university. They come and go as they like. Of course the good students attend regularly, and the bad ones we are very pleased to be without.

But you have no means of getting rid of them?—We can get rid of them at the end of three years.

But suppose you get a slack student?—He drifts away.

He comes when it pleases him?—Yes.

And you have to let him come for the three years?—Yes.

You have a limit time now?—Three and five years.

It used to be seven?—Yes.

And ultimately?—Unlimited.

A man could stay there all his life?—Yes.

You consider that both side and top lights are essential in a really good place?—Yes.

It would be absurd to build a place for a school without both?—Yes, I am afraid you cannot take our buildings as a sample of a well-lit academy.

Professor Frederick Brown.

You are a professor at the Slade school?—Yes.

Will you give us a description of the practice at that

school?—I will try to do so. You must first understand that the school is essentially what is called a fine art school, that it does not deal with anything apart from the study of the human figure and subjects connected with it. There is no technical instruction of any kind there, except that applied to fine art. The school is composed of men and women studying from the antique and from the life. They commence from the very first by drawing some portion of the human figure, from the cast that is, and continuing till they are considered fairly proficient in giving a general idea of the structure, attitude and proportion of the human figure from the cast. Then at the very earliest moment they are put to draw from the living figure. In some cases they are put up within a month or two of their arrival at the school. In slower cases it is perhaps a question of six months. One very important point of the system of the school is at once, or at least as soon as possible, to put them to draw from an object which is living. I think that is perhaps the note which distinguishes it from all other schools, at any rate in this country, of which I have ever had any experience. The usual system is to keep people drawing from the antique figure for years. I have known them in some cases go on for three years. In my view that is a very childish and stupid thing to do, if I may use strong language. I think it leads them into a mechanical way of drawing, that constant working up of the surface of the cast without any comprehension really of the principles which underlie the construction of the figure, which is the point we make the most of. They should constantly study the movement of the figure and its organism, the way it is built up, and, in fact, get at the principles of the thing before they begin to finish or elaborate at all. The consequence is all the finished work of the school is done at the end and not at the beginning. The life class, of course, is first of all rather a long study of drawing from the figure, sometimes lasting for two or three years, sometimes less, a couple of years perhaps, and then they are allowed to paint. Then, when they have gone through with the painting and have got proficient and we can do no more for them, they are considered fit to start on their own account.

Do you have any test on entry?—None whatever; in fact, we prefer them to know nothing, to have them young.

You take them directly; you can get them?—Yes, it is much better that they should know nothing than come with ideas that are all wrong, which is generally the case.

Especially if he is from another art school?—Yes.

How many pupils have you room for?—Two hundred about, annually, varying a little, one side or the other, sometimes more, sometimes less.

How many years do they stay?—I think a very capable student gets right through in about three years, and gets as much as we can do for him—possibly four years at the extreme in the case of an able student.

How are your students divided between men and women?—All life classes, of course, are separate. There is only one large antique room, which is a common room to both sexes.

I suppose your building makes it necessary there should be a certain proportion between them. What sort of proportion?—No, we do not maintain any kind of proportion. Of course, we always accept men students when they come. Sometimes it has been necessary to limit the number of women, but there is no fixed proportion between the two. We have got so much accommodation that we desire to fill the accommodation.

You have never filled the men's accommodation?—Not so full as it might be.

And the women, I suppose, are generally overflowing?—The women are overflowing rather, yes. I think we average about fifty men, sometimes sixty. The women, of course, make up the remainder, a total of about 200.

Are there any studentships?—There are six scholarships, four of which are running every year. The scholarship is for two years. I think it has a very slight value—about 35 $\frac{1}{2}$ l. The amount of prizes is not more than 70 $\frac{1}{2}$ l. in all, in addition to the scholarships—about 70 $\frac{1}{2}$ l. worth of prizes.

The school is supported by fees?—Entirely, except that there is a small endowment.

Is there for the school?—No, for the chair only, not for the school.

For the professor?—Yes. I believe there is a very small sum of money for meeting odd expenses, but it is very slight. I have never been able to get more than 10 $\frac{1}{2}$ l. a year for that purpose.

You do not get anything from any grant of any kind?—No.

You do not attempt to earn anything?—No.

You simply go by the fees?—Entirely.

What time do your students stay with you?—The best of them stay about four years. That is a very complete course for a student.

Taken from the very beginning?—Taken from the very beginning.

And practically they all come from the very beginning?—

Not all, of course. It is a mere preference that they should come and not have ideas which we have to get rid of.

I suppose most of them do come on from other places?—Yes.

Very few of them you get at the beginning?—We get a number of young people who come direct from the ordinary school at the age of fifteen, sixteen, seventeen and so on, a very fair number. I should think at least fifty or sixty, perhaps, out of the total. But, of course, a large number come from other schools.

Can you tell us the amount of the fees per annum?—The sessional fee is 18 guineas. That means three terms of three months each.

Are there any extras or anything?—The anatomy lecture, I think, one and a half guineas for the course extra.

If you have a student come in simply to learn to paint, has to pay a fee of 18 guineas and provide his materials?—Yes, his materials, but not such materials, easels, for instance; but paint, brushes, paper and all that of thing he has to provide. But materials which you provide, of course, we provide—easels, stools and that sort of thing.

Then about the buildings; you have a certain top light?—We have side lights mainly.

They are high side lights?—They are fairly high, and consider they are the best, much superior to top lights, provided they are sufficiently high.

The side light in your life school is very high, I remember?—Yes, but every room has a side light. In the case of the lower life-room, it also extends obliquely into the room a little, but not much. It is practically a vertical light.

You think a very high light is a *sine qua non*?—Yes, not a top light. A top light is objectionable in many respects. I think a high vertical light is the most desirable form of light.

Would you say that anybody who said that a school could be perfectly lighted from the top was making a mistake?—I think so.

Then the teaching; how is that done?—The teaching throughout the school is carried on by all the masters—to say, the work is not divided up, at least with an exception which I will explain directly. The teacher who teaches the advanced life class also teaches in the elementary class; we consider that a most important thing that the same man or at all events a man of the same capacity, should teach beginners as well as advanced students. I think that is a desirable and important feature in the teaching of a school.

You have more than one—you have an alternative teachers, do you not?—I have a staff of three people from lecturers; they are really artists working outside; they come to the school on certain days of the week—some of them come three days a week and one one day.

It is a modification of the visitors?—Yes, practically.

Have you any permanent salaried teachers who stay all the time and do nothing else but teach?—No, I am not there myself the whole time, but when I am not there the staff is there, so that the school has always some one there during the work—at least two of our staff are always present.

You have not a school of architecture?—No.

It is only painting and sculpture?—It is painting and sculpture at the present moment. We have given up our school of architecture.

You have three teachers of painting, three visitors?—A staff, consisting of three people and myself, do all that is to be done; only in one or two cases—for instance, in one case one of my teachers comes exclusively for painting. After he has done his work with the painting, he assists with the sculpture and so on.

Any student comes under them all?—Yes; at different times he comes under all the teachers.

For all purposes, from the beginning of his course to the end?—Yes. At least that does not apply to the teacher who comes to teach the painting, but he goes round the other drawing classes too when he has time. But as regards the staff, you might call the staff, three parts of the staff are constantly in teaching the whole school from beginning to end.

Will you tell us the names?—Mr. P. Wilson Stead, Henry Tonks and Mr. W. W. Russell. Then there are two courses, lecturers—lecturers on perspective and on anatomy.

The Westminster Council have asked the Common Council to support the following resolution:—In view of the damage to health and property caused by smoke, the London County Council be urged to undertake inquiry into all the methods of cooking, so as to ascertain whether there is any form of apparatus which is smokeless and at the same time practical and economical for general use."

MANCHESTER SOCIETY OF ARCHITECTS.

PAPER on "Modern Domestic Architecture" was read before the above Society on November 12 by Mr. Alfred Orbert, who said that the advance during recent years in art of architecture had been greatest in domestic work, had been largely influenced by the feeling that modern architecture must be founded more on sound and straightforward construction, and the suitable treatment of materials, on the forms of buildings erected to fulfil the requirements of some bygone century, although careful study of old buildings is a necessity to every architect. Noting as points as to the choice of materials and methods of construction, stress was laid on the advantages of solid construction of floors, &c., and details given of some varieties of solid concrete or wooden floors. A double cavity wall was mentioned probably having some advantages. Speaking of various treatments of wall surfaces, half-timber work, when used merely casing in front of a brick wall, was condemned as being a less and more or less perishable deception. The aspect planning of the chief rooms, and of the house as a whole, was briefly commented on, and illustrated by examples of plans by Mr. Norman Shaw and others. Referring to the general treatment, it was insisted that the scheme must be actually realised as a combination of materials of certain colours and textures, not merely as a pleasing arrangement of colours on paper, and that local material should generally be used. While moulded brick is a useful material, terra-cotta was thought to be quite unsuitable for country houses. The remainder of the paper consisted of comments on lantern slides showing over fifty views and plans of good modern domestic work by leading architects.

After a few words by Mr. J. W. Beaumont, the president, a vote of thanks to the lecturer was proposed by Mr. W. A. E. and seconded by Mr. J. S. Hodgson.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

MEETING of the Institute of Architects was held on Monday evening last, Mr. John Slater, B.A., vice-president, in the chair.

The Hon. Secretary announced the death of Mr. Silvanus T. J. T. HOMOLLE, director of the French School at Athens, elected Fellow in 1893.

M. J. T. HOMOLLE, director of the French School at Athens, read a paper on

The Treasury of Cnidus and Ionian Art at Delphi.

M. Homolle, in his introduction to the description of the excavations at Delphi, paid a tribute to the memory of the late Mr. F. C. Penrose, and he thanked the members electing him as a corresponding member. In the choice of this subject he wished to associate the work of English archaeologists and architects who had by their continuous efforts collected together in the British Museum valuable fragments of the monuments of Asiatic Greece, and who had sagaciously interpreted their meaning as to be enabled to substitute them in the original forms. By the aid of drawings, by M. Tournaire he would briefly describe the sanctuary of Apollo. The Treasury of Cnidus was situated by the Sacred Way in the enclosure of the Temple. It was a type of Ionian architecture of the sixth century, B.C., and exemplified the richness and originality, all the vigour and beauty of the period. In order to give an idea of the discoveries at Delphi and to locate the position of the Treasury, M. Homolle described the plan of Delphi and its approaches, and especially a view of the site and its monuments as restored. The Treasury of Cnidus, he said, was found in complete ruin, and its restoration presented was carried out from the collection of fragments found under the debris. Many of the sculptured fragments were deposited at a distance from the site, and might perhaps belong to other monuments. The style was, however, the same throughout. To justify the interpretation attempted of the original monument, lantern views and photographs of the fragments were shown upon a screen, and the relation of each part and the motif of the ornamentation carefully considered. During the progress of the excavation the details of seven temples were discovered, and the value of the find could be appreciated when it was known that in the restoration of the Treasury of Cnidus they had brought to light Greek work which was of greater antiquity and beauty than the Temple of Jupiter at Olympia. It was a monument which gave new importance to Ionian art at Delphi, and in general to the history of ancient art. The plan of the Treasury was that of a temple in antis, measuring 30 by 8 m. 80. The restoration began with the entablature. They discovered details of a frieze and bands of ornamentation which greatly helped the work. The relation of the ornament to the frieze was believed to be true, because never a part of a figure in the frieze encroached upon the detail of the ornamentation had been cut away to make it. In all cases the several parts were connected together by reason of the relationship they evidently bore to

each other. In this way the architraves were placed in position, the height of the monument being suggested by the discovery of a caryatide with its base. The base was found in three parts, but its character was apparent since a representation of a short column was found in a portion of the frieze they had excavated. The casement of the door was suggested by a fragment of sculptured moulding, and the lower portions of the monument were thus completed in one whole. The richness and the extent of the decoration of the Treasury were most remarkable, for when the space did not admit of sculpture, painting was introduced. There was a uniform motif throughout the entire monument, varied by an appropriate adaptation of the different architectural details to the office which they served, carried out with admirable execution, full of vigour and possessing great decorative dignity, and giving a unique character to the monument. The Treasury of Cnidus, like some Greek monuments, did not follow a general rule in its position. It faced the west, but could be seen from all points of view. The sculptural frieze was continued round the four sides, that on the west front representing the "Apotheosis of Hercules;" the south, the "Rape of the Daughters of Leukippos;" the east, the "Contest between Greeks and Trojans round the Body of Euphorbos;" and the north, the "Fight of the Giants." In style and technique the bas-reliefs formed two groups. The treatment was either angular or soft, flat or round. The proportion and form of the figures were archaic, and the style was that of the sixth century. The figures were short and heavy, and the treatment and the groups were evidently subjected to a rigorous rule of symmetry, the grouping showing a corresponding number of figures on each side of the principal one, and the attitudes being analogous. They would be found, however, sometimes wanting in unity. The portion of the frieze showing the combat between the Greeks and Trojans before the assembled gods was a notable example. In the treatment of the figures could be observed an influence like that seen in the black figures painted on vases. The pediment showed the "Contest between Apollo and Hercules for the tripod of Delphi." In conclusion, M. Homolle said the name of the monument was arrived at by the discovery of inscriptions found on it, and by an implicit allusion to the monument in the writings of Pausanias. In conclusion, the Treasury was declared to be Ionian in spirit and execution, having an exuberant richness, a vigour that was somewhat heavy, originality of invention and marvellous execution. Details of the polychromy were illustrated by water-colour drawings by M. de Fonseca, and which represented the coloured ornaments, friezes and figures. The colours were red, white and blue. Metal was sometimes substituted for marble.

Dr. ALEXANDER S. MURRAY, who proposed a vote of thanks for the paper, said he need not assure the meeting of the great compliment M. Homolle had paid them in coming all the way from Athens to give a description of the most charming Greek building ever seen, with a fascinating argument for its relationship to Ionian art. He would rather call attention to their great obligation to him, who from the beginning to the end had been the life and spirit of the excavations at Delphi, which had produced results never equalled, and, in conclusion, he cordially wished that M. Homolle might be able to finish his task with all the success that had attended his first labours.

Mr. G. MACMILLAN, who seconded the vote of thanks, said he most cordially echoed all that Dr. Murray had said concerning the lucid and eloquent description, not only of the general plan and site of Delphi, but, in particular, of the excellent monument. Perhaps he would be allowed also to congratulate the Institute on their brilliant success in having M. Homolle to give a first account of his great work, and he could only feel sorry that the paper had not been given to the Hellenic Society. He hoped, however, that as the Society next year completed its fiftieth anniversary, M. Homolle would be persuaded to make a second visit to London and lecture upon another point in his work.

Dr. A. J. EVANS said only those who had been to Delphi could thoroughly realise the magnitude of the work carried out there. They felt that in Delphi had been discovered the beginnings of a Greek religion and an influence which had affected the whole of the civilised world. The work of excavation at Delphi had entailed the expenditure of vast sums of money, and the conduct of most difficult negotiations with a very difficult Government, which, however, appreciated the results obtained, and they could only the more admire the work M. Homolle had carried out and the great public spirit of his Government.

Mr. J. L. MYRES and Sir L. ALMA TADEMA, R.A., supported the motion.

The CHAIRMAN, in conveying the thanks of the meeting to M. Homolle, said that several years ago the Institute had been honoured by M. Schliemann, the celebrated explorer of the ruins of Ilium, and now they were proud to be able to offer a hearty welcome and thanks to the revealer and reconstructor of a building that was of supreme interest to the architect.

NOTES AND COMMENTS.

THE report of the Royal Scottish Academy refers to one subject which is worth attention by those who have charge of public galleries and museums. Lady SIEMENS bequeathed a portrait by RAE BURN to the Academy, which was to be delivered free of Government duty. The Inland Revenue authorities in England exacted payment from the executor of estate duty and legacy duty on the value of the portrait. The Finance Act of 1894, however, empowers the Treasury to remit the estate duty or any other duty leviable in respect of such portraits, prints, books, manuscripts, works of art or scientific collections as appear to the Treasury to be of national, scientific or historic interest, and to be given or bequeathed for national purposes. By the Act 39 George II. cap. 73, legacies of prints, pictures, statues and other specific articles given or bequeathed to or in trust for any body corporate, and not for the purposes of sale, are exempted from certain duties imposed on legacies. The provisions of the Acts were brought by the Council of the Academy under the notice of the executor, who claimed repayment of the duties that had been exacted in respect of the bequest. The claim was allowed. This establishes a principle which may be of importance in relation to any future legacies, more especially if the bequests should not be made free of duty. The part of the report relating to the library says that the aggregate attendance (185) shows a considerable diminution on that of the past three years, though it is well over that of many previous sessions. As in past, and especially in quite recent years, the attendance has been mostly of students or of those who have recently passed through the Academy's class. The bulk of the works lent out have been borrowed by students, and it is pleasing to be able to add that such volumes have been returned in good condition and within reasonable time. Mr. and Mrs. CARNEGIE have endowed the Academy with gold bonds of the United States Steel Corporation to the amount of 12,000 dollars, for the purpose of providing scholarships to enable students of the Academy's life school to study for a time abroad and to visit the great art centres.

THE competition of façades in Paris is an advantage for architects, and consequently the more often there are records of them the greater will be the gain to those who design as well as to those who possess the properties. It suggests the extent of the interest taken in the subject when the French journal *La Nature*, which is supposed to be devoted wholly to science, published an article on the competition. The article was illustrated. A reproduction from a photograph of one of the successful buildings did not satisfy the architect, M. LEGRIEL, and accordingly an action was instituted against the journal. There is a difficulty in finding a basis for such a claim, and it was therefore charged that the reproduction was a forgery. The tribunal dismissed the case. It was laid down by the judge that everybody had the right to reproduce a public way, and consequently the houses which were to be found alongside; moreover, a critic of art had the right to give evidence in his article by views which became graphic information and corresponded with literary quotation. Whenever there was an abuse the judge could intervene if called on. The case, we suppose, was experimental, and it has been decided in favour of the principle of encouraging whatever affords information to the public.

THERE are some landscape painters who do not believe they can do justice to themselves or to their art by occasional visits to the country. London is no doubt a pleasant abode for an artist, but it is exasperating to be in the midst of the turmoil at a time when the fields are inviting and skies are showing themselves under delightful aspects. One of the painters who for over thirty years had preferred to establish his home amidst the quiet attractions of Sussex was Mr. A. F. GRACE, who was buried on Saturday last at Amberley. He lived at Steyning, which still retains a good deal of evidence of its antiquity. Last year he exhibited a water colour of the High Street in the

Royal Academy. He had removed to Steyning from Amberley. He was an Academy student and won the Turner Medal. He caught the spirit of the Sussex landscape and was able to suggest the true appearance of the Downs. During a great part of his life he suffered from illness and in painting he found a solace, but for over year he was unable to use his hand. Under the circumstances death was a merciful release, for he must have suffered at his inability to represent what was around him.

THE "Luther of Architecture," as his countrymen use to term KARL FRIEDRICH SCHINKEL, died in October 1841, and his reputation is supported by selecting subjects of a hazardous kind for the prize bearing his name. The Architects' Union of Berlin do not propose anything of a Château-en-Espagne class. They take requirements of an everyday kind, and which can only be met by designs that possess practicable qualities. As the preparation of designs requires time as well as careful study, the subjects for 1905 were arranged on Friday last. The first is a museum of architectural sculpture. The site assigned is on adjoining the technical school in the Hardenbergstrasse, Berlin. The museum will not only be supposed to form part of a group with the existing buildings, but it is to become suggestive of the whole history of architecture and sculpture. The successful competitor must possess not merely encyclopædic knowledge, but will have to be skilful in representing details of all styles. A second subject is a bridge which will convey the Rhine-Elbe Canal over the river Weser. As the site is supposed to be in the vicinity of Minden, the possibility of harmony with the building will have to be considered. The third subject will be for an engine building in connection with the railway station on the Savignyplatz, Berlin. It will be allowed that the subjects afford excellent tests of constructive skill as well as designing power. They are, moreover, not too much above such commissions as any architect might have to undertake.

AMONG the French painters who were recognised as Individualists, and were therefore difficult to classify, CAMILLE PISSARRO held a prominent place. By birth West Indian, he was accepted in France as a true native. He studied under COROT and for a time he carried on the master's principles. In 1859 he exhibited a scene at Montmorency and followed it with others, in which the scenery on the banks of the Marne was utilised. But he became acquainted with the Impressionists, and not even COROT's influence could prevent a change in PISSARRO's treatment. The dreamlike representations of the country were superseded by visions of cities and towns, as if the mission of the landscape painter was to come nearer to humanity than was possible in the fields, where trees and clouds offered rival fascinations. Paris, Rouen and other French cities were shown in a manner which was derived from no earlier master. PISSARRO was not afraid to attack London, and one of his most remarkable paintings is a view of the railway bridge at Charing Cross. There was no artist in Paris who was more beloved, and he deserved to be, for PISSARRO could be considered as an honorary professor whose skill and experience were always at the service of younger men who were feeling their way and believe there was much to be known which was not taught in the academies.

THE SOCIETY OF ARCHITECTS.

first meeting of the session 1903-4 was held at St. James's Hall, Piccadilly, W., on Thursday, November 19.

The late Mr. Silvanus Trevail.

President, Mr. WALTER THOMAS, in opening the proceedings, said the beginning of the session had been clouded by the death of their late president, Mr. Silvanus Trevail. The news had come as a great shock, and the circumstances under which so useful a life had been suddenly ended was a matter for the deepest regret to the Society, which he had been connected for eighteen years, and no less to the senior architectural body, the Royal Institute of Architects, with which Mr. Trevail had been associated as a Fellow for ten years.

Vote of condolence to the relatives was unanimously passed. During the evening the following gentlemen were elected members and studentship:—

Honorary Membership.—Past President Colonel Ellison. *For Membership.*—Franklin Joseph Bellamy, Herbert Burnett Brown, Percy Martin du Feu, Samuel deade Edmunds, William Longfield Hill, Herbert Hillier, Aubrey Burton Houchin, William Herbert Rowland Lloyd Jones, Charles Mitchell, William John Rams, George Meek, William Henden Winder. *For Studentship.*—Clive Ewart Ardley, William Heather Evans, Scott Mackintosh, Joseph Peascod, Oliver George Herbert Longstaffe Webb, Evelyn Shirreffs, Isaac Simpson, John Stalker, James Stewardson.

President's Address.

I select a man to the office of President is to bestow upon him the highest honour which it is in the power of the members of the Society to confer, and to place upon him many responsibilities, not the least of which is the preparation of a presidential address.

Let me say at once that I greatly appreciate the honour conferred upon me; not merely from a personal point of view, but as representative, as it were, of that large body of country architects which is the backbone of the Society, and to whose support it is largely due that the Society holds its position in the architectural world.

The result of the existence of so many architectural societies is that about this time of year there is somewhat of a glut of presidential addresses covering much the same ground, so that it becomes a matter of difficulty to prevent repetition, though, on the other hand, one may perhaps learn to avoid it.

I have very few remarks which I shall address to you to-night, but as far as possible with the practical side of our profession in mind, I shall more particularly with the various questions taken up by the Society, and indicating some of the directions in which the Society should extend its sphere of utility, for the welfare of the profession is surely a member's first care, seeing that the stronger the Society the more advantages it will be able to give him. I am fortunate in coming into office at a time when the Society is in so prosperous a condition, a state of things for which I have to thank those who in the early days of difficulty stood by and supported it.

The Society has arrived at a stage of its existence when its sphere of utility and influence has been demonstrated beyond doubt, and when it might well essay to stand alone, not only in regard to such matters of general interest as registration, but also to questions which more particularly affect the members, such as a scale of charges, a form of contract, articles of association, conditions under which alone a member will come into the Society.

I shall now first deal with one or two matters of general interest.

Architectural Education.

Nothing has done more to promote the advancement of architectural education in this country of late years than the gradual development of schools of architecture and the institution of departments of architecture in connection with the universities of London and Manchester, the former being the first of the kind in this country, and the latter owing its existence largely, I think, to the efforts of the Manchester Society of Architects. The allied societies afford facilities for gaining knowledge, the Leeds and Yorkshire Society being perhaps the most successful. And I trust before long the University of Aberystwyth, which will have its school of architecture, will have my hearty support if established.

The new School of Architecture in London in connection with the Architectural Association has just completed a most successful first year's work, and is deserving of the hearty support of the profession; its curriculum is unique and its

scheme admirable, providing as it does a means whereby a man may test his adaptability for the profession before binding himself down for a term of years, thus enabling him to withdraw in good time if he finds that his abilities are such as would have better scope in some other profession.

The great fault of the usual system of pupillage to my mind is that in many cases a youth is bound down for a term of years, only to find at the end that he has mistaken his vocation and wasted time and money.

In Ireland also this question is receiving consideration, but after all, these praiseworthy efforts to raise the standard of architectural education do not much more than touch the fringe of the profession, for the reason that the system is a voluntary one, and until schools of architecture are State supported, or, in other words, a system of statutory education is established, it is hopeless to expect that more than a small proportion of students will avail themselves of the advantages now open to them.

A system of compulsory education would do good in two ways—it would show to the intending student exactly the course of study which he must necessarily take if he ever aspires to be more than a subordinate, and so would enable him to shape his studies from the first with a definite object in view, while the mere fact of a certain standard being set up, which all must reach, would tend to stop the ever-increasing stream of incapables who are now attracted to the profession by the fact of its being open to all.

This question naturally brings one to a matter in which the Society is particularly interested, viz.:—

Statutory Registration.

Does it not seem to be not only common sense, but common justice, that a man who has entered the profession by legitimate means—that is, by spending his time and money in properly fitting himself for its duties and responsibilities—should be protected against the bogus practitioner whose only claim to the title of architect is the fact that it appears on his door-plate?

The principle of registration is one against which a valid objection has never been made; it is only when it becomes a question of carrying into effect that principle that objections are raised on certain points by those who are so bigoted and prejudiced as to be unable to consider the matter from any point of view other than their own narrow one, and who endeavour to obtain a cheap popularity by the easy way of indiscriminate condemnation of a measure of the clauses of which it is evident they know nothing at all.

Very little to my mind is gained by controversy, but much may be accomplished by persistent and continued effort towards a definite end. No amount of argument can get over the fact that the profession is practically solid on the principle of registration, and when it comes to fighting out the details, the common-sense of the majority must win.

It is not my wish or intention on this occasion to go deeply into the *pros* and *cons* of the question, but I should just like to take one point. If I understand our opponents rightly, their main objection to the Bill is based on the assumption that it will be the means of indiscriminately registering all and sundry without question, and that thereby the evil which they admit now exists will be increased; this only shows what irresponsible statements can be made and what inflated nonsense is talked in the hope of stemming the tide.

It is true that Parliament will not pass any measure which does not protect properly vested interests, and quite rightly, but that is a very different thing from registering indiscriminately.

The Bill provides for registering only those who can prove to the satisfaction of the General Council that they were before a stated date and are still actually practising architecture, the General Council being composed of a body of architects in the nomination of whom the R.I.B.A. has the preponderating influence, and the choice of who shall be registered rests entirely with the General Council, which might be supposed capable of properly adjudicating on the claims placed before it.

The President of one of the allied societies recently said in effect that an imperfect Bill was better than no Bill; this is perfectly true, because the least that a Bill would do would be to stop admission to the profession except by legitimate means, and for that reason alone it would deserve every support.

The position of an objector who is already a member of any architectural body is an untenable one, because he has already admitted his agreement with the principle by voluntarily registering himself, and that objector forgets that though he may to a certain extent protect himself by so doing, yet so far as the public are concerned he cannot prevent those persons he may consider unqualified from inserting their names alongside of his in the public directories and other lists, so that he is to all intents and purposes compelled to submit to be classed in the public eye with all and sundry who may care to assume the title of architect, so that he at present suffers the indignities

which he pretends to fear would be the result of a Registration Bill.

Every man has a right to his opinion, and if there are a few who are genuinely satisfied with the present state of affairs or who are unable to express an opinion one way or the other, there are very many others who are not content and who will agitate until they get what they want.

It is understood that the architectural societies generally are in favour of registration, and that some of them have urged the R.I.B.A. to take the matter up. That is as it should be. The senior body is the right one to take the lead in this, but because it does not do so that is no reason why others should not, and the support that the Society has lately received shows that it is recognised that it is not fighting for its own hand, but in response to a generally expressed feeling in the profession that the time has come when the matter should be taken up in earnest.

The tendency of the times is towards federation, and in matters architectural there is the same feeling and desire for consolidation and for some strong central authority to control the whole.

Straws show which way the wind blows, and recent events in Ireland and elsewhere make it plain that the senior body is acting against its own interests in not fairly and squarely facing the question of registration. It is encouraging to find the President of the R.I.B.A. making registration the principal theme of his address, and to have his assurance that the Royal Institute is in sympathy with every effort to raise the status of architecture and architects in this country, which of course includes the registration movement; but it is evident that the only practical way of obtaining the desired end, viz. by Parliamentary powers, will not be sought by the Institute until it has tried every other possible scheme.

The proposal to form a Board of Architectural Education, if carried out, may be useful in focussing and controlling the efforts of the various schools of architecture throughout the country, but it will do nothing at all to remedy the grievances which it is admitted exist in the practice of architecture.

As usual, the Institute fears to definitely pledge itself one way or the other on the question, though it admits that the large body of opinion in favour of compulsory registration cannot and must not be ignored. The Institute is apparently on the horns of a dilemma; anxious to propitiate those few leaders who object, and at the same time knowing that the general body of practitioners must be reckoned with, it proposes a middle course—that of a scheme of voluntary education, which, however good and desirable in itself, will be unable from its very nature to deal effectually with the question.

Such a scheme will not at all appeal to practical men, who are aware that nothing less than statutory powers will enable any authority to deal effectively with such an important question as the education and consequent necessary registration of architects.

The present situation may be summed up in a few words. It is admitted that grievances exist which should be remedied; the question is how? Very many of us know and say that there is but one practical way, while a few others are anxious to try various schemes before accepting the inevitable; but let those who think they can by any means effectually hinder progress in this matter remember the legend of the Saxon king who was taken down to the seashore and told what a clever fellow he was. He showed his advisers however that he could not stop the advancing waves, and if our opponents care to see a parable in that, the advancing water is the tide of progress which they can no more stop than could the wise old king the waves.

Public Improvements and Building Restrictions.

There must necessarily be certain restrictions and conditions imposed upon those who propose to erect buildings, but one would naturally think that when these conditions emanate from the landowner who is presumably anxious to dispose of his sites, that they would be of such a character as to encourage rather than put off an intending buyer. The opposite seems to have been the case in the Holborn to Strand improvements.

Those who have read the conditions of sale will see at once that they are of a character calculated to make the boldest hesitate. The decision on any point afterwards arising is in the hands of the Council's architect, from which there is no appeal. The objection is not a personal one to the architect as such, but to the principle which places so much power in the hands of an official.

There must be something wrong when the opportunity to secure sites in so valuable a centre fails to attract purchasers. I think the conditions should at any rate be subject to an arbitration, in case of dispute.

This is a question not only for lessees but for architects who have to advise their clients who propose to take sites. If there is no reference to an arbitrator in case of a dispute, a client may be mulcted in a large additional expenditure he never contemplated, and which may bring him to ruin.

Conditions of Contract.

It is satisfactory to find that after negotiations extending over eight years a form of conditions of contract has been arrived at between the R.I.B.A. and the Institute of Building, which contract defines as definitely as may be the relative positions and responsibilities of the building owner, the architect and the contractor.

Architectural Competitions.

It is a sign of the times that a few architects should be obliged to form themselves into a Competition Referee Society with the object of "blacklisting" competitions with conditions of which they do not agree, and they have done good work in this way; but why was it left to them to take up? Here again is shown the want of the strong hand in the present system of putting out designs to competition in which has come to stay, and it is not to the credit of the profession as a whole that, in spite of protests and requests, architects should not compete in certain instances, there are always found some who will disregard such requests, and must lower those who enter in the eyes of the promoters themselves to find that there are men willing to quote terms which they will undertake the work in the event of their being successful. Such practices want putting down with a strong hand; but who is to do it? Were there a statutory authority it could absolutely control these matters by making it a question of professional conduct. Promoters would then quickly see that it was waste of time to come before the profession with an invitation to compete, the conditions of which were not in accordance with professional usage.

Assessor as Joint Architect.

There is a matter in connection with the Liverpool Cathedral competition which I think has not received the attention it deserves, and that is the appointment of the assessor to act as joint architect with the author of the selected design. To maintain that the principle is an entirely wrong one is opposed to the best interests of the profession, and I consider the attention of the profession should be called to it, and steps should be taken, say by the Competition Reform Society, to bring the matter to the notice of those in authority. In the competition for the Liverpool Pierhead Baths and Tramways Offices, which in the first instance proved a failure, there were found six or seven firms of architects to enter in a second competition for baths only, without any assessor being appointed or any premium offered. Then there was a competition for the housing of the poor upon the site known as the Hornsby Street area, Scotland Road—another failure—the work being afterwards carried out by the Corporation's own officials. Surely this state of things can only have one result, and that is to drag the profession through the mire. If the profession does not respect itself, what can it expect from the public and public bodies? You cannot find any other profession that would submit to this sort of treatment in the architectural profession does. I am glad to say that the firms of architects who act in this way are getting fewer every year, and the sooner they are wiped out the better for the profession.

Having expressed my disapproval of certain things, I must give credit when credit is due. The Liverpool City Council and the citizens have done their share to advance architecture and public improvements.

Liverpool Cathedral.

One of the most important works of modern times within the cathedral it is proposed to erect in Liverpool, the proportions of which are quite equal to any of the ancient cathedral buildings of England. In fact, the two towers are probably be higher than any church or cathedral tower in the British Isles. His Majesty the King has recognised the importance of the work by intimating his willingness to lay the foundation-stone in the spring. The area of land covered by the buildings without cloisters will be about 10,200 square yards, a greater area than which only one or two, if any, cathedrals in England occupy. The committee has been exceedingly well in accepting the decision of the referees in the competition recently held. It had a precedent for appointing so young an architect as Mr Gilbert Scott, for Mr. H. Elmes was about the same age when he won the competition for St. George's Hall, Liverpool. This leads me to say that I hope that a memorial to Elmes will before long be erected at St. George's Hall.

But the cathedral is not the only great building that Liverpool is about to erect. The Liverpool Dock Board has recently had a competition and a very satisfactory conclusion was come to when they accepted the designs of a local firm of architects. The Liverpool Corporation has completed and opened a new technical school built from the designs of a London architect. The Royal Insurance Company has recently erected a magnificent pile of buildings of the most modern construction. Then there is the new Church House in the

st. The banks and the large steamship companies and
men appear to find their own offices and shops too small;
e old buildings are being pulled down and palatial new
ions taking their place, amongst them being new offices for
Alfred Jones.

he city to which I belong has always been in the fore-
I might almost say has led public opinion with regard to
questions for improving the conditions under which the
ring classes have to live. The housing question has been
a up in an enthusiastic spirit and made a special study of
e housing committee and the Council. Although many
able schemes have been brought to a satisfactory com-
on in the past, it is only a few days ago that a further
me was inaugurated by H.R.H. Princess Louise to erect
ers' dwellings at a cost of 150,000/.

he Liverpool School Board, which has now ceased to
ave made a particular study through their various
jects of the highest standing in Liverpool of school build-
and the most recent one erected, Birchfield Road school,
suppose as complete an elementary school building as will
be erected.

Architects and the Education Act.

Whilst speaking of elementary education I would par-
ticularly like to draw the attention of architects to their
tion under the new Education Act. Most of the committees
formed of sub-committees of city councillors or county
councillors or urban district councils. Now most of these
lemen seem to think the persons they ought to employ as
itects and surveyors for their future new buildings are their
surveyors, land surveyors, county surveyors, road surveyors
other gentlemen whose particular qualifications are more of
nature of land stewards, bridge-masters and road surveyors
architects. Now there are gentlemen in our profession
during the last thirty years have made a particular study
chool building, and it appears to me that valuable expe-
ce that they have gained during that period will be lost to
community if the principle I have just indicated is per-
ed in. Most of the county and city surveyors have as much
k as they can possibly personally attend to, and they have
in the past no practical or personal experience of school
ding. Therefore it is very important that we, as the
ety of Architects, should bring before the notice of these
ous authorities the importance of appointing architects of
rience in school construction to look after the supervision
their schools in the future, and not leave them in inex-
perienced hands, with results that will mean disaster and
eased rates.

Ancient Lights.

A question in which the Society of Architects is particularly
rested is that of "Ancient Lights," which is to form a subject
discussion at our next meeting.

The Bill which has been drafted by the joint committee of
R.I.B.A. and the Surveyors' Institution does not seem to
much more than take the matter out of the hands of the
ayers to put it into those of the surveyors, so that the benefits
the building owner are not increased—rather the opposite in
e cases.

The Future of the Society

Turning now to matters which more particularly affect the
mediate needs of the Society and its members, I need only
r you to the report presented at the last meeting and the
ance sheet which has been put before you for evidence that
Society is in a thoroughly sound position and entitled to
k forward with some confidence to considerably extending
scope within the immediate future.

It is within the province of every member to assist the
ociety in developing its resources to the utmost extent; its
wth and influence depend on individual effort, and no
ortunity should be lost of making the Society fully repre-
tative, particularly of that important section of the profession
which it especially appeals, viz the provincial practitioner,
o has more difficulties to contend with in his endeavours to
ourably carry out his professional duties than perhaps the
tropolitan architect has any conception of. Particularly is
the case with the architect in the smaller towns, where
haps the scope is not great and where he has to meet en-
achment on his legitimate sphere of practice.

Membership in any corporate body not only confers certain
vileges on those who gain admittance, but it also entails
on them certain obligations, one of the greatest of which is
t of forwarding in every possible way the aims and objects
of which that body was founded. Especially is this the case
in a young and growing Society such as ours, which actively
es up questions it believes to be for the general good in a
y which no other architectural society has attempted.

It speaks well for the Society that, in spite of r perhaps
ause of the institution of a stiff entrance examination and
er tests as qualifications for membership, our numbers go
steadily increasing; but there is yet great scope in this

direction, and it should be the duty and pleasure of every
member to recommend for membership those whom he knows
to be fully qualified, and so to enlarge the influence of the
Society, and by this means show his practical interest in its
welfare.

THE RHIND LECTURES.

THE Rhind Lectures, which are delivered in Edinburgh
generally treat of subjects relating to a very remote age.
This year the course is devoted to "Scotland in the Time of
Queen Mary," and the lecturer is Mr. P. Hume Brown, M.A.,
LL.D., Fraser Professor of Ancient Scottish History and
Palaeography.

In his opening lecture it was pointed out, says the
Scotsman, that the title of this course might suggest expecta-
tions which were doomed to disappointment. Who could
think of the times of Queen Mary without thinking of her as
the central figure to whom all contemporary persons, events
and circumstances are but the setting in which she worked out
her destiny? It was her dramatic story that had made the
sixteenth century the one period of our annals that had
commanded the attention of the world. Yet it had to be
remembered that the period of Mary Stuart's reign possesses a
larger interest than her individual character and fortunes. In
strictest truth it might be said that it was the most momentous
period in the history of the Scottish people. It saw the begin-
nings of a new society, the birth of new national ideals, the first
distinct awakening of the nation to a sense of its own destinies.
This development was not bound up with the existence of
Mary Stuart, and apart from her the period of her reign
presented a field of interest at once wider and more important
than the incidents of her personal career. Questions of religion
and politics would be left out of account in the lectures as
subjects that had been so often and so voluminously treated
and as inappropriate to the present occasion. The subject of
the course therefore would be the physical, the social and
economic aspects of Scotland in the time of Queen Mary.
In studying any period in the history of a nation the question
we first naturally asked was:—What were the physical condi-
tion and aspect of the country in which its people lived their
lives and performed the actions which it is the business of the
historian to chronicle? In the case of a period so remote
as the sixteenth century the question could be answered
neither so definitely nor so comprehensively as we could
wish. No contemporary had such a knowledge of his
native country as would have enabled him to present
a picture of it as a whole. By piecing together the
different descriptions of native historians, however, and from
the notes of foreign visitors and casual references in public
and private documents, we were enabled to form a tolerably precise
notion of the general appearance of Scotland in the time of
Mary. There was one peculiarity in the appearance of the
country which struck all foreign visitors, from Æneas Sylvius
in the fifteenth century to Dr. Johnson in the eighteenth—the
general absence of timber in every part of the country through
which they travelled. The disappearance of timber in Scotland
had been a gradual process, which we could trace in the
successive statutes passed for its preservation. Writing in
1617, the year of James VI.'s visit to his native kingdom,
Sir Anthony Weldon declared that Judas could not have found
a tree in Scotland on which to hang himself. But this
was only one of the senseless gibes of that splenetic southron.
It was true that throughout the southern half of the country
wood was so scarce as to give its distinctive character to the
landscape, but even in the time of Mary, trees were not so
absolutely non-existent as Weldon would have us believe.
Successive Acts of Parliament had made it compulsory for
landlords to rear plantations in the immediate neighbourhood
of their seats, and we had the testimony of visitors that such
plantations were frequently to be seen, especially in Fife and
the Lothians. Besides the general absence of wood in the
Lowlands, there were other features in the landscape which dis-
tinguished the Scotland of the sixteenth century from the
Scotland of to-day. Everywhere there were numerous mosses,
lochans, and even lochs which have long since disappeared,
and the disappearance of which had materially altered the
general aspect of the country. It was in consequence of the
numerous mosses and waters in the flat country that the slopes
of the hills were so generally cultivated by the Scots—a custom
which the southern visitors regarded as one of the peculiarities
of our remarkable country. Another peculiarity which struck the
English visitor to Scotland in the latter half of the sixteenth cen-
tury was the total absence of enclosures or fences throughout the
length and breadth of the country. We should be greatly
mistaken if we imagined the Scotland of Queen Mary to have
been a land of swamps and stony wildernesses, which knew not
the diligent hand of man. Even by the reign of David I, we
know that the process of bringing the land under cultivation
had been strenuously begun, and from his day onward legisla-

tion and private enterprise had gone hand in hand in prosecuting the good work. It was unlucky for Scotland that some of its most productive districts adjoined its "old enemy of England." Crossing the Tweed, the invading host could at once begin its work of devastation, for the Merse, though excelled in fertility by certain other parts of the country, reared abundant crops of oats and barley. When the enemy chose to enter the country by Teviotdale rather than the Merse a still richer spoil awaited him, as he could then overrun the cultivated lands of the great abbeys of Kelso, Jedburgh and Melrose. But it was when the invader made his way into Lothian that he could satisfy his rapacity to the full, since, according to contemporary testimony, it was "the chief of the provinces of Scotland by the plentifulness of its ground and by the decking and apparelling of its houses and the fairness of their building." In Tweeddale the number of sheep that fed on its hills extorted the admiration of strangers, single sheep-owners possessing as many as five hundred or even a thousand. Nithsdale was another of the fertile districts in the south of Scotland that presented a tempting spoil for the invader. Galloway was not a county where an English army found luxuriant quarters, but it filled its place in the national economy by supplying the Lowlands with cattle and ponies and eels. The district of Kyle, in Ayrshire, is described even in the fifteenth century as "that country plentiful and fair," and Clydesdale was named "the paradise of Scotland." Fife, according to the testimony of natives and strangers, was a veritable Land of Goshen—Mary of Lorraine declaring that she had nowhere else seen "so many good faces in so little room." From the earliest period of which we have record the Carse of Gowrie had been cultivated like a garden, and had been called "the youngest sister of Piedmont." To the fertility of Angus and the Mearns there is concurrent testimony, at least from the fifteenth century. But of all parts of the country it was Moray that had the greatest name for the fecundity of its soil and its high cultivation, and when strangers visited Scotland they were told that they must go to Moray to see what the country could produce. From a contemporary description of the western islands their present inhabitants might be justified in regarding the sixteenth century as the golden age of their country. From the general survey that had been given it might be inferred that the most fertile parts of the country now under cultivation were largely under cultivation in the time of Mary. The principal crops reared were oats, barley, wheat, hemp and lint. English visitors were impressed by the fact that Scotland was a corn-growing country. Fruits had been reared from the early Middle Ages in Scotland, but this had been mainly in connection with the religious houses. At the close of the sixteenth century a friendly observer had said "that of flowers or fruit there are little or none in Scotland," and it was not till the close of the following century that fruit-growing became a more general industry.

II.

Having described the general appearance of Scotland, Mr. Brown said they would now glance at the villages and towns—specially noting the peculiarities that struck the traveller from other countries. A Pomeranian noble who visited Scotland in the sixteenth century had noted that "the Scottish villages looked very poor, the houses having stone walls not as high as a man, upon which the roofs were erected and covered with sod." Another visitor about the same period described a typical abode in a Scottish village as built of "one course of stones, another of sods of earth, and with a door made of wicker rods." Englishmen spoke contemptuously of the houses in Scottish villages, but the Spaniards, who visited England in the reign of Mary Tudor, spoke with equal contempt of the houses of the English peasantry, which they described as being made of "sticks and dirt." The Spaniards had expressed their surprise that the English peasant, who lived in such a wretched hovel, could afford to feed so well, and we had a similar testimony from foreigners as to the fare of the agricultural labourer in Scotland. Satisfactory evidence would seem to show that the condition of the Scottish peasantry in the time of Mary compared favourably with that of the same class in France and Germany. The towns of Scotland appeared to have made a more favourable impression on strangers than the villages. One peculiarity of Scottish towns had struck all strangers—the absence of walls of defence. Native writers had explained their absence by saying that the Scots were too brave a nation to need them, but this flattering explanation was not borne out by facts. The real reason for the absence of walls in Scotland was the expense of constructing and maintaining them. Perth was the only town in Scotland that possessed defences after the manner of continental cities. As some bulwarks were necessary, however, both for fiscal purposes and purposes of defence, the Scottish towns had to be content with dykes instead of walls, which, however, but inefficiently served their object. Generally they were of the

most rickety description, and were constantly under repair. After Flodden a hasty attempt was made to surround Edinburgh with a stronger line of defence than it had hitherto possessed, but all through the sixteenth century there were renewed efforts to construct a wall that would effectually serve the desired purpose, but the town records showed that the work was never satisfactorily accomplished. The best known description of Scottish towns in the sixteenth century was that of Pedro de Ayala, the representative of Ferdinand and Isabella at the Court of James V. Ayala's description, however, must be taken with some reserve. Thus it was not strictly true that all the houses in Scottish towns were built of hewn stone, nor was it true that they were generally provided with glass windows. From such descriptions as we possessed of Scottish towns in the time of Mary it seemed that some of them had not improved in appearance since her day. Glasgow, which held only the eleventh rank in point of taxable value, was generally considered the most beautiful of all the Scottish towns, while Edinburgh impressed the stranger as the most striking and peculiar. It was its length, spaciousness and cleanness of the thoroughfare extending from Holyrood to the Castle that specially arrested his attention, but he also admired the "plain and fruitful fields of corn" to the north and south of the city, and Holyrood was abounding with "hares, conies and deer." On the other hand, the inhabitants of the city were described as a "sluttish, idle and slothful people." It was impossible to determine with precision the population of the whole country, or of its different towns. We should probably not be far from the mark, however, in estimating the whole population at about 500,000. Edinburgh might have contained about 30,000 inhabitants, Aberdeen at the close of the sixteenth century had about 4,000, at the same date the adult population of Glasgow was 10,250. We had more exact data for determining the relative wealth and national importance of the towns. From successive tables of taxation drawn up in Mary's reign we ascertain the contributions from the different burghs, and from the evidence we could arrange the principal towns in the following order:—Edinburgh, Dundee, Aberdeen, Perth, St. Andrew and Haddington, Cupar-Fife and Montrose, Stirling, Glasgow, Brechin, Dumfries, Inverness and Linlithgow. We left out Dundee, Aberdeen and Perth, Edinburgh contributed as much as all the other towns taken together. In Mary's reign the clergy contributed a half, the burghs a third, and the burgh a fifth to the national taxation. Owing to the nature of the country, communication between the different parts of Scotland was attended with greater difficulties than elsewhere. From the early Middle Ages, however, many public highways had existed. Highways ran from Berwick to Inverness, and from Glasgow through Ayr, passing through Lanark to Edinburgh. The domains, lay and secular, lay the obligation of the towns and necessitas, which involved the maintenance of roads, bridges and fortifications. But this obligation had always been perfectly fulfilled, with the result that in Scotland, as in other countries, the roads were impassable at certain seasons of the year. Yet an English visitor to Scotland had said that the highways there were "tolerably good, which was the greatest comfort a traveller met in that country." The building of bridges was considered an even more pious work than the making of roads, and it was by ecclesiastics that the most important bridges were erected. It was incumbent on neighbouring proprietors to build and maintain bridges as well as to make and repair roads, but this obligation was only perfunctorily fulfilled, with the result that most of the bridges in the country were in permanent disrepair. One of the most knavish classes in the community were the ferrymen, against whom, in Scotland as in other countries, the Legislature had passed laws to protect the lieges from their extortion. Parliament did its best to encourage the establishment of hostels, but for two reasons its enactments had not much effect. Travellers were few, and when Scotsmen did travel they were the habit of taking up their quarters with their kinsfolk. One of the great wanderers of the time were the beggars, who must have made up little less than a fourth or a fifth of the population, and who, from the terms of the various statutes directed against them, might be compared to an invading host taking free quarters in an enemy's country. It had to be remembered, however, that the "plague of beggars" was not confined to Scotland; in England the "valiant beggar" was as free and as formidable a personage as the "sturdy beggar" of Scotland. Travel by sea was attended by still greater dangers and discomforts than by land. The rascality of custom-house officers, the squalor aboard the boat, and the terror of pirates, as Erasmus had testified, made a crossing to the Continent a nightmare to haunt the memory. Even in times of general peace the seas swarmed with pirates, and a vessel at all times was a veritable running of the gauntlet. When the Earl of Bothwell, after casting his last die at Cardross, betook himself to the trade of pirate, he was but following a common and profitable calling of his time.

III.

In his third lecture Professor Hume Brown said they would take a closer glimpse of the conditions under which Mary's subjects lived their lives and carried through the revolution which involved such a complete breach with the old and changed the destinies of the kingdom. It was in the reign of Mary that the most intense life of the nation was concentrated, it was by the towns that the breach with the old religion was mainly effected. It was to the life of the towns, therefore, that attention would for the most part be directed in the coming lectures of the course. A glance, however, must be taken of the conditions of life in the country, at the various stages of society who made up its inhabitants, and at any new developments that distinguished the reign of Mary. The great lord of the sixteenth century still kept up most of the customs and accomplishments of his ancestors, but he had acquired some other things and accomplishments besides. The spread of education followed the revival of learning had affected the nobility as well as other classes of the community. A Scottish noble of the sixteenth century, and especially of its latter half, could no longer glory in the ignorance of a Bell-the-Cat, and, in fact, the lords who played a leading part in the reign of Mary generally possessed all the attainments requisite for the new statecraft and diplomacy. Most of them still continued to live in the grim abodes of their ancestors, but they had begun to deck their apartments, to polish their tables, and to adorn their persons in a fashion which had been unknown to their ancestors; and the same change had passed over the manners of the lesser barons and gentry. But the most notable change in the upper classes was to be found in their increasing desire for a more social life which had satisfied their fathers. It now became a common thing for baron and laird, and even bishop, to take up their residence in the nearest village or burgh and settle there with their household for a considerable portion of the year. The legislature vainly endeavoured to check this custom, to the continuance of which they must partly ascribe the genial relations which subsequently subsisted between the different social classes in the country. An important change had to be noted in the condition of the tenants of the greater and lesser barons at the beginning of the sixteenth century John Major had expressed his regret that the landlords would not let their lands in perpetuity, but by that date this practice had already begun, and in Mary's reign it had become general. Though hindered by some disadvantages, the tenure by feu-farm was generally in the interest of the landlord and tenant. Secure in their holdings, all that was wanting to the farmers as a class was improved husbandry, but the day was yet far off when improved methods of tillage were to convert the inferiority of the soil into a stimulus for enterprise and skill. In Sir David Lindsay's "Satire of the Three Estates" we had a vivid sketch of the class of cottars in the portrayal of pauper. From that description we were led to believe that but for the extortions of their superiors the cottars as a class contrived to live with a comfortable amount on their single field with their one horse and three or four cows. Still, the condition of the poorer tillers of the soil was such that they had begun to look with longing eyes to the towns, and by the period of Mary's reign the immigration from country to town had already begun. The towns in the time of Mary, however, did not throw open their arms to all and sundry, but guarded themselves by conditions which kept outsiders at arm's length. What these conditions were would afterwards be described, but meantime they might be realised what a Scottish town in the time of Mary was like. In this attempt it must of course be only the general idea they could have before them. Even under the rigid uniformity imposed by Mediaeval conceptions of society and individual there was abundant scope for national and even racial differentiation. In approaching any town they should be within its precincts when still at some distance from the town itself, for it was a peculiarity of Scottish as distinguished from English towns that they owned a considerable extent of land in their immediate neighbourhood. At any time between sunrise and sunset they would see the numbers of cattle and sheep browsing on the town common—the one detachment under the charge of the town herdsman, the other under that of his fellow, the shepherd. In the case of larger communities one herd was found insufficient to look after the whole stock. In the moss, which was likewise the town property, men and women might be seen at work digging and stacking peats for the general supply in the coming winter, and in the town warren and fishings there would be similar signs of activity. Passing through the midst of the "town acres" they should arrive at the town gate, where, as likely as not, they should find its guardians asleep. It would be early morning when they set foot in the town, their ears would be greeted by the sound of the "swesch," or drum, which summoned the inhabitants to their daily avocations. If their ears were thus pleasantly greeted, it would be otherwise with their senses of sight and smell, for except it were a Sunday morning there would be pungent exhalations

from the multitudinous middens and the equally numerous pig-styes. As they entered the town they should have a vivid impression that it was in a general state of dilapidation, though it had to be noted that in many English towns of the period the same state of things prevailed. Among the edifices that would specially attract their attention would be the parish church with its burying-ground, the latter being the favourite haunt of all the town beggars, the general grazing-ground, the place into which superabundant refuse could most readily be shot. At an earlier period the church had been not only the centre of religious life, but the centre of the social, civic and political life as well. Owing to the erection of tolbooths, however, the church had ceased to be the common meeting-place for the transaction of business, public and private, though it was still frequented more "for malice and mischief than for God's service." Progress through the streets of the town would be attended with considerable difficulties, at once from the numerous dust-heaps, the roving swine and the spacious gutter, sufficiently broad and deep to form the common sewer of the community. A striking feature in the vista of the street would be the numerous projections from the main buildings, consisting of outside stairs and the wooden shops of the various tradespeople. Two prominent objects would not fail to attract their attention—the town cross and the tron or weighing-beam, the one the symbol of the spiritual, the other of the material life of the inhabitants. The tolbooth would also call for note, for by the time of Mary tolbooths were to be found in all the more important Scottish burghs, and, like the churches of the Middle Ages, were put to curiously miscellaneous uses. Behind the main street they should discover a succession of houses with the invariable forestairs, and behind each the yard or garden, in which flourished the universal "kale," occasionally a little corn and even a solitary tree. Progress through the town had its risks by day, but by night these risks were considerably increased by the feeble illumination even of the principal thoroughfares. It was a stringent regulation that every booth and forestairs should be lighted with a lamp, and that every passenger after nightfall should carry a light on pain of being housed in the Netherhole; but these regulations were systematically disregarded. As a general rule, however, after ten o'clock of a winter's night the solitude of the streets was only broken by the tramp of the watch as they went their rounds through the slumbering town.

HISTORIC HOUSES.

THE historical records and buildings committee of the London County Council report that they have had under further consideration the question of indicating by means of memorial tablets houses of historical interest in London, and that they considered the following three houses worthy of commemoration, namely—(1) No. 56 Devonshire Street, Portland Place, a residence of Sir J. Herschel, the astronomer; (2) No. 1 Devonshire Terrace, Portland Place, a residence of Charles Dickens; and (3) No. 12 Clarges Street, Piccadilly, a residence of Edmund Kean, the actor. They had carefully verified the facts connected with the houses in question, and had also in each case obtained the necessary consent of the ground landlords and the lessees to the erection of the memorial tablets. They accordingly recommend that the three tablets be immediately placed in position.

ARCHITECTURAL ASSOCIATION OF IRELAND.

A VISIT by the members of this Association was paid on the 16th inst. to the new nurses' home in connection with Cork Street hospital. A very fair muster of members turned up for the occasion, including Mr. C. H. Ashworth (the president) and Mr. J. H. Webb (the hon. secretary of the visits committee). The visitors were received by the architect to the building (Mr. W. M. Mitchell, R.H.A.), who, having exhibited the drawings and made a brief explanatory statement, afterwards conducted them through it, pointing out the various objects of interest therein. The new home is very advantageously situated opposite the hospital, with Cork Street intervening. The main front enjoys a sunny aspect, overlooking a lawn of considerable extent bordered by trees, which was formerly used as the burying-ground of the Society of Friends. No interments, however, have taken place there for nearly half a century, and it will shortly be transformed into a verdant garden for the rest and refreshment of the inmates after their arduous duties at the hospital. Accommodation is provided in the building for about fifty nurses, each having a separate bedroom, while large, airy day-rooms occupy the ground storey. The floors, partitions, &c., are fireproof throughout, and an external wrought-iron staircase is provided for emergencies. The entire building is

heated by hot water, and electric lighting has been adopted. The sanitary wing, which is connected with the main building only by a corridor having cross ventilation, is fitted with the most approved type of baths, lavatory basins, &c. The building and sanitary contractors respectively are Messrs H. & J. Martin and Mr. H. MacGarvey, both of whom have given great satisfaction, while Mr. Hynes, the clerk of works, efficiently discharged the duties of his office. The hospital committee will require a further sum of 3,000*l.* to enable them to discharge the debt which will be incurred by the erection and furnishing of this building. We trust there will be no difficulty experienced in obtaining the necessary funds for this purpose.

NEW NATIONAL GALLERY, EDINBURGH.

ALTHOUGH not embodied in their report, the Treasury committee which has just reported on art matters in Scotland had under consideration the question of a site for the suggested new National Gallery. One site which, it is understood, was spoken of is that occupied by the Royal High School, at the foot of Calton Hill; and it is understood that inquiries were made as to the adaptability of the school buildings to the purposes of a National Gallery. These, it is believed, were satisfactory. The matter was not carried further than inquiry, but it is understood that members of the Board of Manufactures and the Treasury committee had before them the result of measurements made by Mr Hippolyte Blanc, R.S.A., of both the High School and the present National Gallery buildings at the Mound. It appears that the superficial floor space of the whole building at the Mound in which the National Gallery and the Royal Scottish Academy are housed is 12,490 feet, while the floor area of the main buildings of the Royal High School, with its fine central hall, amounts to 13,914 feet. The gymnasium recently built has a floor space of 8,896 superficial feet, so that between them the floor space is 22,810 superficial feet, as against 12,490 for the National and Royal Scottish Academy Galleries, an increase of over 9,000 feet. There are also at the Royal High School other buildings, which give an additional area of 2,346 feet, which might be suitable for minor exhibitions; and there are possibilities of extension of the main building, without in any way destroying its beautiful architectural features, which would give 3,000 to 4,000 additional superficial feet of space. Built in 1829 from designs by Thomas Hamilton, the High School has always been considered one of the most perfect Classical edifices in the country, so that from an artistic point of view the buildings on their splendid situation would be perfectly suitable for a National Gallery of the arts. The Royal High School, which was originally the property of the Corporation, is now vested in the School Board; and should anything come of the proposal, which it is evident will be discussed, to acquire it for a National Gallery, the educational interests which it now serves would, of course, have to be duly considered and conserved.

THE LATE PROFESSOR THURSTON.

ONE of the authorities on the strength of materials whose conclusions were accepted in Europe was Robert H. Thurston, who died suddenly on the 25th ult. The circumstances were particularly sad. It was his sixty-fourth birthday and his wife had arranged an informal dinner to celebrate the occasion, to which Andrew D. White, Dean Hufcut, Joseph C. Hendrix and Professor Hewett were invited. While waiting for these old friends and fellow-workers for the good of Cornell, he suddenly fell asleep and never awoke, for heart failure carried him away almost instantaneously.

Dr. Thurston, according to the *Engineering Record*, came from a family prominent in mechanical work in New England. Soon after graduating from Brown University in 1859, he entered the service of his father's firm, Thurston, Green & Co., of Providence, and there obtained that intimate practical knowledge of engine building which distinguished him throughout his life. On the outbreak of the civil war he joined the engineering branch of the navy and served with such distinction that at its close he was appointed professor of natural philosophy at the Naval Academy, where he remained until June 1871.

In that year he was called to the chair of engineering at Stevens Institute of Technology, where the late Dr. Morton was gathering together a small group of eminent men, which has probably never been excelled since. Stevens Institute became a training school for professors as well as students, and the work Dr. Thurston did there soon made him famous. Not only did he turn out students well grounded in those subjects which he taught, but he also, through his abundant energy, attracted the attention of manufacturers throughout the country to the important work the school was carrying on. A demand soon arose for graduates of the school, which was largely due to his

business shrewdness in advertising, in a legitimate way, what was being done. During this period he also found time to write many papers and to serve on the United States Scientific Commission to the Vienna International Exhibition of 1873, the United States Commission to investigate the cause of boiler explosions and a similar commission to test metals.

In 1885 he severed his connection with Stevens Institute to become the director of Sibley College at Cornell University. Hon. Andrew D. White, president of the university, at that time, has made the following statement concerning Dr. Thurston's connection with the College:—"Up to that time everything had been tentative; there had been in that department excellent professors and thoroughly good instructors, but a College of Mechanical Arts was, in those days, an entirely new thing. What the demands upon it were to be no one could say; it was all an experiment. There were differences of opinion as regarded both the theory of such an institution and the practice which it was to adopt. There was much uncertainty and even discouragement in the Board of Trustees regarding it when, discussing the matter with Professor Thurston, then of the Stevens Institute at Hoboken, I found he was willing to come to us and accept the whole responsibility of Sibley College provided the proper power and support were given him. He was immediately called to the position and his first meeting with the Trustees greatly encouraged us all. Mr. Hiram Sibley, who had already shown himself very generous to the College, made increasing donations; men eminent in mechanical engineering throughout the country began to take an interest in it; a large number of the foremost of them came and delivered lectures; the student body grew steadily and rapidly; the faculty was increased in numbers to meet the new demand and the prosperity which thus began has been continued from that day to this. While giving full honour to his associates, it is not too much to say that this wonderful result which we now see has been due mainly to Dr. Thurston's power of organisation, his knowledge of the whole field to be covered, his skill as a teacher, and a certain power which he developed in a remarkable degree to prevent or allay all friction and difficulties between departments and individuals. In addition to these qualities should be mentioned the high standing in his profession which enabled him to enlist its leaders in the work of Sibley College, and his amazing ability in work, which was a perpetual surprise to all."

When Dr. Thurston took hold of Sibley College it had a register of sixty students, to-day it has nearly a thousand. It is doubtful if such a record has ever been made by any technical school which confines its courses of instruction to mechanical and electrical branches solely. Dr. Thurston reports to the university president concerning the needs of the College were startling at times, owing to the absolute freedom with which he criticised the way the Trustees supported it. It is in this fearlessness that is doubtless to be found the secret of his great success in securing the co-operation of the governors of the university. No one can read these reports without feeling absolutely certain that the man who wrote them was thinking wholly of his College and not at all of self. Dr. Thurston has been accused of pushing himself to the front, but this is not true; while he occupied a foremost place in many gatherings of engineers and of business men, he did so solely as the representative of a great mechanical college.

The remarkable literary output achieved by Dr. Thurston has caused astonishment to those acquainted with his work in other directions. His "Materials of Engineering," "History of the Steam Engine," "Manual of Steam Boilers" and "Manual of the Steam Engine" are probably his most notable works, but his books number about twenty volumes and his papers before technical societies and in the scientific press are nearly three hundred in number. One reason for this remarkable fertility in literary work is to be found in the methodical habits of Dr. Thurston. His daily work moved with the precision of a machine. He spent so much time over each day that at his home certain hours were devoted to writing, and as he early learned the use of a typewriting machine and was able to turn out copy at a far faster rate than with a pen, he was able to accomplish what many men would consider impossible.

He invented many pieces of apparatus, introduced improvements in the steam engine and conducted elaborate research work for which special machines had to be designed. He was one of the pioneer investigators of the properties of alloys, and his studies of friction and lubrication are known everywhere. His appreciation of the importance of experimental investigation in engineering subjects led to the organisation in 1872 of the now famous engineering research laboratory of the College. His knowledge in the department of steam engineering won for him many years ago an international reputation. While thus busily engaged in professional work both for the College and of a national character, he found time to perform the duties of a true citizen. He was an alderman of Ithaca for many years, and only recently resigned his membership in the Ward Board for that city. No one ever came to him for advice who was turned away without receiving the best thought of a great

ind. Although of small stature physically, Dr. Thurston was noticeable in any gathering for the remarkable energy which his appearance clearly indicated. He was a born leader, and the engineering profession has great reason to be thankful that the quality of leadership was exercised for its good, rather than in some other field.

It is proposed to commemorate his works at Cornell in a fitting manner. President Schurman has indicated its nature follows:—"His last letter to me—written on October 20—was the subject of a large and costly new hall or laboratory for Sibley College, now greatly overcrowded. I propose that the university undertake the erection of this memorial to our much-remembered friend. The building should be called Thurston Hall." In view of all the good work done by this eminent engineer and broad-spirited citizen, it is to be hoped that not only Cornell graduates but also the many men and corporations who have received the benefit of his advice will unite in making his building a structure worthy of the man honoured.

A RELIC OF OLD LIVERPOOL.

DURING the excavations which are now taking place at the upper end of South Castle Street, near Redcross Street, a portion of a large vault built into the solid rock has been laid bare. The close proximity to the site of the Castle of Liverpool naturally at first suggested to those in charge of the work, says the *Liverpool Courier*, that this vault might have formed at one time part of the cellars of the Castle. Not wishing to destroy any important traces of ancient Liverpool, the city engineer (Mr. Brodie) made inquiries on the subject, and entered into communication with Mr. W. Fergusson Irvine, of Liverpool, hon. secretary of the Historic Society of Lancashire and Cheshire, to whom we are indebted for the following interesting information:—

The vault in question, Mr. Irvine points out, lies too far south to have formed part of the old Castle cellars; in fact, the southern edge of the moat ran across Derby Square probably 10 or 12 yards to the north of the present excavation. An examination of Perry's map of Liverpool (1769) shows that at that date the fish market was located on the site of this discovery, and in its centre stood a structure known for many years as Tarleton's Obelisk. This obelisk was a sort of glorified town's pump put there during the year in which John Tarleton was mayor (1764), and at his suggestion, for the purpose of keeping a constant supply of water for scouring and flushing the fish market and stalls.

In "Gregson's Fragments" (Harland's edition, p. 160) an account is given of this pump, and the statement is made that the cistern which supplied the pump was fed by the rain-water collected on the roof of St. George's Church. It is obvious that such an intermittent source of supply would necessitate considerable storage capacity, so that it is not surprising to find that this cistern, which is now being unearthed, is a large one. Only a portion has been excavated, but there are indications that as much more still lies buried under the roadway opposite Old Castle Buildings. If confirmation were needed of this explanation of the original use to which the structure was put, it is found in the fact that the city engineer reports finding at the base of the central pier of masonry an outlet from the tank running up the centre of the pier, and evidently communicating with an iron pipe still *in situ*, which was no doubt the original suction pipe of the pump.

Though the discovery is not of great importance, it is interesting to know of this relic of Liverpool in the days when the town was dependent upon such curious devices as this in order to supplement the totally inadequate water supply derived from wells and local springs. To all interested in the relics of the old city it will no doubt be a welcome item of news that a suggestion from the Historic Society to mark the site of some portion of the old Castle in a permanent manner has been favourably received by the City Council, and the question of the way in which this can best be done is now receiving consideration.

The German Ambassador sent a letter to the housing committee of the Liverpool Corporation, intimating that the Kaiser had noted the visit to Liverpool of the Princess Louise to lay the foundation-stone of a block of municipal dwellings for the poor. The letter proceeded:—"His Majesty, taking a great interest in similar projects, has commanded me to ask the proper authorities kindly to let him have, if possible, some designs or plans of the buildings. Under these circumstances I should be greatly obliged if you could assist me in the matter." The committee have agreed to forward plans and other documents illustrative of the scheme now in progress in Liverpool, the cost of which is estimated at 150,000.

TESSERÆ.

Richard Fox, Bishop of Winchester.

THE work of Wykeham and Waynflete in Winchester Cathedral was continued by Bishop Fox. He added to the fund established by Cardinal Beaufort, and determined to give a new exterior structure to the choir of Winchester Cathedral. Britton conceives that the works erected by him are the two turrets of the eastern extremity of the presbytery of Winchester Cathedral, with the magnificent window between them and the whole of the ornamental wall over it, terminating with an elegant tabernacle ornamented by the pelican, his favourite emblem, and containing his statue in stone, &c. His own chantry is a masterpiece of its kind. Of the architectural works of this bishop, Dr. Milner, his biographer, says we cannot fail in particular of admiring the vast but well-proportioned and ornamented arched windows which surround the eastern part of the cathedral at Winchester and give light to this sanctuary; the bold and airy flying buttresses that stretch over the side aisles support the upper walls; the rich open battlements which surmount these walls, and the elegant sweep that contracts them to the size of the great eastern window; the two gorgeous canopies which crown the extreme turrets, and the profusion of elegant carved work that covers the whole east front, tapering up to a point where we view the breathing statue of the pious founder, resting upon his chosen emblem, the pelican. In a word, neglected and mutilated as this work has been during the course of three centuries, it still warrants us to assert that, if the whole cathedral had been finished in the style of this portion of it, the whole island, and perhaps all Europe, could not have exhibited a Gothic structure to equal it. Britton seems to think that this prelate built Bath and Wells cathedrals. There is a singular passage in Speed, which seems to transfer the credit of the design of King Henry VII.'s Chapel to the King himself and Bishop Fox. After speaking of the Savoy Hospital and the six religious houses built by Henry VII., he says:—"Of his (Henry VII.'s) building also was Richmond Palace (built in the Burgundian style, according to Dallaway) and that most beautiful peee, the chapel at Westminster, which forms of more curious and exquisite building he and Bishop Fox (as it is reported) learned in France, and thence brought with them to England." This peculiar architecture (the Burgundian) was effectually promoted by Henry VII., whose enormous wealth enabled him to undertake the most sumptuous buildings; and in most instances his avarice directed that they should not be paid for till after his death. By his executors, in the early part of his son's reign, the chapels of Westminster, King's College, Cambridge, and Windsor were completed. King Henry VIII. contributed nothing. Bishop Fox died in 1528.

The Ancient Theatre.

Goethe has observed that the ancients were to the moderns what a remarkably clever and intelligent child is compared with an adult of common understanding. Superior as his intuitive faculties may be, he is, and must be, inferior to the man in knowledge, for a few grains sown in the most fertile soil will not produce an abundant harvest. This childish inexperience manifests itself to us in almost all that the ancients have left us. Let us examine their theatres, for instance, and how ill do we there find the means adapted to the end? So long, indeed, as the drama was considered rather a popular religious solemnity than a scenic representation of real life, the utter want of anything like illusion could not have been prejudicial, imitation being entirely out of the question; but invention and improvement in dramatic exhibition certainly did not keep pace with the advance of the drama itself—that is, in a literary point of view, for in other respects its progress was exceedingly limited, and the business of the scene continued to be confined almost to monologues and dialogues that would either send an English audience to sleep or rouse them so vehemently that the manager would be apprehensive of his house falling about his ears. Without having recourse to translations of the Grecian tragedians, the mere English reader may derive a tolerable idea of this—we had almost said somniferous—form of the drama from Milton's "Comus" or Johnson's "Irene." When an audience could tolerate a chronicle from the mouth of an actor by way of exposition of the story of the piece, they might easily put up with other incongruities by wholesale, and be content to draw very largely upon their imagination to furnish out all the accessories indispensable to scenic effect. It has been asserted by some that the ancients were not unacquainted with the use of theatrical mechanism and stage properties, yet, although their pieces occasionally required something of the kind, we may fairly doubt whether they had made even a tolerable degree of proficiency in scenic decoration, it being evident that the stage was not at all adapted to change of scenery in any part of it. It is probable, therefore, that the *Deus ex machina* was only a fellow let down in a sort of basket by ropes, which might be sufficiently substantial without thereby diminishing the illusion.

or offending the eyes of the spectator. Illusion, in fact, must have been entirely out of the question where the performance was by daylight and in the open air, and when above and beyond the scene the audience could view the actual trees and hills, or other objects surrounding the theatre. There does not appear to have been the least attention paid to what may be called the background and perspective of the picture; while the casualties of daylight, and the impossibility of preventing some part of the stage being obscured by shadow, must have tended very materially to destroy the illusion, and would have rendered painted scenery inapplicable, even had its management been understood. Palladio's Olympic Theatre at Vicenza has been extolled as a perfect model of an ancient one: it certainly exhibits all the inconvenience and defects of its prototype, and is so far an argument decidedly in favour of the superior contrivance shown in a modern playhouse. Nevertheless, in speaking of the stage and permanent scene of columns, the Italian's biographers and critics have indulged in the most hyperbolic praise, and actually seemed at a loss for superlatives to express their admiration. The sad and sober truth is that this piece of decoration, whether designed by Palladio himself or by Scamozzi, is quite a burlesque of architecture, a mass of unmeaning nonsense and bad taste.

Sixteenth-century Barge-boards.

Wooden gables were usually more profusely ornamented than those of stone, from which they likewise differ materially in more than one respect, for in the latter mode of construction the upper edges of the gable rise above the roof, so as to form a slightly elevated ridge; and the face of the gable has seldom more ornament than one or two series of inclined mouldings resembling those employed for string-courses. Here, on the contrary, the edge of the roof rests upon the sloping sides of the barge-boards or gable-boards, as they are indifferently termed, which form a deep projecting border, and the face of which is entirely filled with carving, either forming some architectural pattern or representing foliage, grotesque figures of animals and other whimsical shapes. Sometimes these gable-boards were worked into a species of perforated tracery, and the lower or inner edges, instead of being straight, were indented in various ways, either by divers combinations of foils and cusps or by a continuous wavy line, by which means a richer and more decided effect was produced, together with an air of considerably greater lightness and delicacy. Although not a universal, the pinnacle was a common ornament of the wooden gable, and this was not unfrequently prolonged downwards till it formed a kind of pendant. In France this part of the gable assumed altogether a different character, for there it was by no means unusual to form a vertical post descending from the apex where the gable-boards unite, bearing the same relation to them that the king-post of a roof does to the principal rafters. This was again intersected by a transverse horizontal piece, giving it the appearance of a cross, the upright part of which was ornamented with a figure in alto or mezzo relievo, above the intersection of the two pieces, and sometimes with a second figure or other carved work below. The faces both of the tie-beams and upright studs were also occasionally enriched in a variety of ways, although they were frequently left plain even when the gable-boards were remarkably rich, or else the former alone were ornamented, while the studs were either left plain or suppressed. It frequently happens, too, that neither tie-beams nor studs appear externally.

GENERAL.

Mr. W. C. Manning, of Newmarket, has been instructed to take out quantities and prepare a specification upon which a contract may be taken for the erection of a new stand at the Brighton race course. The total cost will probably be about £3,000.

The Governors of St. Bartholomew-the-Less will make an application to Parliament in the ensuing session for an Act authorising them to pull down the church of St. Bartholomew-the-Less and "to build over and use" its site and also that of the adjoining burial-ground. The church in monastic times served as a chapel to the hospital.

The King has sent a donation of 10*l* towards the fund being raised to complete the payment due on the work of the restoration of St. Mary's Church, Swaffham Prior, Cambridge-shire. The church was reopened for service a year ago.

The Jury in the Concours de Façades in Paris commenced on Thursday their examination of the 104 buildings submitted for the competition. The members consist of four architects, MM. Pascal and Charles Girault (members of the Institute Bouvard et Sauger) and five municipal councillors, MM. Ernest Caron, Froment-Meurice, Quentin-Bauchart, Ballière and Chérix.

Chichester Market Cross, which is being restored as a memorial of the Coronation of King Edward, will soon resume its normal appearance. Some difficulty is being found in obtaining a clock dial in harmony with the structure and yet distinct.

A Statue of Cervantes is to be erected in Paris, and application has been made for a site in the Champs-Élysées.

The Candidates for the vacant chair in the Académie des Beaux-Arts comprise M. Mounet-Sully, the tragedian; M. Clauss, architect; M. Comte, former director of civil buildings; M. Charles Normand, archaeologist; Dr. Richer, sculptor, medallist and physician; M. Berger, director of the Exhibition of 1889; M. Leygues, former Minister of Fine Arts; M. Bouchot, conservator of the department of engravings at the National Library.

The London County Council, for the purpose of the early reconstruction on the conduit system of electrical traction of the first 22½ miles of the Council's northern tramways and for lines in the south, are going to invite tenders for 12,500 tons of rails, conductor tees, fastenings, &c., at an estimated cost of 90,000*l*. An estimate of 13,850*l*. for the purpose of constructing new termini at Tooting has been agreed to.

Messrs. Dorman, Long & Co., Ltd., manufacturers of steel joists, &c., have announced a profit of 57,476*l*. for the past year.

Herr Kamillo Sitte, an architect and writer on art topics in Vienna, died on Monday, in his sixtieth year. He was the author of the work entitled "The Construction of Cities upon Artistic Lines," which has been translated into French and English.

A New senior mixed school was opened on Monday at West Hampstead for the accommodation of 450 boys and girls in the higher standards, together with a special school for about sixty mentally defective children. The buildings have cost about 18,000*l*. and the site nearly 10,000*l*. Messrs. Lawrance & Sons, the contractors, completed the buildings several weeks within the time allowed by the contract. The designs were prepared by Mr. Bailey, the architect to the London School Board, and the work has been carried out under the supervision of Mr. Westcott, the Board's clerk of works.

Messrs. Clayton & Black, architects and surveyors, have removed from 152 North Street to 10 Prince Albert Street, Brighton.

M. Raffaelli is holding an exhibition in Paris of his works, chiefly landscapes, executed by his new process of solid oil-colours. His invention is exemplified by other artists, among whom are MM. Steinlen, Fritz Thaulau, Chéret, &c.

The International Art Exhibition in Venice has been closed. It was visited by about 405,000 people, and the purchases amounted to 375,000 lire.

The Place formed by the Rues Auber and Scribe, on the west side of the Paris Opera House, is henceforth to be known as the Place Charles Garnier, and it will indicate the position of the architect's memorial.

The Canadian Club, of Toronto, has during the past five years placed inscribed bronze tablets on ancient buildings or their successors which possess any historical value.

Dr. Grenfell stated at the last meeting of the Egypt Exploration Fund that another ten years or so would probably see the end of excavations in Egypt for papyri, and indeed of excavations in Upper Egypt altogether. The chances of accidental and sporadic finds would remain indefinitely, but no excavations were worth undertaking, even if they were practicable, unless there was a reasonable prospect of finding something important. The Egyptian Delta, from Cairo to the Mediterranean, was too damp for the preservation of papyri.

The Wesleyan Chapel Building Fund have acquired thirty sites for building in and near London. Seven churches are about to be commenced. The Stepney Hall will cost 46,000*l*.

An Exhibition of repoussé work in silver will be open next week in the Quest Gallery, New Bond Street. The collection includes bowls, loving and wine cups, rose-water dishes, confetti boxes, mugs, as well as many smaller pieces.

A Bill has passed the Danish legislature for the restoration of the castle of Christiansborg, which was destroyed by fire in 1884.

Sheriff Guthrie, of Glasgow, in a recent judgment in a builder's claim, said "it might not perhaps be wise in all cases for owners of property to put themselves entirely into the hands of their architect, but if they did so, they had themselves to blame, and if the architect had exceeded his powers in dealing with contractors who had been allowed, as in this case, to suppose that his powers were unlimited, the remedy was against him and not against the innocent contractor."

Mr. George Evans, surveyor, late of Adelphi House, 10 Duke Street, W.C., announces his removal to 24 Hazlitt Road, West Kensington, W.

Houses, Winchmore Hill.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

authors of signed articles and papers read in public must necessarily be held responsible for their contents.

communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

BRAY.—Nov. 30.—The committee of Bray Pavilion and Fern Gardens invite plans for proposed pavilion and winter gardens at Bray. First prize, 30*l*.; second prize, 15*l*.; third prize, 10*l*.; with three prizes of 5*l*. 5*s*. each. Messrs. Frank Peel, Edw. Lee and P. Macdonnell, hon. secretaries, Town Hall, Bray.

ERDINGTON.—Feb. 1.—The Urban District Council general committee invite designs for new council house and library buildings, to be erected at the junction of Mason and Orphanage Roads, Erdington. Premiums of 50*l*. 30*l*. and 10*l*. will be awarded for the designs placed first, second and third respectively. Mr. Herbert H. Humphries, district engineer and surveyor, Public Hall, Erdington, Birmingham.

LONDON.—Dec. 16.—The Lambeth Borough Council are invited to erect a public library, with residence for librarian, in the Fern Hill ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for a public library, with residence for librarian, in the Fern Hill ward of the borough to Mr. H. J. Smith, town clerk, Lambeth Town Hall, Kennington Green; by 12 noon on December 16. General information as to the extent and

nature of the accommodation required in the proposed library and residence can be obtained on application to the town clerk.

SCOTLAND.—Dec. 7.—The Elgin Landward School Board invite competitive plans and estimates for the erection of school buildings at New Elgin capable of accommodating about 340 pupils. Mr. Hugh Stewart, clerk to the Board, Elgin.

SELLY OAK.—Dec. 7.—Competitive plans and designs are invited for public baths at Selly Oak, near Birmingham. Full particulars of the site for the proposed baths, limit of maximum expenditure, &c., with copies of sketch plans showing the accommodation required, &c., may be obtained on application to the Urban District Council's surveyor, Mr. A. W. Cross, 23 Valentine Road, King's Heath, near Birmingham.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WINDSOR.—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l*. returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

HEALTH AND DRAINAGE.

SOME few years since some successful experiments were made with the Merryweather hydraulic flusher in the sewers at Mile End and St. Martin's-in-the-Fields, London, as well as at Liverpool, Eccles and other places in the country. A recent article in the *Daily Telegraph* on "The Health of London" contains figures which prove that the heavy rains of this year have had a remarkable effect on health by keeping the sewers well flushed, and thus doing the work which the invention referred to was designed to accomplish. The late Mr. Walker, the eminent surveyor of St. Martin's, was of opinion that there is no more efficient way of cleansing the tops of the sewers than by the Merryweather plan. This system only requires water under pressure to be led into the sewer by hose pipe and distributed by means of a perforated tube on wheels, which is drawn through from manhole to manhole in a simple manner. The powerful jets thoroughly cleanse all parts of the pipe or culvert, and speedily discover cracks in brickwork or pipes, faults which are often responsible for the discharge of sewer gas into house or roadways. The record rains of this year are not likely to be repeated, and some such system as that described will have to be adopted sooner or later by our local authorities to keep our drainage system in proper order.

BUILDING AND BUILDERS.

NEW Primitive Methodist premises, to cost 3,000l., are to be built in Memorial Road, Walkden, to supersede a mission-hall school.

THE Local Government Board have held an inquiry concerning the proposal to borrow 2,000l. for acquiring a portion of the Gyllingdhane estate at Falmouth for a carriage drive.

EXTENSIVE repairs are about to be carried out at Atherton parish church, which has become seriously damaged by coal-mining operations underneath. Over 1,000l. is required for the work of restoration.

RAPID progress has lately been made with the work of promenade widening at Blackpool. Over 500 men are employed and the expenditure is now averaging over 1,500l. a week.

MR. UNDER-SHERIFF BURCHELL and a special jury having sat to hear a claim by Mr. W. E. Brown and Mrs. Rowe, the freeholders of 2½ acres of land adjoining Brixton prison required by the Home Office for the extension of that institution, a verdict by consent was given for 7,550l.

THE Norwich city coroner (Mr. R. W. Ladell) held an inquiry last week at Lakenham Terrace, City Road, as to the death of Mr. John Downing, aged 74, of the firm of J. Downing & Sons, builders and contractors, who suddenly expired on the

6th inst. A verdict of "Death from natural causes" was returned.

AT Winsford Mr. M. K. North, Local Government inspector, held an inquiry into the application of the Urban Council to borrow £1,100 for the extension of the water supply at Bradford Wood, for widening and the improvement of Dingle Lane, and for a sewerage scheme for Ways Green. There was no opposition.

A PROJECT is on foot to renovate the interior of the parish church of Olney, Bucks, a church that is inseparately associated with the memory of the poet Cowper and the Rev. John Newton. The scheme of renovation includes reflooring and reseating, the removal of a gallery and repairs to the fabric. The total cost will exceed £1,300.

THE foundation-stone of Christ Church, Broadheath, Worcester, was laid on the 6th inst. The church, which will cost about £3,050, is being erected from designs by Mr. C. Ford Whitcombe, in red sandstone, and fronts the Martley Road. It will consist of a nave and chancel, with a tower at the west end and an ambulatory at the south side, which will easily allow of extension. It will seat about 210.

DR. MANBY, Local Government Board inspector, held an inquiry at Omskirk respecting an application by the joint Hospital Board for sanction to borrow £300 to defray the cost of the erection of a caretaker's cottage adjoining the infectious hospital and 80c for the furnishing of the nurse's rooms in the administration block. It was stated that the loans were required for forty years.

THE housing of the working classes committee of the London County Council recommend that the tender of Messrs Kirk & Randall, amounting to £17,884, be accepted for the erection of Vallette Buildings, Jerusalem Square, Hackney. The total estimate is £19,200. The buildings are to be erected for the accommodation of persons of the working-classes displaced by the Mare Street improvement. They will consist of one block of five-storey buildings and will provide accommodation for 416 persons in 39 tenements of two rooms, 34 tenements of three rooms and 7 tenements of four rooms, and according to the terms of the rehousing scheme approved by the Home Secretary, they must be completed by May 8, 1905.

THE Ayr District Lunacy Board have selected a design for the proposed new hospital at their asylum. Twenty designs were submitted for the work, and were reported upon by Mr. Sydney Mitchell, architect, Edinburgh, as assessor. The

Board offered three prizes of £75, £50, and £25. The assessor placed the designs as follows:—First prize, Mr. John Arthur, 131 West Regent Street, Glasgow; second prize, Mr. J. K. Hunter, architect, Ayr; third prize, Mr. John B. Wilson, 92 Bath Street, Glasgow. After carefully considering the designs in view of the measurer's report, the Board have selected the design presented by Mr. John B. Wilson.

THE Royal Waterloo Hospital for Children and Women, Waterloo Bridge Road, S.E., which was founded in the reign of George III., is now in course of reconstruction, reorganisation and enlargement. The Board are in hopes of establishing cots, and, if possible, entire wards to be supported by various public bodies. Owing to the fact that the new Union Jack Club will shortly be erected in the immediate vicinity, they hope to establish a military ward, with the assistance of the various London corps. The name and regimental crest of each regiment to be fixed at the head of each cot, and devoted to the sick children and wives of the rank and file; 630 shillings, or 30 guineas annually, will support a cot, or the capital sum of 1,000 guineas. Already one individual has generously promised to endow a cot on condition that five others will do the same.

MR. F. H. TULLOCH, Local Government Board inspector, held an inquiry at the public buildings, Oldbury, into the application by the Oldbury Urban District Council for sanction to borrow £620 for the purchase of a piece of land in Dudley Road for the purpose of a tip in connection with the sewage disposal works, and £1,650 for the purchase of three shops in Freeth Street, with a view to extending the public buildings. Mr. W. Shakespeare (clerk to the Council) explained that the public buildings were erected in 1890, and at that time the accommodation was sufficient for the requirements of the town. Since then the staff of the Council in the various departments had greatly increased, and the Council had recently become, under the new Education Act, the local educational authority. It was necessary that the offices should be increased, as many of the officials were compelled, through lack of accommodation, to utilise the committee-rooms as offices. Evidence was given by Mr. T. H. Shipton (surveyor), who spoke of the details of the scheme.

THE London and North-Western Railway Company have under consideration a scheme for the enlargement of their Manchester Exchange station, which occupies so important a site opposite the Manchester Cathedral, just across the banks

VARIETIES.

THE Archbishop of Canterbury recently dedicated the tower, clock and bells of the parish church of Beckenham, thus completing one of the finest modern churches in the diocese.

ST. JOHN'S CHURCH, Leeds, which was erected in the year 1631 and following years, has just been restored. The cost was 1,500*l*.

THE ceremony of opening the Lyveden ward of the Lady Margaret hospital, Bromley, Kent, was performed by Julia Lady Lyveden.

THE fine new church erected by the Wesleyans on Chorley Old Road, Bolton, was formally opened on the 11th inst. The building is of an entirely new character so far as Bolton is concerned, the mosque design being adopted, and it is lighted by electricity

A NEW church in the Early English style of architecture, designed to accommodate 450 worshippers, was dedicated on the 6th inst. at Elland, Yorkshire. The site was given by Lord Savile. The scheme has cost about 12,000*l*., and when completed the total outlay will have been 15,000*l*.

THE fine mosque at Larissa, which stood near the bridge over the Peneios, and was such a familiar object to all who were in that part of Thessaly during the Greco-Turkish war, has been destroyed by an accidental fire. The most picturesque relic of the Turkish period in Greece has thus disappeared

THE London County Council having again asked the St. Pancras Borough Council to give its consent to the construction of tramways along Tottenham Court Road to form a junction with the existing Hampstead Road tramways, a proposal will be made at the local Council's next meeting to accede to the request of the County Council.

AN overhead travelling bridge and electric tramway is to be erected to connect Portsmouth with Hayling Island. The span will be 500 feet, with a carrying capacity of 60 tons, and the whole will be worked by electricity. The scheme is estimated to cost over 60,000*l*. Mr. Kennedy, a Glasgow contractor, has agreed to carry out the whole contract and be responsible for the capital.

THE Hounslow town hall will shortly be offered for sale. Built thirty years ago by public subscription, it was afterwards acquired by a company known as the Town Hall Company. It has been used by the Heston and Isleworth District Council

the Irwell, and consequently in Salford. It is proposed to bring the front of the station forward and nearer to the river bank. The plan will involve the demolition of much of the old property between the station as it now stands and the river, and will be a great improvement to the district. The extension will perhaps renew the interest in a scheme which was discarded in the city not long ago. The suggestion was then made that the whole of the river opposite the Exchange station and the cathedral might be covered over and made into a piece of ornamental ground. This would no doubt add to the dignity of that part of the city. There are now three ways of approach to the station. The principal is from a point nearly opposite the Cromwell monument, which leads to the sloping bridge across the river. The second is from Chapel Street, near the end of Blackfriars Street, up a slight incline along the whole length of the station on the Chapel Street side. The third is at the east end of the station, and was provided a few years ago as a more convenient means of access from Bughton and Strangeways. The station now covers an area of 12,000 square yards, and this will be largely added to.

THE Engineering Standards Committee have appointed Messrs. Crosby Lockwood & Son, of 7 Stationers' Hall Court, E.C.4, as official publishers to the committee. All the reports and specifications published by the committee may be had from the official publishers to the committee or direct from the offices of the committee, 28 Victoria Street, Westminster.

ALSO AT LIVERPOOL, MANCHESTER, PARIS, AND CAPE TOWN

as offices since the formation of that body, but they have recently decided to build more commodious premises, and in twelve months' time the hall will be empty. The company, in view of this contingency, have decided to wind up and sell their property.

IN connection with the recent competition of the Paviers' Company for essays on the question of the provision of street subways, to allow gas mains and water pipes to be laid without tearing up the roadway, an exhibition will be held at the Guildhall on Monday next of the drawings sent in. The three prizes of 100, 30 and 20 guineas were won respectively by Mr. R. M. Parkinson (Peterborough), Mr. A. J. Price (Lytham), and Mr. F. M. Royle (Nottingham). The exhibition will remain open during the week.

THE discovery of a sedilia of the Perpendicular period in the south wall of the church chancel, Walton-on-Thames, is being investigated under the careful supervision of Mr. A. E. Gough. The sedilia, which is of grey stone and measures 4 feet high by 2 feet wide, is situated between the aumbry previously discovered and the piscina, but is not nearly as ancient as the former, which is of very crude workmanship of early style, and may not be as modern as the latter, which is partly of freestone. The three niches form a very picturesque group, and are of much archaeological interest, owing to the different periods of their construction, and the marks and inscriptions cut in the seat and sides of the sedilia.

THE strike of the Penrhyn quarrymen, which has lasted over three years, was terminated at the close of the past week. Although all the men were not out during that period, it has cost the district the sum of 364,000*l.* in wages alone. Prior to the strike, which commenced in October 1900, scarcely any slates were imported into this country. For the quarter ended March 1901 the quantity imported amounted to 15,722 tons, and for the quarter ended September 30 the figures reached a total of 31,581, showing a steady increase, which has considerably alarmed the North Wales quarry-owners. It is feared that the slate trade of North Wales has been permanently injured by the dispute.

AT a meeting of the Edinburgh Architectural Association—Associates' Section—recently held at 117 George Street, Mr. J. A. Arnott in the chair, Mr. Ramsay Traquair delivered a lecture on "Notes on Later Scottish Gothic." The lecturer briefly traced the rise and progress of Gothic work in Scotland, pointing out the manner in which the earlier English style was

replaced by a mixed school influenced both from France and England. Great stress was laid on the need of studying the simpler examples of the earlier style as a base on which to raise new ideas. A number of characteristic buildings of the Later Decorated period were then fully described. The paper was illustrated by lantern slides.

THE Corporation of Wolverhampton have issued the necessary notice of their intention in the ensuing session to apply to Parliament for an Act to enable them to do a variety of things. They intend to ask for powers to construct tramways into Heath Town and Wednesfield; reconstruct, widen and improve a bridge over the canal at Wednesfield; erect new buildings supply electricity; transfer to the Corporation the power of vestry, abolition of offices of vestry clerk and collectors of poor rate; and deal with markets, streets, sewers, drains, sanitary provisions, infectious diseases, milk, provisions, commodious lodging-houses, collection of rates, borrowing of money extension, application, incorporation and amendment of Act and other matters. Power is also sought to run omnibuses within and without the borough; to supply electrical energy in bulk to local authorities, companies and persons outside the borough; to accept a transfer of an electric-lighting undertaking in an adjoining district, and to supply energy within that district.

THE Council of the Institution of Civil Engineers have made the following additional awards in respect of papers dealt with in 1902-3:—A Telford gold medal to George Deuchars, London; Crampton prizes to A. B. Brady, Brisbane, and C. Maxwell Lawford, London; Telford premiums to T. Johnston Bourne, Tientsin; R. H. Rhind, London; H. T. Hincks, Marikuppam; G. A. Hobler, Cairns; A. J. Goldsmith, Brisbane; F. H. Frere, Derby; R. Appleyard, London; F. Hamilton, B.Sc., London. For students' papers the award are:—The "James Forrest" medal and a Miller prize to Waude Thompson, Burton-on-Trent; the "James Prescott Joule" medal and a Miller prize to I. V. Robinson, West Hartlepool; Miller prizes to H. A. Bartlett, London; J. D. Morgan, Glasgow; H. S. Watson, London; J. V. Thomas Gloucester; O. B. Rattenbury, Doncaster; and C. M. Skinner Newcastle-on-Tyne.

THE Durham City Field and Research Club held their last outdoor meeting of the season on Saturday, the 7th inst., visiting, among other places, Witton Gilbert, the old hospital for lepers, founded by Gilbert de la Sey in the time of Bishop

sey, where there remains an interesting window, which has consisted of two Pointed lights within one arch, the moulding of which contains the ball ornament. In the spandrel is a quatrefoil. The church was next inspected, and Mr. Watts pointed out many improvements which have been made out, and gave a deeply interesting account of the architectural features of the church. The pulpit is a beautiful specimen of carved work, and Mr. Watts suggested that it may have come from the cathedral, the living of Witton Gilbert having often been held by a canon of Durham. An interesting dish, of seventeenth-century date, was handed round for inspection. It bears a representation of the spies returning to the Promised Land carrying a huge bunch of grapes, but it is interesting to note that the spies were clad in armour. Early parish registers were admired for the beautifully executed entries, Mr. Watts reading extracts of extreme interest. Outside work being concluded, the party adjourned to the rectory, where they were entertained to tea by the rector and Mr. Watts.

TRADE NOTES.

A new Savoy hotel extensions will be equipped with nine "Otis" electric elevators. The installation comprises four powerful passenger elevators, four luggage elevators and four service elevators; all are electric, with "Otis" controllers, with the exception of two or three smaller short-rise ones. The speed of the elevators will range from 250 feet to 300 feet per minute and upwards. Regard being had to the speed and carrying capacity, the hotel as a whole when complete will have eight "Otis" hydraulic elevators in the existing buildings) probably the largest hotel-elevator installation in this country.

The chapel schools, Cavalry Barracks, York, are being heated and ventilated by means of Shorland's patent Mantel stoves with descending smoke-flues.

The parish church at Crathie has just been reroofed by the order of His Majesty's expense, terra-cotta tiles, supplied by Messrs. Stanley Bros., of Nuneaton, having been substituted for the grey slates which previously served.

Mr. A. HIGGINS and Mr. S. Griffiths have entered into partnership to carry on the business of electrical engineers and contractors, at Albany Street, Regent's Park, N.W., under the name of Higgins & Griffiths.

THE firm of Goddard, Massey & Warner, of Nottingham, have secured the contract—5,886*l.*—for the furnaces for the new dust destructor about to be erected at Croyden.

THE Heckmondwike public clock committee have decided upon erecting a new clock, showing the time upon four external dials, in the centre of the market-place from where the electric cars start, and have placed the order with Messrs. Wm. Potts & Sons, clock manufacturers, Leeds and Newcastle-on-Tyne.

THE new hotel which forms part of the Leeds Corporation New Central Market buildings is being equipped with an electric passenger lift by Mr. Robert Middleton, Sheepscar Foundry, Leeds, the town's main 2-phase current supplying the motive power. It will carry six persons at a speed of not less than 120 feet per minute.

WE have received from the London and District Westrumite Company, Ltd., an illustrated pamphlet descriptive of "Westrumite," the new disinfectant road-making and dust-laying agent. In this we are informed that "Westrumite" is a preparation for laying the dust in roads, streets and open spaces, and is composed of oily substances rendered soluble in water by certain patented chemical and mechanical processes. It is to its property of solubility in water that the great value of "Westrumite" as a dust-layer and road-preserver is due, for undoubtedly the practical solution of the dust problem was found directly it became possible to evenly disseminate on roadways oil or oily substances capable of dilution with water to any required degree, which is what "Westrumite" accomplishes. Any process attempting to deal with so vast a problem as the effectual laying of dust must necessarily possess such qualities of cheapness and facility of application as will render its general adoption feasible from an economical point of view. Until the advent of "Westrumite" there were only three agents which could lay any claim to some consideration as possible dust-layers, although none of them offered a true solution of the dust problem; these were water, tar and crude oil. In "Westrumite," however, which is a combination of the serviceable qualities of the three, the solution has been found. As showing the permanent efficiency of "Westrumite," attention is drawn to the following extracts from a report made on September 9 of the then state of the roads in Ireland which were treated on June 30:—"Apropos of the recent Gordon-Bennett race, I have no hesitation in saying that what contributed in a great measure to the absence of any serious casualty during the progress of that great event was the

dressings of sections of the track which were considered dangerous with 'Westrumite.' It was perfectly apparent that when the cars, which were enveloped in clouds of dust elsewhere, passed over the sections so dressed not a particle of dust was to be observed. This was very material for the safety of the competitors, which has been clearly demonstrated by the absence of accidents." The sole agents are Messrs. Freeman Hines, Ltd., Westminster Palace Hotel, Victoria Street, S.W.

ELECTRIC NOTES.

MANY districts in Flintshire are to be connected by electric railways and tramways, and powers will be applied for from Parliament for that purpose.

THE Wednesbury (Staffs) Town Council have decided to acquire the tramways, and will start the electrification of them very shortly.

THE installation of the electric-lighting plant in the Wholesale Market, Smithfield, Birmingham, has been completed, and the whole of the market will be electrically lighted this morning. The electricity will be supplied from the power-station at the New Meat Market.

THE Cheshire coroner was apprised of the shockingly sudden death on the 11th inst., at Middlewich Electrolytic Alkali Works, of L. Page, a Liverpool electrician, aged thirty. Deceased only went to the Electrolytic Works on the Monday, and on Wednesday night was found lying unconscious on the floor of the diaphragm cell-room. He had fallen presumably in a fit, but no one was present at the time. Death took place before the arrival of a doctor.

A FURTHER extension of the electric tramways at the West End will probably be put in hand before long, and will, when completed, enable residents in London to travel on electric cars all the way from Shepherd's Bush or Hammersmith to Taplow, and one of the most beautiful stretches of the Thames, the London United Tramways Company having, on Saturday, given notice of their intention to apply for powers in the next session of Parliament to extend their system in that direction. They wish to connect the Brentford, Hounslow and Ealing lines with towns and villages in the county of Bucks, including East Bedford, Stanwell, Feltham, Ashford, Staines, Harmondsworth, Slough, Farnham Royal, Burnham, Taplow, Hitcham and Colnbrook. No part of Surrey is yet served by

the company, but they possess powers as far as Kingston Surbiton and Wimbledon, and are now seeking properties in those places for the widening of the roads, with a view of an early extension of their system there. As far as possible they will construct double lines to insure the best possible service.

THE QUANTITY SURVEYORS' ASSOCIATION

THE first general meeting of the above Association was held on Wednesday, the 18th inst., at the Holborn Restaurant. There was a numerous attendance of both London and Provincial members of the profession. Mr. W. Hoffman Wood of Leeds, was voted to the chair.

The proposed Memorandum of Association having been read by the hon. secretary, Mr. F. B. Hollis, was unanimously adopted by the meeting.

The following officers were elected:—*President*—Mr. Walter Lawrance, F.S.I. *Vice-President* (London)—A. J. Gate, F.S.I. *Vice-President* (Provincial)—W. Hoffman Wood (Leeds), and a council of twelve, consisting of the following eight London and four Provincial members:—London: W. Lawrance, F.S.I., A. G. Cross, F.S.I.; A. J. Gate, F.S.I.; W. R. Hood, F.S.I.; R. L. Curtis, H. England, H. W. Crickmay and F. B. Hollis, who was also unanimously elected hon. secretary and treasurer. Provincial: H. Curtis-Card, F.S.I., of Lewes; H. L. Beckwith, F.S.I., of Liverpool; R. J. Tollit, of Cambridge; W. Hoffman Wood, of Leeds.

The hon. secretary, F. B. Hollis, 17 Bedford Row, W.C., will be glad to receive further applications for membership, or for particulars of the Association.

THE ROYAL VISIT TO THE CITY.

THE decorations of the City in honour of the visit of their Majesties, the King and Queen of Italy, were most effectively carried out by Messrs. Defries & Co., of Houndsditch, and possessed some pleasing features of novelty. In Cheapside, for instance, an entirely new scheme of street decoration was introduced. Richly decorated vertical banners were suspended above the centre of the roadway, supported on either side by special Venetian banners 40 feet in length bearing the Italian, British and City colours. These were carried to the buildings on either side, and large flags were placed at each extremity of

Floral rose garlands surrounded the centre banner, carried down to the side buildings, and caught up in festoons. The centre banner on the first line of decoration bears the Italian Arms, and these are followed by the Arms, the City Arms and various Colonial Arms. These various lines of decoration are interspersed with lines of and festoons of streamers, each supporting a handsome basket above the centre of the roadway. The electric lights are also appropriately decorated to harmonise with the general scheme. In the West End a number of the lead-lights and firms illuminated for the occasion.

CHURCH REPAIRS IN JERSEY.

In each parish in Jersey there is (1) an ecclesiastical assembly (2) a civil assembly, composed of the same persons, and the "Principaux" of the parish, and who are all the laymen in the parish rated above a certain sum. In January last at a meeting of the Ecclesiastical Assembly, at which the rector of the parish of St. Saviour's was in the chair, a proposal was made as to the repairs of the parish church, which was referred to the Civil Assembly. The Nonconformist principle of the Ecclesiastical Assembly did not appear alive to the fact that the object of this reference was to endeavour to place the cost of such repairs upon the Civil Assembly, and therefore on the parochial rates. The Civil Assembly met under the presidency of the constable a few days later, and decided by a majority that plans should be prepared and an estimate given by an architect for the carrying out of the work at the cost of the Civil Assembly. Several of the principals present protested strongly against the course as an illegal appropriation of public moneys, but they were outvoted. The estimate and plans were subsequently at a meeting in August brought first before the Ecclesiastical Assembly, and then in September before the Civil Assembly, who voted 2000*l.* to be charged upon the parish for the purpose of repairing the parish church. Two of the principals appealed in the Royal Court of Jersey to upset this, as they argued, illegal appropriation of public moneys. The Judge of this Court decided against the appeal, on the ground that they had been present at the meeting of the Ecclesiastical Assembly in February. A further appeal

is now pending on behalf of another of the principals, who was not present at the February meetings. The matter will very probably in the event of an adverse decision in the pending action be brought before the Privy Council.

NEWCASTLE-UNDER-LYME HIGH SCHOOL.

THE formal opening of the Dutton science wing, an extension of the Newcastle-under-Lyme high school, which has just been completed and named after the late Mr. W. H. Dutton, the first chairman of governors of the Newcastle Endowed Schools, took place on the 6th inst. The new wing is attached to the old buildings at the south end of the large schoolroom, and consists of chemical and physical laboratories, a lecture-room, a preparation and store-room, with communication with the chemical laboratory and the lecture-room, a balance-room, private laboratory, dark-room and cloak-room and lavatory. All the rooms are commodious, well lighted and ventilated, and the floors are laid with red deal blocks on a good bed of concrete. The external elevations are faced with red stock facing bricks and stone dressings to windows, &c, and the roofs are covered with dark brindled tiles, the work being carried out to correspond with the old buildings. The chemical laboratory is fitted up to accommodate thirty-two students. The physical laboratory is fitted up to accommodate forty-two students, and is provided with six working benches, two apparatus cupboards, &c. Sliding doors divide the dark-room from the physical laboratory. Doors of communication give access to the new wing from the corridor, and from the large schoolroom of the old buildings, and an outer door is provided for the use of evening students. The total cost of the new building was about 3,600*l.* The laboratories have been designed for teaching chemistry and physics, and to foster the scientific method in the boys from their earliest youth. Around the physics laboratory and in the adjoining corridors is stored the apparatus for making measurements of various kinds, and for studying the laws of motion, of mechanics, hydrostatics, heat, sound, light, magnetism and electricity. All this comes under the head of physics. A great advantage over less modern laboratories is comprised in the wonderfully perfect arrangements in the new chemical laboratory for getting rid of all odorous fumes as fast as they are formed. At one end of the chemical laboratory is a muffle furnace, a gas furnace which

will heat a crucible up to the melting point of cast-iron, and other varieties of combustion furnaces, besides an automobile arrangement for the continuous distillation of water. The science work taught in these new buildings will range from the most elementary principles to the most advanced research work. The fittings and equipments are available for work in all branches of chemistry, technical and industrial. It is understood that a number of young men working in the manufactories of the district are about to prosecute research work in this building in connection with the local industries.

BUILDING CONDITIONS IN LONDON.

At a recent meeting of the County Council it was stated that the absence of offers for leases of plots of land in the Strand, Kingsway and Aldwych was to be accounted for by the fact that disputes as to buildings were to be settled by the architect to the Council instead of by arbitration. The matter was referred to the corporate property committee of the Council, who have considered whether the building conditions should be modified. The committee report that as the conditions stand at present there is no provision made for arbitration, and they go on to say:—

"We have made inquiries as to the practice which obtains in regard to the letting of land on the estates of the large ground owners of London, and we are advised that the conditions in use on these estates are generally more onerous than those imposed by the Council, and that no provision for arbitration is made in the conditions. It does not appear that the Council's conditions have hitherto restricted building operations on its land. From figures which have been submitted to us it appears that the building work on the Council's freehold has increased nearly sevenfold since the year 1897, and we are of opinion that the inability to dispose of more surplus land is not due to the conditions, which have been practically the same for many years past. We are further informed that while the standard of work insisted upon is sufficient for its purpose, the Council does not press this beyond what is believed to be consistent with the circumstances of the case. That the tendency is towards leniency rather than the strict letter of the conditions is in a measure confirmed by the large increase in the building work on the Council's land. Having regard to all the circumstances, we do not think that the Council would be well advised to make any alterations in

its building conditions, and we are of opinion that, although there were no bidders for the plots of land in connection with the Holborn to Strand improvement at the last auction, the Council will not experience any difficulty in eventually disposing of the plots under the existing conditions."

HOUSING IN SALFORD.

THE proposal of the Salford Corporation to build workmen's dwellings on land in Seaford Road, Pendleton, was the subject of a Local Government Board inquiry in the Salford town hall by Major C. E. Norton. The application of the Corporation was for sanction to borrow 47,737*l.* under the Housing of the Working Classes Act, 1890, for the purchase of the site and the erection of houses.

The town clerk, Mr. L. C. Evans, in his opening statement explained that the Corporation, under an order of the Local Government Board of 1902, were bound to provide accommodation for 1,500 persons who were dispossessed of their homes by the demolition of insanitary property in various areas. The Corporation had already by several schemes provided housing for 2,432 persons, and had therefore exceeded their obligations. One of the sites on which, under the order, the Corporation had to build houses was known as Block 3, a piece of land off Chapel Street, near Trinity Church; but after an inquiry, in December 1901, the Local Government Board relieved the Corporation of the obligation to build on this particular site, on condition that they provided dwellings upon the Seaford Road site. It was the proposal to fulfil the condition which was the subject of the present inquiry. The scheme prepared provided accommodation for 1,155 persons. When this had been carried out, the Corporation would have provided for 3,587, or for 2,087 more than they were obliged to. The Seaford Road site had already been approved of by the Local Government Board, so that he understood the scope of the inquiry that evening was limited to the details of the scheme and the suitability of the proposed buildings.

Mr. Mavor said he was instructed that the houses were really being built for the accommodation of the tramway employes, that the rents proposed were too high for the people who had been dispossessed, and that the site was too far away from the No. 3 block to allow the people to get conveniently to their work without paying tram fares. The Inspector said

ould not hear any objections to the site, because that had
dy been approved of.
Mr. Corbett, the borough engineer, explained the scheme.
tion of the site, he said, was land which was acquired by
tramway committee for the purpose of a tram shed, but
h it had not been necessary to use. This was to be trans-
d to the housing committee at cost price, and the cost was
ncluded in the amount for which borrowing powers were
ht. It was proposed to erect 231 dwellings. The esti-
d rent of 200 of these was 5s. 6d. per week, four at 6s.,
en at 7s. 6d., one at 8s., seven at 8s. 6d. and three shops
s. The 5s. 6d. houses would consist of two rooms up and
downstairs, passage, scullery, water-closet and conveni-
s.
a cross-examination by Mr. M'Ivor, Mr. Corbett said he
not designed these houses for the convenience of the
way men, but he did think some of these men would be
y to go into them. He thought the houses at 5s. 6d. were
ble for many of the people turned out of Block 3. The
orth site was a mile and a quarter from Chapel Street.
M'Ivor asked a number of questions with the object of
ing that 5s. 6d. a week was a much higher rent than had
paid by the occupants of the condemned property. Mr.
ett admitted that in some cases this was so, but he thought
generally speaking, the property was suitable for the
nmodation of the dispossessed persons.

THE PLUMBERS' COMPANY.

Tuesday a conference between the Plumbers' Company,
representatives of the larger water authorities of the
try and the Royal Institute of British Architects was held
e Guildhall, to discuss the question of the technical educa-
and registration of plumbers and the efficiency of plumbing
generally in connection with the public supply of water.
Robert Crawford (warden of the Plumbers' Company)
ded. Delegates from the water authorities of Birming-
Glasgow, Sheffield, Hull, Bradford, Cardiff, Dublin and
towns were present. The Royal Institute of British
itects was represented by Mr. H. D. Searles-Wood,
Thomas Blashill and Mr. W. D. Caröe, and the British
society of Waterworks Engineers by the secretary, Mr.
ey Griffith.

The Chairman remarked that the Plumbers' Company had
done a great deal towards stimulating public interest in the
matter of good plumbing, more particularly from the health
point of view. Undoubtedly the country had been thoroughly
aroused to the advantage to be derived from an increase of
responsibility and skill on the part of the plumber. On its
sanitary side much that was of value had been done in the
training of plumbers, and the attitude of local authorities
towards plumbing had greatly changed as compared with what
it was a few years ago. Of late, however, another department
of the plumber's work had come into prominence—that relating
to the prevention of the waste of water in domestic use. In
convening the conference to consider this subject in particular,
the Plumbers' Company did not suggest that the water authori-
ties did not know how to manage their own affairs, but it was
thought possible that the company might act as a sort of line
of union for the discussion of the means to be adopted in order
to secure greater uniformity in respect of by-laws, fittings and
the skill and qualifications of plumbers. He concluded by
moving a resolution approving the efforts of the Plumbers'
Company to secure the more efficient training of plumbers and
the registration of qualified men, and pledging the conference
to support the company's endeavours to obtain the necessary
legislation in furtherance of that object.

Mr. Hind, in seconding the resolution, pointed out that the
effect of the company's efforts was visible in the improvement
which had taken place in plumbers' work during the last
twenty-five years. He hoped that architects and others would
support the company by employing registered and qualified
plumbers in preference to others.

The Chairman mentioned that the Bill promoted by the
company for the registration of plumbers had been viewed
favourably by the Local Government Board, but the Govern-
ment had not seen their way to afford the necessary time to
secure its passage through Parliament.

The resolution was carried.

Mr. Searles-Wood said that as architects they strongly
sympathised with the movement for the better education of
plumbers. He did not think, however, that they could pledge
themselves to the sole employment of registered plumbers,
because architects did not interfere between the contractor and
his men. He afterwards proposed :—"That, with the object of
giving practical effect to the previous resolution, the represen-
tatives of the Royal Institute of British Architects and the
water authorities present recommend that preference be given

to the employment of registered plumbers to carry out and inspect plumbers' work executed under architects and water authorities." In the course of further remarks, he said that the Institute deprecated any interference with the apprenticeship system. It was one thing to execute specimen joints and other things under the direction of a master in a highly fitted-up shop at a technical school and another matter to do it under the ordinary conditions in which the work had to be done in a building.

Mr. Holdsworth (Bradford) seconded the resolution.

Mr. E. A. Lees (Birmingham) said that in Birmingham there were a good many firms of the highest repute who had not allied themselves with the registration movement, and the Water Board could not shut their eyes to the fact that those firms carried out their work in a way to which no exception could be taken.

Mr. Atkinson (Hull) said that the same difficulty would arise in his town. If registration was to be adopted it should be optional for a period and only compulsory after the lapse of several years.

Mr. Holdsworth observed that registration gave a status to a plumber, and was an inducement to men to register themselves.

Mr. Hind said that they could not at present hope to make registration compulsory, but they could make it desirable and to the advantage of plumbers to register themselves.

After further discussion the resolution was carried.

The question of uniformity of regulations and the standardisation of fittings was afterwards discussed, among the speakers being Mr. Blashill, Mr. Gale (Glasgow), Mr. Askwith (Newcastle-on-Tyne), Mr. O'Dowd (Dublin) and others, and it was decided to appoint a small committee representing the Plumbers' Company, the Royal Institute of British Architects the water authorities and the water company engineers to consider the question.

THE VIEW FROM RICHMOND HILL.

The parks and open spaces committee of the London County Council report that they had arrived at an agreement with Sir J. Whittaker Ellis as to the terms upon which the action brought by the Council against him for the enforcement of his promise not to build upon certain land in the line of view

from Richmond Hill and generally for the protection of the Council's interests in relation to the preservation of the view from Richmond Hill might be settled. The agreement in effect provided that no buildings except conservatories or other buildings of that nature for garden purposes were to be erected between the river Thames and a certain line on the plan, that no dwelling-house might be erected above that line, that no other building (except those now existing) should be allowed between that and another line, known as line B, and that no manufacturing building or chimney-shaft should at any time be erected on the land above line B. The agreement also provided that, as between Sir J. Whittaker Ellis and the adjoining owner on the south-west, the existing line beyond which buildings might not be erected should be maintained, and that no alteration of it, so far as the adjoining land was concerned should be agreed to without the concurrence of the Council. A deed of covenant embodying the agreement had been prepared and approved by Sir J. Whittaker Ellis and the Richmond Corporation, and the committee now recommended that it be approved by the Council and be sealed in triplicate.

THE BUILDING TRADE IN DUNDEE.

THE *Dundee Advertiser* calls attention to the unfortunate condition of the local building trade. It has been found, it states from careful investigation that the number of workmen who, in ordinary circumstances, earn their livelihood in the business but who are meantime unemployed, is much larger than has been known for many years. The operatives chiefly involved are masons, joiners and labourers, but others, such as plasterers, plumbers, painters, glaziers and heating engineers are also feeling the pinch. Within recent months hundreds of young workmen, unable to find scope for their energies at home, have sought the wider fields offered by the colonies. Indeed, the departure of the emigrant train on Friday evenings has come to be numbered among the events of the week, and it is one of the commonest spectacles to witness on those nights vast crowds assembling at the railway stations to take farewell of departing relatives. This is an altogether new phase of Dundee life. Before the war it was unknown. The cause of this extraordinary depression is difficult to ascertain, but its roots seem embedded in the dual circumstance that tenement property has been over-built, and that no structures of a public character are meantime in course of erection. Within recent

is a feature of the trade which has forced itself upon the minds of those concerned has been the steady and increasing tendency of those occupying central flats to move towards the suburbs. This exodus from the more thickly populated parts regarded by the municipal authorities as excellent, but against investors, whose capital is sunk in property, it is a matter for concern. Tenements, as a natural consequence, suffer depreciation in value. From the strictly industrial point of view, however, the movement has advantages, inasmuch as it will lend an impetus to the erection of self-contained dwellings. The inevitable result of this shifting has been a corresponding movement of weekly tenants into better-class properties, to many of which the system of weekly rents has recently been applied. This, in turn, has involved the desertion of the older and less salubrious localities, in the heart of which at the present moment hundreds of one-roomed houses are vacant.

LOCAL GOVERNMENT WORK.

The annual report of the Local Government Board which was issued on Saturday states that during the year consent was given to the borrowing by county councils in 176 cases of sums amounting to 714,461*l*. Of this total, 392,569*l*. was required for purposes of lunatic asylums; 118,835*l*. for the provision and improvement of police stations and court-houses and other public buildings; 76,277*l*. for roads and bridges; 74,704*l*. for erection of hospitals; 21,530*l*. for purposes of the Technical Education Acts; 15,203*l*. for contributions to the cost of providing open spaces; 11,193*l*. for the acquisition of land under the Military Lands Act, 1892; 3,550*l*. for industrial schools; 2,500*l*. for a highway depot; and 250*l*. for purposes of the Local Government Act, 1898. The largest item of expenditure in the accounts of county councils, other than the London County Council, relates to main roads. The county councils themselves expended during the year ended March, 1902, 16,202 miles of roads, of which 15,785 miles were situate in rural districts. The amount expended by the county councils, otherwise than by means of loans, during the year on the maintenance, repair and improvement of these roads was 1,077,695*l*. The total length of the main roads in England and Wales maintained during the year ended March 31, 1902, was 27,115 miles, of which 11,101 miles were situated in urban districts and 23,101 miles in rural districts. There were 828 councils of urban districts who maintained the main roads in their districts during the year.

The total length of main roads which they repaired was 3,597 miles, and the amount of the contributions received by them from the county councils in respect of these roads was 729,585*l*. In 250 of the 672 rural districts the main roads were during the year maintained by the rural district councils. The total length of main roads which they repaired was 7,316 miles, being nearly one-third of the total mileage in rural districts. The amount of the contributions received by them from the county councils during the year in respect of these roads was 454,639*l*.

INSTITUTION OF ELECTRICAL ENGINEERS.

THE first meeting of the session of the Institution of Electrical Engineers was held at the Institution of Civil Engineers on the 12th inst.

The president, Mr. R. K. Gray, in his inaugural address, referred first to the condition of the Institution. He said that developments in the near future might permit of an alliance with kindred societies for the erection of one large temple of engineering, where the various branches might find their homes. A temple of engineering, costing a quarter of a million, would be a fit home for the engineering bodies of the country. Electrical legislation was in urgent need of reform. In spite of legal impediment, however, substantial progress had been made in the utilisation of current for light and power purposes. Some 300 towns were now enjoying an electricity supply. The tramway work of the London County Council in South London was excellent. He strongly preferred the conduit system to the overhead system. The extra money involved in the construction of the conduit was well spent. Of wireless telegraphy there were no new developments to report, and there seemed to be no immediate prospect of this competing seriously with the existing cable companies.

He believed electrical industry in this country was almost entirely in the hands of engineers educated in England, but he doubted whether this could be said of chemical industry. In the calico printing and dyeing trades, for instance, Great Britain had practically been the home of the raw material and one of the greatest consumers of its products, but through the application of greater knowledge and skill, Germany could furnish our printers and dyers with the greater proportion of their requirements. We were being beaten in a race in which the foreigner was handicapped. He believed this was due to

the want of those opportunities which the foreigner possessed rather than to our natural incapacity. With wisdom we opened our arms to the skilled man of other countries, and through his skill we could, in certain directions, maintain supremacy. We must, as a policy, continue to welcome all comers, but while so doing we should continue to equip ourselves so that by sheer skill we might conquer in the end. The equipment we wanted was technical education. In this connection he was informed that there was under consideration the formation of a science guild whose fundamental object would be the encouragement of application of scientific principles to industrial and general purposes. He trusted the scheme would be adopted.

THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, November 10, Sir William White, K.C.B., F.R.S., president, in the chair, the paper read was "Tensile Tests of Mild Steel and the Relation of Elongation to the Size of the Test-bar," by Professor W. C. Unwin, B.Sc., F.R.S., M.Inst.C.E.

In the case of steel, the engineer relied on tests of samples for assurance that he was obtaining suitable material. It was important, therefore, that the information given by tests should be definite and comparable. Mechanical tests were for the engineer the most important, but as usually conducted they were not wholly satisfactory, and had to be supplemented. The object of the paper was to consider some conditions which affected the results of tests, especially as regarded the measurement of ductility. Ductility was probably the most important quality in the material for working purposes.

Some conditions were then discussed. The time effect was only negligible, provided inertia forces might be neglected. The method of gripping the test-bar and the form of fracture as affecting the results were discussed, and the influence of enlarged ends on the elongation. The effect of the position of fracture between the gauge-points was examined, and some numerical results were given. Next, the effect of small variations of cross section, which was greater than was ordinarily supposed, was shown.

The total elongation was shown to consist of a general stretch, nearly uniform along the bar, and a local stretch. As geometrically similar bars deformed similarly, the percentage of ultimate elongation was the same in similar bars of the same material. The law of percentage of elongation in

geometrically dissimilar bars was then examined, and it was shown that for bars of any given material, of gauge-length and cross-section A, the percentage of elongation was given by the equation

$$e = \frac{c}{l} \sqrt{\frac{A}{b}} + b$$

where the first term on the right was the local and the second the general extension, c and b being constants. This equation was first verified by application to some results obtained by Mr. Barba on bars of varying gauge-length, cross section and form of cross section. The proportion of local to general extension in certain cases was determined.

An account was then given of a series of tests on ship and boiler-plates of different thicknesses, made for the engineering standards committee. The results were first discussed by using plotted curves without assuming the elongation equation. Taking from the curves the elongations for bars of a standard form, the real relative ductility of these bars was found. This was compared with the elongations for bars of constant width such as were generally used in testing. It was shown that the elongations in the latter case were very misleading as to the relative ductility. In the case of similar bars the ductility decreased as the thickness of the plates increased. But the results on bars of constant width would lead to the conclusion that the thickest plates were the most ductile.

The constants in the elongation equation were then given for the bars in each of six series of tests and for plates of $\frac{1}{4}$ to $\frac{1}{2}$ inch thick, with a detailed comparison of the elongation calculated by the equation and observed in the tests.

A further series of tests on plates with varying percentage of carbon was given. The constants c and b in the elongation equation decreased as the percentage of carbon increased.

Lastly, a series of tests was made by Mr. F. C. Fairholme of the Cyclops Steelworks, on short test-bars cut from tyre and axles. It was shown that the elongation equation was applicable to these short test-bars. The forms of short test bars which could be used in such cases was discussed, and a very simple recommendation was made which would secure that in all such tests the elongations would be comparable.

The question of quality figures for materials was then examined. It was pointed out that if quality figures were to be of value the tests must be made on similar test-bars, or the results must be reduced to equivalent results on similar bars.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINES

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Picture-house Shutters and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, on account of its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Painters, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised, are labelled either inside or outside with our Trade Mark "The Anchor."

values were examined of the quality figure for the whole the tests described in the paper for test-bars of different as of section.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

The ordinary annual general meeting of the members was held on the 12th inst. at the Grand hotel, Colmore Row, Birmingham, Mr. Albert S. Smith presiding. The annual report expressed regret that the depressed condition of trade referred to twelve months ago has continued during the past year. After again meeting the operative plumbers in conciliation, the committee had been unable to come to any satisfactory arrangement as to the code of working rules, the operatives declining to sign for less than three years. There were, therefore, no rules in existence with this branch. In view of the unreasonable demand of the National Association of Operative Plasterers in various parts of the country, that members should be paid on works in districts where a lower rate of wages prevailed the current rate of the districts where the contractor's chief office was situated, the committee given notice to the operative plasterers to abolish all existing rules after April 1 next. With this exception the committee had, after careful consideration, decided not to disturb the trade by serving notices for alteration of rules. Although, in their opinion, the present state of the trade fully justified notices to reduce the existing high rate of wages. The dispute with plasterers at Marle Hall, Llandudno, on this question had been before the committee on several occasions, also before the National Federation, and was not yet fully disposed of. On several occasions deputations had interviewed committees of the Architectural Association on matters of importance in the interests of the trade, notably the interpretation of the prime cost clause in the conditions of contract, and terms of making good after other trades." The balance-sheet showed total ordinary receipts for the year 219%, which, the balance from last year, made a total of 391%. The various disbursements amounted to 204%, and there remained 147% to the credit of the Association.

In moving the adoption of the report and balance-sheet, the President said he wished that the opening paragraph of the report had been different in tone. Trade last year was bad. Since then it had visibly declined. The decline was small in name, which also meant that the builder's profits had been proportionately fine. They could not say that prices were low.

Materials had not come down to any great extent. Labour was at the highest point it had ever reached; and so they could not quite say that building prices were low. Nevertheless, the committee, after carefully considering the question, had refrained from giving notice to the operatives for a reduction of wages, hoping that trade would soon show a turn for the better. The relationship between masters and men had been good throughout the year, with the exception of one branch. He referred to the plasterers. With them, as with other branches, a code of working rules was drawn up and signed by masters and men. These rules applied over a radius of five miles: but the National Association of Operative Plasterers had sought during the year to extend the radius to 120 miles, under cover of a by-law of their own union. He thought this needed no comment for him to show its flagrant unfairness and one-sidedness. If they sent a plasterer into a district where the rate of wages was lower than theirs, they must pay him their rate of wages; if they sent him into a district where wages were higher they must pay him the higher rate of wages. It was thought by the committee that if the signed rules of the plasterers were to be contravened in such a way—by by-laws made to circumvent them—it would be better to be without them at all. It was hoped and confidently expected that other towns would follow their example in giving notice to the operative plasterers to abolish the existing rules after April 1 next. Until rules could be made which would be loyally abided by and fairly kept by both sides it would be better for them to have none. If the builders broke the signed rules they were quickly brought to book. Fair play was a jewel, but it must be observed by both sides alike. With the exception of this branch of the trade the rules had been honourably adhered to. They had, he thought, reason to congratulate themselves upon the progress of the Association, and he held the Birmingham Association was one of the strongest and most loyal outside London.

Mr. William Sapcote seconded the motion, and endorsed what the President had said in reference to the plasterers.

The motion was carried unanimously. Lieutenant-Colonel Barnsley was unanimously elected president for the ensuing year, and Mr. J. B. Whitehouse vice-president; Mr. G. Twigg was reappointed treasurer, Messrs. Thomas Johnson & J. S. Surman auditors, a strong committee was elected, and Mr. E. J. Bigwood was re-elected secretary.

On the motion of Mr. J. B. Whitehouse, seconded by Mr. C. Copeland, a cordial vote of thanks was passed to Mr. Albert

S. Smith for his services during the past year in the position of president

Mr. Smith having responded to the compliment, a vote of thanks to the chairman concluded the meeting.

A dinner followed in the Grosvenor Room, and was largely attended. The chair was occupied by Lieutenant-Colonel John Barnsley, and among those present were Mr. Ebenezer Parkes, M.P., Councillor F. G. Whittall, Alderman J. Bowen (ex-president National Federation), Alderman Bigwood, Messrs. C. H. Barnsley (president Midland Federation), A. S. Smith, G. Squires, F. F. Jefferson, A. Rowse, J. B. Whitehouse, A. Harrison, and many others. After the loyal toasts had been honoured, the toast "The City and Trade of Birmingham" was submitted by Councillor Whittall, who gave an interesting account from a builder's point of view of the work carried on in some of the departments of the Corporation, mentioning in particular the Public Works Department and the Drainage Board. He also attached much importance to the education side of the work of the Corporation, and in this connection referred to the splendid results obtained at the technical schools, which had recently been described in such glowing terms by Professor Perry, the well-known engineering expert. If manufacturers were to satisfactorily compete in the commercial and manufacturing world it was imperative that the greatest attention should be paid to the scientific and technical training of students. He mentioned that in the building trade there were no fewer than 580 students, while a great many applicants had had to be rejected owing to the pressure on the school accommodation. As a Builders' Association they were always glad to adopt any policy which was calculated to add to the efficiency of the working men.

The toast was well received, and Mr. Ebenezer Parkes, M.P., whose name had been coupled with the toast, responded. He recalled the fact that he had taken a part in the municipal life of the city, and bore testimony to the public spirit and self-sacrifice displayed by so many of its citizens for the good government of the city. People had to go away from Birmingham to fully appreciate it. In his travels he had heard the praises of the city more than within its boundary. He warmly commended the work that was being done in the secondary, technical and art schools of the city. In the present stress of competition in commercial life their importance could not be over-estimated. He believed that the educational work of the city so recently taken over by the Council would be well performed. He thought it could not be denied that it was

advantageous that it should be in the hands of the people. Touching on municipal enterprise, he pointed to the importance of a judicious restriction of the public debt, especially having regard to the increased facilities for loans. He incidentally alluded to his visit to America, and said he was much impressed by the loyalty and affection shown to the mother country by Canada.

Mr. Thomas Barnsley proposed the toast "Success to the Birmingham Builders' Association," giving an interesting account of the successful work carried on by the organisation during the past year. That work had been advantageous to employers and workmen alike; between both there was better understanding, and by means of the Association employers had been able to meet workmen when friction arose and to satisfactorily settle their differences by conciliatory conferences. The toast was acknowledged by the President, who also testified to the better relations existing between employer and employed, which was the result of a better understanding and was largely attributable to the influence and operations of the Society. He incidentally touched on the fiscal question, and pointed out that one important matter affecting the building trade related to how importations, such as steel and timber goods, would be regarded—whether as raw material or manufactured goods.

The toast "The Architects and Surveyors" was proposed in fitting terms by Mr. J. B. Whitehouse, and Mr. Arthur Harrison and Mr. Anthony Rowse responded on behalf of the architects and surveyors respectively.

Mr. A. S. Smith, the new president, proposed the toast "National Federation of Building Trade Employers of Great Britain and Ireland," and referred to the excellent work which had been performed under its auspices, especially during the past few years.

The toast was well received, and response came from Alderman John Bowen, the ex-president of the National Federation, and Mr. C. H. Barnsley (president of the Midland Federation). Mr. Bowen explained that for the last two years their organisation had been federated—a circumstance which he hoped would prove beneficial to the trade and the community at large. He believed it to be a step in the right direction.

The other toast honoured was that of "The Visitors," submitted by Mr. George Squires and Mr. Fred Jefferson.

At intervals vocal selections were given with much acceptance by the Moseley Quartette.

DURESCO

THE IMPROVED WATER PAINT

For the Treatment of Walls and Ceilings, either for Plain Work or Artistic Decoration.
Dries Flat and is not Absorbent like Common Distemper.

SEE BOOK OF 28 DESIGNS, by W. J. PEARCE, PRICE 2/6, POST PAID.

PETRIFYING LIQUID

THE STONE PRESERVATIVE.

This Material has now been extensively used for over Sixteen Years for Arresting Decay in Porous Stone and Brick Buildings, Monuments, &c.

CHARLTON WHITE (ZINC) OIL PAINT

NON-POISONOUS. CHEAPER THAN WHITE LEAD.

THE SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

The Architect.

THE WEEK.

THERE has been some excitement in Paris, which news-
correspondents have communicated to other parts of
the world, concerning the "sensational discovery" of M.
REDON, the architect, that the Louvre extends for more
than 24 feet below the present ground level. He has
described the building as a colossus which is buried up to
its knees. M. REDON considers that PERRAULT and his
contemporaries were guilty of a gross act of vandalism in
digging and abetting the burial of the ancient palace. The
excavations have brought forgetfulness to as much perfection
as it were an art. Not quite twenty years have elapsed
since a predecessor of M. REDON, the late M. GUILLAUME,
effected a similar discovery. A correspondent of *The*
Architect, writing on June 13, 1885, gave the following
account of the subterranean part which he was privileged
to visit:—"On Tuesday the place was lighted by
candles, which were held by attendants, and probably
can only be visited under special conditions. It
is evident from the columns and remains of groins
that there was a great hall on the site, and judging
from the masonry it may be considered to have been erected
in the thirteenth century. There have been many altera-
tions about the Louvre in the course of six centuries, and
though it is now so much below the ground level, the
roof of the hall may have been a few feet above the level
of the Seine. A large circular opening suggests an *oubliette*,
which recalls the legends of the Tour de Nesle on the other
bank of the river, which has been supplanted by the respect-
able building of the Institut de France." The discoveries
attributed to arose out of the arrangements for heating the
future galleries. All that M. REDON has done by
digging trial excavations outside the building in another
direction is to confirm the conclusions which would be
drawn by any architect who visited the subterranean part
in 1885. That French architects and archaeologists will
make a noise about the recent "discovery" is not surprising
to anyone who knows how rarely their views extend beyond
today.

IN *The Architect* of September 4 it was stated:—"Unless
administrative changes occur in Paris in 1910, the Eiffel
Tower will share the fate of numerous other structures, and
be sold as old metal. The difficulty of disposing of its
labour of the same age, La Galerie des Machines, sug-
gests that seven years hence there will be a similar scarcity
of speculators, and the tower may continue to dominate
the greater part of Paris." That likelihood has been
strengthened. The Society of Civil Engineers, possessing
influence in France, has protested against the removal
of the two structures, which exemplify in a remarkable way
what can be done by means of steel. It is also noteworthy
that M. PASCAL, the French architect, and a member of the
Society, has sided with the civil engineers. There will
frequently be a contest between those who consider that
the Gallery of Machines will prevent the realisation of
M. LOUVEAU's project of a fine park and other improve-
ments and those who are inspired by utility alone.

EVERY visitor to Edinburgh is aware that the city
possesses not only one Acropolis, but two. On one side
the Castle, crowning a rocky hill; on the other, the
Calton Hill, are the uncompleted National Monument,
which was to be a copy of the Parthenon, an Observatory,
monuments to DUGALD STEWART, PLAYFAIR and
others. It is to be regretted that so noble a site does not
contain some grand structure that would be suggestive of
the art or literature of the Scottish Athens. The Royal
Academy, which is one of the buildings which were made
the subject of the departmental inquiry, or the adjacent
National Galleries, should have been erected there if archi-
tectural effect alone was considered. FERGUSSON, in speak-
ing of the former building, which he greatly admired,
said:—"The great defect is its situation, being so low as
it looked down upon from the approaches either

in front or rear. From George Street the spectator
is on a level with the cornice, and so loses all
effect of perspective, and from the Castle Hill he
has a revelation of skylights and chimney-pots sadly
destructive of the illusion produced by the purity of
the external architecture. Placed on the Calton Hill, or
on any height, it would have been one of the most faultless
of modern buildings. Where it is, it fails entirely in
producing the effect which is due to the beauty of the
design." It will be found in the report of the evidence of
Mr. HONEYMAN, R.S.A., in the present number, that there
would be an opportunity to remedy the mistake made in
the selection of the site by re-erecting the National
Galleries on the Calton Hill. The two buildings on the
Mound being in Classic style lost much of their importance
when the Scott Monument and the Royal Bank of
Scotland were erected in the neighbourhood. But the
elevation of the buildings in Princes Street and the immense
structures erected in connection with the improvement of
Waverley station have rendered it still more difficult for two
Classic buildings of a single storey to assert themselves.
On the Calton Hill either or both would have a chance
of appearing effective when seen against the sky. Any
difficulty there is in approaching the summit could easily
be diminished by an improvement of the roads.

WHEN we published our first illustration of the Indian
scenes of Mr. EDWIN LORD WEEKS we pointed out the
strangeness of an American painter utilising so vast a field
for subjects which English painters ignored unless they
were sent out to India on a public commission. His works
were always viewed with interest in the Salon. The sub-
jects were novel to Frenchmen, and no brighter colouring
was to be found in the works of any of the French artists
who treated Oriental subjects. Sometimes, as in his
Three Mendicants of Cordova, he suggested the relationship
between scenes in India and in other lands where the sun
triumphed. It is with sincere regret we have to announce
that Mr. WEEKS will no longer enrich the world with his
works, for he died a few days ago in Paris, where he
resided for the greater part of his life. He was a native of
Boston, and he owed his selection of subjects and their
treatment to the instruction received from M. GERÔME
and M. BONNAT. He was deservedly recognised as one of
the ablest of the band of American artists who have con-
stituted Paris their home. His death was due to the con-
sequences of a fever which attacked him in India.

UNLESS wood pavement is kept in the cleanest state it
may become injurious to the public health. An apprehen-
sion of that kind has been an obstacle to the use of blocks
in many places. The question was raised in the Court of
Appeal on Monday whether cleaning might not be carried
to excess, or, in other words, an unnecessary quantity of
water be employed in the operation, and therefore mainten-
ance became more expensive to the contractor. The pave-
ment of Westminster has been for some time a subject for
newspaper criticism, and one of the latest incidents was an
application to Mr. Justice PHILLIMORE for an injunction
on behalf of Mr. ALCOTT, the contractor, to restrain the
Council from watering excessively the pavement laid down
in Whitehall. His lordship having refused, an appeal was
brought. The plaintiff was to maintain the pavement he
had laid down for the long term of fifteen years, but under
varying conditions. For the first three years all the repairs
were to be carried out at the plaintiff's expense. He
asserted that the blocks were never allowed to become dry
and that the concrete foundation was softened by the water.
By the contract deed the Westminster Council were allowed
to wash the pavement, and indeed it would be strange if
liberty of that kind was withheld. The Master of the Rolls
affirmed that the case was not one in which the Court
could interfere in the form of an injunction. It was a
question of damages which must be fought out unless the
parties could arrive at some solution of the difficulty. The
case is important, and it is to be hoped that the proposed
application to the Lord Chief Justice to have the trial
expedited will be successful.

GERMAN SCHOOLS OF BUILDING.

IN the discussions relating to technical education which are now common, it is not sufficiently recognised how wide is the difference between the school or college system and the system of apprenticeship. There are some advocates who would have the latter superseded by the former. There are others who would combine them. There is a third class who still favour apprenticeship, especially when it can be supplemented by occasional attendance of technical classes.

In the evidence of Professor FREDERICK BROWN, of the London Slade school, which we published last week, he said that he preferred to have his students caught young, for "it is much better that they should know nothing than come with ideas that are all wrong, which is generally the case." The meaning was that the methods adopted in other schools were not appreciated in the art classes of London University College. The heads of many business establishments would agree with the Professor. Turn-over apprentices have a hard life and are rarely welcomed, whether they find their way into architects or engineers' offices or builders' workshops. In other callings we see the same belief that instruction of any kind is not of uniform excellence in all places. We even can hear it among representatives of regiments and crews of the Army and Navy.

When, therefore, people speak about the superiority of a foreign method of training, or *vice versa*, it is possible that only partial views are taken of the students, and there is no real comparison between the finished products. For instance, it would not be difficult to meet with a student who, after being only a few terms in a technical school in Germany, could calculate the diameter of a gas-pipe that would afford light to a single room, and the result would be worked out to a remote decimal degree. A student might be double the time in an English architect's office, and yet would be incompetent to set about such a problem. But he would know what sizes of gas-piping are to be had in the market for immediate use, and how far experience has decided the ratio between them and the number of lights required in a house. The German student would imagine, at least until the time arrived when he had to encounter actual practice, that his calculated diameter, with its array of decimals, would be adopted by the builder; and the piping would be rolled or manufactured according to his figures. That is mere ignorance of the conditions of business. Yet an educational investigator who examined the two representatives would feel no hesitation in declaring that the German student was the better, and was eventually more likely to become a thoroughly competent architect. The difference between them arises from theory being adopted in one case as a basis, while experience is the foundation in the other.

If we could suppose the two students arriving in a colonial town, there is little doubt the Englishman would be the more competent to undertake the carrying out of a building. Being aware of the economy of utilising the materials which were to be found in the market, and of adapting his plans to them, the building would be far advanced under his direction before his competitor discovered how costly and tedious it is to have things specially manufactured, and how a slight increase in size or weight has compensatory advantages. Our German might then reflect how few of the great buildings he was taught to admire were constructed by means of data which corresponded with those he had acquired in his college classes. Classic, Gothic and Renaissance structures would all be found to be incorrect if tested by the constructional formulæ which are presumed to lead to perfection in building. It is only the metaliferous piles of the cities of the United States which can be considered as the truest exponents of advanced theories in building, and of the close connection between theory and practice.

There is consequently an impossibility for any collegiate system to properly equip a student to be an engineer, architect or builder. The professors have to deal with examples on a small scale. TREDGOLD'S conclusions about the strength of materials, the dimensions of parts of engines,

&c., led to surprising deductions, especially when we remember the poverty of the man. But they were only misleading, and are now of no use in practice. Doubtless a professor who has gained experience in practice will be able to point out to his students the shortcomings of specimens or of models. But it is only under exceptional circumstances men of that class drift into lectureships, and perhaps less often in Germany than elsewhere. Yet the tendency at the present time is to make technical instruction take the place of apprenticeship.

It may be granted that the old conditions of apprenticeship were onerous. It was possible in the majority of trades for an apprentice if treated fairly to become a competent workman in less than seven years. Instruction, however, was not the aim of the system. Every trade was a close corporation and selfishness dictated that entrance should be difficult. Hence it was that the rules and regulations in England were condemned by that great judge, Lord MANSFIELD, as being against the natural rights of man and contrary to the common-law rights of the land. In some trades the period of apprenticeship was extended to ten years, and it is believed a still longer servitude was occasionally exacted. At a period when all the operations of a trade were performed by hand seven years was sometimes not excessive. A country carpenter or blacksmith of the old school was expected to deal with wood or metal in so many forms, his versatility was not easily acquired. There were no books of instruction to give him hints, and he had to derive his skill mainly by a course of failures for which he was made to suffer. The punishment of apprentices by a master was allowable according to English law. But in our time, when division of labour is adopted to a remarkable extent, and in every trade materials are partly or wholly prepared by the aid of machinery, the seven years' term is unnecessary. One of the causes for its continuance arises from the dislike of workmen to the admission of others on easier terms than were enforced from them.

Equality is one of the objects of English trade unions, and consequently there is no provision in the system which would encourage working men to become foremen or general overseers. As a rule carpenters have been selected in cases of building, and the Carpenters' Company, taking advantage of the custom, hold examinations of would-be foremen; but there is no reason why any one trade should enjoy a monopoly. A carpenter may be longer on a job, but there is no economy in choosing him, for it is only on small buildings he could work at his trade and serve as foreman. In Germany, where military discipline prevails, the haphazard method of obtaining foremen, which was similar to that of England, gave rise to discontent about seventy years ago. Men who were ambitious to acquire the knowledge were obliged to take lessons from private teachers, foremen, or even from architects. Accordingly a building-trade school was founded in Stuttgart in 1832. There are now about fifty such institutions, and twenty-two of them are in Prussia. In some cases they are State schools, in others municipal or provincial schools, or they may be State, municipal and provincial schools combined. Originally most of them were intended to afford instruction in building operations. But as time went on new courses were added, and the majority of them are now building and engineering trade schools. A report by Dr. ROSE, the British Consul-General at Stuttgart, gives particulars of the instruction followed in them.

The literary history of Germany reveals the sacrifices which were made by students who became renowned in order to acquire learning. Everyone has heard of HEYNE, the great Classical professor and editor, arriving at Leipzig to study all learning without having enough to pay professorial fees or to buy a loaf, and he was sometimes compelled to subdue hunger by eating peas-cods he found in the streets. In his eagerness for study he for a time allowed himself only two nights of sleep in a week. The majority of the students of the mysteries of building live in extremely modest circumstances, and sometimes they meet their expenses by working at a trade and studying in alternate terms. Dr. ROSE supplies tabular information of the average expenditure of a great number of students. The following relates to the winter term, which lasts about four and a half months:—

Items of Expenditure.	Amount.	
	From	To
Simple room, board, heating and service, 2l. 5s. to 3l. per month	10 0	13 10
Drawing materials, &c.	1 15	2 5
Pocket-money per month, 10s. to 13s.	2 5	3 0
School fees	1 10	1 10
Various	0 15	1 0
Total	16 5	21 5

The next is an approximate estimate of the annual (or for two terms) expenditure at Stuttgart:—

Items of Expenditure.	Amount.
Fees for two terms	5 0
Drawing materials, books, &c.	3 0
Combined bed and sitting-room and board for two terms of from 4 to 4½ months	27 10
Coals, light and service	3 10
Miscellaneous	11 0
Total	50 0

The Stuttgart school has three sections, viz. building, engineering, surveying and drainage and irrigation. There are twenty-nine professors and thirty two assistants, or masters for special subjects, making in all a staff of sixty-one teachers. Out of that number ten professors and four assistants deal with building and architecture. There are six successive classes for building besides a preparatory class, and the average number of hours varies from forty to forty-six per week. The subjects taught in the preparatory class are German, physical geography and history, arithmetic, geometry, geometrical drawing, freehand drawing and calligraphy. In class 1 algebra is substituted for arithmetic, stereometry for geometry and geometrical drawing, and building drawing for physical geography. In class 2 descriptive geometry, physics and chemistry are introduced. In class 3 are mathematical exercises, theory of the strength of materials, graphical statics and building construction. In class 4 perspective, building materials, supervision of building operations, general details of buildings, building styles, designing of buildings and modelling of ornaments are treated. In class 5 firing, heating and ventilation; road and bridge-building and book-keeping are new subjects. The tasks for class 6 are the following:—Mathematical exercises, stone-cutting, building mechanics and construction and designing of same, designing of buildings, building estimates, building laws, exercises in road and bridge-building and prevention of fires. As each class takes half a year, i.e. a hundred days' actual work, to go through the curriculum, in those schools where the instruction is given during the winter months only the course would extend to six years, but where there are summer and winter courses the duration would be three years. There is a supplementary inspection of buildings in the neighbourhood of the school. Sometimes more distant excursions are organised which may extend to a week, and the travelling expenses are defrayed by the school. If the students can show certificates of a satisfactory preliminary education they need not pass through the elementary classes. As the monetary condition of the majority of students is realised, they are not required to attend the classes in uninterrupted succession. The breaks are allowed in order that they may earn money. For the same reason building instruction is generally given in winter to enable the students to engage in actual operations during the summer. Additional consideration is shown when the students are clever but very poor. In the winter of 1902-3 no less than 270 pupils were dispensed from the payment of fees in Stuttgart. The King of WÜRTENBERG and the Freemasons have established scholarships. As the fees are only about 2l. 10s. per term, or 5l. a year, a student who can live with his family in Stuttgart is happily placed. Having passed examinations and obtained a diploma, a student becomes eligible for an official appointment or can find work in other forms.

The number of students in the winter term 1901-2 was 1,049, of whom 915 were natives of Württemberg, 95 belonged to other German States, and 39 were foreigners. Some of them went through courses of engineering, sur-

veying and drainage, but 458 are described as masons and stonehewers, and 165 as carpenters. It is remarkable how many of the students already possessed practical knowledge. In the returns, 172 were described as building overseers, foremen and draughtsmen; 673 had served apprenticeship in some technical branch, and 166 were apprentices, while 38 had already received certificates of the "Techniker" class. The larger number of the students ranged between twenty and twenty five years of age. Of these there were no less than 377. The lowest age was 14½ and the highest 35½. The principal professors' salaries are 200l., 220l. and 240l. per annum, and 15l. for house rent; 3l. per hour per week is received for every extra hour beyond the limit agreed upon in the contract of appointment. The assistant professors are paid 3l. per hour per week of instruction given. Thirty hours per week would accordingly yield 90l. per term and 180l. per annum. Assistants obtain 100l. to 115l. per annum, together with 10l. for house rent. The pension for professors is 40 per cent. after ten years' services, 60 per cent. after twenty years, and 90 per cent. after forty.

In the Karlsruhe school there is no department for surveying as at Stuttgart, but railway technical science is taught, and there is training for students who wish to be masters in industrial schools. It has also been arranged to open a section for electro-technics. The fees are only 1l. 10s. per term, or 3l. per annum for all subjects, and some students are exempted from paying those modest sums. The Nuremberg school gives instruction from November 22 to May 31. The remainder of the year is devoted to practical work in connection with the school. After a couple of years manual work is not insisted on, but the students are expected to obtain engagements as draughtsmen or assistant overseers. The fees are 1l. 16s. per term. As the school cost in 1900 5,891l. and the fees amounted to only 816l., the State, province and municipality were obliged to subsidise to over 5,000l. There are twenty professors and twenty masters. The programme of instruction is very extensive, and includes not only design and construction, but building legislation, regulations and commercial book-keeping. The fees of the Prussian schools, according to Dr. Rose, are higher than those of other German building schools. They amount to 4l. per winter or summer term, or for the preparatory classes. A further fee of 1l. per term is levied for the use of drawing-boards and materials, of writing materials, of technical instruction books and for medical treatment during illness. Foreigners are required to pay five times more than Germans.

The interest taken in building by German Governments requires no great astuteness to explain. In the first place, it is considered desirable to exercise as much control as possible over all classes of business, and foremen or overseers who hold Government diplomas, and by whom official appointments can be acquired, are likely to be loyal to authority. Then, again, it is well known there has been a very earnest competition for the favours of the working classes, in the expectation of outbidding communist leaders. A circular issued by the Prussian Government in 1877, urging the erection of building-trade schools and promising State contributions, explained the new zeal by saying that the majority of builders, building foremen and overseers were either unwilling or unable to give the workmen and apprentices any other than a purely manual instruction. There were several private building-trade schools, but so important a branch of instruction should not be left to private speculation, of which the results had not always been of a satisfactory nature.

As it was not intended to scare the workmen by too extensive a programme, a course of three successive classes was arranged. The German master-builders, however, appealed to have it lengthened to four courses, in order that more proficiency in the designing of buildings could be acquired. The meaning of the move is that builders are now able to obtain designers who possess a knowledge of building construction on much lower terms than would have to be paid to a young architect from one of the technical high schools or universities. The architect's work in Germany seems therefore likely to be restricted to important buildings, whilst those of an ordinary class will be designed and superintended by students of the building-trade schools.

RATING OF PROPERTY.*

THE list of law cases referred to in Mr. FARADAY'S volume fills nineteen pages. If all those which have been heard in various courts relating to rates were printed in a list, nineteen hundred pages at least would be required. The manner of determining the value of property, and therefore the amount to be paid in rates is so lax, and there is so little uniformity in different places, it is surprising that litigation on the subject ever ceases. According to JOHNSON "a rate is a tax imposed by the parish;" and now as well as formerly the word "imposed" does not always mean fairly assessed. New candidates for office generally profess to be advocates of economy, and resolved to bring down the rates, but they sometimes suggest in a friendly way to voters that they would be able to reduce the valuation of particular premises, for where is the occupant or owner who believes he is fairly treated?

It would be an advantage if the property of the country could be valued by men who have been specially trained for such work. The Poor Law Amendment Acts give authority to guardians to appoint a competent person to assist the assessment committee, and the remuneration is to be derived from the common fund of the Union. But, as is pointed out by Mr. FARADAY, "it would appear to be necessary where a valuer is appointed by a Union to value certain properties in that Union that he should have a separate agreement with the guardians for each parish in which the property he is valuing is situated." This is enough to show how easily obstacles can be raised to valuing on a definite basis. One reason is that in old times the value of property was supposed to be a matter of common knowledge in a parish, and the variations which might arise were never much above or below an average. The custom is suggested by some of the enactments framed with regard to taxes payable to the king. Thus, in the reign of EDWARD III. an Act was passed for the creation of "commissions of review," who were to go through the country in order to ascertain whether the levies in money were obtained without abatement, or if any were passed over. It was then commanded that "from henceforth the people shall be taxed after the old manner, and not otherwise." In fact, it was a principle of the law of England that no one was to be twice charged for his property. To attain that end local knowledge was reckoned preferable to any skill a stranger might possess.

Rent is assumed to be a sufficient standard for adoption for valuation purposes. But efforts are often made by those who have to fix rates to compel a tenant to pay on a higher basis, on the ground that the rent then paid was fixed by considerations which should be taken into account, for they were not altogether just to the Union or parish. If the rent paid by a tenant at an earlier time was higher, an endeavour is made to assess on that amount. Or it may even be stated that by fully utilising the property it would be easy for an occupier to derive from it far larger sums than those required to meet an increased taxation. The judgment which was delivered by the late Mr. Justice LUSH should always be kept in view when such cases arise; or, in other words, the present value is to be considered rather than the past or the future. According to his Lordship:—"The rateable value of property is not to be determined by what it once was or may hereafter become. If a piece of fertile land were to be covered by the ashes of a volcano or by an inundation, it would have no rateable value so long as it continued in that condition. So also, on the other hand, a barren rock, so long as it remains a barren rock, has no rateable value, but the moment it is worked as a quarry it becomes rateable. The rateable value of property must be determined by what it is at the time the rate is made."

It would be useless to question the equity of the adoption of house-rent as a standard of income. MILL maintains that no part of a person's expenditure is a better criterion of his means, or bears on the whole more nearly the same proportion to them. "A house-tax," he says, "is a nearer approach to a fair income-tax than a direct assessment on income can easily be." But circumstances which

are not easily defined often compel people to live in residences which are more costly than prudence would dictate. About half a century ago the then Duke of DEVONSHIRE is reported to have said that he could not afford to live at Chatsworth for longer than a month in the year, and many agents and surveyors assert that large houses are always obtainable on cheaper terms than those of moderate size. The outcry raised on the discovery that at one time houses like Belvoir and Chatsworth were rated at not more than 200% a year was therefore not altogether justified. In the same way the ground-rent is sometimes supposed to bear an insignificant proportion to the rent of the building, and that it falls always on the landlord. But it will be found that a leaseholder, in addition to his annual ground-rent, often pays a sum equivalent to what would be required to change the building plot from a leasehold into a freehold. This is easily managed. When the sites are "eligible" a speculative builder is sure to add to the cost of erection a liberal sum to represent the advantages of the position, and which is all profit to him. The building-rent and the ground-rent in reality differ from what the economists mean by those phrases.

The old-fashioned system of regarding rent as a basis hardly corresponds with the arrangement now enforced, by which all houses from 40% upward are treated as one class. As Mr. FARADAY points out, "there is a maximum rate of deduction from the gross value or rental value to arrive at the rateable value, and notwithstanding that the Act says that the rate of deduction shall not be more than it provides for, there is no clause which says it shall not be less."

The assessment of houses is exceedingly simple, and on that account when a poor rate was first established it was not anticipated there would be any difficulty in determining the valuation. But in the course of time buildings were erected for purposes which were unknown in the Elizabethan period, and their assessment demands considerable judgment on the part of valuers. In theatres, for instance, there may be boxes which are held on lease and which have to be treated as separate properties. Some charitable institutions are only nominally rated. But hospitals are assessed by a percentage on their structural value and a percentage on the value of the site. Private lunatic asylums are valued at a high rate; and what seems most extraordinary, workhouses, which may be considered as representing a part of that provision for the poor which originated rates, are not necessarily exempt. Indeed, the apparent anomalies are so numerous it is strange that the assessment of property should ever be allowed to be conducted by ordinary shopkeepers, who in the majority of cases prepare lists without any professional aid.

Mr. FARADAY'S volume justifies the promise of the title, for it deals with "Principles, Practice and Procedure." It is comprehensive and an earnest effort is made to impart some unity to subjects which are sometimes regarded as too diversified for classification. He has had the assistance of Mr. VULLIAMY, who is a solicitor, and has been long engaged with the duties of assessment. It will be found a most useful addition to a practitioner's library, as well as to land agents and others who are connected with rateable property of all kinds.

NEW NATIONAL GALLERY, EDINBURGH.

THE following evidence relating to the inadequacy of the existing National Gallery and the necessity of the erection of a new building was given by Mr. John Honeyman, R.S.A., before the departmental committee of the Board of Manufactures:—

You have come forward to give evidence on behalf of the Royal Scottish Academy, I think, specially with regard to the question of space for the collections?—Yes.

I may take it, from what we have seen ourselves to-day, that there is practically no room for expansion, even if there is sufficient room for the existing pictures?—That is my opinion.

What would be your view as to how the extra space should be acquired?—There are three proposals made by the Academy, one of which is the erection of new galleries on a new site. Another is the making of an addition to the present gallery, and the third is to give the building to the south to the National Gallery, and this building for the use of the Royal Academy.

* Rating: *Principles, Practice, Procedure*. Second edition. By Philip Michael Faraday. The legal matter revised by A. F. Vulliamy. (London: *Estates Gazette*, Ltd.)

Turning this building in which we are now into galleries?—Yes, gutting it out entirely and turning it into galleries. I think it will probably be considered for your convenience if I strengthen my evidence as much as possible and not go into details of detail very much, unless I am asked.

Certainly, if you give us the general lines, and if members of the committee wish for further information they can ask for the details?—Well, I have come to the conclusion, after very careful consideration, that neither of these latter proposals should be entertained.

The latter proposals are those dealing with this building?—The second and third—that we would require to fall back on the first, that is, the erection of a building for the National Gallery on a site where expansion would be possible. My view is that for the purposes of such a building, as has been abundantly proved—especially in London, where enormous sums have been expended to gain a little addition from time to time—it should be an essential condition that the possibilities of the future should be provided for, especially with the hope we have that under better conditions the National Gallery will grow at a much more rapid pace than it has hitherto done. It seems all the more essential that provision should now be made for its extension to a very considerable extent, so that the site might be retained probably in perpetuity without difficulty. There is another objection to the conversion of this building which I might just refer to—to the gutting out of this building and spending a lot of money on it—that after all it would be merely a temporary expedient which would not be worth the large expense involved in doing it, and also that there is some doubt in my mind about the advisability of spending much money on this building, because it is a very well-ascertained fact that the foundations are not in a satisfactory condition. It rests on wooden piles; it depends on them at all events chiefly, and these have reached a stage of decay in which we may expect the progress of decay to become much more rapid.

It takes it incidentally that this building is not fireproof?—No, it is not fireproof.

And it would be desirable in housing a National Gallery of pictures that the building should be fireproof?—Yes, so far as possible—indeed, it is quite practicable; it would be decidedly practicable. Without touching further on the existing arrangements, if there were no other reason for going out, there is, I think, that it is quite impossible to add to the National Gallery any other you house it in the present building or in this one here and convert this for its use. I may pass on to say that an idea occurred to me which would probably meet the requirements of the case, and also conduce to economy in the first instance, and that is to remove all this building entirely to the Calton Hill, and transfer the location of the National Gallery to that position. It is a very superior position in every respect except one, and the objection to removing the building is purely a sentimental objection. The Calton Hill, from our point of view in Glasgow, at all events, is a very central position. We are accustomed to greater distances. The Calton Hill is within ten minutes' walk of the very centre of Edinburgh, and the very centre of bustle and traffic in the neighbourhood of the Post Office and Register House; and even if you take the boundaries of Edinburgh, which now extend to Portobello and almost to Corstorphine, and from Calton Hill to the very south side of Morningside, the position is very centrally, and entirely different from what it was as I can well remember Edinburgh more than fifty years ago, when the prevailing notion was that it was a very out-of-the-way place. In fact, it is not. It is a place of easy access, and it would be entirely free from a disadvantage which exists at this place here, and that is the dust from the road, which almost circles the buildings, and the smoke and the dust from the motive engines passing below. There are none of these objections to the Calton Hill, and there is ample ground there to transfer this building, which would save a great deal of expense in the erection of a new building, and would preserve the building which is justly appreciated by everyone in Edinburgh. It would also effect a very great improvement here in the part of Princes Street, which might be a consideration to some of those interested. This building was rather a prominent and important building when it was erected, but at the time there were few houses west from here, unless in Princes Street, and the houses that did exist were two-storey houses—ordinary dwelling-houses with areas in front of them—and therefore this was a very imposing building, but now it is entirely overshadowed—and dwarfed, in fact—by those enormous hotels and drapery establishments which go along the other side of the street. That has imparted a rather degraded and low appearance to it, and therefore it would be a very great improvement if it were raised to what might be called a more dignified position, where it would look down upon those buildings; and it would also have the effect of opening up the full vista from west to east of Princes Street, which is now obstructed for a considerable distance by the presence of this building. It would also improve the facilities

for traffic along the front of it, which projects awkwardly into the street. That is a thing which I see no difficulty whatever in doing. The building, stone for stone, could quite well be transferred to that site at the Calton Hill.

May I ask, incidentally, to whom does the Calton Hill belong?—I am not sure.

Would the site have to be acquired?—I have not the least doubt it could be acquired from the Corporation. I think they are the proprietors or custodians.

Do you think they would place the ground at your disposal?—I think they certainly would, in exchange for the very great improvement that would be effected here. I have no information on that subject, but I assume that that would be the case. If this building were properly cut up into galleries that would provide not far short of double the accommodation the National Gallery has at present, and that would certainly do for some years, and it would be permanent. The money spent upon it would not be merely for a temporary expedient. So far it would be absolute gain, and if the circumstances required, of course it could be extended there to any extent. It would make ample provision for all the growth of the Academy for this century, at all events, and perhaps for ever.

You would place in the new building you suggest on the Calton Hill both the Academy and the National Gallery?—No. I beg your pardon, I should have said only the National Gallery.

Because you mentioned the word Academy?—It would leave it practicable to give the whole of the existing building to the Academy.

Would you house the Royal Society in the building on the Calton Hill?—No. That would hardly suit the members, I am afraid; but I must say I have not much sympathy with the Royal Society. I think they are quite in a position to do what the corresponding Society in Glasgow did a good many years ago. The Royal Philosophical Society of Glasgow, which is quite a similar institution, built a place for themselves, and they did so without any Government grant or without any assistance of the kind, whereas I understand the Royal Society has a yearly grant of 300*l*.

They pay 300*l* a year for their rooms?—Yes, I think they probably apply it in paying the rent of the rooms; but with such a subsidy they ought surely to be able to provide a place for themselves if the other Society could do so a good many years ago without any subsidy at all, because, of course, the 300*l* would be a very great advantage in the way of money negotiations in doing a thing of that sort. Therefore, for my own part, I think it would not be advisable to allow any consideration of that sort to interfere with the proper accommodation for art purposes in Edinburgh.

Don't you think that the Royal Society of Scotland should be housed in a public building?—The Royal Society of Edinburgh.

Well, it occupies rather a different position, and has always occupied a different position, from the Philosophical Society of Glasgow?—Nominally I admit it does.

And in the general opinion of scientific men too?—Yes. I do not mean to differ from that opinion at all, and it has also a sort of prescription, you may say, in having accommodation here for so many years. All these things, I quite admit, are worthy of consideration, but at the same time my position simply is that the mere question of giving them accommodation, when it could be got elsewhere, should not interfere with carrying out a great and beneficial change in regard to the other institutions.

What would happen to the schools that are carried on in this building at present?—The schools, I think, are generally admitted to require more drastic treatment. That is to say, there must be some other institution for the tuition in art than exists now, properly organised and properly equipped according to modern ideas, and that could not be done here.

And that would require fresh buildings elsewhere?—That would require fresh buildings.

Then your claim is one of financial magnitude?—Yes, if the building of a school of art is connected with it; but that is a matter that is required in Edinburgh quite apart from anything that is done here, and quite apart from anything that is done by the Board of Manufactures. It is generally admitted to be an absolute necessity.

Don't you think there would be an irresistible outcry about such a proposal as to take down this building and cart it away to somewhere else?—I do not think so.

As matter of fact, in spite of its being surrounded so closely by the buildings of Edinburgh, it is a very famous example of a famous architect, and it has been very much admired in its time. Do you think it would be practically possible to carry through such a proposition as you make, to take it down and build it up somewhere else?—I do not contemplate destroying the building, but preserving every bit of it, and preserving it really on a better foundation and in a very telling situation.

But don't you think that in the present state of opinion such a modification of the outline of Edinburgh, and such

drastic treatment of a building which has been known to two or three generations of people, would be opposed so strongly that it could not be carried out as a matter of fact?—I think it would be opposed by a certain section, but I think the more it was looked into the better chance there would be of people agreeing to it. For the purpose of giving an indication of the treatment that could be made of the site, I have prepared a rough block sketch which I have no doubt you, Mr. Chairman, will at once understand. The idea would be to sweep this building away entirely, and treat the space between Princes Street and the building on the south side of the Mound (the present Royal Academy and National Gallery) symmetrically, taking the centre of that building as an axis. That leaves the road up the Mound untouched, and the boundary of Princes Street Gardens untouched, and there would be just a clear space between Princes Street and the National Gallery building, which would then have a very good effect, and the vista along Princes Street would be enormously improved. You would see the Scott monument from a much greater distance west, and you would see west from a much greater distance east. If people look at the thing as it actually stands, and imagine the change, I think they will see that this building has got out of its intended position altogether.

Still, its transformation into a National Gallery would involve the displacement of the Board of Manufactures, or whatever succeeded it, and it would involve the displacement of two schools, and it would involve the displacement of the Royal Society of Scotland, besides the building itself?—These would all be displaced if the third proposal were entertained, that the National Gallery should have the whole of the building behind, because you would require to make a clean sweep of the inside here to provide galleries for the Academy.

That is, if you remove this building for the purposes of the National Gallery; but would not all these requirements be met if a new gallery could be built, giving the space occupied by the National Gallery to the Royal Academy, and leaving this building for its present purposes?—Yes, that would equally well solve the difficulty.

It would solve the difficulty the same as your scheme would do, but you say that yours would add to the public improvement of Edinburgh?—Yes.

But so far as the committee are concerned, in making a recommendation for the benefit of the galleries of Scotland, surely if, for the sake of argument, a National Gallery were erected on the Calton Hill, and this building left to its existing purposes, and the place now occupied by the National Gallery handed over to the Royal Scottish Academy, you would have all you wanted?—That would meet all we want.

And a building on the Calton Hill, on that supposition, could be adapted to the Calton Hill?—Yes.

And we would not be tied to having buildings suitable to one site and not suitable to another site?—No; that has much to recommend it from an architectural point of view as well; but my suggestion was rather with the view of economising to some extent, as we have been rather pushed for money to carry out improvements in Scotland for a good many years, and also with the view of preserving this building and putting it in a more telling position than it is placed in now. It is very much overlooked and dwarfed by the existing buildings here. But, so far as we are concerned, what you suggest would amply satisfy us.

Would there be very much difference in the cost of taking down this building and removing it, and putting it up again on the Calton Hill, compared with building a new building with similar accommodation on the Calton Hill?—Not a very great deal, not many thousands.

Do you think there would be any at all?—Yes, there would be some, every stone would be used.

But the whole structure would have to be reconstructed, because the arrangement of the rooms at present would not be suitable for a National Gallery?—Yes.

You save a lot of hewing?—Yes, a building of this character, with all its columns, involves an enormous amount of hewing, and that would all be saved.

But you would not necessarily put a copy of it on the top of the Calton Hill?—Certainly not.

Can you tell us anything more about the foundations; that struck me as very important?—In regard to that, I may say that some years ago, in conversation with Mr. Stevenson, C.E., of the Northern Lighthouses, he told me that this building—in fact, both these buildings—were a source of constant anxiety to him. He was never sure of what was going to happen next. There was always some settlement appearing or some difficulty about the foundations; and I have since heard that idea confirmed by statements that were made to me in Edinburgh by architects and others.

Who is the architect in charge of these buildings now?—The Stevensons were employed professionally.

Was this communication in recent years?—Within about ten years.

Of course in early days there was a good deal of trouble with the foundations?—Yes, this corner was rebuilt not long ago, and a foundation of piles is not an easy thing to put right—to extract old piles and put in others with a proper bearing. Still, if the building is retained here for its present purposes, it may last for a great many years just as it is.

Does the Calton Hill afford a good site for a National Gallery?—I think it does. It affords many advantages.

You mean as to space?—As to space and prominence because every stranger almost goes up to the Calton Hill, and the National Gallery would be kept in sight, as it were, in a very prominent way, and it would be no trouble for anyone visiting Edinburgh to get up. The approach might be improved, but even as it is, it is no great matter.

I have stepped it, and there is space between the National Monument and the east side of the observatory?—It would be possible architecturally to group it with the National Monument if there was a chance of the building being built, but I do not think that would be advisable, and it would not interfere with the building at all. There would be plenty of room for it, and no necessity for interfering with the picturesque look of the Hill as it is.

It might add to it immensely?—It might add to it immensely, building a proper gallery there.

I was going to ask whether, if the Academy were to obtain possession of the whole of the buildings, which they have no part of, much alteration would be required?—None would be absolutely required, but there is an objection to these octagon rooms. It would be more convenient to have them square but that is a mere matter of having partitions run across the corners. There would really be no necessity for any alteration. Another idea that occurred to me was that in the event of the National Gallery being transferred to the Calton Hill the offices of the Board of Trustees might still be in the building up here. It would be more convenient to the members of the Board to have their offices there—that is, the space occupied by the sub-curator now. That could easily be made into offices for the Board of Trustees.

The departmental committee, in their report, say:—Having asserted the need for a new National Gallery we felt bound to indicate the sources from which the money should come for its construction. It has already been pointed out that the Board of Manufactures, out of savings from the annuity under the Treaty of Union, built the Royal Institution at a cost of 47,000*l.*, contributed 20,000*l.* towards the cost of building the National Gallery, and has expended out of its capital on these buildings and the National Portrait Gallery large sums. In London and Dublin the expenses for buildings and for extensions of buildings for the national collections have been defrayed from the public exchequer; and Scotland might quite fairly claim that her new National Gallery should be built out of public money exclusively. Still we are prepared to suggest that, in the event of our other recommendations regarding the National Gallery being adopted, a sum of 20,000*l.* might be advanced from the accumulated capital of the Board of Manufactures towards the construction of the new gallery, the rest of the cost to be borne by the Exchequer. We have no doubt that the Town Council of Edinburgh would be very generous towards providing a site for the new National Gallery as they were fifty years ago towards that of the existing one.

We would only make this addition to our recommendation. A National Gallery will take several years to build. The want of space, already noticeable, will be more keenly felt year by year. We would strongly urge, therefore, that steps be immediately taken by the Board towards the acquisition of a site and the commencement of the construction of a new National Gallery.

RECENT DISCOVERIES AT KNOSSOS.

ON Tuesday Mr. Arthur Evans addressed a meeting of the Hellenic Society on "The Last Campaign at Knossos." During the last season he had expected that the work would be finished in a month or two, but there were unexpected developments, and he lighted on the remains of outlying buildings adjacent to the palace. These proved to have been structures of an earlier period, and constituted interesting additions to the first discoveries. There were some closed one or two houses apparently of high officials of the court. On the north-east side of the house there was a characteristic room with a square pillar in the middle. There was also a window in the outer wall, and on the portals he discerned a beautiful fresco of lilies. There was also a space of porphyry or similar material, and close at hand a wall-painting of olive or myrtle sprays. At the back he found a columnar chamber on the floor of which was a quantity of curious pottery which appeared to have been dedicated to sacred purposes. The house itself, with its double colonnade, was in fact a kind of miniature of the palace. On the north-east of the palace there was a sort of royal villa. The site

hill was tunnelled, and going through the passage he struck on a stone staircase from which two smaller staircases branched off. More searching investigation disclosed a perfect Minoan house, the elevation of which might be seen in elaborated detail on the screen. The main entrance was from a terrace above, and traces of upper storeys were discernible. There was also a noble doorway which led direct into the largest hall of the palace. This system of open halls which might be shut off at will secured coolness in summer and warmth in winter. One of the most remarkable features was a recess in which were found the remains of a throne—indeed in these early times there were many of the features which marked a Christian basilica. It was clear that this tribunal was a seat of honour. An elaborate system of lighting had also been devised. There were other rooms which, like the one to which he had referred, had a pillar in the centre. The roof was made of timber more massive and solid than any now found in the island. Many interesting objects were found in the house—among them, vases of a wholly different character from those in the palace itself, and wall-paintings of designs like those of the vases. Two of the latter were specially beautiful, with papyrus relief forming good examples of the later palace style. The house itself was built against the rock, and in it there was a system of corridors, light wells and other arrangements for excluding the damp. There were marked evidences of the careful attention bestowed on sanitation by Minoan builders. During the season pits were sunk, and they came to a lower pavement and a large stepped area. The remains were in a decayed condition, but the line of the outer wall could be made out and the general dimensions were fairly ascertained. The stepped area was, it would seem, a primitive theatre, though it was hard to conjecture the character of the performances. A dance of the workpeople was given in the course of the work, and they danced in wandering fashion, recalling the maze of ancient days. The entertainments could hardly have been bull-fights, but there was probably boxing. Near at hand were very singular miniature frescoes of gaily dressed women. Close by was a building of great complexity of wall, and on the ground were many objects illustrating the local cult of the double axe. A group of fine bronze vessels was also found with a foliated design and motifs of an Egyptian style not unlike those of Thothmes III. The ornament was of a lotus and papyrus development. On a lower level were vases of an earlier period, which might perhaps be assigned to the third millennium B.C., when Crete was in communication with the Egypt of the twelfth dynasty. This might be termed the middle Minoan period, and the work was of elaborately beautiful design. There was also a deposit of earlier times, which might be called Early Minoan, ranging from the sixth to the eleventh dynasties of Egypt. The ware was incised, and appeared to fit on with late Neolithic work. There was altogether a depth of about 25 feet of deposit at Knossos of different periods. The remains of the earlier period appeared to have been deposited, probably after some revolutionary movement. It might be stated with reasonable probability that the latest part of the place was of the date of 1500 B.C. Many of the objects appeared to be religious emblems, and the goddess and the lions frequently appeared. These were found in what might be presumed to have been a sanctuary disclosing the relics of a shrine. The pottery was like the early work of Melos. The religious character was found on many of the seal impressions in which the goddess and the lions were seen and snakes held in the hands. It was a surprise to come upon faience figures of women in a strange costume beautifully embroidered. Initiatory rites with snakes were figured in this faience, which showed the extraordinary perfection of the art of the middle period. There was also a very remarkable faience relief of a wild goat and kids. The Italian mission had discovered a smaller palace and sarcophagus, which also illustrated the cult of the double axe to which he had referred. The inference was that the kings, like Minos himself, had a sacerdotal character—were priests as well as kings.

YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual general meeting of the Leeds and Yorkshire Architectural Society was held on the 19th inst. The air was taken by Mr. Butler Wilson, the president of the society.

The President's prize of five guineas and the silver medal measured drawings of Whitby Abbey were presented to H. Winterburn; Martin Shaw Briggs took the first prize for sign, and Ralph Thorp the second. The prize for construction was won by P. A. Horrocks, for sketching by Ralph Thorp, and for essay by P. A. Horrocks.

In the course of his address the President referred to local alterations. He said:—

During the last few years Leeds has seen the sweeping away of vast blocks of dilapidated and insanitary property and the upraising of structures, whether beautiful or no, at least fitted with every modern convenience and appliance. Broad

thoroughfares have appeared, some of them leading to nowhere in particular. The electric tramways have created, whether legitimately or not, an inclination on the part of the authorities for rounded street corners; an inclination which has developed into a mania, born, I presume, of a passion for the curve of beauty.

Whilst upon the making of new streets, one is constrained to consider whether our arteries of traffic can be diverted by the tempting prospect of a broad thoroughfare which is even a little off the main line. The answer is emphatically "No." It is easier to turn the course of a river than to divert the natural stream of a city's traffic. That stream will pursue its natural tenor however restricted the confines. The moral would seem to be that it is wiser to spend money upon widening the existing natural veins of traffic rather than upon the creation of new thoroughfares in the midst of which one may stand, secure from harm, and listen, amid their spacious silence, to the rumble of traffic in the congested but natural artery only a few yards away. It is pleasant, of course, to possess these fine streets, so quiet and peaceful, where one is enabled to indulge in musings so far and yet so near the maddening crowd. But I submit that it is somewhat expensive. Piecemeal improvements are futile unless they form part of a pre-arranged scheme. After the Great Fire, London missed its chance for evermore of rising from its ashes and taking the shape of a nobly planned city, owing to its neglect of the admirable plan for its re-formation which was prepared by Sir Christopher Wren. No such mistakes were made by Paris and Washington. I do not suggest for one moment that we are in a position to follow their example to the full, but surely we can do something in such direction. As a means of thoroughly realising the position, I would propose that a map of the city be prepared with the streams of traffic shown and the varying density of such traffic indicated by distinctive colours. Street improvements should be guided by that record. Do not railway companies, when asked for additional trains, commence by checking the number of passengers they are carrying and so arrive at a decision?

An interesting paper on this question was read before us last session by Mr. Musto, one of our members, who went to great trouble in preparing plans illustrative of his ideas. One of these, referring to the widening of Vicar Lane, is exhibited here this evening, from which it will be readily seen that this street instead of pursuing its present aimless wanderings could with a little forethought have been constructed in a perfectly direct line from the dispensary to the new markets without additional expense.

Our Society has been twitted with the remark that it always raises its voice after the event, when it is too late to adopt our suggestions. We contend that we cannot suggest improvements in schemes of which we have no clear and definite knowledge, and that such intentions should be frankly made known to both profession and public. The City Council reply that they must conceal their intentions, or owners will unduly inflate the price of land which it is ultimately intended to purchase.

They do not work on this principle of secrecy in Paris. They pursue a directly opposite course, with results the success of which is beyond contention. We will see how much secrecy enters into their mode of procedure, which is as follows:—Plans are prepared to fully demonstrate the scheme, and it is announced by means of placards and newspaper advertisements that an inquiry will be held. For fifteen days the plan is publicly exhibited in order that citizens and others interested may examine it and record their observations in writing. One would think that this would suffice to ventilate public opinion; but they court still further criticism. For three additional days a specially appointed agent attends to record all verbal observations made to him regarding the scheme. The agent also prepares a full report, giving his own opinion on the scheme, which is forwarded with all other documents to the City Council, and should it be determined to modify the scheme a revised plan is exhibited. The plan and reports are then submitted to the Ministry of the Interior which controls the whole of the thoroughfares of France. If approved the scheme becomes effective by the signature of the chief of state to a declaration of its "public utility."

The idea that the proposals of our City Council can be altogether concealed is, I contend, fallacious. If I am wrong, and it is a fact that there is successful concealment, then Leeds ought to feel proud indeed in the possession of a corporate body and an official *personnel* from whom nothing, short of rack or torture chamber, can drag prematurely the secrets which they have sworn to keep inviolate.

Mr. G. B. Bulmer proposed a vote of thanks to the President for his address.

Mr. H. S. Chorley (hon. secretary), in seconding the vote of thanks, said that during the three years that Mr. Wilson had occupied the office of president the membership of the Society had increased from 110 to 130, and the Society showed every sign of continuing to increase.

NOTES AND COMMENTS.

AN important report by Professor UNWIN has been issued by the Engineering Standards Committee. It relates to the "influence of gauge-length and section of test-bar on the percentage of elongation." It was a common practice to cut strips 2 inches wide from plates when tests were required. But as in the case of cement briquettes, it is now supposed uniformity of width is not desirable. Professor UNWIN has come to the conclusion that a normal test bar should have more width at the ends than in the middle. He represents one with two ends $4\frac{1}{2}$ inches each in length and a central part having parallel sides of 9 inches or 8 inches gauge; for, as he says, "nearness of enlarged ends to the gauge-length diminishes the percentage of elongation; hence the parallel part should be rather longer than the gauge-length, and curves should join the parallel part to the enlarged ends." For plates from $\frac{3}{8}$ inch to $\frac{7}{8}$ inch in thickness it is suggested the gauge shall be 8 inches and the cross section of the test-bar shall not exceed 1 square inch. The maximum width of the bar need not exceed 2 inches.

ALTHOUGH the University of Liverpool is only a young institution it possesses a department of Egyptian archaeology. We also learn that an opportunity is about to be offered for exploration in Egypt. A firm has been obtained authorising the resumption of work in the necropolis of Beni-Hasan, where Mr. JOHN GARSTANG was engaged in excavations last winter. Objects derived from the place are in the museum of the university. Beni-Hasan has long been known to explorers. Columns seen there were supposed to be the prototypes of the Doric shaft. It was also believed that the arch was recognised in constructing the ceilings of tombs. The coloured figures imparted an additional impetus to inquiry, and ethnologists discussed whether some of the figures were not representations of the Jews. Beni-Hasan has afforded materials for many volumes, but it is far from being exhausted. Archaeology has demonstrated the value of objects formerly little prized. It is proposed to undertake the exploration of a great tomb near Negadeh, a place where a Roman temple was discovered by M. PRESSE. The tomb is by some thought to have been that of MENES, the first king of Egypt and the creator of Memphis.

THERE was a time when the name of QUATREMÈRE DE QUINCY was familiar to architects in England. His speculations about the Principles of Taste, especially with reference to buildings, were studied with respect. He was also fond of making designs to suggest the character of famous works of art, such as the chryselephantine statue of ZEUS by PHIDIAS, or to attempt the embodiment of imaginative works like the "Shield of Achilles." He made a model of the western pediment of the Parthenon from NOINTEL's drawings, and was the first to demonstrate that the remains of the principal figure belonged to a *Neptune*. He was also one of the earliest to explain the system of polychromy as applied to sculpture and architecture by the Greeks. His name is now rarely mentioned, but he deserves remembrance, for he was one of the few aestheticians who possessed a knowledge of the processes of art. On the 13th inst. an effort was made by the venerable M. WALLON to revive an interest in QUATREMÈRE DE QUINCY by reading a paper on his life and works at the annual meeting of the Académie des Inscriptions et Belles Lettres. It is remarkable that M. WALLON was his successor. QUINCY died in 1849, and consequently the same chair has been occupied by the two savants for a century.

A DESIGN has been prepared by Sir S. S. JACOB, superintending engineer, Jaipur, Rajputana, for the canopy to be placed over the statue of the late Queen VICTORIA at Ajudhia. The style, it is needless to say, will be Hindu, for the designer is well known for having directed the production of the noble work on Indian art which was brought out at the expense of the Sultan of JAIPUR. The foundations of the canopy will be of brick masonry on a bed of concrete. The terrace will be 40 feet square and raised $6\frac{1}{2}$ feet above the ground, the approaches being by a flight of steps 13 feet 6 inches wide. At the corners will be kiosks. The canopy will be of Jaipur marble, supported by four bracket columns with capitals projecting 5 feet. The

outer covering of the canopy is formed of horizontal rings terminating in a sikkar or spire. The estimated cost is 49,967 rupees.

STOKE NEWINGTON SYNAGOGUE.

THE new synagogue in Shacklewell Lane, Stoke Newington, was consecrated in September of this year, being the fifteenth and latest constituent of the United Synagogue. The synagogue and schools, with forecourt and outbuildings, stand on a site of 135 feet frontage by a depth of about 110 feet, the synagogue building being 95 feet long by 58 feet wide, and the internal dimensions of the place of worship 64 feet by 54 feet. The gallery and roof are carried on iron columns. On the gallery level at the west end of the building is a committee-room, separated from the synagogue by shiftable shutters, so that this room can be used as part of the gallery by the poorer female portion of the community during the high days, the ladies occupying the gallery floor while the men use the ground floor, as is customary in Jewish synagogues. At the east end of the gallery on both sides is an emergency exit leading into the garden outside the building. The seating accommodation is for 434 males and 295 females, the seats being of pitch pine made by Messrs. HARBROW. The Almemar, or reading-desk, and gallery front are of pitch pine and oak, made by the builders, Messrs. PERRY BROS., of Whitecross Street, City. The pulpit has been specially designed by the architect. It is in the Ionic style, is five-sided and made of Carrara marble, the base, steps, balusters and electric-light newels being all of the same material. The small capitals and fluted pilasters are carved and polished in high relief, the front panel has the Shield of DAVID also in high relief, and with diminishing dentils with trusses on either side. The side panel records the fact that it was presented by Mr. GUSTAVE TUCK. The whole of this work was carried out at the works of Messrs. HARRIS & SON, under the personal superintendence of the architect. The steps up to the Ark, with the balustrade on each side, are also of marble wrought by Messrs. HARRIS & SON. The two tablets containing the prayer for the Royal Family have been made by the same firm. The Ark, which corresponds to the altar in a church, has been made by Mr. BOEKBINDER, of Pratt Street, Camden Town, from full-sized drawings supplied by the architect. Mr. BOEKBINDER has also carried out all the internal plastering work. The floor space in front of the Ark is of marble mosaic, and the floor of the entrance hall is of terrazzo mosaic supplied by Messrs. EBNER. The stairs are of composition stone, and of course comply with the Building Act as regards safety from fire. The front of the building is of red Istock bricks ornamented with terra cotta. The heating of the building has been done by Messrs. BURROUGHS & SON, and is arranged so that the synagogue shall be warm during the coldest weather. The electric-light fittings have been supplied by the General Electric Company; and the electric installation has been fixed by Mr. CREWE, of Chapel Street, Cripplegate. At the north end of the synagogue site is a school divided up into four rooms by movable partitioning, so that the whole room, which is 64 feet by 20 feet in the clear, can be turned into a place of worship for some 250 children during holy days, or can be divided up into four classrooms for the Sabbath classes. This school has a flat leaded roof, with glass movable light in the centre, so that it can form a Succah during the Feast of Tabernacles, 32 feet long by 20 feet wide. At the west end of the schoolroom is a small room for the master's use. The architect is Mr. LEWIS SOLOMON, of 55 New Broad Street. The synagogue has been built mainly for poor members of the community who inhabit the district. The architect has therefore not spent any money in elaborate ornament. The whole of the building is finished in white, which gives a very light appearance to the structure. The cost of the site and building together is about 12,500*l*.

COWLEY MANOR.—BALL ROOM—BILLIARD-ROOM.

PURLEY LODGE, BOSCOMBE, BOURNEMOUTH.

THE RED HOUSE, BOURNEMOUTH.

THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. R. S. Balfour, vice-president, in the chair. The following were elected as members:—Messrs. H. S. Coll, J. A. Wilson, F. S. Chesterton, C. W. Lucas, G. Ward, R. H. Browne, L. Velasco, H. de A. Broun-Morison, Collard, S. Murray, S. L. Steane and L. G. Rayner. M. H. Field was reinstated a member. Mr. H. M. CAUTLEY read a paper on

Farm Buildings.

will be within the memory of a few of you, and I hope very few, that but twelve months ago I read a similar to this before the Discussion Section of this Association, the practice of farming does not vary so rapidly as to have changed much in that time, I am afraid that much of what I said must be repeated now; but I have been at pains since to solicit fresh facts from my farmer friends, and to settle my opinions on several points, which I did not then dare debate, in order to fit myself for and fill the wider scope enjoyed by a paper. I am fully aware of the diversity of conditions under which farming is engaged upon in this country, and that the problem is satisfactorily solved in the west country would require a very different solution to be equally satisfactory in the east, the underlying principles are essentially the same, so that I will speak to-night wholly from within my practical experience gathered on farms and amongst farmers in the eastern counties; and as the one condition that does not vary is that of the agriculturists' finances, I shall restrict myself to the description of that type of buildings and fittings in which the truest economies are effected, and thus made most suitable to meet the requirements of those to whom farming is a real business. It is so easy to be elaborate, so difficult to exercise economy, no difficulty will be experienced when one has to build a farm for a rich hobby-rider: in introducing the porcelain and the catalogue's nickel-plated fittings for the humbler farmer, the principle remaining the same, and the only important being that they are entirely suitable for their purpose. And now as to the site and position of the buildings. The essential, of course, is a good water supply for both house and outhouses. You will, no doubt, have noticed that this necessity is provided for by our ancestors by grouping all the buildings round some good pond, and though no doubt picturesque in the days of windmill-power and hydraulic rams, some further economies must be adduced for planning the buildings about the water. The next most important point, in my estimation, is to get the building quite close to some hard metalled area maintained at the public expense. A farmer's private road in and about his holding are a perennial source of expense to him, and I have rarely seen them except in such a position that the labour of carting is doubled. In this year, when I have seen corn unable to be carted from the land owing to its heavy state, there seems an added importance to this point. As to the position of the buildings on the holding, in an ideal one they should be as near the centre as possible, unless the slope of a hill, when it should be nearer the top to save uphill carting of manure. Of course, it will be thought that is left the uphill carting of the crops, but with the improved machinery of to-day, threshing and winnowing can be accomplished all in one performance, and thus there is no necessity for bringing all to the stack-yard adjoining the barn, which can be stacked in the field it is cut in and marketed straight from there. In dairy farms, however, the buildings should be near the centre of the pasturage part of the holding, in order to avoid fetching and feeding the cows from long distances. And further good points one might look to find in an ideal homestead would be a dry, healthy soil, easy drainage and sheltered southern slope. The best aspect for stock is no doubt south with a touch of east in it; but when building on a slope, unless the aspect is very wrong, the building should perhaps be placed across the direction of the slope, or some very awkward steps will have to be dealt with. Finally, in rebuilding old homesteads—and in England a good deal of our work must be with such—do not accept it as an axiom that they should be rebuilt on the old site. Some of the advantages should be looked for on the holding, and in greater measure at some other point rebuild your homestead there! Do not be afraid of leaving one or two buildings too good to be pulled down isolated; they will prove a variety of objects. And now, having to erect a new homestead, what should be the arrangement and construction? Of the conditions which govern it we are sure. It should be built with an eye to the economy of construction and maintenance in the most saving and convenient manner possible; but, above all, it should provide for the most suitable and sanitary housing of the stock that they may be maintained in the most healthy

and therefore profitable manner. Should the solution of this problem seem easy to anyone, I am afraid its appearance will be found very deceptive, for I have never seen any group of buildings for a mixed farm even when I have visited so-called "model" buildings which were not teeming with defects.

I have not come with any perfect plan, nor am I prepared to tell you how it may be attained, but I believe that it will be found somewhere between the two extremes presented by the old-fashioned and modern or "model" homesteads. But perhaps it would be most helpful to glance at the advantages and disadvantages of both. In an old homestead there will generally be a large rambling old barn of flail-threshing memory, with perhaps the cow-sheds ranged about same; then the stables will be in an entirely separate block, the piggeries in another, the granary, chaff-cutting house and cart-shed in another, and various outlying loose boxes and small cow-sheds wherever there is an odd corner. In addition to this, the yards are nearly always of a much too large size, rain-washed and wasteful of litter, all tending to the making of bad manure, whilst apparently the aspect was rarely studied at all. This is obviously not of a labour-saving character, or suitable to the modern practice of farming. It means carrying fodder from the granary to both the cow-sheds and the stables, from the mixing floor to isolated stock scattered about the homestead, and straw from the stack-yard and barn to all the various departments, which, besides entailing endless labour, keeps all the roadways in a constant litter.

But to turn to the modernised type, which common usage designates as "model." Here all the buildings, even down to the fowl-house, are grouped in one large parallelogram, the outside walls of which arise square and gaunt, with scarcely an opening to be seen. I am not urging its ugliness, though I believe it to be the outcome of one of its most practical defects, namely, that everything is approached from within, frequently from internal roads and alley-ways. Were it situated on some of our bleakest wold lands I should find excuse in the pitiless winds and rains which drive across them, but why when on some sheltered hillside or sunny valley? Did it save roadways, as its exponents urge? I should not even then think it counterbalanced its disadvantages, for think of the indescribable filth into which these internal approaches must be churned, the insanitariness of it all, and on a heavy winter's night or sultry summer's day the stagnation of the exhalations so enclosed. But it does not save roadways; the sparse openings are distributed on all sides and they must have approaches, so I believe the system is even wasteful of cartway.

I cannot believe either that the buildings so grouped can be as healthy and sanitary as those built in more open formation, for the large deposit of manure which accumulates in the yards must have a deleterious effect when in so confined an area, whilst the ravages of disease would be much more difficult to check. The internal alley-ways also make independent walls just as necessary as they are in more open formation, so I do not believe there is any economy effected in construction. In case of fire, too, the whole range of buildings is endangered, and unless the removal of the stock was undertaken early in the conflagration many must inevitably be lost, whilst in any case their rescue would be seriously hampered.

In designing a complete homestead myself I should certainly have as few internal approaches as possible, but everything, as far as possible, approached from a common farm roadway, and whilst grouping the cow-sheds, stock-yards and piggeries under the shelter of the barn, granary, &c., keep the horse-yards, stables and cart-sheds distinct. The staffs that work these two departments are entirely distinct, and if over the cart-sheds a roomy loft was constructed, into which a stack could be threshed direct, the extra labour involved is nothing, as only chaff and corn would have to be carted from the granary block, which is but a small operation, and even if the departments are grouped in one block it is impossible to get them all adjoining the barn and granary so closely as to save all labour and carriage.

But I will proceed to the practical details in connection with the various buildings, only reminding you again that I shall treat of each in its simplest form, believing so thoroughly as I do that all repairs should be capable of being undertaken by the estate carpenter, or else whatever is broken or missing is sure to be neglected till some serious mishap arises through it. For this reason, and for the reason that on most estates enough timber is felled and steam-sawn sufficient for the purpose of repairs, I am strongly in favour of the simplest wood construction in everything but the main fabric. Where it is only a question of nailing a plank up a tenant will always do it himself, but should it be anything less simple, it is either neglected or the landlord burdened with it.

In cart-horse stables it is very desirable that each horse should be provided with a separate division, which must in no case be less than 6 feet wide. In old-fashioned stables it was not at all unusual to find all the horses standing together with no divisions between, but this is much to be regretted. It is but seldom, perhaps, that one horse damages another, but it

will be found that under such circumstances some of the horses will never lie down, much to the detriment of their working powers, and, what is worse, the stronger horses will prevent the weaker from getting their fair share of food. Here then is a strong plea for separate stalls, but it will be found, I am afraid, that many farmers shrink from what they consider such extravagance, when, perhaps, the best compromise is to divide up for pairs, the divisions with 10 feet centres, and the weak horses can then be put together. The width of stables may be arrived at by allowing 2 feet for manger, 7 feet for standing, 12 inches for gutter and 5 feet for passage way behind. The cubical contents necessary, 800 feet per animal, applies to both stables and cow-sheds.

No general rule for determining the number of horses required to be provided for can be given, as to-day many farmers go in for stock so largely that, laying down much grass, the quantity of arable land is greatly reduced, and not so many horses needed. Roughly speaking, a horse to every 25 acres is what is generally needed. The manger should be of 1½-inch plank, and about 3 feet high, with stout, rounded, hardwood chin-piece, preferably in oak, as I believe the acid in this wood makes them most averse to crib-biting. The divisions should have hardwood heel posts, 1 foot in front of gutter and 5 feet out of ground, with, it will be hardly necessary to add, all the arrises taken off, as should be done to all fittings, and the boarding to them may be 1 inch rough, but in any case should not be tongued, neither tongued into the rails (as this makes repairs difficult at once), but nailed one side only, and kept off the ground to prevent decay. I will say nothing about feeding passages behind the manger, as there is not the objection in feeding horses from the front there is with cows, but should it be possible to indulge in this extravagance, there is no doubt that horses would do better with their noses further from the wall.

The doors should be 4 feet wide, and at least 7 feet 6 inches high in two heights, and capable of being hinged right back and there fastened, as should all farm doors, whilst the windows should be of the hit and miss pattern, with glazing over, unless, having a lofty stable, you can put your light in front, but well above the horses' heads, or better still, can bring yourself to put plenty of glass tiles in the back slope of the roof, than which, I suppose, there is really no better way of lighting (at all events for cow-sheds) or of avoiding breakages. But unless the roof is pantiled and glass tiles are being used, large sheets should be employed, as every joint forms a lodgment for dirt and eventually obstructs the light. For the paving in stables a very hard brick will be required, or the iron-shod feet of the horses will make short work of it. Blue bricks on edge will make the cheapest efficient paving, or there is a red brick made at Skier's Spring, near Barnsley, which I believe to be just as good. The fall would be at least one in forty, and the gutter can best, perhaps, be made with bull-nosed bricks, and of sufficient width to allow the free passage of a shovel.

To insure the all-important ventilation I think the best and safest form is still that employed by our ancestors, namely carrying the eaves well over, leaving out all filling between the rafters' feet and raising every fourth or fifth ridge tiles. A fodder and harness-room combined should be in connection with the stable and approached from same. A small compartment opening out of same for chaff is a great convenience, especially if arrangements are made for filling it from outside by a small door high up. Lofts running over the stables, with arrangements for bundling the hay down into overhead racks, are to be condemned on every score. They cannot be as healthy, and even if we do not think the overhead rack a faulty arrangement in itself, filling them from above so that all the dust of the loft gets into their eyes is evidently wrong, whilst the very ease of the operation conduces to the greatest wastefulness, enough stuff often being put down to last a week. If, on the other hand, hay racks by the side of the manger are adopted, and the hay has to be carried separately to each manger, it is far less likely the men will be troubled with this spirit of wastefulness. To form these racks the chin-piece should be carried through, bars let into same and carried down on to a brick pinning about 9 inches high, and the bottom sloped up to the back so as to let out all the hay-seed and dust.

The stables should have direct access to a horse-yard, with shelter sheds in same, in the construction of which it must be remembered that the manure is allowed to accumulate to a depth of about 2 feet before removal, so that the eaves must be kept high enough to allow of it and for the horses to pass beneath; about 8 feet is usual. They are often also made far too shallow, so that little protection is afforded the animals; 14 feet must be the minimum depth, and 2 feet or 3 feet more may be added with advantage. All the eaves should be spouted to prevent the manure being more rain-washed than is necessary, but I would not advocate horse-yards being entirely covered. In the eastern counties we turn the horses out at night, and attribute their hardness to it, which will make evident my objection to doing so.

In all shelter-sheds, cart-sheds, &c., where one has to

employ posts let into the ground to take the roof-plates, one troubled with the constant annoyance of rotting feet and the attendant necessities of spurring them. I have seen various attempts to obviate this. An ingenious one, based on the fact of posts always rotting at the ground level, was to set them in a drain pipe, the top of which was kept 6 inches above the ground and filled in with cement; but the best I think I have seen is the use of steel joists bedded into a block of cement and attached to the roof-plates with angle-irons, but should these be used there must be bolted to both sides of the web, at least for a height of 6 feet, a chamfered block of wood, or serious injury may happen to the animals. Cast-iron columns ought never to be used owing to their liability to fracture; a car backed up against them would in many instances be sufficient to break them, and I have even seen a 4-inch one broken by a bull which found it in its way.

The gates of all yards should be 10 feet wide and hung open outwards and fall right back. When there are gates between two yards they must, of course, be hung at least 2 feet up to clear the manure as it rises; and so, if the yards are ever to be used for pigs to run in, the bottoms must be fitted with elm slips, constructed like miniature gates, to work in grooves formed in the gate posts. Palings make very bad fences between or around yards, but should they be necessary on the score of economy, do not point the tops and let them close, or an animal may get hung up and seriously damaged. For the same reason keep the top rails of gates close enough to prevent animals ever getting their heads through.

Cow-sheds.

In treating of cow-sheds, we come, perhaps, to the most important buildings which go to make up a homestead. Two kinds of sheds are in common use—those for single rows of cows and those where they stand double. No preference can be given to either system, except that in the latter, for a large number of cows, it will be cheaper if the building stands independently, as then one roof takes the place of two; but generally it is possible to arrange some of the sheds lean-to's against a barn or some higher building on the north side, thus giving them welcome protection and making quite economical the roofing of a single shed.

In a shed in which there are two rows they may either be arranged head to head with the feeding passage in the centre, which is perhaps most convenient, as the stockyards naturally flank the shed, the manure can then be thrown straight out into them (though this arrangement makes it difficult to get fresh air to the heads of the animals), or tail to tail, with the dunging passage in the centre and the feeding passage on either side, in which case, however, the manure has to be bundled all the way down the dunging passage to the outside door; but as far as space is concerned, neither of the arrangements is more economical than the other, as may be deduced from the following figures:—The feeding passage must never be less than 3 feet in width, the manger will take up 2 feet, the standing 6 feet 6 inches from manger to edge of gutter; the latter must be 12 inches wide, and the dunging passage at least 4 feet.

I know to some the above length of standing may seem short, but should you make it more the cow will be nearly certain to foul its bed, under which circumstances, not only is the litter wasted, but the milking carried on under unfavourable conditions, for I should think it would be difficult to find a man who would trouble to clean his cow before milking it. I would even advocate a still shorter standing for Alderneys or other small breed of cows. It is usual to tie the animals in pairs, which case the divisions need to be with 8 feet centre, 6 inches, or even 12 inches less, is often given this, but leaves the cows very cramped and also hampers the milker. The divisions may be constructed in much the same manner as those described for stables; but the heel-post is better not so far back, or it will get in the way of the milker. It should certainly be 2 feet in front of the gutter and only about 3 feet 6 inches high, whilst if it rises to 5 feet at the back of the manger it will be ample.

The construction of mangers is important, but little understood, I am afraid. There is, in my mind, little question, however, that each cow should be provided with two bins, which means four bins in each of two-stall divisions, each bin capable of holding a bushel easily, and the bin next division in each case fitted with ventilated lid to hinge back and fix with butt against it. This arrangement permits of the two feeds being put in at the same time, and allows of the cows being fed the first thing in the morning without delaying the milking. It will also be found that some cows will not let their milk down unless feeding, so that a bin one can open for a short time will be found convenient. At haysel, too, and harvest a double bin will allow of the men getting into the fields to help, whereas with a single bin only it would have been necessary for them to have been feeding their animals still. The height should certainly not be more than 1 foot 9 inches, or the front piece will seriously incommode the cow's dew lap, and it will

experience a greater difficulty in rising should it not be able to get its head over it. As to the depth, the usual custom is, for ease in construction, to use an 11-inch plank for the divisions. They should be constructed of 1½-inch plank, and the plank at least should be well cantled. Of course, no chin-need be provided. There will, however, want to be a support half-way between the divisions. The food placed in bins, such as brewers' grains, chopped roots, &c., assisted by the dripping of their noses, keeps them rather damp, so that the points should be painted in. A cantled fillet is often placed at the angles to enable them to clean their food up better. To prevent the cows pushing out the food into the feeding passages is a very difficult problem, and one which I have never seen satisfactorily solved. If you put a roll edge projection at the back it would prevent a large-horned cow from getting at the bottom of the bin. I think if you can spare room a ledge at the back with small curb or a cantled plank, as shown on my section, is best. The cow will then be able to get at what it throws out. Of course, this difficulty does not arise where there is no feeding passage, a cantled ledge against the wall throwing the food back. In this case it must be remembered, however, that the bin must not be put close up to wall, or the large-horned cow would be in just as awkward a case. The cows are invariably chained up nowadays, but the chain should not be fixed to the side of the manger, or they might damage each other with their horns and get each other's food. It will be best with a turning ring on a stout upright iron bar, fixed on division near manger. With quite a short chain, the cow then has perfect freedom when lying down, as the chain drops with it. Far away the most common mistake in cow-shed construction is the paving of the whole area up to the manger, or letting there be a continuous fall from manger to gutter. The whole of the cows' excrement falling behind, there is in the case no need for it, and when, added to this, we consider how averse a cow is to lie on a slope, and that the best standing is rammed chalk or clay, it will readily be seen that paving in front of the heel-posts should be level and of the same substances. If you have observed cows lying on a slope you cannot fail to have noticed that they invariably lie across the slope, and should you go into a cow-shed where the standing is sloped right up to the manger you will see the cows standing or lying as far back as the chain allows, vainly trying to get on a more comfortable level. Not only is this poor treatment for the cows, but poor policy as well, for lying over a gutter with their hindquarters unsupported is likely to result in abortion. Of course, if by chance a single cow should be chained up in a double stall, it will lie across it close under the manger and foul the standing above the paving, but this is a chance not worth reckoning with. As to the paving of cow-sheds, if it were not for the expense I should use V-grooved bricks, the grooves running only in the direction of the fall, as in economising litters it is very necessary that the liquids should pass rapidly to the gutters; but as a cheap paving I do not suppose a good bed of cement concrete finely faced can be improved upon. The gutters are very important, as in all districts the local sanitary authorities are now empowered to control the construction of cow-sheds, and they will not allow any covered drains, but insist on the main channel being carried right outside the shed a distance of 18 inches before the liquid manure is disposed of in any way. Long lengths are thus made necessary, which should clear themselves with a small flow as rapidly as possible. I have therefore adopted as the most satisfactory type that which I have shown in my section. The standing next gutter is terminated with a stone slab slightly rounded on edge, and the feeding passage, which is all at a lower level, is sloped to meet with a steeper incline as it approaches it. This system has many advantages. It forms a platform of the standing, and the dung falling on a lower level keeps the bed clean, whilst the litter falling from the platform is less liable to choke the channel. It is also easy to clean, conducive to a rapid flow and easily detected. Of course, an ordinary channel such as described for stables may be used; but the litter always bridges it, making a platform for the dung which will foul the cow, and its presence is also obscured. The paving of the feeding passages may be of rammed chalk or clay, or wheel trolleys are to be employed, when a concrete floor is necessary. It might be here mentioned that it does not seem necessary to have an elaborate system of drainage connected to one big tank. I should say its benefits are more than doubtful. It is the custom now to have liquid manure carts with a pump and length of hose attached, so that small cemented tanks near the separate buildings with channels leading direct into same are practicable. They should, however, not be made of too large a size and should have a small outlet at one end of the chamber into which to put the hose. The width of the door to the cow-shed should, I think, be about 3 feet 9 inches to 4 feet 10 inches. If you make it less, the cow forward in calf may be seriously injured, whilst should you make it more, it would probably be equally dan-

gerous, as then two cows will try to push in at once. Doors must be provided from sheds into the stock-yard, and then cattle will generally be let out this way, for voiding nearly always takes place immediately after they are loosed, and the roadways are thus saved being fouled. The sheds will naturally be built adjoining the yards, and unless you have covered yards with only dwarf walls between them and the stalls (it is difficult to foresee the action of draughts with the arrangement), it will be found convenient to have low doors somewhere at the ends of the sheds, opening into the yards, for throwing out the manure (the space beneath the windows can generally be utilised), and here again it must be remembered that the manure is allowed to accumulate to a depth of 2 feet or more, so that the floors of the sheds must be kept up from the yards and sloped ways made to the doors.

Provision for calves should be made in conjunction with the cow-sheds. Very often a space at the ends of the stalls is partitioned off for this purpose, particularly now that the custom of weaning those young bull calves to be reared on their mothers is so much in vogue for the fine points they develop under that treatment. Calves, however, are very liable to scouring, and great care must be taken to insure a dry bed for them. If the site is dry, they will no doubt do well on a well-drained floor, but if there is any possibility of damp, a stout slatted floor, with 1½ inch spaces, will be necessary, and a dished floor beneath; all the voidings will then fall through. The slatted floor must, of course, be easily removable for cleaning purposes. Calving boxes should have at least 180 square feet, and, if drained, the floor should but slightly fall all one way to a gutter underneath one of the divisions kept up for that purpose; no gutter or other irregularity of the floor must be allowed, and a rammed chalk floor is preferable. The angles may have racks and mangers fitted across same.

Bull-houses should be entirely independent, and open into stock-yard. Mention should be made of cattle-boxes for fattening beasts; 80 feet to 90 feet super is allowed for each box, and they should be built in ranges, divided by gate-like divisions capable of rising with the manure in grooves on either wall and entirely removable. The beasts then rise on the manure they are making during the fattening period, and the manure generally attains a depth of about 3 feet. The end of the building should be capable of being opened, so that with the divisions taken away a cart can back right in and clear away the manure. Of course, ordinary stalls answer for this purpose, but these boxes are very useful, as should they not be required for fattening purposes the division can be taken away and the shed used as a covered yard for young stock or any other purpose.

As to the desirability of covered yards, I know there is a wide divergence of opinion amongst those who should be the best judges, but when you think of the general use now made of cake foods, and the high manurial value of the excreta of animals so fed, it would seem to be most unwise to abstain from taking precautions to avoid the waste of it in rain-washed yards. Warmth, too, with stock takes the place of food, and one of the few disadvantages that can be urged against covered yards is the thinness of the coat on young stock engendered by their use. In constructing them 160 feet super should be allowed per animal, free ventilation should be provided in the roof, which should be of one span, and the gable ends should be covered in.

I will only further state that the average annual amount of manure produced by cattle is 16 tons per head, and that the estimated value of manure from 1 ton of decorticated cotton-seed cake is 5½. 10s., from a similar amount of meadow hay 25s., and from roots about 5s. As fattening beasts are largely fed on cake, these figures will enable you to estimate the fine quality of the manure formed in the cattle-boxes just mentioned.

Coming to what may be termed the administrative block, namely, that which contains the straw-barn, food-stores, &c., this is generally a two-storeyed building stretching east and west, with the stock-yards, &c., grouped and sheltered under it on the south, and the stack-yard on the north. The food factory thus comes in its rightful position, between the food to be consumed and the consumer. The straw-barn now does not want to be of the size of the old threshing-barns, but only commodious enough to store about one day's threshing. It should be carried up the whole height, and have large doors 14 feet high for access, whilst, if possible, I like to see it arranged myself that waggons can pass right through and out the other side through one of the stock-yards. The floor may be of concrete, but the cartway would soon get broken up if of this material, and may best be made of wood. I have seen the sawn off butts of felled trees used with advantage. At the blank end, doors high up in the walls are useful for passing the threshed straw through. Next the barn is generally placed the mixing-floor, with the root-store adjoining, and only divided by a dwarf wall, over which the roots can be served into the pulper which stands just inside the mixing-floor. Both these departments should have wide doors so that carts may back right in, in the one case to dump the roots, and in

the other to load up the ready-mixed food when required about the farm. It will be very evident that the root-house must have blank walls opposite the doors, against which to stack the roots, and in the same way the mixing-floor should have a blank corner against which to stack the prepared food.

Over these departments are placed the cake-room with its crushing machine and chaff-cutting machine, with their shoots to the mixing-floor, and beyond the granary, all connected together for the convenience of trucking right through. The end next the barn should be open, and a cart under cover may then be loaded up with chaff, cake or corn and meal from the granary, as may be required. The floors of these upper departments should be grooved and tongued; any skirting should be in cement, and the end of all joists and the spaces above roof-plates filled up solid, and the ceilings should not be plastered, lest there should be any hidden harbour for vermin. The roofing to these buildings must be quite weather-proof, and I do not consider pantiles sufficiently so.

If a fall of the ground can be utilised, or by banking up a cart may be drawn level with the floor of the granary, so that everything can be barrowed straight in and all mechanical or other lifting dispensed with, it will be found of the greatest convenience. It is difficult to give an exact rule for determining the size of a granary, but they are very useful of a good size, and 2½ feet super per acre should be the minimum.

Dutch barns are very deservedly growing in favour amongst farmers; their cost of construction is so little and their usefulness so great that they must be a good investment. Not only is all the cost of thatching avoided by their use, but in wet weather loaded waggons can be drawn beneath, and it is said ricks dry much better under them owing to the free passage of air over the top. The waggons draw between the bays, so that these should not be less than 12 feet in width, and as cost is the only thing which governs the length that they may usefully be made, any multiple of that figure will do; whilst to admit of topped-up waggons passing through, they should be 14 feet high to the underside of plate, and to afford protection to the load they would best be 20 feet wide. As much space as possible should be left in the roof, and the whole fitted with gutters and down-spouting, with the gable ends closed in.

Cart-sheds should, if possible, have a north-east prospect, and the openings not less than 9 feet in the clear; the height of these should be not more than 8 feet, in order to keep out the weather as much as possible. As to depth, a single waggon or two tumbrils will require 20 feet, but 30 feet will accommodate two waggons or four tumbrils. Knocking stumps should protect the posts at entrance, and a guard-rail should be placed in front of the back wall. An implement shed for the more expensive implements is necessary, and should have an opening 10 feet wide, with doors to lock up and provided with windows. If a tool-house is provided—and it is very useful for storing ropes, rakes, forks, &c.—it may be best placed in conjunction with this.

Before designing piggeries, some thought should be given as to whether they should take the old form of covered sty and run or the more modern box or pen. If the former is adopted the chief necessity is to keep the covered lodging well above the level of the run to insure its being dry. But I would rather describe the boxes, as I believe them to be most useful. They should, if possible, be placed adjoining the stock-yard, so that the manure may be flung out into the same, and the store pigs allowed to run when the cattle are at pasture. This practice will greatly improve the quality of the manure in the yards. The boxes should have an area of from 80 feet to 90 feet super, with perhaps one or two rather larger as farrowing pens, and be separated by walls about 4 feet 6 inches high. If a feeding passage can be provided at the back leading to the boiler-house at the end of the range, it will make a most compact department. A further labour-saving device will be to have the feeding troughs midway between the pen and the feeding passage, with a swinging shutter hung centrally above same so that it may be bolted on the pen side in filling the troughs, and then swung back and bolted next the passage, throwing the whole into the pen. It has a further advantage in not allowing the pigs so easily to get into the trough, fouling and wasting their food. The shutter, however, must be very strong. A guard rail 6 inches wide and 9 inches above floor should be placed round the farrowing pens to prevent the sow lying on her young. Pigs will soon rout up a brick floor, and I believe the best is again concrete, cement faced, as this is more impervious, and will carry off quicker the large amount of liquid voided by these animals, and for which good drainage should be allowed into the yards. The boiling-house should provide accommodation for several meal and swill tubs, and have a good-sized copper and furnace fixed in it.

One or two good-sized loose-boxes on the premises will be found useful for foaling and to act as sick boxes, and perhaps in one of them may be fitted a beam capable of sustaining a ton for slinging an injured animal or slaughtering those past veterinary aid.

I think now I have mentioned all the more important

buildings about a farm for housing stock, as I do not intend to waste your time with fowl-houses, and, of course, permanent sheep-folding yards are now acknowledged as a mistake and become obsolete.

My paper might not seem complete, however, without some slight allusion to dairies. I shall make it slight, for there would be almost enough matter for a separate paper did I discuss boiler-houses, refrigerators, separators, and all the complexities which go to the making of a modern dairy. I shall only, therefore, mention one or two details of a housewife's dairy, where butter is made but occasionally and in small quantities. Of course, it should have its main window north but to get a fresher current of air I like another window east or west, which can be sheltered by bushes grown outside should prove too hot. To maintain an even temperature, the wall should be hollow and the roof of thatch or plain tiles—certainly not slated.

A settling-room should be provided with wide slate shelves around the walls, but not close up to same, a little space being left for the freer passage of air about the pans. It is customary to whitewash dairies throughout, but the whitewashing had better not extend down to the shelves; or, the pans being pushed carelessly back, will flake it off, and give you the ridiculous comic-paper article of milk with chalk in it. Two rows of an kind of tiles will obviate this. It is impossible, of course, without artificial heat to maintain a temperature of 58 degrees, but this temperature should be striven for as nearly as possible, as at it milk gives off 30 per cent. more cream than the same quantity at 30 degrees Fahr.

The butter-making department must have no drain inside the building, but the floor should slope to a channel outside the building, conducting into a gully. The ceilings in all cases must be ceiled, and everything conducive to the greatest cleanliness. The gauze should be on frames fixed outside the windows and easily removable for cleaning.

I feel that it hardly falls within the province of this paper to discuss farmhouses and their cottages, so will content myself with throwing out only two or three hints for your guidance. Do not waste your clients' money in providing a second sitting room and laying on hot and cold water for a farm of a hundred acres. It will never win a tenant from the class of men who would wish for so small a holding. On the other hand, you will never get a tenant for a farm of larger acreage unless most of the luxuries to be found in a modern two-sitting-room house are present.

Do not again, in striving after compactness, put your house so close to the stock-sheds that after its erection one or other is proclaimed by the sanitary authorities uninhabitable. This may sound very superfluous advice, but I have known such cases, and remember that there is in this country a very tender bias towards progressiveness, so that in twenty years' time it may be deemed necessary to have the malodorous pig sty 50 yards from the dwelling-house instead of 33, as at present.

Finally, in labourers' cottages do not put in less than a 24-gallon copper or they will not be able to brew enough to fill an 18-gallon cask at a time, a serious inconvenience, and one which I feel the importance of, having had to remove in some cottages that I built the smaller coppers provided and put in larger.

Mr. H. P. G. MAULE, who proposed a vote of thanks, said the paper was exceedingly interesting and full of matter. He wished to discuss some points raised, but the remarks, he hoped, would not be taken as criticism. All the objections to the paper to the so-called "model" farm buildings were to the point. A considerable number of this kind had been built, and in most cases they were quite unsuitable for farming, although the work of an architect. Nothing had been said about saving rain-water. A supply of rain-water was valuable on stock farms, being more healthful than hard water. The large area covered by the roofs of the buildings afforded an easy means of catching rain, and storage tanks could be made to hold the supply. In the choice of a site for a farm it was important to have a position sheltered by trees, because animals were like plants in a garden, and protection from the prevailing wind was necessary to their well-being. In dealing with stables, the paper adopted dimensions which allowed of a harness-room in connection with them. The measurements might be greater and it was doubtful if the harness-room was necessary, because farmers often preferred to have the harness of each horse hanging on the wall behind it. The argument against the arrangement was that the leatherwork decayed quickly, but if the stable was properly ventilated the effects of ammonia would be carried away, and the harness could not perish. In the construction of piggeries the speaker advocated an arrangement of plan which allowed of a feeding passage being made because it saved labour, and when connected with the boiling-house gave easy access in serving the troughs. Pigs should be kept warm, and as a brick floor was warmer than concrete and more easily repaired it was well to use the former. In conclusion, he said farm buildings were not beneath the dignity

structure, and the treatment of roof and gable ends offered scope for artistic effect.

V. C. WEYMOUTH seconded the vote of thanks, and simplicity of construction should never be overlooked. In buildings it meant economy of labour, an all-important successful farming.

rs. C. H. HOOPER, M. G. PECHELL, H. TANNER, jun., MEARS also joined in the discussion.

THE RHIND LECTURES.

fourth lecture of the course by Professor Hume Brown, LL.D., as reported in the *Scotsman*, on "Scotland in the time of Queen Mary," related to towns. The external appearance of a Scottish town in the time of Queen Mary has been described, they would, he said, now glance at its organisation, at the principles on which its common life was based, and the conditions under which the individual burgher performed his functions as a responsible member of the community. What had been said of the external appearance of a town was equally applied to its organisation: it was still a medieval town, alike in its scope and the aims to which it was directed. From the town records of the time one could see how far they were forced upon them—that the prime consideration of town policy was security and self-defence. The security required was of a double nature—protection from external violence, and protection from the conflicting interests of neighbouring communities. Of every candidate for citizenship it was made as the first condition of his receiving it that he should possess the full equipment of weapons and armour prescribed by the laws of the burgh. As a guarantee of his ability to maintain this condition, he had to appear before the Council with his arms and accoutrements, and give a pledge, moreover, that they were his own property. Nor in the time of Mary was the town a purely military service, a merely formal one, as was proved by plaintive petitions from burghers to be relieved of its burden. Another proof that security was still the chief concern of the burghs was found in the fact that at that time had they been so zealous in their attempts to extend their bounds with effectual lines of defence. But the security from open violence, there was that other security which had just been noted—security namely from the rivalry of other communities, and the consideration of this brought them face to face with the fundamental consideration under which the town-dwellers had roofs over their heads, found food for their mouths and raiment for their bodies. Originally, it had to be borne in mind, the territory of the town arose formed part of the domain of some superior—king, baron, or ecclesiastic. For the tenements and other erections on the town territory therefore dues had to be paid to the superior, whoever he might be. At first each holder paid his own fee directly to the superior from whom he held his land, but as the town grew in extent and population, it was found to be an inconvenient arrangement, and by the fourteenth century most of the Scottish burghs had entered into a new agreement, which had long been in use in England and other countries. The superior granted a lease to the burgh, on condition that he should pay a stipulated annual sum, as the collective rent of all the land in the territory and the subjects that pertained to it. To this annual collective sum was thus the first and all-important consideration that determined the manner in which the community should be organised and governed. From one point of view the town was simply a collective unit which had to pay dues to its superior. How, then, was the annual sum raised, and from what sources was it derived? By the laws under which the town held its tenure there could be no private property. All its territory and its adjuncts belonged to the superior, and were leased to the community as a collective body. There was thus but one method of raising the annual contribution for which the town was bound. The Town Council, or the representative bodies elected before town councils, let the town territory and its adjuncts to the highest bidders, who retained them on condition of paying the stipulated rent to the common purse. It was this system of letting, therefore, that determined the entire scope and character of the constitution of the burgh. It prescribed the duties of the various officials, regulated trade and commerce, controlled the life of the individual townsman, and determined the relations of each burgh to its neighbours. But the system was not without its drawbacks. Whatever contributed to the common good had to be applied, which revealed another aspect of the town life of the community. Besides the rentals from the town territory and its adjuncts, the superior claimed a further contribution from its occupiers. In return for certain privileges of trade he enacted an impost on all commodities that entered and out of the town gates. In the earlier period of the history of the towns it had been the function of the chamberlain or subordinate officials to levy directly the customs due

to the Crown. But when the town received its perpetual lease, the town itself took over the levying equally of the petty customs taken at the town gates and the market, and of the great customs enacted from commodities shipped for foreign countries. The methods of raising the petty and great customs were then described, and it was pointed out how these affected the administration and organisation of the community. A condition which affected all business transactions was the fixed idea of the Middle Ages, and still prevalent in the time of Mary, that every article had an intrinsic just price which was not to be altered either at the caprice of the individual or by competition in the market. Originally it had been the privilege of each burgh to fix the prices of all commodities that changed hands within its own precinct, but by the reign of Mary the privilege had to a certain extent been curtailed, though not to the same extent as in England. The rigorous supervision necessitated by the fiscal and commercial arrangements did not insure honest dealing on the part of buyer and seller. Everywhere—in England and the continental countries alike—the same regulations were promulgated, and everywhere the experience was the same. Burghs and Parliaments passed endless laws to enforce their application, but legislation was futile against evils that were inherent in the economical system. In the case both of home and foreign trade individuals, and even communities, constantly sought to evade restrictions which were yet generally recognised as necessary in the interest of the general welfare. The most lucrative exports were barley and oats, hides, skins, wool, coal, salt, coarse cloth and fish, and of these sheepskins, wool, herring, salt and cloth were the most valuable. The chief manufactures were plaiding, salt, linen, knitted hose and gloves, of which by far the most important were plaiding and salt—the two national industries. The foreign trade was mainly carried on with Campvere in Zealand, Bordeaux, London, Newcastle and the ports in the Baltic Sea. From Zealand corn was chiefly obtained in return, from Bordeaux wine and walnuts, from the Baltic flax, hemp, iron and tar; and from England mainly wheat and oats.

V.

The general conditions of town life in the time of Mary having been described, they would now, said the lecturer, consider the community that was gathered within its precincts. In the first place, it had to be noted that with the exception of Edinburgh, the number of indwellers, even in the more populous burghs, amounted only to a few thousands. In such a society every one was more or less familiar with his fellow-townsmen, and as he had scarcely any interests beyond the community of which he was a member, his feelings were proportionately keen regarding all that concerned it. If the records of the burghs were to be trusted, we must conclude that a sixteenth-century Scottish town was a sufficiently lively place, and could on occasion be the scene of humorous and dramatic incidents, which the march of civilisation had made impossible with so many other things. In the town community there was a deep line of cleavage which divided the inhabitants into what were virtually two hostile camps. On the one hand there were the burgesses or freemen, and on the other the non-burgesses or unfreemen. According to the laws of the burgh, though they were not unfrequently broken, the unfreemen could not follow any handicraft, could not engage in any form of trade or merchandise, could not be taken into partnership by any freeman, nor be employed by him in any business capacity either at home or abroad. But if the freeman had valuable privileges, he had also weighty responsibilities—so weighty indeed that he often became convinced that he had made a bad bargain in accepting them. He had to pay a considerable sum for admission to burghership, he had to take his share in watching and warding—everywhere rigorously enforced, and hardest duty of all, he had to be ready at any moment to don his jack and take his hagbut and halbert, and march with his fellow-burgesses wherever his king might require his services. Besides the deep cleavage between burgesses and non-burgesses, there was a further subdivision in the ranks of the burgesses themselves. The freedom of the burgh was shared by two classes of persons, who in Scotland, though apparently not in England, were in bitter and chronic antagonism. The one was the class of merchants, the other the class made up of the more or less numerous crafts that were to be found in the free burghs. By the beginning of the fifteenth century the various crafts had attained such numbers and influence that the merchants were unable to maintain undisputed influence in the affairs of the burghs. By the same period, in England as well as in Scotland, the crafts had begun to attract the attention of the executive by their restless activity and by what were deemed their revolutionary tendencies. The conflicting legislation regarding them showed the embarrassment of the authorities in the presence of this new power in the commonwealth. The question at issue was whether the crafts should have deacons or masters over them, and what powers should be assigned to them. The

objection of the Government to the appointment of deacons was that "they were the cause of great trouble in the burghs," and gave occasion to "raising of the king's lieges." On this ground the office of deacon was abolished in 1555, during the regency of Mary of Lorraine, but so powerful had the crafts become in all the burghs that the very next year the Government was forced to cancel this Act. In the reign of Mary the long controversy between the crafts and the merchants mainly turned on one point, and it was one of far-reaching importance. Having gained the right of appointing their own deacons, the crafts now set themselves to procure representation in the town councils—in this following the example of the same class in other countries. To this demand of the crafts the merchants offered the strongest opposition, and it was only from sheer compulsion that in 1560 the Town Council of Edinburgh admitted two craftsmen into its body. The victory of the crafts, however, was still far from being won, and it was not till the close of the sixteenth century that they gained their point in the leading burghs of the United Kingdom. In the conflict between the crafts and the merchants great national issues were involved. Under one aspect it was a conflict between the democratic spirit on the one hand, and the spirit of exclusive privilege on the other. It was in its economic bearings, however, that the conflict had the greatest significance. The question essentially at issue between the crafts and the merchants—and it was the great economic question of Mary's reign—was what authority should possess the power of fixing the prices at once of raw products and of manufactured goods. The attainment of this authority underlay all the strivings of the crafts, and the conflict that arose in connection with this privilege moved the inhabitants more deeply than the change of the national religion. The fact that the struggle did not fill a larger place in the general history of the period had a simple explanation: owing to the isolation of the burghs from each other, the issues at stake could not give rise to a collective struggle in which the whole nation would be cleft in twain as in the case of the religious revolution. Up to this point they had been mainly concerned with the more serious concerns of the people, and they must now try to see them when relieved from the pressure of duty, and when they looked about for such pleasures and enjoyments as the conditions of life offered them. The call of the watchman at hours determined by the authorities sent burgher and villager to rest at night and summoned him to his avocations in the morning. Such was the rule of life among the respectable members of all classes, but there was a number of the population who made the tavern their daily and nightly resort, and indulged in gambling, roystering and all manner of disorderly conduct, Sunday being the day when the taverner drove his best trade, as was the case in every other country at the period. It was the business of the town authorities to provide amusements for the inhabitants. Each town had its staff of musicians, and they heard of performers on the big and little drum, the pipes, the fiddle, the trumpet, the cornet and the German whistle. The most popular amusement was the annual frolic of Robin Hood and Little John, on which the Government in vain laid its interdict. Within doors, cards, dice and backgammon were the chief games, and betting was a general practice. Outdoor games were catch-putty or tennis, football, golf and shooting with the long-bow, cross-bow and culverin, though this practice was hardly regarded as an amusement. Most of the burghs had also their annual horse-race, the prize being a silver bell or cup presented to the winner by the Council. Both from the literature and the public documents of the period we gathered that in the reign of Mary there was a rapid increase in luxury of living. The dress of the different classes of the people was then described, and the futile attempts of the Legislature to regulate it. In the case of the mass of the people cabbage and colewort, pease and beans were the principal vegetables; salted mutton and geese the common meats. In the towns wheaten bread was to be had, but it was only the wealthy who could afford to buy it; the bulk of the people had to be content with oatcakes. Wine was the beverage of all persons of substance, but ale was the general drink of the people. Visitors to Scotland charged the upper classes with intemperance, but this was a charge which each nation brought against every other.

VI.

The Professor, in the sixth and last lecture, said that in the importance of its contribution to the national development the reign of David I. was the only one in our history to be compared to the reign of Mary. The reign of David definitely created the social order under which the Scottish nation existed throughout the later Middle Age; and the reign of Mary broke up that order and gave a new direction to the nation's ideals and aspirations. Mary's reign abounded with picturesque and tragic incident as well as with striking individualities, but it was as an epoch at once of violent revolution and of gradual transition that it commanded our special attention in any

serious view of the national destinies. Besides the religious revolution that shook the foundations of the kingdom there were other processes at work, which, though less obvious, were eventually hardly less powerful in transforming the aims and ideals of the nation. The sixteenth century saw the great schism from Rome, and it saw an equally decisive breach in the economic system which had grown up under the aegis of that Church. In the case of religion, the breach with the past was nowhere more complete than in Scotland, but for various reasons the change in its economic system could be so rapid and fundamental as in the case of certain other countries. Yet in the reign of Mary, and still more in that of her immediate successor, there were many indications that the nation was fully alive to the economic developments in progress in other countries. The most striking characteristics of the Mediaeval society were to be found in the position held by the nobility in the Church, and in the conditions under which trade and industry had been conducted in every country. In England, France and Spain the power of the feudal nobles had been completely broken when Mary began to reign. But as the example of Mary's reign signally proved, the nobles of Scotland were by no means been so completely "shorn" of their power. Nevertheless, but for what might be called "accidental" circumstances, the Scottish nobles would have shared the same fate as their order in other countries. In Scotland the same old feudal tendencies were at work as in the rest of Christendom, and the Scottish sovereigns as deliberately aimed at absolute power by the suppression of the nobility as the contemporary rulers of England and France. In such a policy they were aided by the tendencies of the time, and conspicuous among the part which the nobles played throughout the reign of Mary their power was in reality no longer what it had been. The old feudal ties which bound the man to his lord could no longer retain their strength in the presence of the new religious ideas, and of the new developments of commerce and industry. The feudal lord, who had hitherto lived a self-sufficing life on the produce of his domains, now required a supply of current coin to enable him to keep pace with the times and rack-rent his tenants as he might; the Scottish baron was usually on the wrong side of his account. A noble with broad domains and a scanty purse was a stranded leviathan, impotent to put his strength in the new conditions in which he found himself. On the other hand, under the new economic conditions the rich burgher and the flourishing town came to play a part of increasing importance in the social and political order. Money being now the prime essential in the conduct of affairs, the wealthy merchant who could supply a heavy loan was a more important person in the State than the impecunious baron. In the close of the sixteenth century these various influences bore their full fruit, and James VI. effectually pared the crown of the once formidable order, and thenceforward the Scottish nobles sank into what they had long been in England and France—the creatures or nominated officials of an all-powerful Court. A second characteristic of the Middle Age had been the immense place which the Church had filled in the social order. The Mediaeval Church had not been merely a great religious institution; it had been a great economic organisation as well. Whether in Mediaeval towns first began to make their appearance, and in several centuries afterwards, it had been the Church that ministered provided for the material as well as the spiritual wants of the people. But a period came when the clergy could not, without renouncing their special functions, be the industrial pioneers of humanity. While the Church ceased to be what it had been—the principal ministrant to material as well as spiritual wants—it remained in possession of the chief source of wealth in every country. As the incidence of taxation pressed on the Church in Scotland on the eve of the Reformation only half the wealth of the kingdom. Hence it was not only the needy Scottish nobles, but the enterprising merchant looking for assistance at a body of men who, while ceasing to be producers of wealth, were yet its principal consumers. When while Knox and his brother reformers assailed the doctrine of the ancient Church, it was assailed from another side by an obtrusive but not less deadly set of foes. The teaching of the Reformers was of but recent growth, and impressed itself only on that limited section of a people who in all ages have been profoundly influenced by religion. But the spirit of material progress had been of slow, unconscious and inevitable growth, and was, in truth, but the spirit of a new epoch that had dawned, and which in the end was to substitute purely secular considerations for those theological conceptions which had been the first and last reference in the conduct of human affairs. A third characteristic of the Middle Ages had been the economic system which arose out of the conditions on which the Mediaeval society was based. Under that system each town had formed an isolated economic centre, regulating its own interests and its relations to the rest of the world. One of the great developments of the sixteenth century was the transition from a merely municipal to a national basis in the operations of trade and commerce. Thus in

the power of each town to determine the prices of all things without reference to any external authority. In the sixteenth century this power was withdrawn from the towns, but of Scotland they could only say that there was no indication of State interference in the regulation of prices. In another direction they found England breaking away from the Mediæval economy, while Scotland held fast to its old ways. In the Middle Ages none but burgesses were allowed to practise any craft, but through the suppression of the guilds any one who possessed the requisite skill was at liberty to pursue his special calling. In Scotland, on the contrary, the crafts were never more powerful than in the sixteenth century, and never were more rigid in their demands towards "unfree" craftsmen. In the case of the textile trade, they found the same contrast between the two countries. In Scotland the hard-and-fast regulations which bound the Mediæval merchant were as stringent as ever, while in England the door was virtually thrown open to all who might desire to put their capital to profitable use. The backwardness of Scotland in the new economic developments had a simple explanation. It was through the growth of capital that these developments had taken place in England and other countries, but in Scotland there was no such growth—a fact sufficiently explained by its geographical position, the character of its soil and climate, its unfriendly relations with England and its remoteness from the trading centres of the Continent.

James Balfour Paul, Lyon King-of-Arms, proposed a vote of thanks to Professor Hume Brown for the series of lectures he had delivered.

Professor Brown, in acknowledging the compliment, said that his typewriter had informed him that in the course of the lectures he had uttered no fewer than 40,000 words. He concluded by thanking the Chairman for his kind words regarding the Society for making him Rhind lecturer, and to the gentlemen who had shown such exemplary patience during the series of lectures.

We are indebted to the *Scotsman* for the careful abstracts of the lectures.

TOYNTON CHURCH.

The church of Teynton All Saints, in the deanery of Bolingbroke, Lincs, which is now under repair and restoration, has been found to contain a thirteenth-century arcade in the south wall and a Norman arcade in the north. These were not discovered till the plaster was removed. The north arcade, which is much damaged by fire, is in a weak condition and needs underpinning, but the bishop, the rural dean and the rector are of opinion that it would be a great pity that the arcade should be built up again for lack of funds. To restore them will add 250*l* to the cost of the restoration, and the Bishop of Lincoln has sent 5*l*. After considerable effort 620*l* has been raised locally towards the restoration fund, and the rector, the Rev. D. Carey, will be glad for any contributions. The architect is Mr. Harold B. of Newark-on-Trent. It may be added that the south arcade, which is of the Decorated style, consists of four bays. There are two limestone pillars, octagonal in shape, but standing on square bases. Three of the arches are quite perfect, but the fourth has at some time been cut away to make room for a window to give light to the west gallery. The Norman arcade, which is probably two centuries older, has five bays of about 12*ft* each. The pillars are round with carved capitals. The arches which have so far been cleared show traces of the old custom of coating sandstone with plaster and then painting the plaster. When the arches were built up in the thirteenth or fifteenth century the brickwork was plastered and the surface adorned with ornamental lettering.

CLAIM FOR REINSTATEMENT.

On Monday Mr. J. Troutbeck, high bailiff for Westminster, presided, and a special jury concluded the hearing of the case in which Messrs. Vacher & Sons, Parliamentary printers, of Great Brunswick Street, Westminster, claimed from the London County Council 25,600*l*., as compensation for the compulsory acquisition of their leasehold interest in the premises, 20 and 22 Millbank Terrace, Westminster, required by the Council in connection with the improvement of that thoroughfare. It was said that the claimants' case was based on the principle of reinstatement, namely, having erected large and commodious premises in Great Brunswick Street at a cost of 27,000*l*., incurring an extra rental of 1,619*l*. and above the 500*l*. paid for the old premises of 1,619*l*. per annum. On this sum they claimed ten years' purchase, and the other items included—value of machinery, 3,849*l*.; 10 years' net profits, 4,700*l*.; and removal of stock, 500*l*. Part evidence in support of these figures was given by Mr. Trollope and Mr. John Esson. Sir Edward

Clarke described the claim as an extravagant one, and said the County Council refused to recognise it on the basis of reinstatement. For the County Council Mr. Samuel Walker stated that the utmost the claimants were entitled to was 4,364*l*. He could have housed them in a nearer and more suitable building for 5,000*l*. Mr. Howard Martin said he thought 4,048*l*. would amply compensate the claimants. The High Bailiff said that unless the jury thought the ordinary mode of compensation would do the claimants an injustice they ought not, in his opinion, to adopt the basis of reinstatement. It was a very serious and important case, as the adoption of the principle of reinstatement might create a prohibitive cost of carrying out public improvements. The jury awarded the claimants 8,413*l*.

HITTITES AND ETRUSCANS.

IN a second communication to the *Times* on the above subject, Major Conder writes:—The arguments of De Cara are not linguistic; the suggestions of Drs. Sayce, Hommel and Jensen as to the sounds of the emblems are mutually contradictory, and are not founded on comparative study or on the sounds of the Cypriote. The name Tarkon is neither Semitic nor Aryan; it is not found in Armenian, Georgian or Vannic, but only in Etruscan and Turkish and Hungarian. It survived in Cappadocia down to the Christian era, and was known to the Byzantine emperors as a Turkish title. The well-known double-headed eagle, found among Akkadians and Hittites alike, was the Seljuk emblem of the Turkish conquerors, and may still be seen carved by them at Erzerum, Trebizond and elsewhere in Asia Minor, as early as the eleventh century A.D. It may be noted in passing that the Hittites were not exterminated in the eighth century B.C., for, according to a recently-found text of Nebuchadnezzar, their princes were still to be found in Syria as late as 600 B.C.

One or two other comparisons are worthy of notice. The Hittite gods stand erect on their animals, just as do the Assyrian deities at Bavian and at Samalla. The demon head of the Etruscan Charon—the infernal deity—recalls those of Babylonian demons, especially as regards the protruded tongue. The labrys, or double axe, which is generally regarded as distinctive, occurs on the ancient slate carvings of Egypt, though it was not an Egyptian weapon in later times.

The horse and chariot were, no doubt, known to the Hittites before the Egyptians adopted them, and also adopted Semitic names for both, but the chariot is found yet earlier among the Akkadians, from whom the Semitic race took so much of its civilisation. Lydian traditions and customs point no less clearly to Babylonia and to Mongolic rather than Semitic origin. The strange custom of the Couvade appears in Lydia as well as in Bretagne and in America, and the tracing of descent from the mother was common to Lydians and Etruscans, and survives among Mongolic tribes in Eastern Asia. The magnificent Etruscan sarcophagus in the British Museum represents an Etruscan lady, whose appearance is most remarkably Mongolian. The Etruscan masonry called "cyclopean" is found at Tiryns and Troy and throughout Asia Minor, where it continued (with the false arch) to be used even down to Roman times. It was attributed by Classic writers to the Cyclops, or "round-faced people" from Asia, who built Mycenæ. It is not, I believe, to be found in Egypt. The Lydians also used Babylonian weights, and built in brick, and traced descent from Ninus.

All these indications serve to strengthen the argument founded on language. But the Etruscan emigration to Italy occurred apparently about 1000 B.C., when the alphabet, derived from the older syllabary of Asia Minor, was superseding earlier scripts, which only survived in islands like Cyprus and Crete, among the Greeks. Thus the Etruscans brought with them apparently an alphabet only, yet not one directly derived from Phœnicians, since they do not use the Phœnician letter-names according to the evidence of the *abecedaria* of Etruria. The history of Mongolic dispersion thus rests on many considerations more definite than art comparisons would by themselves be considered.

THE AMERICAN ACADEMY IN ROME.

IN 1894 a number of artists who had been engaged together upon the work of the World's Fair at Chicago established "The American School of Architecture in Rome." Their object was to enable American students of architecture who had passed with honour through leading technical schools, or who had been equally qualified by private instruction, to develop their powers more fully under the most favourable conditions of direction and environment. The students of the school were selected by competition and received pecuniary aid. The school was wholly supported by the artists referred to and their personal friends.

The rapid improvement in the work of the students and their enthusiasm convinced those who were interested that the scope of the school should be made broader, and should include the allied arts of sculpture and painting. To this end representative sculptors, painters and architects, together with other persons interested in the subject, decided in 1897 to found, on the lines of the French Academy in Rome, a school which should be open to American students of sculpture and painting, as well as of architecture.

In pursuance of this design the American Academy in Rome was incorporated under the laws of the State of New York in June 1897. A constitution was then adopted, and suitable rules made for the government of the institution. All these steps were taken under advice of competent legal counsel. In 1901 the Secretary of State for the United States authorised the Ambassador at Rome to accept the position of trustee *ex officio* of the Academy, and directed him to secure for it "all the privileges and exemptions that are accorded by the Italian Government to like institutions of other countries."

The Academy is therefore legally established and competent to receive and hold any moneys that may be donated.

The Academy, like the School of Architecture, has been until the present time supported solely by the incorporators and a few of their friends; to the end that the usefulness, importance and practicability of the undertaking might be fairly demonstrated before any public request was made for funds for a permanent endowment. For this reason the number of scholars sent to Rome has of necessity been small, and the facilities and conveniences for work have not been such as would be afforded by an older well-equipped and well-endowed institution.

But now the work of the Academy has justified its existence. It is no longer an experiment. It is an established institution, working along the same lines and for the same end with the French Academy, whose pre-eminence in the world of art has been proved by the experience of more than two hundred years. The incorporators feel that the time has come when they have the right to ask the friends of art in America for a permanent endowment, and to ask them also to become members of the Corporation, in order to help provide funds for current expenses until such time as the income of the endowment fund is available for this purpose.

GENERAL.

The Council of the Royal Academy will on December 15 elect a Cooke annuitant, who will receive 35*l* a year. Applicants are to be painters in oil or water-colour, not less than sixty years of age, and in distress from age, sickness, or some other cause.

The Rev. D. Carey, rector of Toynnton All Saints, Lincs, the discoveries in which are described elsewhere, has received from a vice-president of the Lincoln Architectural Society an offer of 10 guineas if twenty-nine others give the same.

Notification is given of an intended application to Parliament next session by the City Corporation for an Act empowering them to rebuild and maintain Southwark Bridge, with approach roads and accesses thereto, to alter, &c., the levels of the streets and roads, and to authorise them for the purposes of the Act to raise further money on the credit of their Bridge House estates. Clauses will be inserted in the Act to empower the Corporation "to stop up and to discontinue" the use of the high-level footway forming part of Tower Bridge.

Professor Schweinfurth has left Berlin in order to undertake additional explorations in Egypt, especially in respect of the Stone Age, which engaged his attention during the winter of last year.

The City Lands Committee of London Corporation has decided not to recommend a scheme of municipal fire insurance.

The Leighton House Executive Committee will hold an exhibition at the house during the next three months of studies and sketches in colour by the late Lord Leighton. The owners of examples of this character are requested to allow them to appear in the exhibition.

Carrington House, which was opened on Saturday on behalf of the London County Council, is a lodging-house accommodating upwards of 800 men. The new buildings, which have been erected in Mill Lane, Deptford, on the site of an insanitary area, are estimated to have cost 51,500*l*. The building, of red brick relieved with Portland-stone dressings, is six storeys in height, exclusive of basement, the five upper storeys comprising 814 cubicles. The Council have also erected twenty-four cottages, each self-contained, with a small garden in rear, and providing accommodation for 144 persons, on land adjoining, also forming part of the scheme for dealing with the condemned area. These have cost 4,767*l*.

The Site selected for the memorial of Goethe in Rome, in the park of the Villa Borghese, which is henceforth to be known as the "Villa Umberto."

Sir Henry C. Burdett will open a discussion on "London Hospitals and Medical Schools and their Sites" at a meeting of the Hospitals Association on Thursday, December 3, at 4*pm*, in the Board-room of Charing Cross Hospital.

The London County Council have had erected at the cemetery at New Southgate a memorial to the memory of the patients who lost their lives at the fire at Colney Hatch Asylum. It is a grey Aberdeen granite runic cross on die and plinth, the front of the shaft and wheel being decorated with carved interlaced work of the Anglo-Saxon type. Underneath is the following inscription:—"Below this stone are interred the remains of the fifty-one patients who perished in the lamentable fire at Colney Hatch Asylum on January 27, 1903."

The Prefect of the Seine has decided against the adoption in Paris of the overhead-wire system for the tramway line proposed by the omnibus company of that city. The Municipal Council and the Minister of Public Works will have to uphold this opinion before it can be enforced on the company.

The Chambers in the Vatican which are known as the Appartamento Borgia having been assigned to Cardinal Medici del Val, the papal secretary, will be closed. The rooms contain works by Pinturicchio, which were recently restored.

The Dean and Chapter of Rochester have decided to rebuild the central tower of the cathedral. The design will be in harmony with the rest of the building; it will closely resemble the original tower, and will be capped by a spire of oak and lead. The donation of 5,000*l*. recently given to the Dean and Chapter by Mr. T. H. Ford will be applied towards this work.

The Royal Military College, Sandhurst, is to undergo extensive alterations. The accommodation for cadets will be doubled to meet the recommendations of the special committee on military education. The sum of 350,000*l*. will, it is stated, be spent on the buildings, &c. A new wing will be added, and the quarters for married people in the basement will be adapted for bath-rooms, &c. A block of officers' quarters is also to be erected at the rear of the existing college.

The Church of All Saints, Penfai, near Bridgend, which has been built at the cost of Mr. R. W. Llewellyn, was consecrated by the Bishop of Llandaff on Monday. The church has been built to Mr. Llewellyn's own designs, and contains sculpture which he brought from Florence and an alabaster reredos, of which the central panels were designed by Mr. Goscombe John, A.R.A.

The Exhibition of the Royal Society of Painters in Water-Colours will be opened to the public on Monday next.

Professor H. Louis, of Newcastle, who was sent out by the Government to investigate the asphaltic deposits of the Trinidad, recently affirmed that he has proved that the so-called pitch lake from which 120,000 tons of asphalt were dug annually is exhaustible. The level of the lake had sunk to a degree corresponding exactly with the quantity taken from it. If they knew the depth of the lake they would know to a certain extent how much asphalt was in it.

Messrs. Waterman & Abrahams, architects and surveyors, 7 Cullum Street, Fenchurch Street, E.C., have dissolved partnership. Mr. Abrahams will continue the practice at the same address on his own account.

The Next Ordinary Meeting of the Society of Engineers will be held on Monday next, November 30, at the Royal United Service Institution, Whitehall, when a paper will be read, entitled "Mechanical Stokers for Electricity Generating Stations," by Mr. Albert Gay, M.I.E.E.

Dr. T. H. Tristram, chancellor of the London Diocese, has granted a faculty to the Rev. Thomas Smith, vicar of St. John the Baptist, Green Hill, Harrow, authorising the erection of a new church to take the place of the existing one. According to Mr. J. R. V. Marchant, who appeared as counsel for the petitioner, the present church was built in 1866 as a chapel of ease to St. Mary's, Harrow, the parish church. At that time the population was not quite 1,000, and the seating accommodation (470) provided by the church was then sufficient. Now the parish has a population five times as great, and it is necessary to have more accommodation.

According to the architect's plans for the new Union Railway station at Washington, U.S.A., just published, it is to be the largest and most ornate in the world. It will cost 14,000,000 dollars. Inside the building will be a huge plaza with fountains, balustrades and terraces in the Romanesque style of architecture, harmonising with the Capitol. There will be five exits, one constructed especially for the President and guests of the White House, for whom a suite of apartments is provided. Among the novel features is an invalids' room where a physician will be in constant attendance. There are to be several mortuary chambers, a Turkish bath and a large swimming pool.

EDITORIAL NOTICES.

the many difficulties which are certain to arise in connection with the law, practice rules and procedure under Workmen's Compensation Act, we have added to our list a **VERY EMINENT BARRISTER**, who has undertaken to subject a special study, and will be glad to answer in the columns of this paper any questions relating to the legal matters arising from the provisions of this Act. Our **LEGAL ADVISER** will further answer any legal question that may be of interest to our readers. All letters must be addressed "**LEGAL ADVISER**," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

We will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders for particulars of Works in progress in which they are interested.

Authors of signed articles and papers read in public must not be held responsible for their contents.

Communications can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Readers are requested to make their communications as short as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

Disappointment is frequently expressed at the non-acceptance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be sent to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

Nov. 30.—The committee of Bray Pavilion and Gardens invite plans for proposed pavilion and winter garden. First prize, 30*l*.; second prize, 15*l*.; third prize, 10*l*. with three prizes of 5*l*. 5*s*. each. Messrs. Frank E. Lee and P. Macdonnell, hon. secretaries, Town Hall, Bray.

Feb. 1.—The Urban District Council general committee invite designs for new council house and council buildings, to be erected at the junction of Mason Road and Church Road, Erdington. Premiums of 50*l*., 30*l*. and 10*l*. awarded for the designs placed first, second and third respectively. Mr. Herbert H. Humphries, district architect, surveyor, Public Hall, Erdington, Birmingham.

Dec. 16.—The Lambeth Borough Council are invited to erect a public library, with residence for librarian, in the Hill ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for a public library, with residence for librarian, in the Hill ward of the borough to Mr. H. J. Smith, town clerk, Town Hall, Kennington Green, by 12 noon on

December 16. General information as to the extent and nature of the accommodation required in the proposed library and residence can be obtained on application to the town clerk.

SCOTLAND.—Dec. 7.—The Elgin Landward School Board invite competitive plans and estimates for the erection of school buildings at New Elgin capable of accommodating about 340 pupils. Mr. Hugh Stewart, clerk to the Board, Elgin.

SELLY OAK.—Dec. 7.—Competitive plans and designs are invited for public baths at Selly Oak, near Birmingham. Full particulars of the site for the proposed baths, limit of maximum expenditure, &c., with copies of sketch plans showing the accommodation required, &c., may be obtained on application to the Urban District Council's surveyor, Mr. A. W. Cross, 23 Valentine Road, King's Heath, near Birmingham.

WAKEFIELD.—Dec. 1.—Competitive designs are invited for the proposed reconstruction of the Wakefield cattle market. Premiums, 50 guineas and 25 guineas, will be offered for the first and second selected designs respectively. The 50-guinea premium to be merged in the commission in the event of the person sending in the first selected design if employed to supervise the carrying out of the works. Mr. R. Ernest Langhorne, solicitor, Wakefield.

WINDSOR.—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l*. returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

BATLEY.—Nov. 30.—For the erection of a refuse destructor at the electrical-generating station, New Ing Fields. Mr. J. H. Craik, town clerk, Town Hall, Batley.

BATLEY.—Dec. 3.—For the erection of new classrooms and lecture-hall at Broomhill church, Taylor Street, Batley, Yorks. Mr. F. Ineson, 18 Bradford Road, Batley.

CORRESPONDENCE.

SIR,—Our business, originally started for the manufacture and sale of the B. & S. patent folding-gates, has increased to such an extent, and other productions introduced by us now form so large a proportion of our business, that our title, "The B. & S. Folding Gate Company," is now a misnomer, and the cause of misunderstanding. In the future, therefore, the business will be conducted under the personal name of Arthur L. Gibson & Co.—Yours faithfully,

ARTHUR L. GIBSON.

19, 20 and 21 Tower Street, Upper
St. Martin's Lane, London, W.C.

VARIETIES.

At Bangor on Monday the new operating theatre and board-room erected in connection with the Carnarvonshire and Anglesey infirmary were formally opened.

In the course of carrying out repairs to the roof of a residence at Loud Sutton, in Lincolnshire, the workmen discovered a large hole in which the bees had deposited a quantity of honey. Over two pailfuls were taken out in a fine condition.

The massive granite pedestal for the statue of Queen Victoria, which is to be erected in Wellington, New Zealand, was shipped from Aberdeen on Saturday. It is 17 feet high, 17 feet 10 inches square at the base and weighs 40 tons. On the sides of the main block will be four fine bronze subject-panels. The granite comes from the Kemnay quarries.

The town clerk of Leeds (Mr. W. J. Jeeves) has tendered his resignation to the finance committee of the Leeds Corporation. Mr. Jeeves, who was formerly town clerk of St. Helens, was appointed town clerk of Leeds on May 3, 1899. He has just been called to the Bar, and it is his intention to practise at the Parliamentary Bar.

The eighth winter meeting of the British Association of Waterworks Engineers will be held on Saturday, December 12, at the Geological Society's rooms, Burlington House, W., at 11 o'clock, A.M. The Council and officers for 1904 and new members will be elected. Professor Henry Robinson will read a paper on the "Storage of Flood Water." Mr. Alfred J. Jenkins will read a paper on the "New Reservoir for the

Hoylake and West Kirby Waterworks," and Mr. Neil J. Peters will also read a paper on the "Cogan Extensions of the Cardiff Corporation Waterworks." After each paper a short discussion will take place.

At the inquest held on the bodies of the four men who died in consequence of injuries received owing to the collapse of the viaduct on the Cheltenham and Honeybourne new railway at Stanway on the 13th inst., the jury returned a verdict of "Accidental death" in all four cases, adding, however, the following rider:—"We are of opinion (1) That, considering the state of the weather, sufficient time was not given for the lime-mortar to set before the centres were removed; (2) that arches of this kind in the winter months especially should be set in cement mortar; (3) that the steam crane was carried further on to the centre of No. 10 arch than was advisable, having regard to the fact that the support of the crane roadway did not extend to the next pier." The inquiry was then closed.

It is a great satisfaction to single out an article of real and lasting utility that one can choose as a Christmas present for any friend young or old. The "Swan" Fountain pen is a gift which will not be merely admired on Christmas Day and then put away and scarcely ever looked at again; on the contrary, it will be placed in the pocket or on the desk, and its first use will probably be the dashing off of grateful thanks to friends for their kind remembrances. The convenience of this valuable pen will grow daily more apparent and indispensable, and as it is good for years of writing, the recipient will often regard it as a mark of the donor's regard. Mabie, Todd & Bard's goods are famous for their quality, while the obliging system of exchange insures every "Swan" possessor being perfectly suited. A fully-illustrated catalogue of pens, ranging from 10s. 6d. to 20s., will be sent post free on application to 93 Cheapside, London.

A NEW reredos has been erected at a cost of over 700l. by the subscriptions of the congregation in St. George's Church, Edgbaston, and has just been dedicated by the vicar (Canon Mansfield Owen). The reredos, which is of oak and covers the whole of the east wall of the chancel below the window, is divided into five parts, the centre being higher than the sides. The top is 20 feet above the altar steps. There are a number of niches with canopies, and it is hoped that all will in due time be filled with figures. In the centre niche has been placed a beautifully carved figure of Our Lord in the act of

blessing, the gift of Mrs. W. N. Fisher. The side niches and canopies will contain figures of the four evangelists, two of which have already been given by Mr. Joseph Barrows and Mr. C. Rainsford. The lower portion of the reredos is filled in with tracery in panels, and a bold moulding about a foot wide, richly decorated with shields and vine leaves, runs on the two sides and top of the centre portion.

THE cottage homes erected by the Salford Guardians at Culcheth were opened on the 19th inst. The village consists of twenty-four homes, each designed to accommodate twelve children. The homes are arranged in eleven pairs of semi-detached cottages and two single cottages. Each cottage contains a kitchen, day-room, lavatory and bath-room on the ground floor, and two dormitories, having six beds in each, a room for the foster-mother, and a spare room on the first floor. Near the entrance gates are placed the schools—a mixed school for 180 children, and an infants' school for 100, connected by a covered way. The offices and workshops' block contains superintendent's offices, board-room, stores for groceries, hardware and milk, bakery, tailors, shoemakers, plumbers and carpenters' workshops, engine and dynamo-room, where electrical energy for lighting purposes will be generated, boiler-house, laundry and swimming-bath. Water has been obtained on the site, and the water-tower forms a prominent feature of the buildings. Near the offices is the superintendent's house, and not far away is a small hospital of four wards having four beds in each ward.

COUNTESS CARRINGTON opened on Saturday last another portion of the County Council's scheme for housing the working classes. The new building, which will be known as Carrington House, is a lodging-house to accommodate 800 men. It has been erected in Mill Lane, Deptford, on the site of what was once known as an insanitary area, and has cost 51,500l. The site has an area of about 39,793 superficial feet, with a frontage to Mill Lane of about 300 feet. The building, of red brick relieved with Portland-stone dressings, is six storeys in height, exclusive of basement, the five upper storeys comprising 814 cubicles. In the lodgers' section of the ground floor have been provided spacious dining, reading and smoking rooms, &c. In addition to Carrington House, which has been named after Lady Carrington, wife of the present chairman of the housing of the working classes committee, twenty-four cottages, to be known as Sylva Cottages, each self-contained, with a small garden in rear, and providing accommodation for 144

WAPICTI

PURLEY LODGE, BOSCOMBE, BOURNEMOUTH.

THE RED HOUSE, BOURNEMOUTH.

TRADE NOTES

WE have received from the Metallic Paint Co., Ltd., of Mount Stuart Square, Cardiff, samples of their paints. The "E. G." solution, which is specially adapted for painting laundry, hospital, asylum, conservatory, engine-house fittings, radiators, laundry appliances, hot and cold water-pipes, &c., has been used with marked success at the Newport and Monmouthshire, and many other hospitals, corporations, and railway companies' engineering works. It has a silvery appearance which is most attractive. When used on radiators or hot-water pipes it has no smell, a matter of vast importance, as many other paints used for this purpose are often very objectionable; it will stand constant washing without injury. The Metallic Paint Co. also supply a particularly good black enamel, known as "Phoenix" black enamel, and a superior red oxide which they term "No. 1 Special." The price of the "E. G." solution is reasonable and the covering properties of the paint satisfactory. The result is undoubtedly successful, the silvery appearance of the finish being most effective. They warn their customers against spurious and worthless imitations, and it is well to see that packages bear the signature of the inventor—"H. Moreton."

MARBLE arrolithic has been selected for the paving of the new operating theatre at Guy's Hospital, and is being laid by Arrolithic Ltd, 18 Berners Street, London, W.

THE Saxon Portland Cement Company, Ltd., are to be congratulated on the result of working for their financial year ending on September 30 last. The company is able to continue the substantial dividend of 10 per cent, with 2½ per cent. bonus, and to apportion the remainder of its profits as follows:—Debture sinking fund, 14·5 per cent.; reserves, 19·4 per cent.; balance carried forward, 19·7 per cent.

APROPOS of a fire which occurred two or three days ago at the premises of Messrs. Hamilton & Manson, Melville Street, Glasgow, which was successfully extinguished by the "Titan" patent automatic sprinkler with slight damage, Messrs. George Mills & Co, proprietors of the "Titan" sprinkler, have received the following letter from Messrs. Hamilton & Manson:— "Your favour of the 21st inst. to hand this morning, and we have pleasure in testifying that at our recent small fire the 'Titan' sprinkler acted very promptly and extinguished the fire with very little damage. We may say we have always found your sprinkler most satisfactory." This is the third fire which has occurred at these premises, all of which have been

successfully extinguished by the "Titan" sprinkler with little or no damage.

MESSRS. SAM DEARDS, LTD., of 34 Old Broad Street, and Victoria Works, Harlow, Essex, have lately secured and carried out the following orders:—Messrs. Brooks & Co., Farringdon; Selwyn Avenue schools, Walthamstow; parade shelters, Bridlington; Royal Engineers, reconstruction of barracks, Colchester; Windsor Street gas works, Birmingham, for meter repairing shop and stores; Brimsdown electric-power station; ironwork and glazing at Bromley, Kent; Hornsey Urban District Council depot; Charing Cross Hospital extensions; Messrs. Foy & Gibson, Finsbury; Messrs. Seward & Co., Gloucester; Sudbury destructor buildings; iron buildings, Croydon; Hare & Co, Holborn, &c., &c., for their patent "Superior" glazing system.

ELECTRIC NOTES.

AFTER considerable opposition the sanction of the Local Government Board has been received by the Clacton-on-Sea Council to the borrowing of 15,225*l.* for an electric-light installation.

THE Croydon Rural Council are about to promote a Bill in Parliament for powers to extend the Croydon electric tramways from Purley to Smitham Bottom, and another branch from Purley to Whyteleaf.

THE most considerable gap left in electric tramway communication between Liverpool and Leeds is on the Yorkshire border. At a Local Government Board inquiry at Todmorden relative to the application by the Todmorden Corporation for borrowing powers for 21,000*l.* for electric lighting and power purposes and 6,000*l.* for an electric refuse-destructor it was stated that there was no intention of laying electric tramways at present, but something might be attempted in the way of electric omnibuses. There was no opposition to the scheme.

"THE Practical Electrician's Pocket Book and Diary for 1904" has just been published, price 1*s.* This admirable little work has now reached its sixth year, and shows a record of steady progress and improvement, never failing to keep pace with the most recent developments of electrical practice. In this, as in previous issues, pains have been taken to keep it abreast of the times, and many alterations and additions have

been made to it. Copies may be obtained from the publishers, Messrs. S. Rentell & Co., Ltd., 36 Maiden Lane, Strand, W.

THE Clyde Valley Electrical Power Company will apply power to supply electricity for lighting and power purposes to the burgh of Johnstone, N.B. The gas is under the power of the Municipal Corporation, the capital is over 20,000*l.*, and the town has completed considerable extensions for future demands, while the price has been reduced to 2*s.* 8*d.* per 1,000. It is understood that the village of Howwood is about to apply to Johnstone for the supply of gas, while the Corporation at present, besides supplying Johnstone, lighting Elderslie Quarrelton, and lately they have added Brookfield, a new suburb of Johnstone. Many are in favour of the new illuminant.

THE lessees for the electric lighting of Hamilton, N., under the Town Council (Edmundson's Electricity Corporation Ltd.), whose resident engineer and manager is Mr. T. Colson, announce that owing to the liberal patronage extended to them, having connected 9,000 lamps to their main in nine months, they have been able to effect a very considerable reduction in their scale of charges both for electric lighting and power. The reduced rate for lighting, which comes into force as from November 1, is a flat rate of 4*d.* per unit, and for power 2*d.* per unit for the first hour, 2*d.* per unit for the second hour and 1*d.* per unit for every succeeding hour per day. The company are presently fitting up 50 Gilbert arc lamps in Cadzow Street and Townhead Street. On the Town Council's inspection, and on their approval the lamps, it is expected, will be adopted for lighting general throughout the burgh.

THE finance and Parliamentary committee of the Stepney Council has decided to recommend the Council to apply to the London County Council for loans amounting to nearly 50,000*l.* for the purpose of effecting improvements in the borough. 12,400*l.* is required for the improvement of Narrow Street, Limehouse, in the vicinity of Eagle wharf; 3,200*l.* for the widening of Dean Street; 2,288*l.* for the widening of Bell Lane Whitechapel; 18,246*l.* in respect to Blyth's wharf and the widening of Narrow Street in that neighbourhood; 6,000*l.* for the acquisition and demolition of the historic Vine House Mile End. Owing to the disinclination of the London County Council to pay anything towards the cost, other improvements are to be postponed for the present.

BUILDING AND BUILDERS.

erection of the new Corporation Halls, Langside, Glasgow, which are situated within part of the Camphill lands, at the corner of Pollokshaws Road and Langside Avenue, is rapidly nearing completion, and it is expected that will be ready for occupation early in December. There is a large hall to accommodate about 750, a lesser hall to accommodate fully 300, with buffet-rooms and kitchens for each hall, the necessary artistes' rooms and cloak-rooms. There are a number of smaller rooms suitable for holding classes and meetings of societies and committees. The whole buildings are being lit throughout with electric light and ventilated by means of electrically-driven fans. It is intended to have a number of Corporation recitals on Saturday afternoons in the hall, as soon as they are ready for occupation. These halls were formerly the National Bank buildings in Queen Street, the masonry has been taken down and re-erected just as it stood in Queen Street in perfect condition, only one or two details requiring to be renewed. Of course, the whole interior has been rearranged to suit the purposes to which the building is now to be put.

THE London and North-Western Railway Company's plans in regard to the proposed improvement of the Exchange Station, Manchester, are, according to the statutory notice which was published in the *Gazette*, as follows:—To extend to a distance of 5 yards or thereabouts, on the south-eastern side thereof, the bridge carrying the company's Liverpool and Manchester railway over Bury Street. To extend for a distance of 7 yards or thereabouts, on the south-eastern side thereof, the bridge carrying the said railway over Legendre Street. To make a new bridge over Gravel Lane, Trinity Market and Blackfriars Road, commencing at a point on the north-west side of Gravel Lane, 32 yards or thereabouts northward from Bury Street, and terminating at a point on the north-east side of Blackfriars Road, 32 yards or thereabouts north-eastward from the bridge carrying the said railway over Bury Street. To extend for a distance of 23 yards or thereabouts, on the south-eastern side thereof, the bridge now carrying Salford approach over Greengate, and to stop up and discontinue and extinguish all rights of way over the undermentioned streets, roads, highways and places, and to appropriate and use sites or portions of the sites thereof for the purposes of the company's undertaking—that is to say, Union Street, Harding Street, Salford Approach, King's Head Yard and all other streets, roads, thoroughfares, courts, passages and

places situate within the area bounded by Blackfriars Road, Chapel Street, Greengate and the Company's Exchange station. To acquire, by compulsion or agreement, and to hold certain lands lying on the south-east side of and adjoining the company's Liverpool and Manchester Railway and Exchange station between Deal Street, Chapel Street and the Cathedral Approach.

EFFECTIVE ADVERTISING.

THE value of the artistic quality in advertisements is now, we believe, generally recognised, and whereas but a comparatively short time ago painted lettering, not always too perfectly executed, used to suffice, we now look for something of a much more elaborate nature.

Mr. W. G. Pether has made it his mission to supply the need thus created, and at his works at Nos. 58 and 60 Banner Street, E.C., may be seen an extensive assortment of newest designs in "Brilliant" glass, metal, wood and other letters, in all of which quality and good workmanship are evident.

One of Mr. Pether's latest introductions is his "Empire" letter, which is of notably handsome design. The body of this letter is cast in a special metal alloy, while the face, which may be in brass, copper, tin or even silver, and can be enriched with stamped or repoussé ornament, is cast on, thus forming a homogeneous whole, the example which we admired at the works being a bold and effective rendering in "Empire" style. This period, however, although it gives its name to the pattern, need not necessarily be followed. The "Carrara," which is another of Mr. Pether's recent introductions, is also a handsome and effective letter. It is made in porcelain, and can be finished in any colour to order, and gilt either wholly or in part. An attractive form of this letter is in white and gold, the face being in lustrous white, with the deep-bevelled shade and sides finished in highly-burnished gold.

A specialty of Mr. Pether's, who is introducing several new kinds of tablets, &c., is that he is able to work to architects' own sketches, and retains designs so produced as the exclusive property of such architects, to whom alone they can be supplied in any quantity. Another improvement introduced by Mr. Pether is his method of fixing wood letters, by which the expense and unsightliness of iron rails across the backs of the letters are dispensed with, and the face of the letters is protected from the effects of the weather, the rain draining down behind the letters without coming into contact with the gilding.

THE INVENTIONS EXHIBITION, BRIGHTON.

AMONG the various objects to be seen at the Inventions Exhibition, which opened on Wednesday last at the Grand Aquarium, Brighton, under very favourable auspices, special mention may be made of the exhibits at the Stand occupied by Diespeker, Limited, of Holborn Viaduct, comprising interesting specimens of their patent British glass mosaic, which, owing to its comparative cheapness, should now, it is claimed, enter largely in the decoration of theatres, restaurants, hotels, churches, public and other buildings, where rich-looking mural decoration is deemed essential. The applicability of the principle to the outside as well as the interior of buildings is amply demonstrated, and evidence is moreover afforded that it can also be adopted with advantage in the manufacture of glass mosaic sign letters, which are so extensively used for shop fronts and other purposes. The introduction of this British glass mosaic is regarded as an invention of a significant character, inasmuch as it is a new home manufacture of an artistic kind that will tend to the beautifying of homes and public buildings at a relatively small cost. The specimens exhibited of this "Opus Tessellatum" comprise, among others, an "Allegorical Design of Venice," an "Allegorical Roman Frieze," and a representation of "St. Nicolo di Bari."

Some capital specimens are also shown of Diespeker's patent marble mosaic stairs, which, besides having a nice appearance, give a good foothold and are very durable. We understand that these staircases have been supplied by the firm in question for the Walthamstow Theatre, Chelsea Palace and South London Music Hall (Messrs. Wilson & Long, architects); the National Hall and the Pavilion Theatre, Glasgow (Mr. Bertie Crewe, architect); the Empire Theatre, Newcastle (Mr. F. Matcham, architect); the Horticultural Hall, Westminster (Mr. E. J. Stubbs, architect), and the new Board schools, Canterbury (Mr. W. J. Jennings, architect). An example, moreover, is shown of Diespeker's patent mosaic inlet steps, which have been specially designed to meet the requirements of a staircase where the noise of busy tramping feet is undesirable, and where a good foothold is likewise assured.

Nor should mention be omitted of other specialties exhibited, such as Diespeker's patent mosaic bath, mosaic wall lining and dado, besides specimens of Venetian marble mosaic floors and of a dome treated in plain gold, &c., the whole of which present an artistic appearance.

FIREPROOF CONSTRUCTION.

IN view of the constantly increasing number of enormous blocks of buildings, such as hotels, flats, schools, warehouses, &c., and the great height to which they are carried, the need that the construction should be entirely fireproof becomes daily more pressing. It is not sufficient that the materials employed in the actual structure itself be fire-resisting; it is also essential for true safety, that the whole of the joinery and fittings be of an unflammable nature. Hitherto this desideratum has been difficult, if not impossible, of attainment, the employment of wood chemically rendered fireproof having entailed largely increased expense, to say nothing of the British workmen's well-known unwillingness or inability to depart from the old well-worn track in favour of anything new. This difficulty is now, however, thanks to the energy displayed by The Non-flammable Wood and Fabrics Company, Ltd., of Townmead Road, Fulham, S.W., overcome, and more than this, a positive saving can be effected by the use of the prepared wood, as will shall demonstrate later.

The Non-flammable Wood, &c., Company, is about to be reconstructed on very much wider lines, and the directors have already erected on their extensive riverside premises at Fulham a large range of workshops, which they have fitted up with the latest and most improved woodworking machinery, all of which is electrically driven.

Here they are prepared to turn out every description of carpentry and joinery in fireproofed wood of every description. The process of fireproofing makes absolutely no difference in the appearance or durability of the wood, which takes paint, polish, &c., exactly the same as untreated wood, and an extremely important fact to note is that while the doors, stairs, window-sashes, mantels and other joinery made of fire-resisting wood can be supplied by the Non-flammable Wood, &c., Company at a cost of only 15 per cent. above that of ordinary wood, insurance companies will allow a rebate of 30 per cent on all buildings, including hazardous risks, where the non-flammable wood is employed.

The Non-flammable Wood and Fabrics Company, Ltd., are now in a position to contract or sub-contract for all the woodwork (carpentry and joinery) of a building complete and fitted up as required, and will be glad to supply estimates for jobs of any magnitude.

It is intended to erect a new Primitive Methodist chapel in Croft Street, Lincoln, to replace the present wooden structure.

ELECTRICITY AT STOKE-ON-TRENT.

COLONEL A. G. DURNFORD, R.E., of the Local Government Board, held an inquiry last week at Stoke-on-Trent with respect to an application by the Town Council for sanction to borrow a sum of 38,781*l.*, viz. 30,640*l.* for an electric-lighting scheme and the provision of a refuse destructor in connection with the electricity works, 1,877*l.* for the purposes of public walks and pleasure grounds, 5,550*l.* for the improvement of High Street, 42*l.* for works of sewerage, 336*l.* for the provision of a steam fire-engine, 221*l.* for the provision of a steam disinfecter, and 115*l.* for the construction of a wharf wall to the canal at Field Place in connection with the proposed destructor works. The town clerk (Mr. J. B. Ashwell) stated that the electric-light works were to be erected on land already belonging to the Corporation, and that the area for electric lighting was the area of the borough. A memorandum in favour of providing electric lighting for the borough had been signed by 88 per cent. of the manufacturers and most of the tradesmen, and there was likely to be a large demand for the light and for electric power. Mr. A. Burton (borough surveyor) and Mr. C. J. Tiddeman (electrical engineer) explained the plans for the buildings, and described the plant it was proposed to lay down for the production of electricity and for the destruction of refuse. In reply to Mr. J. Massey, the town clerk stated that to guard against loss on the undertaking during the first few years two years' grace in the repayment of loan and interest had been asked for. The town clerk explained, with regard to the proposed improvement of High Street, that the widening was necessary owing to the Board of Trade having allowed the Potteries Electric Traction Company to lay a double set of rails there, notwithstanding the opposition of the Town Council. Mr. Moncur (county surveyor) stated that the County Council was in accord with the proposal, and was of the opinion that, as the Tramway Company had brought about the necessity for widening the road, they should be made to contribute something towards the cost. Formal evidence was given in support of the other proposed loans, some amusement being caused by the statement that the manual fire-engine, which it was intended to replace by a steamer, was probably one hundred years old. In reply to an appeal by Mr. C. F. Robinson, the Inspector promised to send in his report as early as possible, and said that no doubt the Local Government Board would do all it could to expedite the matter. The

Inspector subsequently visited the sites of the proposed works and improvements.

THE ENGINEERS' CLUB.

UNDER the foregoing title a new association has been formed for the promotion of social intercourse between members of the engineering and allied professions. The programme at present arranged includes a smoking concert at the Westminster Palace Hotel on Friday, November 27, and a children's party, followed by a Cinderella dance, at the Caxton Hall, Westminster, on Saturday, December 12. An attractive list of other social gatherings to follow is being prepared. The club has been founded under the auspices of the Junior Institution of Engineers, but membership is open to the profession generally upon proper introduction. It is hoped, in the future, to be able to engage permanent rooms so that members may enjoy the usual advantages of a club-house. Mr. Fred. S. Pilling, 20 Victoria Street, Westminster, S.W., one of the joint-hon. secretaries, will be pleased to answer any inquiries.

CONTRACTORS' CLAIMS.

IN the King's Bench Division, Dublin, application was made before the Lord Chief Baron, Mr. Justice Kenny, Mr. Justice Barton and Mr. Justice Wright, in a case in which Messrs. H. & J. Martin, Ltd., builders and contractors, are plaintiffs, and Messrs. Arnott & Co., Ltd., of Henry Street, are defendants, and which was several days at trial before Mr. Justice Madden and a city special jury.

Serjeant Dodd, on behalf of the plaintiffs, said he had to apply to the court to reverse an order made by Mr. Justice Madden at the trial, and to allow judgment to be given for the plaintiffs. The case proceeded upon a trial of issues of fact, and if the matters of fact had been determined in such a way as to lead to the assessment of an amount of damages, it was arranged between counsel and assented to by the judge that the matter should be sent for adjudication, and that details should not be given until the question of principle had been discussed. The action was by the plaintiffs against Messrs. Arnott, with Mr. George P. Beater, who was their architect, as a second defendant. The case arose out of a

contract for the building of Messrs. Arnott's new premises in Henry Street, the contractors for which were the plaintiffs, who proceeded with the work on a signed contract and specifications. It appeared that Mr. Beater wrote to Messrs. Martin telling them about the contemplated erection of the buildings, and suggesting to them to tender, saying that the bills of quantities had been made out by Messrs. Gribben & Butler, who could supply them to plaintiffs. Accordingly the latter got the documents on payment of 10%, and their case now was that these bills of quantities obtained from Messrs. Gribben & Butler were taken out on a different specification from that which Mr. Beater said they were taken out on. That was the short matter in the case, and plaintiffs claimed 5,000% damages in respect of the extra work imposed upon them in fulfilling the actual contract, which was for 18,400%. They struck at the root of the contract, while defendants maintained that they were bound by it. The question for the court, therefore, was whether there was evidence to support the findings of the jury, and whether on those findings the plaintiffs were not entitled to an inquiry by a proper officer as to damages, or to a new trial in the alternative. No evidence was called for the defendants, and the jury found that Mr. Beater was a partner with Messrs. Gribben & Butler in taking out the quantities; that the work provided by the contract and specification differed from the bill of quantities; that Mr. Beater knew the quantities were taken out on the document relied on by the plaintiffs; that Mr. Beater represented to the plaintiffs that the quantities were taken out on the specifications, but that he did not do so fraudulently. They also found that Mr. Beater acted as agent for the defendants. On these findings a verdict was entered for the defendants, and Mr. Justice Madden allowed either side to move for judgment on the defendants' counter-claim, which was for 1,850%, being for penalties at the rate of 25% a week for seventy-four weeks' delay in carrying out the contract. Counsel maintained that on behalf of the plaintiffs they had proved not actual fraud, but what was equivalent to fraud, and that the case should not have been sent to the jury without hearing defendants' case and their explanation.

Mr. O'Shaughnessy, K.C., stated the case for the defendants, who maintained that the plaintiffs were bound by their contract. If this case was to be carried at all by the plaintiffs it could only be carried on the direct issue of fraud. There was no halfway house. The case had been confused by raising the argument that defendants had to do more work than they

imagined they would have to do, but in the end it came round to this—whether the claim made by these plaintiffs could be sustained in point of law. The party who alleged fraud must prove it as he alleged it, or in substance as he alleged it, and he (counsel) submitted that the plaintiffs had failed to do that here. There was nothing to show that they had not entered into the contract with their eyes open, and in the action they had entirely failed to sustain the allegations set out in their statement of claim, because admittedly the plans showed everything that was required to be done. Counsel contended that there was no evidence to show that the specification called Mitchell's specification, on which the plaintiffs relied, was, as plaintiffs alleged, the original specification or had been copied from it. Unless it could be shown that it was, plaintiffs had really no case. It was the only thing they had to take them out of the rule which bound them by the contract. Counsel pointed out that the principal witness examined as to this document had only given two or three instances of similarity between it and the contract specification, and a comparison of the two would show that there were more matters in the contract specification which were not in Mitchell's than there were in Mitchell's which were not in the contract specification.

Mr. Henry, K.C., in reply for the plaintiffs, dealt with three questions which the Lord Chief Baron suggested, viz. the proper measure of damages; secondly, the three items—the alleged alterations in the specification for the heating chamber, for the extra work arising out of the extra height of the pillars wrongly supplied by independent English contractors, and that arising out of an alleged alteration as to the amount of plastering work; and thirdly, as to the counter-claim for penalties for delay. The Court reserved judgment.

ARCHITECT'S RESPONSIBILITIES.

At the City Sessions, Dublin, before the Recorder, a case was heard in which Mr. Mathew Farrell sued Mr. George Tighe Moore, architect, to recover 50% damages for injuries sustained by the negligence of defendant—who was employed by the plaintiff to superintend and see certain work done by a builder and give certificate for it—in giving certificates for work not done.

The case for the plaintiff was that he employed Mr. Moore to certify the building of a house at Glasnevin by Messrs.

Scott & Co., which was to be finished in June 1902. Instances were given by the plaintiff in which he alleged that the work had not been carried out in accordance with the specifications. He was kept out of possession of the house for nine months. The contract price was 800*l*., while the law costs in an action he brought against Messrs. Scott in connection with the matter were 700*l*.

Mr. Butler, an architect, said he believed 100*l*. better house could be built for the money.

For the defence, Mr. Moore stated that the matters complained of had been dealt with by allowances or by the defects being afterwards put into repair by the contractors.

Counsel for the defendant submitted that no action could lie against the architect after he had given his certificate unless fraud was proved.

The Recorder pointed to the hardship that an unfortunate man should have to pay 700*l*. for having these matters now before him tried. He did not think their jurisprudence was so faulty as to say that if a builder and an architect were alike guilty of gross negligence there was no remedy if the architect gave a certificate. He gave a decree by consent for twelve guineas.

INCORPORATED SOCIETY FOR PROMOTING THE ENLARGEMENT, BUILDING AND REPAIRING OF CHURCHES AND CHAPELS.

THIS Society held its usual monthly meeting, the first of the present session, on Thursday, November 19, at the Society's House, 7 Dean's Yard, Westminster Abbey, S.W., the Rev. Canon J. Erskine Clarke in the chair. There were also present Lieutenant-Colonel the Hon. G. H. W. Windsor-Clive, the Hon. Richard Strutt, the Revs. Canon J. Allen, D.D., S. A. Donaldson and Canon Utterton, Messrs. E. Lee Warner, C. K. Norman, J. E. Ollivant, Basil E. Richardson, F. H. Rivington, Lewis Wigram and the Rev. W. B. L. Hopkins, secretary. Grants of money were made in aid of the following objects, viz.:—Building new churches at Bristol, St. Aidan, 130*l*., for the first portion; Catford, St. Andrew, Kent, 200*l*.; Clydach, St. Mary the Virgin, near Swansea, 175*l*., and Kippington, St. Luke, near Sevenoaks, Kent, 100*l*., and towards enlarging or otherwise improving the accommodation in the churches at Bettws Evan, St. John, Cardiganshire, 15*l*.; Brechfa, St. Teilo, near Carmarthen, 20*l*.; Feckenham, St. John

the Baptist, near Redditch, Worcester, 20*l*.; Haverfordwest, St. Mary, Pembrokeshire, 75*l*.; Hornsey, St. Peter, Middlesex, 50*l*., making in all 175*l*.; Leicester, St. Mark, 50*l*., and Thornham, All Saints, near King's Lynn, Norfolk, 40*l*. Grants were also made from the Special Mission Buildings Fund towards building mission churches at Aldersbrook, St. Gabriel, near Wanstead, Essex, 50*l*., and Gorefield, near Wisbech, Cambs, 20*l*. The following grants were also paid for works completed:—Cotteridge, St. Agnes, King's Norton, 200*l*.; Tilbury, St. Chad, Gravesend, 100*l*.; Darwen, St. George, Lancs, 143*l*.; Upton Park, St. Alban, Essex, 150*l*.; Saintbury, St. Nicolas, Broadway, Worcs, 10*l*.; Cardiff, All Saints, 100*l*.; Waverley Park, St. Silas, Surrey, 900*l*., on account of a grant of 1,000*l*.; Muswell Hill, St. Andrew, Middlesex, 300*l*.; Weston-on-the-Green, St. Mary, near Bicester, Oxon, 10*l*.; Hartshorne, St. Peter, near Burton-on-Trent, 20*l*.; Haslemere, St. Christopher, Surrey, 120*l*.; Penrhicweiber, All Saints, Glamorgan, 40*l*.; Gosberton, near Spalding, 30*l*.; Weaste, near Manchester, 40*l*.; and Tranmere, St. Paul, near Rock Ferry, Cheshire, 30*l*. In addition to this the sum of 557*l*. was paid towards the repairs of twenty-eight churches from trust funds held by the Society. The Society likewise accepted the trust of a sum of money as a repair fund for the church of St. Columba, Bradford. The grants voted at this meeting have nearly exhausted the funds at the disposal of the committee. Liberal contributions are earnestly invited to enable the committee to vote substantial grants, and to continue the valuable work which this Society has so successfully carried on during the past eighty-five years.

THE SURVEYORS' INSTITUTE.

At the Surveyors' Institute on Monday evening a paper was read by Mr. Herbert T. Scoble on "Industrial Decentralisation an Important Factor in the Solution of the Housing Problem." The lecturer considered that a review of present circumstances with regard to economic production was singularly opportune. Past conditions were briefly examined, Mr. William L. Madgen's pamphlet on "Industrial Redistribution" was favourably commented on, and a criticism of the "Garden City" project from a business point of view followed. Like many other schemes (More's "Utopia," Bellamy's "Looking Backward" and Blatchford's "Merrie England," to mention

JENNINGS' PATENT DUPLEX BATH VALVES

a few of the best known), the practical carrying out of the theorist's view presented, he said, great difficulty. A city, he argued, must be complete in every respect, and until all the varied parts worked harmoniously together nothing much worth doing could be accomplished. Some points in Mr. Howard's garden city scheme were considered in detail, the lecturer arriving at the opinion that owing to the enormous expense attached to the realisation of the scheme it was practically impossible. His comparison of the advantages and disadvantages of town and country with regard to factories and labour showed a substantial balance in favour of the latter, though exceptional cases would occur from time to time and should not be taken into account. Short descriptions of two recently-erected factories, one rural and one suburban, lent weight to the lecturer's contention that decentralisation paid, and that most substantial economies were made in the handling of goods, in rent, rates, insurance against fire, &c.

Bournville, he said, dated from 1879, but it was not until 1895 that any great progress was made with the village. It was now administered by a Trust, and it was satisfactory to learn that notwithstanding the provision of large gardens, the erection of semi-detached houses, or of groups not exceeding four in number, a return of 4 per cent. was secured after payment of all outgoings. In constituting the Bournville Village Trust (the lecturer went on) the founder, Mr. George Cadbury, stated that he was desirous of alleviating the evils arising from insanitary and insufficient accommodation, and of securing to workers in factories some of the advantages of outdoor village life, with opportunities for the natural and healthful occupation of cultivating the soil. The operations of the Trust not being confined to any one locality, various suggestions as to the use to be made of the funds were put forward, amongst others such dwellings as may be erected to occupy about one-fourth of the sites on which they stood, the remainder to be used as gardens or open spaces and factories and shops, to be limited to one-fifteenth of the total area of the estate. From a private census taken in December 1901, Mr. Scoble had learnt that of the householders living in Bournville 41·2 per cent. worked in Messrs. Cadbury Brothers' factory, 40·2 per cent. in Birmingham, and the remainder, 18·6 per cent., in the villages of King's Norton and Selly Oak. The provision of comfortable homes and good gardens was sufficient to attract numbers of workers in Birmingham, and that the gardens were successfully cultivated was borne out, he said, by the following comment from the *Economic Review*:—"There are 43½ acres under

cultivation, and at the ascertained average yield per acre of 59*l.* 8*s.* 8*d.* per annum this gives a total of 2,585*l.* 7*s.* per annum. Under ordinary methods of farming the yield was previously less than 5*l.* per acre per annum—that is, the total yield of the 77 acres which are at present opened out used to be about 385*l.* per annum. Thus at the present time these 77 acres produce more than six times the value of their former produce, and in addition, at the same time, house under ideal conditions a population of nearly 2,000 people." The yield per acre, the lecturer resumed, was worked out from the return per garden, which after making allowances for all outgoings, showed a net gain of 1*s.* 11*d.* per week. The average garden covered some 600 square yards, and the estate gardeners prepared and planted the same so that the tenant on entry had not to convert a howling wilderness, brought into undue subjection in parts by building operations. The rows of fruit trees at the end of the gardens formed a very pleasant screen between opposing backs. The cottages built before 1901 had mostly parlour, kitchen, scullery and three bedrooms, and the usual conveniences, while some of the larger houses had an extra bedroom and a bath-room. Latterly several cottages of a different type had been erected, and these contained one large living-room, scullery with bath embedded in the floor to economise space, three bedrooms, and in some cases an attic. The rents ranged upwards from 5*s.* 6*d.* per week, rates included.

In considering the effects of decentralisation as regards manufacturers, workers and the community, Mr. Scoble quoted a case where by removal to the country manufacturers of machinery were enabled to reduce the price of their goods by no less than 20 per cent. Mr. Scoble's view was that by migration to rural or semi-rural districts the manufacturer would be in a position to produce more cheaply; that if he studied the interests of his workpeople, which by the way were no less his own, comfortable houses would be erected for them; and that, by virtue of the lessened cost of manufacture, more successful competition in the home, colonial and foreign markets may be expected. The establishment of factories in the country and the housing of labour in the immediate vicinity would do more to solve one of the most pressing problems that had to be dealt with—namely, the housing of the working classes—than the erection by municipal or philanthropic effort of tenement buildings in or dormitory towns near our industrial centres, or the provision of transit facilities, which must inevitably lead to greater congestion.

VENTILATION IN WEAVING SHEDS.

THE report has been issued of the joint conference of employers and operatives held at Blackburn last month to consider certain suggestions made by the Employer's Association relative to ventilation in weaving sheds. Captain Hamilton Smith had been appointed by the Home Office to investigate the conditions of the various systems of ventilation and ascertain the attitude of the trade towards them.

The case for the employers was that the trade had done its best to meet the requirements of the Act, which fixed the standard of purity of the atmosphere in weaving sheds at nine volumes of carbon dioxide in 10,000 volumes of air. Owing to the changes in the atmospherical conditions the employers thought they were entitled to consideration beyond what the Act laid down for them. They wanted a margin. Having spent a big sum of money in having tests made, they contended that they were being asked to do what was impossible. They never found a shed, whatever ventilation it might have, that could be got down to nine volumes and maintained at nine.

The operatives' representatives, on the other hand, declared that they could prove that at a number of mills the carbon dioxide was less than nine volumes, even less than eight. They did not object to new tests, but asked that the employers should in advance bind themselves to abide by the result.

Mr. Higson, who presided, said that the employers wanted to demonstrate that they were unable to maintain a standard of nine volumes. If they could not make good that contention they would haul down their flag.

With respect to the appointment of an expert to conduct an examination, Captain Hamilton Smith said that Mr. Scudder was a chemist as to whom there seemed to be general agreement.

CHESTERFIELD ELECTRIC-LIGHT INQUIRY.

MR. R. H. BUCKNELL, Local Government Board inspector, held an inquiry at Chesterfield on Friday morning relative to the application by the Corporation for sanction to borrow 15,000*l.* for the electricity undertaking.

There were present Councillor C. P. Robinson (deputy-mayor), chairman of the electrical-energy committee, Mr. J. Middleton (town clerk), Mr. R. L. Acland (electrical engineer), Mr. Geo. Broomhead (borough accountant), Mr. C. G. Broom-

head (assistant overseer), and Mr. C. W. Hadfield (committee clerk).

Mr. Middleton informed the Inspector that the population of the borough in 1901 was 27,185, its area was 1,219 acres, its assessable value was 92,673*l.* 8*s.*, the outstanding loans on all accounts, remunerative and otherwise, were 80,119*l.* 1*s.* 10*d.*

The Inspector asked for a short history of the electrical undertaking.

Mr. Middleton said that the "Chesterfield Corporation Electric Lighting Order" was granted in 1894, and on April 16, 1900, an inquiry was held into the application to borrow 25,000*l.* to start the undertaking. The estimates were altered and increased, and the Local Government Board sanctioned a loan of 29,674*l.* That was the only sanctioned loan in connection with the undertaking. Operations were commenced, and they began to supply current on October 3, 1902. It had been necessary in order to complete the installation to add to it in several ways, and at the end of December, 1902, they had spent on capital account 31,274*l.* 4*s.* 4*d.*

The Inspector: Approximately 1,500*l.* more than the sanctioned loan.

Mr. Middleton: Yes. Proceeding, he said that at December, 1902, there were 192 consumers, who took current equivalent to 15,208 eight candle-power lamps, and at the end of last October there were 291 consumers taking power equal to 22,855 eight candle-power lamps. The increase was still going on. There was no stand-by plant, and last year the Corporation were bound to add to the machinery, and it was now running and supplying current. The loan now applied for was made up of the following estimates:—Extension of boiler-house, &c, 1,000*l.*; a 200 kilowatt dynamo, boiler and condenser, 5,500*l.*; extensions of mains, 7,000*l.*; and meters and demand indicators, 1,500*l.*

The Inspector: There is only one point, and you know what I am going to say, and it is regarding the doing of the work before the sanctioning of the loan. The Board are getting more and more particular about that every day, for the simple reason that often certain authorities get into the habit of at all times carrying out work and then applying for a loan. That reduces the inquiry to a farce, and the Board very strongly object to their inspectors holding inquiries that are farces. Seeing the way that the undertaking was growing, it would have been easy to foresee that an increase of plant would be necessary, and if the Corporation had written to the Board pointing out that it was becoming so great that they desired to

erect new plant immediately at a cost of 10,000*l.* or 15,000*l.*, some of the trouble would have been got rid of, and the Board would have replied, "Go on with the work and we will send down an inspector as soon as possible."

Mr. Acland, in reply to the Inspector, said that close upon 11,000*l.* of the 15,000*l.* applied for had been spent between October 1902 and September 1903.

The Inspector: It was obvious in October 1902 that further money was wanted, but it was not until August 11, 1903, that the Town Council passed a resolution authorising the borrowing of the money. I hope, Mr. Middleton, you will persuade your Council to look a little further ahead and give us a chance to hold an inquiry before spending the money.

Mr. Middleton: We appreciate that, but there is a difficulty in getting machinery when we want it.

The Inspector: I recognise those difficulties, but it does not get over the fact that when we come down we find the work done—I admit we don't often have to find any fault—and it does not give us any power to do anything.

Mr. Middleton: It does not, but I think this is the only instance where we have done anything before holding the inquiry.

The inquiry then terminated and the Inspector proceeded to inspect the electricity-generating station.

IMPORTANT SEWERAGE WORKS IN EDINBURGH.

FOR a long time past the condition of the sewers in Princes Street has been a source of trouble to the burgh engineering staff, as well as to the inhabitants of that thoroughfare. Flooding at various points of the main artery at intervals, the escape of sewage gas and the disagreeable presence of rats in the branches and on the ivy-clad ridge of the West Gardens have been, says the *Scotsman*, the chief sources of trouble and complaint, and in order to rectify these the Town Council some time ago, on a report by Mr. Massie, the burgh engineer, resolved to improve or do away altogether with the old and unsuitable sewers and replace them with sewers more adapted to the requirements of the present day. The date of the construction of the old sewers cannot readily be traced. No doubt a commencement had been made with them when the Nor'

Loch was drained, and that the work of laying them down had been pushed forward bit by bit as Princes Street was gradually built upon. These old sewers and the contributing branches from St. Andrew Square, South St. David Street, Hanover Street, Frederick Street and George Street were originally rough rubble-built, with arched roofs and flat stone sills, averaging in size 3 feet by 6 feet, the branch connections and road gullies being small-built drains laid with very little attention either to line or gradient. Careful examination revealed the fact that the sewers were in a very bad state; the joints in the masonry were open, and there was a considerable deposit in the sewers. By the month of May last, it may be recalled, what may be described as the East Princes Street Gardens portion of the scheme, extending from Waverley station to the Mount was completed. Here the burgh engineer's jobbing squad did the work that was necessary, short of total reconstruction. The flat stone sills were cut out and new sills substituted, composed of half-pipes and concrete, all properly graded. The rubble-built branch drains were reconstructed in pipes, sufficiently graded and connected to the sewer, while the side walls and arch were picked, pinned and carefully pointed, and all the openings at the branch drains built up. In West Princes Street Gardens, on the other hand, matters were such that it was found necessary that a new sewer should be put in, and the work, which is being done by contract, was entered upon a fortnight ago, and is likely to be in progress for several months to come. The old Nor' Loch sewer has been rubble-built, varying in size from 2 feet 6 inches by 4 feet 6 inches to 2 feet 9 inches by 6 feet, with arch cover and flat stone sills. It drains an area of about 170 acres, and requires to discharge in heavy rains 5,626 cubic feet per minute, but, as it is not capable of carrying this volume of sewage, it has, as has been indicated, repeatedly burst, with the result that flooding of the Gardens ensued. The new sewer will be of brick and concrete, circular-shaped and 4 feet 6 inches in diameter, and the junctions with the branches from Princes Street will be reconstructed and properly trapped. When the work is completed, which, it is expected, will be towards the end of February next, the old sewer will be removed, and the Gardens immediately restored to their normal condition. The total cost of the scheme is about 7,000*l.* In excavating for the new sewer, a sharp look-out has been kept for relics of the old Nor' Loch, but so far nothing has been found but a small toy boat made of oak, which, possibly, some youngster of old Edinburgh sailed in a bygone day.

THE WEEK.

THE imposing presence of the late Sir FREDERICK BRAMWELL will be missed in Parliamentary committee-rooms, the Law Courts, the Institution of Civil Engineers, the Institution of Mechanical Engineers, the Royal Society, the Royal Institution, the Society of Arts, the British Association and other places where representatives of practical science congregate. Up to a few years ago he might be called ubiquitous, but the rush from place to place did not seem to affect either his health or his good-humour. He was always ready to treat on the varied subjects which came within his province, and in civil and mechanical engineering he could claim to be omniscient. It was a pleasure to listen to him while giving evidence before a Parliamentary committee or in a patent case in one of the courts. He would have been an ideal professor in an engineering college. He possessed the power of inventing impromptu examples and illustrations which threw a light on his case. On one occasion when he was to appear as a witness concerning the advantages of subways in the Metropolis he saw some labourers digging a trench at the foot of Great George Street. On his way to the House he had some glass tubes filled with the earth which was thrown up. Before he answered any questions he produced his tubes and told the committee they could judge of the condition of the earth, which was permeated with gas, close to the walls of the Houses of Parliament. He went to the table and partly drew one of the stoppers. That was sufficient. An order was immediately made that the tubes should be taken outside. The counsel for the gas companies and other opponents of the measure did not make much headway on that day. It was only one instance of Sir FREDERICK BRAMWELL'S readiness in bringing evidence that could not be controverted to support his statements. It is no wonder he was in demand as a witness, as an arbitrator and as a general consulting engineer. Many inventions have been successful through his suggestions, and none of his contemporaries was so widely connected with the engineering of the nineteenth century. It would, however, be difficult to discover any sample of a mechanical or structural kind which will bear his name. His opinions were accepted as authoritative, and the vast extent of his business is never likely to be known, but hereafter the reason for his prominence among engineers may be questioned. He deserved the honours he received and the confidence which investors felt in him. He was born in 1818; he was the son of a London banker and a brother of the late Lord BRAMWELL. He died on Monday last and the baronetcy is now extinct.

THE destruction of the Artillery Theatre at Woolwich on the 18th ult. may be considered as involving the London County Council to some extent. It does not in any way serve as a test of the regulations which the Council formulated. The building was mainly intended for the army, and by an Act of Parliament was excluded from the jurisdiction of the County Council. The disaster, however, exemplifies the necessity for stringent regulations. The building, it appears, was erected in the early part of the nineteenth century, and for a time served as a chapel. For thirty-five years theatrical performances were held in it. The site was a good one and the building was nearly isolated. But the arrangements were not of a kind adapted for a structure used for theatrical performances. The stage and auditorium were practically in one fire risk, the only separation between them being a screen of wood, plaster and canvas, and the stage was enclosed by the dressing-rooms and stores for scenery and properties. The stage and auditorium were under one roof, and the premises were lighted throughout by means of gas. Hydrants were placed in various parts of the house, but the pipes with which they were connected were not charged with water, and it was three quarters of an hour before a proper supply could be obtained. Had there been a brick proscenium wall, and with an efficient fire-resisting screen such as is required for modern theatres, there is little doubt that the fire might have been confined to the stage. It is believed

that if the theatre is rebuilt the military authorities will adopt regulations similar to those enforced in the Metropolis.

In the annual of the German Archæological Institute there is a paper by Dr. LUDWIG BORCHARDT upon the condition of the buildings in the islet of Philæ. At the desire of the Egyptian Government he was appointed in 1895-96 to prepare a report on the ruins. His acquaintance with Philæ is not of yesterday. He says it is impossible to judge as yet of the effect produced by the water of the Assouan reservoir on the ruins. The larger and higher buildings, of which the lower parts only are inundated, may long remain. But those on the northern side of the island must now be considered as lost to archæology. In that part there were at one time a great many houses which probably belonged to the Byzantine period. There were also the remains of some extensive official buildings, two churches, a cloister and a structure that was erroneously described as a triumphal arch of DIOCLETIAN. Not far off was a temple of AUGUSTUS, which, according to a Greek inscription, was erected thirteen years before our era under the prefecture of RUBRIUS BARBARUS. There was a statue of an emperor in front of the temple which probably commemorated AUGUSTUS. A part of the northern wall of the cella, in existence a year ago, is now invisible. Whether it is overthrown is not determined.

THERE can be no questioning ADDISON'S competency to describe the practice of English church-going in his time. His account of a Sunday with Sir ROGER DE COVERLEY may be accepted as referring to what was general in country churches. According to him, "as soon as the sermon is finished nobody presumes to stir till Sir ROGER is gone out of the church. The knight walks down from his seat in the chancel between a double row of his tenants that stand bowing to him on each side." The occupation of the chancel by the owner of the parish, we may therefore assume, was not uncommon in England in the early part of the eighteenth century. A paper read by Professor COOPER before the Ecclesiological Society of Scotland reveals that the "lairds' lofts" were often found in the same place. Many of these lofts were erected at the east end of the church in the chancel, immediately over the spot where in pre-Reformation times the altar stood. The reason of this was that in the general spoliation of church property the rectorial tithes passed into the hands of the proprietor, and with them went naturally the chancels of the churches, which it had always been the duty of the rector to maintain. On that account, as well as for other reasons, the lofts are considered by him to have their historical value as witnesses of the relations which throughout the greater part of two eventful centuries subsisted between the lairds and the Church. They possess also in many cases no small artistic merit, and in the severe exclusion of other ornaments they are often the only internal decoration of the churches where they are found.

THE avenue in the Champs-Élysées is probably the finest example of its kind in Europe. The majority of visitors to Paris believe it terminates at the Arc de Triomphe, but it has been continued, although in a less grandiose form, to Courbevoie. It is now proposed to prolong the avenue to the Carrières-Saint-Denis, and ultimately to the terrace of Saint-Germain. It would consequently have a length of ten English miles, and would be the shortest distance between the Place de la Concorde and the terrace which HENRY IV. commenced and LOUIS XIV. finished. The Chamber has voted a sum of 700,000 francs to enable the work to be embarked upon. It is needless to add that the sum will be only a fraction of the cost. It is expected that at least ten millions will be required. That amount will not appear excessive in view of the fact that it will be necessary to construct three bridges across the Seine. At present the usual way for those who have time to visit Saint-Germain is by one of the river steamboats, and the journey is repaid by the sight of the scenery passed through, as well as by the unrivalled view from the terrace. In the course of time Saint-Germain will be no more than one of the suburbs of Paris.

THE WATER-COLOUR SOCIETY.

ARCHITECTURE is largely represented in the Winter Exhibition of the Society of Painters in Water-Colours. The public, however, is more likely to be attracted by the collection of drawings by members and associates presented to the KING and QUEEN on the occasion of their Coronation than by views of old buildings. There are fifty-nine drawings in that collection, besides an illuminated dedication designed by Mr. R. ANNING BELL. They are arranged in two large frames. Apparently there has been no attempt at competition, and it may be said there is an average not only of size but of quality which helps to give from its uniformity a decorative effect to the series. The majority of the artists have presented something corresponding with the classes of subjects associated with their names. Consequently it is a collection that hereafter will be considered as fairly representative of the Society in 1903.

At the opposite end of the room the central position is occupied by Mr. W. MATHEW HALE'S *The Passing of Arthur*. The idyll was the earliest of the Arthurian cycle treated by TENNYSON. But at a later time the poem was not superseded by any other version. It will be remembered that as the wounded king painfully arrived on the shore of the level lake "there hove a dusky barge, dark as a funeral scarf from stem to stern," and when the king was placed in it the barge "with oar and sail moved from the brink, like some full-breasted swan," until it seemed like one black dot against the verge of dawn. The poet described the scene as happening at night, and the lament of the queens in the barge rises to the stars. Mr. HALE assumes the time to be early morn. The sky shows great red streaks that seem to be overspreading the yellowish dawn, and are nearly suggestive of ARTHUR'S face. So many detached and strongly marked elements excite surprise, and on that account rather diminish the mystery which should belong to the event. The task, no doubt, is extremely difficult, and more effect would have been gained if the red appeared in larger masses. On such an occasion some liberty is allowable to an artist. The great lake and the dark boat, with the surrounding mountains, have the qualities that are called for, but the poet imagined a moonlight scene, and MACLISE'S drawing so represents it. Not far from Mr. HALE'S drawing is the single contribution by Mr. CLARENCE WHAITE, *Solitude*—"Midst a vast solitude." We see the summits of a mountain range partly enveloped in grey clouds and mist, and with nothing to suggest the existence of life in organic form. The artist has several times withdrawn the spectator to remote places, but we cannot recall any of his drawings more suggestive of a primeval world which was sublime in its vastness and coldness. Mr. CHARLES GREGORY'S *Where Silence Reigns* has also a suggestion of aloofness in autumn, but the couple of figures introduced give the scene a modern character.

There are many landscapes, and of varied character. Mr. THORNE-WAITE'S *The River below Aysgarth*, is exquisitely coloured, but the sky suggests alterations by the artist, and a dimmed effect, which is disowned by the rest of the work, is the result. Mr. COLIN PHILLIP'S grey drawing, *Mist Effects after Rain—Loch Lomond*, realises its title, and appears to be a genuine record of something observed. His principal work is his *MacGillicuddy's Reeks*, as seen beyond the clear Lough Caragh. The *Sunny Summer Day in the Highlands*, by Mr. R. W. ALLEN, shows a great expanse of low hills, with a stream running through the valley. But it is more sombre perhaps than is necessary. The land corresponds in colour with that in the *North Sea Coast*, as if Scotland never varied. Mr. J. W. NORTH'S *Trout Stream and Honeysuckle* is faithful to his customary limitation of colours. The vegetation prevails, and is so treated as to appear at a little distance as if it were a mere bunch of greenery. Warkworth Castle is becoming a favourite subject, and is well rendered by Mr. SAM EVANS. Mr. ROBERT LITTLE'S *Sunrise on the Tiber* introduces one of the old bridges, which, in spite of the wear and tear of traffic, is in a stronger condition than the high fort seen on one side. The French school is suggested by Mr. J. PATERSON'S *Golden Autumn*. There could hardly be a greater contrast than is afforded by Mr. J. JESSOP HARDWICK'S *The Banks of the Greta, near Greta Bridge, Yorkshire*, and Mr. ALLEN'S *North Sea Coast*, which

are hung side by side. The English view seems to belong to another clime, and is rendered with an appreciation of its beauties. There is another landscape by the artist from the same district, besides some delightful drawings of flowers.

Mr. NAPIER HEMY displays great force this year. Indeed, one would desire to see him express the sea in a quiet mood. *On the Crabbing ground* might be a boat cut out of a much larger drawing, owing to the energy of the men in it to whom the sea serves as a foil. *A Destroyer* would make TURNER or STANFIELD believe there is no longer naval architecture. It is a type of a scientific rather than an artistic age, and no sea serpent could be more hideous than the modern war engine.

The figure subjects are not numerous this year. The *Original Design for the Painting of Claudio and Isabella*, exhibited at the R.A. in 1853, by Mr. HOLMAN HUNT, possesses a pathetic interest. It may now seem incredible that fifty years ago a reform of painting was considered possible by means of an intensity of expression for which a distortion of the figure was necessary. But hereafter the historian of art is likely to say that such a work reveals the influence of the Gothic revival, of stained glass and Mediæval sculptured figures which were then in their ascendancy. In that drawing the effects of mental emotion are expressed. The more modern system is suggested by Mr. LIONEL SMYTHE'S delightful drawing illustrative of a subtle verse of DANTE ROSSETTI, another pre-Raphaelite, viz.:—"The mother will not turn, who thinks she hears her nursing's speech first grow articulate; but breathless, with averted eyes elate, she stands, with open lips and open ears, that it may call her twice." It is a charming representation of a field strongly illuminated, with a young woman and a baby, while from its brightness it at once attracts the attention of the visitor. But supposing the verse from ROSSETTI were not at hand to refer to, would any ordinary spectator realise what was the subject? Would ROSSETTI himself have approved of the selection of that particular verse by a painter? We know that mother and child are pleased, just as we know something horrible must have been suggested to the prisoner and his sister in Mr. HOLMAN HUNT'S drawing. But in both cases a certain initiation into the mystery is requisite to prevent the two works from becoming puzzles. Mr. J. R. WEGUELIN'S *Echo* is the nude figure of a girl standing in the open air and repeating sounds. Mr. HOPWOOD'S *The Village Baker* is an argument in favour of a rigorous administration of sanitary laws, and once more repeats the old fact that sanitation and picturesqueness do not go together. The artist is represented by several other drawings, among which an old woman, *Dinner Time*, deserves to be pointed out. *The Carpenter's Shop* by him is admirable for its light and shade, and deserves commendation, although perhaps more shavings are introduced for the sake of effect than is necessary. Mr. R. W. MACBETH has three drawings, of which the most popular will be *A Ray of Sunshine*, women with a baby, which is charming in drawing, colour and sentiment. There are two large cartoons for paintings at Welbeck Abbey, by Mr. LEWIS DAVIS, the subjects being *Love Active* and *Love Passive*. They appear destined for circular panels and have children for figures. Mr. GLINDON'S *Faint Heart* is not without humour.

Among the architectural drawings the largest is Mr. T. M. ROOKE'S *West Front and Tower of the Church of St.-Pere, Sous Vézelay*, a work which is always admired by lovers of Gothic. It has been subscribed for in order to be presented to the Birmingham Art Gallery, and is probably the first drawing of a building favoured in that way. Mr. ROOKE generally is taken as an exponent of pre-Raphaelitism, but in this case his treatment is distinguished by unusual breadth. He shows other drawings from Vézelay and elsewhere, one being the sculpture on the west front of Auxerre Cathedral. Mr. REGINALD BARRATT has five drawings from Venice. It is needless to say that justice is done to the buildings. But the water of the canals is less successful. Miss CLARA MONTALBA continues to be faithful to the city with which her name should be associated like CANALETTI'S. One of the views is of the Ducal Palace. Mr. HERBERT MARSHALL derives inspiration from Chartres, Saumur, La Rochelle, Rouen, Chinon, St. Emilion, as well as from London. *The Grey Saumur*

likely to be judged the most pleasing. Mr. S. J. HODSON is also some foreign views, but the series of City scenes on Whit-Monday, including *St. Paul's as Seen from the Roof of St. Bartholomew's the Great*, deserve to be secured in the Guildhall Art Gallery. To many they would be a revelation of the occasional quietude of the great city and its busiest part. Mr. WALLIS exhibits a view of the temple at Philæ. Mrs. ALLINGHAM has also ventured to Venice, and has given a drawing of S. Giorgio Maggiore and a view from the far end of the Giudecca, which are unexpected novelties.

On the screens are a great many excellent drawings. Mr. RACKHAM, who is gifted with more versatility than is usual with water-colour artists, contributes a series of illustrations as *Greek Stories*. The subjects selected are most difficult, being *Jason subduing the Bulls of Ætis*, *Antæus*, *Hercules and Cerberus*, *Theseus and the Minotaur*, *the Dragon of the Hesperides*, *Theseus and Corynetes*. They show vigorous draughtsmanship and an interpretation which does not recall that of the Greeks or of FLAXMAN, or of any modern artist. The Classic scenes usually found in the Society's exhibitions are marked by their prettiness. Mr. RACKHAM is more vigorous, and would appear to have a world of Classic illustration before him which has been neglected, that is, interpretation in a northern spirit. The Winter Exhibition may not on the whole be considered as possessing extraordinary merit, but there are many attractive works to be seen on the walls.

PLINY THE YOUNGER AND BUILDING.

THE reputation of PLINY THE YOUNGER has suffered because he is supposed to have imitated PILATE by allowing injustice to be done through his want of decision of character. He was appointed governor of Bithynia and Pontus. Some Christians in his province were tried and convicted for acting illegally. Although he was a studious man, and had taken a prominent part in the Roman courts, PLINY professed to be ignorant of the doctrines of the Christians, and whether they were injurious to mankind. He acknowledged the torturing of two deaconesses, and failed to obtain a confession of guilt. But he did not give the converts the benefit of his doubts. He evaded responsibility by asking the Emperor TRAJAN to instruct him about what was to be done. At the worst PLINY regarded the sect as superstitious, but he was resolute about having the members executed unless they abjured their belief. Like other Romans, he was not perfect, and the liberty of thought he would allow to other men was exceedingly limited.

While we admit his moral weakness, we must entertain respect for a man who was an enthusiast about building. It is now impossible to say whether he was peculiar in that way or whether he resembled a great many other Roman gentlemen who were cultured and wealthy. If it were not for his delightful letters, which, fortunately, have been preserved, we should know nothing concerning PLINY's love of building. Some of his contemporaries may have had a similar hobby, but accounts of them have not reached us. The historians or satirists would not condescend to notice such an expenditure of money, and no contractor's bills of the first century have come down to our time.

As our readers are aware, there were two PLINYs. The elder was distinguished as a credulous lover of science or of natural curiosities. He was also a statesman. His nephew, called the YOUNGER PLINY, was a lawyer, an official, and might be considered a practical philosopher. The uncle conferred his name upon him and constituted him his heir. Having held high offices, which in those days were opportunities for a man to enrich himself beyond the dreams of avarice, the second PLINY was enabled by means of his wealth to render many services to the people of Como, where he was born, as well as to the Romans. He rebuilt the Temple of Ceres, engaging for architect MUSTIUS, to whom he allowed the fullest liberty of action. It is doubtful whether he did not construct several other temples. He also erected various public baths. In one town he re-erected the houses which had been destroyed by fire; he completed a theatre; he made aqueducts, a canal, sewers, and appears to have been

generous in the promotion of public works. From surviving inscriptions it would appear that people were indebted to him for many structures of which there is no mention in the letters. In a communication to a friend whom he congratulated on his resolve to erect buildings, PLINY says that he possessed several houses on the shore of the Lake of Como. One of them was entitled "Tragedy," partly because it stood on elevated ground, and partly, no doubt, on account of its dignified appearance. Another was known as "Comedy." He inhabited either according to his mood. From one he could see the whole extent of the beautiful lake. From the other he had only a partial view, but there was compensation in the circumstance that he was able to fish in the waters without leaving his chamber. PLINY endeavoured always to provide sufficient space in his own grounds to permit him to take long walks as well as places for other forms of exercise. As he became a philosopher, he wished to secure a luxurious retirement whenever he desired, but he was not selfish, and by temples, schools and libraries he sought to elevate the people from whom he shrank. Indeed, in his Laurentian villa it was necessary to provide a special refuge to which he could retreat. It was a small lodge standing within a court enclosed from a garden. It was so secluded the voices of the young slaves could not reach it. When the period of Saturnalia came round he could there enjoy peace, and while the remaining premises were in uproar follow his accustomed studies.

Among PLINY's mansions we have only descriptions of two from his own hand—the Laurentian villa and his Tuscan country house. However able a writer may be, it is difficult, except in the simplest cases, to realise from words alone either the planning or the appearance of a building. Several attempts have been made to produce a restoration on paper of the two buildings, but it cannot be said that conviction has followed the study of any of them. M. AMPÈRE, who believed there was a close connection between Roman buildings and Roman history, imagined that the modern villas closely resembled those of ancient times. But the details given by PLINY do not correspond with any prince's house which has survived.

It is believed that the villa at Laurentum occupied a part of what is now the estate of the CHIGI family, near Ostia, which is about fourteen miles from Rome. The fragments discovered are not of great importance. PLINY, in his letter to his friend GALLUS, told him the place could be reached in the evening after a day spent in business in Rome. A portion of the road was too sandy for carriages, but was pleasant for riding. The house was described as spacious and commodious, but not too sumptuous. The aim was to attain a mean between simplicity and grandeur. There seem to have been several courts with buildings around, and an analysis shows there were many varieties of rooms. The only drawback to the site, according to PLINY, was the absence of springs to form natural fountains, but as he could employ wells he did not suffer. Although so near the sea, the water had not the least saline taste. He points out that as there are three public baths in the village a guest who arrived unexpectedly could go there instead of waiting while the baths in the house were warmed.

PLINY evidently wished to make his friend familiar with the course he would follow in passing through the different rooms. This manner of description is open to the inconvenience of not suggesting what part would appear most commanding to a visitor on his approach. There was an atrium and then a portico which was supposed to stand about a circular court ("Deinde porticus in O-litteræ similitudinem circumactæ, quibus parvula sed festiva area includitur"). However arranged, the portico was safe against wind and rain, for it was glazed probably with alabaster or some transparent material. Then came another court of larger size surrounded by lodgings. There was also a triclinium or dining-saloon, so planned that when the wind blew from Africa and the sea lost its violence the waves approached the foot of it. On all sides were doors or windows which gave the inmates several fine outlooks. Evidently the enjoyment of land and sea views must have had much influence on the architect. PLINY was evidently a great admirer of landscape. There were also rooms adapted for use in winter and a gymnasium where the servants were able to take exercise. It would be necessary

to study the assumed site of the villa at Laurentum in order to arrange the rooms which were adapted for residence at various seasons. As became a scholar, PLINY possessed a library. The wall was curved so that the sun might pass through the windows during a great part of its course. Manuscripts were precious in those days, and the cupboards to contain them were placed in the thickness of the wall. The works were of a kind which allowed of perusal with pleasure more than once. Near the library was a dormitorium or sleeping place separated by a passage with a partition, which allowed the vapour to be communicated at such a heat as was desired. There were also rooms for freedmen and slaves, and they were kept in a condition to be ready for use by guests if required.

PLINY evidently takes the triclinium for a centre, for he says that on the other side of it there is a large chamber leading to one which can be used occasionally as a dining-room, and receives light from the sea as well as from the sun. Then there was another chamber which, on account of its height, was agreeable in summer, while in winter it was enclosed against all winds. In this part of the residence were the baths on a spacious scale; they were adapted for swimming in addition to ordinary tubbing, the water being of varying degrees of temperature. There were rooms for perfuming and rooms remarkable for their richness of adornment. From one of the bathing-rooms it was possible to obtain a view of the sea. After the bath a game of ball or tennis could be enjoyed in an apartment genially heated. Next two pavilions, or summer houses are described, which not only provided means for enjoyment of the views, but contained suites of apartments. From one triclinium, where the sound of the waves was only heard in times of great storms, there was a view of the gestatio, where equestrian or carriage exercise was taken, and the garden. The gestatio was enclosed with box or, in places, rosemary ("Gestatio buxo aut rore marino, ubi deficit buxus, ambitur"). It is remarkable that at the present time rosemary is still found in abundance along the coast of Laurentum. In an inner part of the gestatio vines were planted, with a walk, which was so soft it could be traversed without wearing sandals. Fig and mulberry trees were found to grow better than any other variety. Another dining-room was placed in this part, and near it was a crypto porticus, or closed gallery, so long it might have served for a public building. Many of the windows looked out on the sea, and they were only opened when the air was tranquil and the weather fine. There was a xystus, or place of exercise, which was fragrant with the odour from banks of violets, and PLINY believed the ground was not only sheltered, but kept warm by the aid of the crypto porticus. Close at hand were the rooms in which PLINY found most enjoyment. He calls them *amores mei*. One of the reasons for his preference was, he says, that he had them constructed. We might suppose from the words that the vast villa was not entirely PLINY'S creation. His rooms were well exposed to the sun, and by means of curtains or glazed doors he could have not only extensive views of the gallery and great rooms, but could extend his own sanctum. There was his sleeping chamber, where there was always profound silence, undisturbed by the noises of the house or the agitation of the sea.

From the description it might easily be concluded that the villa at Laurentum covered a large area. But some commentators hold that it was not comparable in size or richness either to the great villas of Rome or to those of the surrounding districts. SCAMOZZI considered that the plan was rectangular, with a length about two and a half times the width; but on that point there can be only speculation. What is most important in the account is the light it throws on the commodiousness of a Roman villa. Evidently the buildings were low, but occupied an extensive site; and where, as at Laurentum, there were fine prospects care was taken to adapt the house to the enjoyment of them. Although so much despotic power was wielded by a master, it is apparent that quiet was difficult to insure in a large household. PLINY is said to have been kind to his slaves, but there is evidence enough in Roman literature to show that even with severe masters the slaves were not disposed to be silent.

It is not possible to decide where was the Tuscan house which the second house described by PLINY was situated.

It has been supposed to be near Tifernum Tiberinum, the site of the present town of Città di Castello. PLINY said that the place possessed a temperate climate, and as a great many old people inhabited the district there could be no doubt of its salubrity. The larger portion of the house was exposed to the south. He had a great portico at the entrance which led by a vestibule to a vast dining-room, which was suited for feasts. There were also *diæta*, or combinations of a bedroom and a dining room, where guests and other residents of the house might take their meals in privacy. On many occasions they went to the triclinium. In this case also the outlooks were valued, but they consisted only of woods, gardens and mountains without any sea view. A staircase stood near the baths leading to a gallery, and from the rooms adjoining were other attractive prospects. Although only a private house, there was a hippodrome, which is described as very large. It is evident that the trees were clipped in fantastic forms, such as the letters of the name of the owner, or the house, or the gardener. Some appeared as if they were boundary stones, others as if bearing fruit. In order to heighten the effect by contrast certain trees were allowed to grow wild. There was also a triclinium in the open air with a trellis supported by marble columns, and close at hand was a fountain. In the garden were marble benches with a small fountain near each. Here also PLINY acknowledges his affection for any house he commenced, and especially when he was able to complete the principal embellishment. But he tells his friend APOLLINARIS that any description he can furnish is far below the original.

The mansion was adapted to his manner of living, or *vice versa*. Although he awakened early, he says he kept his windows closed until he arose. Then he summoned his secretary, to whom he dictated or sent away if he had to work or to meditate. From his bedroom he went either to the closed gallery or to the xystus, or place for open-air exercise. He next retired for meditation or dictation, or afterwards was borne in his litter, and occasionally slept during the journey. He spent some time in reciting as loudly and as distinctly as he could some Latin or Greek oration, so as to strengthen his chest rather than his voice. Perfumed essences were poured on him. He took exercise, and then he bathed. Next he dined, and during dinner a comedy was read or some musicians performed. Afterwards he walked about with his guests, some of whom were sure to be learned men. The evening was spent in quiet conversation, and the day thus passed most quickly. His Tuscan house he preferred as a summer residence, and his Laurentian villa for winter.

It is apparent that PLINY desired to own several properties, not from ostentation but from prudence. He looked to the future, and he considered a man was unwise in so unstable a world to be confined to one place. He deemed it also judicious to buy land which was near his estates. But on one occasion he evidently feared he might be unable to work the property advantageously. The soil was exhausted by neglect, he wrote to a friend, and as he never had one of his slaves working in fetters on any of his estates, he was afraid labour would be too costly. The agents, he remarked, asked three millions of sesterces—about 25,000*l.*—for the property, and there was no doubt five millions had been formerly given. The friend he wrote to will, he said, no doubt inquire in the first place, Can PLINY find three million of sesterces? To this he answered that although his wealth is mostly invested in land, yet there was some lent out on interest and there would be no difficulty in his raising a loan. His mother-in-law was rich, and she told him he might regard her money as his own. The only question for his friend to decide was whether the investment was advisable.

In that transaction PLINY resembles a modern Englishman, who was desirous to enlarge his landed estate in order to secure himself against a neighbour who would not be welcome, but at the same time would like to obtain immunity without loss to himself. Indeed, in many respects PLINY seems to belong to our time. It is to be regretted, however, that he did not condescend to record more particulars of his transactions in building. A few letters about his architects and workmen would form a record which the world "would not willingly let die," for that class of information is now unattainable.

THE LATE E. J. MARTIN.

ON Monday the funeral took place at Kensal Green of Mr. Edward James Martin, M.Inst.C.E., F.R.I.B.A., late secretary to the Government of Bengal in the Public Works Department, who died at Brighton on the 24th ult. Appointed to the Indian Civil Service in 1859, Mr. Martin served in the Punjab in the Buildings and Roads Branch as assistant and executive engineer till 1869-70, when he was transferred to the North-Western Provinces and posted to the Rajputana State Railway. He afterwards officiated as engineer-in-chief of the North State Railway, and of the Rangoon and Irrawaddy Valley State Railway, and also as *ex-officio* manager of the latter line, being transferred to the Railway Branch in Bengal in November 1878, and appointed engineer-in-chief of the Central Bengal system of State Railways. In January 1880 he was promoted to be superintending engineer of the third class of transference to the Bengal Provincial Branch. The following year he was employed on special duty under the chief engineer in Bengal as Government architect, was promoted to be second class in 1882, and deputed to Indore on special duty in 1884. Mr. Martin reached the rank of superintending engineer of the first class in December 1885, was officiating chief engineer and secretary to the Government of Bengal in the Public Works Department from June 1888 till May 1889, when he was appointed second chief engineer, and from January 1890 till his retirement in 1891 was chief engineer and joint secretary to the Government of Bengal.

CHURCH ARCHITECTURE AT TOYNBEE HALL.

THE subject of a long and interesting lecture by Mr. Thomas Francis Bumpus at the Toynbee Hall on Monday evening last was "Some Gothic Cathedrals in England, France and Germany of the Romanesque and Early Pointed Epochs." A pleasant surprise awaited his audience, when at the conclusion of his remarks upon the architecture of the Transitional period, Mr. Bumpus, observing that "architecture was frozen music," and that by some mysterious agency the two arts were allied, proceeded to the grand pianoforte and played a selection of music from the office books of the Western Church, appropriate, as far as possible, to the views presented to the audience. The company was much gratified by this novel aparture, and wishes were expressed that such a selection might be introduced into Mr. Bumpus's next lecture, which is announced for January 25, the subject being "Gothic Art at its Height: Its Decline and Fall."

Some of our musical readers may like to have the names of the pieces played, and the views represented:—

The Kyrie Eleison, from a Mass according to the Use of Amiens. (Here a view of the choir of Amiens Cathedral, looking west, was shown.)

The Office of Compline, as sung daily in the cathedral at Paris. (View of Notre-Dame, looking east.)

The Hymn for Festivals of Apostles and Martyrs, "Sanctum meritis" (View of Bayeux Cathedral, whose bells play this melody every quarter of an hour.)

"Sanctus" and "Agnus Dei," from the "Missa de Angelis," frequently heard in French churches. (View in Bourges Cathedral.)

The Hymn of St. Bernard of Clairvaux, "Jesu dulcis memoria." (Interior of the Cistercian Abbey Church, Fontigney.)

The hymn "Pange lingua gloriosi." (Nave of the Cathedral of Meaux, near Paris), and

A very taking Gallican melody to the hymn, "Iste confessor Domini colentes," from the Rouen books. (View in the south aisle of Rouen Cathedral.)

THE LONDON WALL.

AT a meeting of the Society of Antiquaries last week Mr. Philip Norman read a paper, illustrated by lantern-slides, on "The Roman Wall of the City of London at Newgate." To show the general direction of the Roman Wall, Cassar's map of about the end of the sixteenth century was exhibited, and with it a tracing from a recent map, from which the course of the wall and Mediaeval gates could be made out. It appeared that in the Middle Ages the City authorities utilised the Roman Wall for defence, raising it by the addition of a parapet. An analogous case of adaptation was to be seen in the bastion at Cripplegate Churchyard. Mr. Norman dealt chiefly with a piece of the old wall, about 20 feet long, which was recovered in October, and was gradually being cleared away, though probably some of it would be left for a few days longer. He described the structure of the wall from the foundation of puddled clay upwards, dealing with the courses on the inner and outer faces and the bonding tiles, with the rubble filling

between the two surfaces. The wall was 9 feet in height, of about the same thickness, and the top some 18 inches below the level of Newgate Street. The south-west corner of the seventeenth-century gateway was then shown. In its foundation fragments of Kentish rag, similar to the material of the wall, and tiles were discovered, and there was also found a chamfered plinth which had formed part of a Roman building, and this, Mr. Norman said, was the only portion of a Roman gateway which had yet been met with. Some discussion followed, and the author was thanked by the meeting for his paper. Blocks of stone, fragments of mortar and pieces of the plinth clamped together with iron were exhibited on the table. The small Roman remains met with during the progress of the works have been deposited in the Guildhall Museum.

PALÆOLITHIC ARTISTS.

IN the course of an address delivered in Edinburgh on "Man as Artist and Sportsman in the Palæolithic Period," Dr. Robert Munro said in an environment of primitive resources and limited culture, the early wild hunters developed a genuine taste for art, and cultivated its principles so effectually that they have bequeathed to us an art gallery of some 400 pieces of sculpture and engraving, so true to their models that many of them bear a favourable comparison with analogous works of the present day. They adorned their persons with perforated teeth, shells, coloured pebbles, and pendants of various kinds. They depicted the animals, with which they were familiar, especially those they hunted for food, in all their various moods and attitudes, often with startling fidelity. Harpoons, spears and daggers, of horn and bone, were skilfully engraved, and sometimes the handles of the last were sculptured into the conventional form of one or other of their favourite animals. They also, in some instances, adorned the walls of the caverns they frequented with incised outlines of the neighbouring fauna, and made actual colour paintings of them in black and ochre, or in one of these colours. The discovery of so many art specimens is of considerable importance among the more notable facts disclosed by these anthropological researches, as it proves that the origin of the artistic faculty was independent of, and prior to, the evolution of religion, ethics, politics, commerce and other elements, of which our modern civilisation is built up. The other characteristic feature in the lives of these people was that they lived exclusively on the produce of the chase; for, without agricultural and pastoral avocations, what else could they do but organise daily hunting or fishing expeditions? To capture the big game of the district was a formidable task, requiring, not only great strength and agility of person and limb, but also strong and well-made weapons. During the later stages of the Palæolithic civilisation their principal prey consisted of reindeer and horses, both of which animals then roamed in large herds throughout Western Europe, thus rendering themselves more liable to be ambushed, trapped or speared by their wily enemies. It is not likely that they would take the initiative in attacking the hyæna, lion or cave-bear, except in self-defence. That, however, these formidable creatures were occasionally captured by them is suggested by the fact that their canine teeth were highly prized as personal ornaments, or as a memento of their prowess in the chase. The weapons used by these hunters were harpoons, generally made of reindeer horn, spear and lance heads of flint and short daggers of bone or horn. Before these weapons were invented, it is difficult to imagine that any member of the genus Homo would have the courage to attack such a formidable animal as the mammoth, armed only with a *coup de poing*; but yet there are facts which suggest that such was the case. When the physical conditions which called these accomplishments into existence passed away, and the peculiar fauna of the glacial period disappeared from the lowlands of Central Europe—some by extinction and others by emigration to more northern regions or to the elevated mountains in the neighbourhood—we find the inhabitants of these old hunting-grounds in possession of new and altogether different sources of food. Finding the former supplies becoming so limited and precarious that it was no longer possible to live a roaming life, now gathering fruits and seeds and now hunting wild animals, they fell somehow into the way of cultivating special plants and cereals, and rearing certain animals in a state of domestication. Whether this new departure was a product of the intelligence of the descendants of the Palæolithic people of Europe, or derived from new immigrants into the country, is a debatable question. At any rate, the expedient was eminently successful. It was in reality the starting-point of Neolithic civilisation, and henceforth there was a rapid increase in the population. They cultivated a variety of fruits, wheat, barley and other cereals; they reared oxen, sheep, goats, pigs, horses and dogs; they became skilled in the ceramic art and in the manufacture of cloth by spinning and weaving wool and fibrous

textures; they ground stone implements so as to give them a sharp cutting edge; in hunting the forest fauna of the period they used, in addition to spears, lances and daggers, the bow and arrows; they built houses both for the living and the dead—thus showing that religiosity had become a governing principle among them. But of the artistic taste and skill of their predecessors they had scarcely a vestige, and whatever they did by way of ornament consisted of a few linear scratches arranged in some simple geometrical pattern.

MODERN ENGLISH ART.

THE Hermione Lectures in Dublin were this year delivered by Mr. D. S. MacColl.

The course began with William Hogarth, who was said to have started English draughtsmanship in black and white, and the lecturer referred at some length to the question of dramatic painting and caricature art raised by Hogarth's practice. Having described the youth of Hogarth, who was born in 1697 of a family from Westmoreland, it was said Hogarth, who was born in the middle class, lived for that class and worked for it. Early access to a neighbouring painter gave him an opportunity he longed for, and Hogarth himself mentioned one material advantage he possessed beyond his competitors, namely, the early habit he acquired of retaining in his mind's eye without copying on the spot whatever he intended to imitate. He began work in an humble way by engraving on copper and silver, after which he got work to do on the frontispieces of books. His illustrations in "Hudibras" were crude specimens of his early work. Next he learned under Sir James Thornhill, with whose daughter he ran away. In those days there was no Royal Academy or gallery, and few schools of painting, but Hogarth's schools were the streets, the churches and the theatres. He had an extraordinary talent for seeing whatever was grotesque and humorous, and he also possessed the faculty of fixing a scene in his mind's eye, and reproducing it faithfully on canvas. The life of London lay around him, and there he found his fascination and his talent. In conclusion the lecturer mentioned a remarkable criticism made to him by the late Mr. Whistler, a man opposed to Hogarth's views, when he said, "Hogarth, there is your English master," a remarkable testimony.

The subject of the second lecture was Turner, and the lecture included a discussion of the older scenic and historical ideas that persist in Turner's treatment of landscape, and the modification of that treatment due to his original study of natural forms and lighting. Turner, the barber's son, who became a great painter and afterwards a millionaire, was one of those characters who could only be done justice to by a great novelist. Turner, on the side of his art, was so keen and so fine that the rest of us were blind and blunt and stupid compared with him. On another side perhaps some of them might have points in comparison with Turner—that was his social side, which he cultivated so little. He cut himself loose from anything that did not concern his art, and therefore he remained on that side undeveloped. Having referred to the extraordinary titles of some of the pictures of the artist, the lecturer went on to say that they had to imagine Turner as a man of extraordinary development on one side and a man imperfect on the other. As to the best book on Turner, he recommended Mr. Monkhouse's book, but there was a more or less official life by Mr. Thornbury; but, above all, he recommended Ruskin, who as a critic was first of all the masters of modern painters. Ruskin stated that Turner, of all painters, stuck closest to the natural facts, and was freest in combining and arranging those forms to suit his ideas of a picture. What they found in Turner was imitation for beauty's sake. Perhaps his most extraordinary power was that of representing objects not only near, but at nearly all distances where they could scarcely be seen. Just like Shakespeare and Handel, he was in a sense a great plagiarist, and there was a great distinction between his water-colour and oil-paintings. It was now believed that Turner studied under Reynolds, and undoubtedly he was influenced first of all by the naturalistic Dutch school and the French seventeenth-century heroic school. The lecture was illustrated with views of some of Turner's works, which showed the difference in his style of treatment after his visit to the Continent.

In his third lecture Mr. MacColl read passages from Constable's writings, in which the painter set out his own ideals as to what he understood by the "natural" in art. Like Turner, Constable had his own followers in the Royal Academy, but while Constable thoroughly appreciated Turner's genius, there was a certain opposition of theory and a very marked difference of practice between them. Turner was a citizen of the world, and had the romantic temperament of a Byron, loving all that was most sublime in nature, and evolving, at the same time, great scenes and studies out of dreamland. On the other hand, Constable, was a regular stay-at-home, caring for

no country but England. Like Rembrandt, he was born and remained the homely miller's son. He was, of course, an educated man, but his education only served to send him back to the scenes and places of his childhood. In this respect he resembled Millais. He was satisfied with the green fields and pastoral scenery of his native county. The mainspring of his art was home affection. A second point of divergence between Turner and Constable was that the latter avoided historical, legendary and mythological subjects. He painted one historical scene, "The Opening of Waterloo Bridge," but it took him fifteen years to satisfy himself with it. He believed that the poetry of light and shade and the movement of the clouds was enough to give the simplest subject a beauty of its own. He saw fairy-like beauty in the squalid banks of the Thames at night, just as he would see it in Venice or Valparaiso. He found his inspiration without travelling to famous scenes of history or invoking memories of ancient Rome. Turner's work suggested the bright dawn and the more brilliant sunrise. There was but little of that in Constable's pictures. He painted of summer effects. He liked the rich and heavy green of the summertime. The hour he chose was when the sun was high in the heavens. The influence of Gainsborough on Constable must have been very great indeed. Only the other day the lecturer saw a collection of Constable's early drawings, and they were entirely in the manner of Gainsborough. At his death some of Constable's grandest work remained in his hands. It needed much courage to take up local English landscape as a subject, but Constable determined to do it and succeeded. In conclusion, the lecturer showed limelight photographs of some of Constable's most famous works—"The Hay Wain," "The Cornfield," "The Jumping Horse" and "The Valley Farm."

The last of the lectures treated of the freer forms of imaginative painting revived by Rossetti, and some account was given of his predecessor, William Blake. Mr. MacColl having referred briefly to the youthful history of Rossetti, said he was so little interested in the study of tone that when he saw the works of some modern masters he could not know what they were at, and he described them as all "slosh." Rossetti was not, like Rembrandt, content with any casual beggar's face that he met. He went to the world with a pattern face of his own, and matched it against the heads of the people he met. In all this he corresponded with William Blake. Blake made little attempt to represent the actual world as he saw it; he drew his own idea. Throughout life Rossetti did not altogether cast off the superstition, and to him the retarding superstition, of oil-painting. If he had continued to work without shade or colour he would have been more successful. When it was asked how far the world was ready for Rossetti they had to take into account two currents, both a little of the backward order. They might briefly be called the line of illustrators and the line of decorators. Naturalness to Rossetti meant the putting in of nothing in his work that was not necessary. He was the poetic one of the pre-Raphaelite party of that time, and his conception of things was to paint his own view and not things as others might see them.

EXCAVATIONS IN ROME.

THE following communication from Mr. H. Stuart Jones, director of the British School of Rome, has appeared in the *Times* :—

In the Forum, Comm. Boni, whose patient and methodical explorations continue to merit the highest praise, has once more been richly rewarded. Work has been carried on at different points. In the very early Necropolis, hard by the Temple of Antoninus and Faustina, has been discovered a Greek vase belonging to the class of (so-called) "Proto-Corinthian" lekythi, a proof that burials continued to take place in this quarter as late as, roughly speaking, 700 B.C. The work of restoring the Rostra is almost complete, and Comm. Boni has been able to determine with certainty the position of almost every fragment of its cornice. But the great discovery of the year is that of a large base of concrete which must at one time have supported a colossal monument occupying a central position in the area of the Forum. The base measures about 40 feet by 20 feet, and in its lower portion some of the beams and planks used in setting the concrete are still embedded. It blocks one of the subterranean galleries which Comm. Boni believes to have been constructed by Julius Cæsar in connection with gladiatorial shows. In the upper surface are embedded three large travertine sockets, in which the supports of the monument were fixed. What, then, was this monument? Comm. Boni does not hesitate to identify it as the *Equus Domitiani*, a colossal equestrian statue of Domitian, described by Statius in the "Silvae." The positions of the sockets, he argues, correspond with those of the legs of the Emperor's charger, one foreleg, of course, having been raised. There can, at any rate, be no question that the base occupies precisely the position assigned to it by the poet.

In other words, the statue faced the Temple of Julius, while those of Vespasian and Concord lay behind it. To the right was the Basilica Julia, to the left the Basilica Emilia, while the Emperor's gaze was fixed on the Palatine and the atrium Vestae. The correspondence with the position of the newly-discovered base is so exact that it is difficult to escape from the conclusion drawn by Comm. Boni. The statue, which as in all probability destroyed after the *damnatio memoriae* of Domitian, seems to have been about six times life-size. It is worthy of note that, like the subterranean galleries referred to above, the base contains fragments of black marble which seem to have belonged to the famous "niger lapis."

The interest of these discoveries is, however, far surpassed by that which attaches to the excavations begun in August on the site of the Ara Pacis Augustae, which lies partly under the Palazzo Fiano Ottoboni and partly under the adjoining Via in Vicinia. It should be added that Von Duhn was the first to recognise in 1881 that the sculptured panels found on the site of the sixteenth century belonged to the Ara Pacis, and that Professor Petersen's monograph of 1894 was superseded last year by a much more elaborate treatise by the same author, published by the Austrian Archaeological Institute. In this most excellent and scholarly work the restoration of the monument, some of whose fragments have found their way to our own country, is exhaustively discussed. Had the author deferred his publication until the excavations recently begun were complete, many problems for which he was only able to furnish a solution by acute conjecture would have been solved in a much simpler manner. A high tribute to his sagacity, however, is implied in the fact that, although his restoration has been proved to be inexact in some details, in its main lines it is indubitably correct.

The Ara Pacis Augustae, which incorporated more fully than any other monument the spirit of the Golden Age, commemorated the return of Augustus from the western provinces in 13 B.C. and the completion of his proudest achievement—the establishment of the Pax Romana throughout the Empire. On the day on which the Senate resolved to consecrate the Altar of Peace (July 4, B.C. 13) and that on which it was finally dedicated (January 30, B.C. 9) became festivals of the Roman calendar. The monument included not merely the Altar of Peace itself, but also the precinct in which it stood and the closing wall, whose sculptured panels form the masterpiece of Augustan sculpture. Along the outer face ran two bands of relief, the lower of which consists in conventional systems of garlands, foliage and flowers, instinct with animal life, while the upper and more important frieze represents a procession in which Augustus himself, with his family, as well as the great ecclesiastical dignitaries of Imperial Rome, takes part, as well as scenes of sacrifice or of religious import. The inner face of the monument consists of two bands, of which the lower, if Petersen's conjecture be right, represents the woodwork of a Roman *tablinum*, while the upper is decorated with festoons of fruit and flowers, together with bucrania and instruments of sacrifice.

The interest of the recent excavations centres mainly in two points—first, the plinth upon which the enclosure-wall rested has been rediscovered *in situ*, as well as the base of the monument. Thus the form and dimensions of the monument can be exactly determined. Secondly, numerous panels of the frieze have already been brought to light, and others may be expected to follow in due course. The main interest, of course, attaches to the band representing the procession; and here a slab of high importance has been unearthed in the last few days. It has been mentioned above that the frieze represents Augustus followed by the chief members of the priesthood and of his own family, and the identification of the extant figures has naturally been a fruitful source of discussion amongst archaeologists. The latest views on the subject are given in an extremely able article by Von Domaszewski recently published in the *Archiv für die Kunde des Alterthums* of the Austrian Archaeological Institute. It is there shown that the procession represented is that which took place when the precinct was consecrated in 13 B.C., and many of the individual figures are identified in a convincing manner. The writer is, however, less successful in conjecturing the subjects of the lost panels. The newly-discovered block fills a gap between two slabs at present preserved in the Uffizi at Florence. It is not completely exposed to view, but it is beyond doubt that upon it were represented two at least of the greater figures—perhaps the Flamen Quirinalis and the Flamen Martialis—with their attendants, while Von Domaszewski maintained that the Rex Sacrorum (who may indeed have occupied a position on the as yet unexposed portion) together with Livia and Julia, the wife and daughter of the Emperor, were to be sought in this position. It will be seen that the further progress of the excavations will be awaited with extraordinary interest. Unfortunately the work, which is being carried on under the able direction of Cav. Pasqui, is attended with great difficulties. The base of the monument lies not only 18 feet below the soil, but about 6 feet below the present level of spring water, which constantly streams into the excava-

tions. Moreover, the foundation walls of the Palazzo Fiano Ottoboni and other buildings which traverse the area of the monument must be tenderly dealt with. The excavations will therefore shortly be suspended and the necessary work of underpinning, &c., preparatory to their resumption in the spring will be begun.

In the meanwhile, proposals are heard for a restoration of the monument, which are likely to give rise to much discussion. The existing fragments have passed into many hands, but they might perhaps be re-collected. It is certain, however, that the Ara Pacis can never be restored *in situ*, owing to the change in the level of the Campus Martius. The excavations have disclosed the remarkable fact that at a comparatively early date the Ara Pacis was already some feet below the surrounding surface. It was enclosed by a brick wall, while a flight of steps led down to the entrance of the precinct. The brickwork has been stated with a fair degree of probability to be of the early third century A.D.—a fact which contains a problem difficult of solution.

While it is to be regretted that these interesting excavations, which the director and other managers of the British School of Rome were enabled to visit by the kindness of Cav. Pasqui, will be inaccessible to visitors to Rome during the approaching winter, the reasons mentioned above render it inevitable that work should be suspended until the spring, and the remains of the Ara Pacis must, therefore, for the present remain under water.

BUILDING BY-LAWS REFORM ASSOCIATION.

At a meeting of the Council of the above Association at 45, Parliament Street, Sir Wm. Chance in the chair, the following resolutions were passed unanimously:—

That a by-laws committee, to consider and report on the amendments needed in the existing building by-laws be and is hereby appointed, consisting of the following members:—Mr. W. M. Acworth, Lord Robert Cecil, Mr. A. H. Clough, Mr. A. Graham, Mr. W. Henman, Mr. Mark H. Judge, Mr. E. L. Lutyens, Mr. Arthur Newbold, Dr. G. V. Poore, Mr. H. A. Powell, Mr. Lacy Ridge, Mr. R. W. Schultz, Mr. J. St. Loe Strachey, Mr. E. D. Till, Mr. Thackeray Turner, Mr. C. Turnor, Mr. H. G. Willink, the Hon. Percy Wyndham, together with the Chairman and Honorary Secretary.

That the report of the special committee appointed on May 14 last, as adopted by the Council, be referred to the by-laws committee with a view to the work being continued on the lines therein laid down, especially as regards the following points:—

For the purpose of securing, with as little delay as may be, some relief from the more oppressive of the by-laws now in force in rural districts, the committee to approach the Local Government Board and endeavour to secure their publishing a new set of model by-laws for these districts, embodying amendments which the committee may suggest to the desired end. Further, to urge district councils to amend existing by-laws accordingly.

Following on the above, to prepare a set of draft building by-laws carrying out the recommendations of the special committee that "the by-laws should lay down principles" and that "each by-law should provide that, unless the principle it enunciates is otherwise given effect to to the satisfaction of the local authority, it shall be considered to be given effect to if the requirements set out in the schedule to the by-law are complied with."

As soon as practicable, to deal with the by-laws of urban districts in like manner.

That the above resolution be forwarded to the members of the Association in a circular letter requesting them to inform the by-laws committee of any cases of hardship under existing by-laws, and asking them to make the Association known to their friends, in order that the number of members may be increased as much as possible before the annual meeting in February next.

A Memorial of Hippolyte Taine, the French writer, who was for several years professor of aesthetics in the Ecole des Beaux-Arts, is to be erected at Vouziers. The commission has been given to M. S. Martongan. It will consist of a red granite stele surmounted by a bronze bust. At the foot a female figure of Philosophy leans on Taine's writings.

The Paddington Borough Council have consented to consider the London County Council's projected tramway from the Marble Arch down Edgware Road to Cricklewood, providing the cost of the necessary road-widening is borne by the County Council as part of their tramway policy, and subject to the insertion of clauses in the Parliamentary Bill satisfactory to the borough council. The County Council required the local authority to contribute one-third of the expense of road-widening.

NOTES AND COMMENTS.

AMONG the sections in the Factory and Workshop Act of 1901 is one relating to the repayment of the cost of structural alterations in bakehouses demanded by the local authority. If the occupier alleges that the whole or a part of the expense ought to be borne by the owner, he may apply to a Court of summary jurisdiction, where such order will be made concerning the expenses on their apportionment as appears to be just and equitable. The Willesden District Council pointed out alterations in a bakery at Kilburn which would cost 183*l*. It was admitted that the tenant was liable for 26*l*. But the question was how the remainder ought to be apportioned. The owner or lessor was summoned before Mr. FLOWDEN at the Marylebone police court. The magistrate said he was of opinion that what was required was one or two things before he could be called upon to make any such apportionment as that suggested. Either the alterations found necessary must in fact be carried out and the bill for them be brought before the Court, or if the alterations were not carried out beforehand, the sum which they would cost must be agreed upon between the parties. Counsel for the Willesden authorities declared the decision would have a far-reaching effect, and asked for a case. The magistrate agreed and said it was most unsatisfactory to expect him to determine what sum the alterations would cost. It was a question he hoped he would never be called upon to decide. The summons was adjourned in order that the parties themselves might come to some arrangement. Of late years a great many responsibilities have been cast on magistrates for which their training as lawyers is insufficient to endow them with competence. The apportionment of expenses under the Factory and Workshop Act certainly requires the aid of a technical assessor, and the Act does not appear to give the requisite authority for his appointment.

ACCORDING to the last report of the Commissioners of Public Works in Ireland the total amount of loans authorised for the erection of dwellings for agricultural labourers was 384,304*l*. That is not a very large sum to be expended in forty years, especially when it is remembered what kind of hovels were used by the people. As MOORE said, two thousand years have passed in vain over the dwellings of the Irish peasant, and indeed some of them seem to belong to a prehistoric age. The amount of money which an architect is able to derive from a commission for the erection of labourers' dwellings in any district can only be a very small sum. Yet we find Mr. T. W. RUSSELL, M.P., declaring at a meeting in Dublin of the Statistical and Social Inquiry Society, that if model plans were provided by the Local Government Board instead of employing architects, and if the whole system that had grown out of the Acts was taken by the throat and destroyed, they could build the houses at a moderate rate, and labourers would be able to pay a rent that would not involve any extra cost. The paper which gave rise to his remarks was one by a Mr. SYNNOTT, in which it was advocated that instead of building new cottages the existing hovels should be purchased and repaired. The waste lands and ruinous walls and buildings to be found in or near every country village in Ireland could, it was said, be procured with less friction, and probably at less cost, than slices of country farms. The majority of the Irish cabins cannot be regarded as more than the work of labourers who were neither masons nor carpenters. It seems unwise to dream of transforming them into healthy dwellings. The materials are rarely adapted for use. It should also be kept in mind that the houses erected by means of Government loans become security for the money until the amount granted is repaid. We cannot suppose the officials of the Commissioners of Public Works would be satisfied with the old ruins under new forms. It may be that in some cases the interests of individuals rather than the necessities of a district are considered in applying for loans, and it may also happen that some tenants are favoured and obtain cottages at too low a rent. No measures can put an end to selfishness. But it will be a bad day for Ireland if the Government will not only approve of shams in building,

but will construct examples which would be in reality whitened sepulchres.

In the competition for a women's hospital at Hove sixty two sets of plans were submitted. According to the assessor, Mr. G. T. HINE, there was much merit in the designs, and they were generally in accordance with the conditions. The first premium has been awarded to Mr. DENMAN, of Clifton Terrace, Brighton; and the second to Mr. E. P. HOWARD, of Cursitor Street, London. The designs of Mr. T. J. PENNINGTON, of Hounslow, and Messrs. J. F. QUILTER & F. ANDERSON, of Adam Street, Adelphi, are declared to be equal for the third premium. It is suggested by the assessor that the premium should be divided, or a sum of 20*l*. be awarded for each design.

GEORGE ELIOT says that GOETHE'S house in Weimar is much more important-looking than SCHILLER'S abode, "but to English eyes far from being the palatial residence which might be expected from the descriptions of German writers. The entrance-hall is indeed rather imposing, with its statues in niches and its broad staircase, but the rest of the house is not proportionately spacious and elegant. . . . It is to be regretted that a large sum offered for this house by the German Diet was refused by the GOETHE family, in the hope, it is said, of obtaining a still larger sum from that mythical English Croesus—always ready to turn fabulous sums into dead capital—who haunts the imagination of continental people." GOETHE went to Weimar when a young man on the invitation of the Grand Duke, whom he served as a Privy Councillor. He occupied the house as a tenant for seven years, and afterwards he purchased the interest in it from an army doctor who was the owner. GOETHE'S reputation extended beyond the limits of Europe and indeed he once complained that he gained nothing from the Chinese artists representing scenes from "Werther" on their pottery. One result was that strangers used to consider it was necessary to make a pilgrimage to Weimar so as to have an opportunity of an interview with the poet. He bore the infliction more patiently than would the majority of persons. But GOETHE was a man who believed it was indispensable to enjoy privacy whenever he desired. His own rooms, therefore, were at the back of the house, and he set much value on the garden, in which he could walk, think and experiment. Accordingly it is supposed he had a wall erected in order that he might be free from observation. The local authorities, for some reason which is not very clear, have now decided to remove the wall. The Grand Duke, as protector of the Goethe Museum, can, it is believed, exercise authority and prevent the removal, but does not seem disposed to interfere. An attempt has therefore been made to obtain as many admirers of GOETHE as possible to protest against the vandalism. It is not easy to arouse Germans, especially at a time when foreign trade is in jeopardy, but the agitation is increasing, and the proposal is now looked on as if it were a sacrilege, for GOETHE'S house is still considered by enthusiasts as if it were a temple. In England we have had a sorrowful experience of "improvements," but in Weimar the reasons are insufficient for destroying the character of a residence which will possess interest for others besides Germans as long as the materials of the house and wall hold together.

THE APPLIED ART SCHOOL, EDINBURGH.

ONE of the witnesses before the departmental committee of the Board of Manufactures was Sir R. Rowand Anderson, LL.D., architect, who gave the following evidence in regard to the Applied Art School, which owes its existence mainly to his efforts:—

The Chairman: You have been kind enough to prepare a statement for us with regard to the Applied Art School in Edinburgh, and we shall be very glad to hear your views upon it. It would be more convenient if you gave them in your own language rather than answering the questions. I think the matter dates back from about 1889?—Yes.

The citizens then formed themselves into a committee with a view of establishing a school in Edinburgh, and from that time you will be able to tell us the history?—From that time we went on, and I am glad to say we have gone on from good to better, and really we are in a very healthy condition just now. The pupils are all doing very well, and are all very enthusiastic and very industrious. Our only fault is that we have not enough money and not enough space. The printed statement which I embody a good deal of what I would say to you.

Will you tell us the history of this movement in Edinburgh?—At the time this school was started, of course art was under the domination of South Kensington. Those who took this matter did not like that system. They thought it was injurious, there was a want of elasticity about it, that it did not go to the heart of things, that it was more a system of production of drawings instead of drawings as the means to an end, that the system of payment by results which was followed then was a very injurious one, and that the teaching was not sufficiently practical, inasmuch as it did not bring the students into contact with old work of every kind. We have from the very first looked upon that as the most important thing in our teaching, bringing the students into contact with old works, so that they can see the thing—not looking at a piece of paper and seeing a thing drawn upon it, but looking at the thing itself, and taught to measure it, analyse it, and understand why this was done and that was done, and so on. That has been the chief feature of our teaching, and we say it has produced splendid results. I have no doubt. I speak more as an architect than anything else. If you ask any architect standing, he will tell you that all his learning has come from a careful study of old work. Of course, we had no means to carry on a school of that kind, and we came to the Board of Manufactures and asked their aid, and they gave us every encouragement except money, as they had not got it. They offered us accommodation here, and they also offered to share in the management of the school, which we at first accepted, because we thought it a very good thing to have it done in a matter of this kind. They laid it down that we should raise money. Well, we put our hands in our pockets, and asked other people to do the same thing, and we raised a considerable sum of money. Then the Board said, Well, that is all right, and we will do now what we can for you. They then referred the matter to the Secretary for Scotland, then the Marquess of Athol, and he was very sympathetic about the matter, and gave assent to the Board taking up this work and going on with it. I do not know about that time got the residue grant, and we applied for it, explained our case to them, and they were very good to us. They gave us 1,000*l.*, which they renewed for five years. Then I am sorry to say the town began to get into difficulties, and the treasurer laid his hands on every penny he could, and gradually clipped our allowance until he wittled it all away. Fortunately we had a reserve fund. Along with Mr. James Watson was successful in inducing the trustees of the late Earl of Athol, who left a large sum of money for various purposes, to be distributed by his trustees, after explaining the whole case to them, to come to the conclusion that it was worthy of support, and they gave us 1,500*l.* Then a friend of mine in Edinburgh gave 500*l.* and Mr. McEwan, the member for the district, 250*l.*, and a number of others gave various amounts, so that we had a good substantial sum to go on with. We opened a school, and we set out with the intention of employing teachers who were engaged in the work they proposed to teach, because we felt that they were in touch with the outside world and with the requirements of trade, and so we have carried that on ever since, and we believe the result has been a very good one. At that time we made the curriculum extend over four years. That went on very well, and then we thought we would lengthen it. We extended it to five years, so as to coincide with the usual term of apprenticeship, and we have always tried to get the pupils just beginning their apprenticeship, and their education and the teaching of the school go on together. That is a very important feature in our school is this, that we employ them all the time. Take any other school—take the Heriot-Watt school, for example; they have at the start 100 pupils, but they melt away and they never see them again. They are here for a year or two's time and disappear. Perhaps

150 will begin, and they will finish off with five-and-twenty, and even less than that. Now, we keep our students all the time, and unless you can do that in an art school, I don't see what good you can do. Then we have also had some very good inducements for them to remain with us. We have got bursaries for them, although small in amount. That is a thing to look forward to. Any young man who can carry off a bursary carries off what will help him all through his life. He has only to produce the certificate or diploma of our school if he goes to an office to be taken on. I have frequently heard from people in London, architects in London, "We snap up everybody you can send us, because they get such a thoroughly good grounding in a practical way."

That is one of the reasons you are able to keep the pupils better?—Undoubtedly. We won't take a pupil unless he declares he will stay five years with us.

Does it come to this, that your curriculum is a longer curriculum than the Heriot-Watt's?—Yes, I should say the Heriot-Watt curriculum is only three years at the outside.

Is that what you mean when you say you keep them longer?—For example, in the Heriot-Watt College there are 197 pupils in for what is called building construction and architecture. The course of the class is for three years. They start with 197 and finish with twenty-six. Then for ornamental design, the course lasts two years. They start with fifty-five and finish off with one. Only one applies for a certificate. Then here is another statement that might be of interest to you, and that is that the total course of architecture, building construction, ornamentation and design, perspective and modelling, in hours is 824, equal to one year and three-quarters of our school.

Are they all the same age and the same class of pupils?—Oh, well, I don't know about that. These figures are taken from their own printed statistics.

Are you really comparing like with like?—I am comparing what professes to be like teaching with like teaching. The individuals may be younger; I don't know.

At what sort of age do the pupils commence your classes?—Fifteen and sixteen.

It would be fair to assume that those attending the Heriot-Watt course would be a good deal younger than that?—No, I don't think so. I understand under the Factory Act that no one can become an apprentice under fourteen. He cannot enter into any contract of apprenticeship under fourteen, and a great many don't begin until later.

Might those figures you gave of children disappearing from those classes and not finishing possibly mean that the children were being educated at the Heriot-Watt College and their parents removed from Edinburgh and took their children with them?—That might account for a certain number, because workmen move about a good deal, but I refer to the education they offer to architects and designers generally. They are not likely to move about so much as a lad learning engineering or some handicraft.

The two schools are teaching the same thing. That is a fair comparison?—No, they are nominally teaching the same thing, but they don't teach it in the way we teach it. It is not so practical as ours.

I don't mean the system—I mean what they are offering to do for the pupils?—I admit there is a certain amount of overlapping of ours. For example, the school upstairs overlaps, but we want to get rid of all that.

Your argument about the attendance and the way you keep your pupils comes to this, that the whole time the pupil is with you he is learning more and more and acquiring valuable knowledge?—Yes.

And after he has been for a time under the curriculum of the Heriot-Watt tuition he begins to doubt that and finally disappears?—There must be a good deal in that. That is my contention. In my statement I say, "Great importance is attached to bringing the students into actual contact with old work of every kind, and for this purpose the students are divided into sections according to their state of advancement, each under a responsible teacher, and places and buildings within a reasonable distance of Edinburgh are visited every Saturday afternoon, and the time is spent in carefully measuring and drawing whatever is of art interest." That is a very popular work with the students, and wakens them up in a way nothing else does.

The result is that your diploma or certificate enables them to get work at once when they leave you?—The moment they leave us they are certain to get good employment. Then I give you also a statement regarding a very important work we have undertaken, and that is a national art survey of Scotland. Two of our bursars hold a bursary for one year, and they leave an office and devote their whole time to this work of measuring and drawing, illustrating-work of all kinds, and we are now accumulating a collection of drawings that is absolutely unique, and which is very valuable and open for consultation for anyone. Now, it is not merely a collection of stone buildings, but we go into everything—metalwork, woodwork and decorative work. We have got a most interesting and valuable

collection of old furniture from many places, and our drawings of plasterwork are simply unrivalled anywhere.

You are combining the best instructions with the accumulation of a very valuable lot of material?—Yes. Then we also give bursaries, which enable students for four months to go anywhere they like, subject to the approval of the committee, and they have to send in their drawings to the committee after the end of two months. Then, if the committee are satisfied that they have been working well, the other half of the bursary is paid, and at the end of that time they send all their drawings in and they are exhibited. That is having a marvellous influence on young men. Then we have accumulated a very considerable amount of property. Our assets are valued at 5,000*l.*, and it is our absolute property; and as the town has somewhat deserted us, we are very anxious to get on to a permanent footing, and our desire has been always, as I say in my statement, to have "one central School of Art in Edinburgh, as the present system of separate schools leads to a dissipation of energy and resources, and they—the committee—feel that the visit to Edinburgh of the parliamentary committee to inquire into the administration and duties of the Board of Manufactures is a favourable opportunity to consider the possible development of that part of the Board's duties which deals with art teaching, and so bring about the creation of a comprehensive art school in the city of Edinburgh. If the parliamentary committee see their way to recommend this, all monetary difficulties would probably disappear. The combined assets for art teaching of the Board of Manufactures and the Applied Art School, probably worth 10,000*l.*, would be at once available for the equipment of the school. If the Board of Manufactures were relieved of the expense of maintaining the buildings now in their custody, by means of a separate grant for this purpose, and the funds derived from the 'equivalent' granted at the time of the Union in 1707 for the improvement of manufactures, &c., and afterwards devoted by Act of Parliament to the establishment of an Academy of Design, which continued up to 1859 under the exclusive management of the Board, be again made available for an art school, the Scottish Education Department would, it is understood, when satisfied that the school was organised on a proper basis, give a substantial sum. These two amounts, with a contribution from the town and the school fees, would be sufficient to meet the wants of a really good school. Elementary drawing is at present taught at the Board and other public schools, and its development, in so far as necessary for the complete education of a mechanical or electrical engineer, and all who are engaged in scientific or technical pursuits, can and should be provided for in the Heriot-Watt College." There is a natural and distinct line of division between the two. No engineer or scientific man can be said to be completely educated unless he can draw. He must be able to understand a plan and section. He must be able to draw diagrams of all kinds, and he must be able to draw a certain amount of freehand also, so that there is a clear dividing line, and that ought to be taught at the Heriot-Watt; but beyond that, I think, and those who are along with me believe, they should not go. In my statement I go on to say:—"The School of Art which we wish to see established should be a comprehensive one, providing all that education can give to the picture and decorative painter, and all whose work calls in the aid of art; and, in the management of this school, representatives of the arts of painting, sculpture and architecture and the applied arts should be called in to act along with a committee of the Board of Manufactures, as is at present done in the case of the Applied Art School. This school should also have a section devoted to the teaching of those who wish to carry on and develop their art training, but who do not require or intend to follow any occupation necessitating the application of art. Provided elementary teaching is excluded from the course of study, the present building of the Royal Institution, with some slight alterations, contains ample accommodation for a large and complete art school."

You have plenty of room here?—I think so. Of course, the art school could not blossom out into a great establishment all at once. It would take time to grow, but there is ample room here, provided the two schools were combined into one art school.

You mean that the present School of Art in this building should cease to exist in its present form and your School of Applied Art should be absorbed in this larger school you desire to establish?—That is so; we desire that there should be only one school of art here, and that the existing schools should be amalgamated, and there is no doubt there would be a considerable economy in that.

What body manages the Applied Art School at present, and how is it done?—It consists, I think, of about one dozen men—one or two architects, one or two silversmiths, one or two furniture people, decorators and bookbinders and myself. That is the committee. Then they act along with a committee of the Board of Trustees.

Did you originate this scheme that you are describing to

us, or did this body originate it?—Well, I may say I was, to a great extent, the originator, but at the same time it has all done in consultation with this body.

But still it is an unusual and more logical and direct scheme than any other that I know. Upon whom does the origin of that idea depend? Was it the committee?—I suppose I am entitled to take a large share of the credit for the whole thing, and I have worked at it since the commencement ten years ago. I have taken the burden on my own shoulders. At first, we tried to get someone to take the lead in the matter, but we found that we could not afford the salary that we would have to keep a really good man, and rather than see the thing go down, I took on the burden of it, and continue to do so. By my doing so that we have been enabled to acquire so much property. We have got a valuable library now and a valuable collection of casts. We could not have afforded to do so were we paying several hundred pounds a year to someone.

What machinery do you propose, supposing your scheme were adhered to, in case of this amalgamation you suggest?—Somebody would have to be found to take a lead in the matter, because it would come to be a much larger thing, and I have too many other things to attend to to take on such a thing as that; but a man should be found who is a capable organiser, and under him should be teachers—qualified teachers of the kind that we have—all engaged in the teaching they profess to teach, and a committee of visitors should be associated with the Board of Trustees, just as we are doing at present.

But under that committee you think there ought to be a director or manager who would insure continuity and prevent control over the whole organisation?—Yes.

Have you any idea what kind of salary would be required? You have directed this school without salary?—I have done so without fee or reward. As I say, they could never have accumulated this property if I had not; but all that cannot go on for ever. You require to pay a good salary to a good man. I do not know if you would get one much under 400*l.* or 500*l.* He would have to be a man who makes that his life work.

He would give up his whole time?—He would have to give up his whole time, and 400*l.* or 500*l.* is not too much to look forward to for his life work, but I would say that the teachers should not be permanent. I would only keep the teachers for a certain number of years. I believe if you did that the school would have far more vitality and life in the school.

Do you mean that you would hang dismissal over their heads, or only keep them for a number of years?—They would come on that understanding. You could get very good teachers who would be following out their own life work, and at the same time do a few hours' work in teaching. By making changes you would keep up a flow of fresh blood and activity in the school, but I think the head of the school would have to be permanent.

For what kind of subjects would you have these temporary teachers? I mean, how far would you go into the actual technical part?—I say in my statement, "Representatives of the arts of painting, sculpture and architecture, and the applied arts should be called in." Painting from the life, all that teaching can do for painters, would be included. I would say that certain members of the Royal Scottish Academy should have a voice in the matter. Probably if they have any valuable figure-painter he could take an interest in the life school. At any rate, I think it would be only fair to give the Royal Scottish Academy a representation on this Board. Well, teaching in the art of architecture and all its varied ramifications, you would always be able to get one or two young architects. Then I would like to see bookbinding and typography introduced. We tried bookbinding, but I am sorry to say it collapsed, not through our fault, but the Union interfered when they were getting on very well. We had a little pleasure with tools and everything, and it was astonishing what they did, and all of them are now in London getting good employment.

Why did the Union interfere there?—I suppose they wanted to reduce everyone to a dead level of mediocrity.

Were the men you employed working over Union hours?—No; they could not be said to be working over Union hours, because they were not working for hire.

How did they stop them?—The moral pressure of the Union.

How was it exercised?—By boycotting so far, and letting them know that that sort of thing must not be done. They would just be raising up a class of men who might be able to snap their fingers at the Union.

You mean, to produce a better class of work than the Union could produce?—Yes.

Did they actually communicate with you?—No.

Is it only a general impression which you have on the subject?—The story comes to me from a bookbinder who was one of our committee, saying that the Union brought pressure on them not to remain at this school.

And had the bookbinder in his employment boys educated

school?—I am not prepared to say to what extent their pressure went, but the story given to me was that the Union had a practical bookbinder as teacher?—Yes.

any coercion put on him?—I have no doubt there was, I am not prepared to define the coercion. I give you the statement as given to me by the bookbinder, who said that the pressure brought pressure to bear upon them.

did not come?—They did not come.

size of class had you?—About eight.

they all go away?—Yes.

ere they finished their curriculum?—Yes; well, you can scarcely say a curriculum, because we started an experiment. The bookbinding class was not under any rules and regulations as the others.

is your idea of the governing body of this new school?—The governing body would be the Board of Manufactures and a body of outsiders engaged in industrial arts, including painters, sculptors, architects, bookbinders and silversmiths.

to be selected?—Well, it is pretty well known in the district who are the best men for a thing of that kind.

ur idea that the School of Applied Art should be put into that?—Certainly.

ed those who are the governing body on the School of Applied Art continue to be on the governing body of the new school?—Certainly.

n you would have representatives from the Board of Manufactures?—Yes.

would you have any other representatives on?—I don't know. I don't quite see what other representatives we require. We want people interested practically in the school.

would they be appointed?—Well, I would say that the present committee had better just continue.

supposing you continue, how do you fill up your death duties?—By consultation among the members, as we have not done.

y election?—By selection. Last year we had a death of one of our members, and we talked the matter over and decided that so-and-so would be a very good man, and got him elected.

ou propose that this new enlarged committee should elect its own members?—Yes; I think it would be better, and who else could appoint?

might say the Secretary for Scotland?—Let the Secretary state listen to this Board. The Board might put some questions before him.

would recommend whom to appoint?—Yes.

posing you have this competent manager of the whole school which you propose to appoint, why do you want this very man?—Then the manager would have it all his own.

wouldn't the present Board be sufficient to prevent the school?—I understood you to say just now, what was the controlling body if you have this man?

understood you to say that you wanted to increase the present Board very much?—No; I think the Board is big enough as it is. What I would say would be that the Board should appoint a committee of their number to deal specially with art education, and that committee of the Trustees would be aided by this outside committee. I think would give great confidence to the public, and that only do that, but would bring to bear upon the work of the school an amount of practical intelligence and knowledge which the members of the Board themselves could not supply.

ut this outside Board be sort of assessors to the present Board in the management of this school?—Very much as it is now. As far as the Applied Art School is concerned, we rely very well and derive the greatest help from members of the Board who have acted on the committee of this school. I don't know if it would be a good thing to have only practical men managing it. I think it would be a very good thing to have a certain element of cultured people not directly connected with any particular art. For example, to hand this school over to a body composed exclusively of painters or architects would never work.

contention is that the plan of amalgamating the school with a certain number of representatives of professions has been successful?—Yes, eminently successful, I don't think anything better could be devised than the old tradition of this place, and you must remember that the Board of Manufactures did a great deal for their day, and they started and carried on the only design in the kingdom for many years, and did a lot of good.

know anything about the other art school in other parts of Scotland?—You have a very excellent art school in Glasgow and they copy us occasionally. I know the headmaster knows he has adopted some of our ways.

Would such a school as you sketch out, if established here, be sufficiently different from the school in Glasgow or any other school in Glasgow to justify the expenditure of national funds upon it, as apart from local funds?—Well, what I hold is that the money granted to the Board of Manufactures was given for art teaching. It has, I hold, been granted by Government for that purpose, but some people think it has drifted in other directions, wholly or in part. I have a very curious statement before me, an extract from "Brydall's History of Art in Scotland, 1889," page 143, in which it is stated that out of the proceeds of the forfeited estates there was a sum of money given "definitely for the purpose of establishing an academy of design in order to promote the taste among the workmen and youth of both sexes in Scotland, hence known as the Trustees' Academy." That is the public statement by him. In any case, the funds of the Board at one time were unquestionably destined to an art school, and what I say is to continue that, only amplify it, and bring it into line with the wants and requirements of the present day.

Supposing there were art schools of the kind you sketch existing already in other parts of Scotland, the school established here would really be only of advantage to the district of Edinburgh, and the money devoted would be absolutely public money?—Glasgow has a very good school, Dundee has a pretty good school, and Aberdeen is getting a good school, but on the other hand, why should you take away the money that has been already granted for that purpose? If you were to ask me if I would go to the Government for a fresh grant for a school of art, I say that I don't see upon what grounds I could do so, because other towns would be entitled to do the same. I can scarcely think that the people in Scotland will object to the money that was voted 100 years ago for this art school being still continued. I don't think so. I don't think the people in Glasgow are jealous of us in that way.

What are your financial proposals? Is what you propose this, that for this enlarged school of art in the future there should be devoted the 2,000*l.* a year under the Treaty of Union, and all the accumulated funds at present in the hands of the Board of Manufactures from that fund?—I would not go that length; no. Supposing that you could devote, say, 1,500*l.*, then I am led to believe that the Education Department, if they were satisfied that this school of art were a really good one, and properly organised, would give a substantial amount. Very well, then, on the back of that, I do not think the town could refuse to give us a grant. Then you would have the school fees, and with that total amount we could run a first-rate art school here.

That is a much more practical financial proposal than what is on the paper here?—Perhaps I should have limited it, but I never thought of impounding all the resources of the Board for an art school. That was not in my mind.

Of course, if you concede that this school could be worked on an expenditure by the Board of Manufactures of 1,500*l.* a year, and they are to discontinue the existing school of art, upon which they pay 1,000*l.* a year, there is some possibility of that sum of money being supplied; but on reading your statement in the paper it seemed to me almost an impracticable one. In your statement you say, "These two amounts, with a contribution from the town." I do not know what ground you have for believing that you will get a contribution from the town or from the Scottish Education Department?—The Scottish Education Department have said that they are willing to support a central school of art, and the town has said practically the same thing.

Such a school of art as you set forth here?—Yes.

Do I understand that your idea is practically the assumption and somewhat wider extension of the School of Applied Art at present in this institution?—Yes.

It does not come to much more than that?—No, it does not come to more than that. It means a school where everyone from the picture painter down to the bookbinder or the printer could obtain an art education.

It largely would be a technical school?—Not technical in the sense of working very much with materials, because it could never do very much in that way.

But still it would be largely a school for giving art training to workmen who designed to go into certain forms of employment?—Yes, we could take in any man who really showed any ability in that way.

Is that the sort of art school that is at present apparently demanded to be furnished by the Board of Manufactures, or by some similar body?—I think that is the school the public want.

We have certainly had evidence laid before us showing us that it is rather a school in which the man who intended to be a painter or a sculptor could get instruction which at present he can only get in London or Paris?—After all, painting is only an item in art; it is not the beginning and end, and Edinburgh can never in our day become a centre for advanced students of painting and sculpture; they will always go to the great art centres of Europe.

You do not mean to include that in your scheme?—Certainly,

I would include all the teaching that is given to painters in Edinburgh at the present moment.

Anything further?—Well, I do not know. For example, they have no costume class here. That would be a very valuable addition.

Your new school of art would be, as Sir John Stirling-Maxwell has suggested, somewhat upon the same lines as that in Glasgow?—I am afraid all art schools must be more or less alike.

Do you expect pupils to come to you prepared?—I certainly would think it a waste of resources to teach elementary drawing. They would get that elsewhere.

Do you think that all elementary work should be learnt in Board schools or other elementary schools?—Yes.

And that they should know that when they come to you?—Yes. It would be a waste of time altogether to teach elementary drawing.

Would you propose to get the co-operation of the Heriot-Watt Governors?—No, decidedly not.

Why?—Because they could not give us any co-operation. The Heriot-Watt College was never intended to be an art school and was not organised on such a footing, and what could they do for art? I cannot imagine anything. If any young man at their school develops any decided art tendencies all that he has got to do is to come here. The constitution of their Trust would exclude the influences which we hold to be essential to a living and progressing art school.

Are they not largely developing their art classes?—By accident more than anything else they have done a good deal, but the Heriot-Watt school was never intended as an art school, and they have not the organisation. They have not the means. For instance, in my statement I say that the equipment of the art school here is worth about 10,000*l*. A really first-class art school would require that. Are the Heriot-Watt to start a fresh school, beginning at the beginning and laying out all those thousands? This is a going concern.

The trustees of the Heriot-Watt College are not prevented by their Act from starting any such thing?—No, I don't suppose so.

And they are an institution whose funds are increasing by leaps and bounds every year by an increase in property?—You know some time ago we were told that the Board were afraid they could do nothing more for us, that there were impending changes coming on, and that the Education Department wanted the Art School to go over to the Heriot-Watt. We said to the Heriot-Watt, "Cannot we come to some kind of arrangement and we will hand over all our assets, provided you will carry on and develop the teaching we have begun and worked successfully?" It turned out they had not a penny. They were poorer than ourselves. They are in debt. They never responded to that invitation.

Have they not laid out a large sum this last year in buildings for a new school?—I don't know the history of that.

It surely would be a mistake to have two schools practically doing the same work?—I think so.

Would there be much taught in your school that the Heriot-Watt College, at any rate, does not profess to teach?—They don't profess to bring their students into contact with old work as we do, and which we hold to be the life and essence of our school. And, then there is the fact that we keep our students; we don't take a student unless he will declare that he is going to remain with us all that time. You cannot have that at the Heriot-Watt.

Why not?—I maintain that the merit of our school is that we keep the students for five years, and we also claim that our teaching is of a much more practical nature than they can give at the Heriot-Watt. Of course, if they choose to start all our methods, you might say they are doing the very same as we are doing. They may do that. I maintain that our school has developed a system of teaching which is not in vogue to the full extent anywhere else, and it is a very practical way of teaching. I don't know if you have looked at this document, where a deputation came from Manchester to inspect what we are doing. I remember meeting the deputation and showing them everything. Their declaration was this:—This is the very thing we have been looking for; we have been to the other schools, but here is the very thing we want. Then you see what Mr Anning Bell, sent down by the Scotch Education Department to inspect our school, says. He gives us the very highest character. Then this work which we are doing in what we call the National Art Survey is not merely the making of a collection of drawings, but it is the work of making that collection of drawings which has such a powerful educational effect on the students.

The Liverpool Architectural Society will hold its fourth ordinary meeting of the fifty-sixth session in the Library of the Law Society, 13 Harrington Street, Liverpool, on Monday next, the 7th inst., when a paper will be read by Miss Ethel Charles, A.R.I.B.A., entitled "Reflections on Architecture."

A MODEL CITY.

IT is not unusual at the present time to hear men who understand the subject expressing regret that Sir Christopher Wren's plan for rebuilding London after the fire of 1666 was not carried out. Apparently the principal obstacle was the difficulty of raising sufficient money at a time when the expenses of the army and navy were considerable. About 130 years afterwards there was another chance of laying out a city on a determined plan, which some compared to a gridiron, when the political capital of the United States was under consideration. According to the marginal explanation on his plan written by Peter Charles l'Enfant, the principle he adopted was as follows:—

1. The position for the different grand edifices, and for several grand squares or areas of different shapes, as they were laid down, were first determined on the most advantageous ground, commanding the most extensive prospects, and better susceptible of such improvements as the various interests of the several objects may require.

2. Drives or avenues, of direct communication, have been devised to connect the separate and most distant objects to the principal, and to preserve through the whole a reciprocity of sight; at the same time, attention has been paid to the laying out of those leading avenues, over the most favourable ground for prospect and convenience.

3. North and south lines, intersected by others running east and west, make distribution of the city into streets, squares, &c., and these lines have been so combined as to intersect at certain given points with those divergent avenues, so as to form on the spaces "first determined" the different squares or areas, which are all proportional in magnitude to the number of avenues leading to them.

The neglect to realise the proposals of l'Enfant has been disadvantageous, and efforts are now being made to improve that in future there will be more attention given to the laying out of streets and open spaces. The project of the construction of the Federal capital for Australia gave occasion for holding a Congress of Engineers, Architects and Surveyors in Melbourne in May 1901. The report of the proceedings has only recently been issued. At the time the site for the proposed capital was not determined, and indeed it is doubtful whether any one discovered by the Commissioners appointed for the purpose, will receive the approval of the Commonwealth. At the Congress at Melbourne could do was to suggest that in selecting a site care should be given to the possibilities of an abundant water supply, having regard to prospective requirements for water and sanitary services, creation of artificial lakes, maintenance of public gardens, fountains, &c., favourable climatic conditions, physical suitability and centrality of position; points which were not likely to be overlooked by any commission of scientific or business men. With more reason it was suggested "that the Federal capital should be laid out in the most perfect manner possible, and that, to avoid the mistakes made in many cities of spoiling the plan by utilising existing buildings, it is desirable that in any site obtained the obstructions be removed that would in any way prevent the adoption of the most perfect design." In other words, engineers, architects, surveyors and allied professions wish to have the clearest field for their operations.

The laying out of a city in the seventeenth or eighteenth century was a simple operation if compared with what has become necessary in the twentieth century. In his inaugural address Mr. George Higgins, C.E., suggested some of the subjects which deserved to be treated at the conference, and the laying-out of the new city, with a view to facilitate traffic and drainage, as well as the attainment of a pleasing appearance, and promoting health; the arrangement of breathing spaces, and the methods of planting parks and public gardens; the most suitable widths of streets and footwalks; devices for diminishing congestion of traffic at street crossings; the type of pavement best adapted to prevent the formation of dust and mud, or, if the formation of dust and mud cannot be altogether prevented, then the best ways of laying the dust and removing the mud; regulations as to lanes and byways; comparison of various systems of tramways; the means for rapidly and frequently removing refuse and waste matters, including schemes and for satisfactorily disposing of such refuse, and for preventing the formation of smoke as far as possible; the question of procuring abundant supplies of pure water, not only for domestic purposes, but also for fire-extinction and street-watering; schemes for architectural adornment, and regulations for the prevention of a too glaring want of harmony of proportion in the various buildings, without, of course, unduly

ing individual taste; the choice of suitable building materials; precautions for fireproofing houses; regulations for building houses from being too much crowded together, such as, for instance, as will prevent houses being so erected that their occupants have to live, during the hours of daylight, in a room lighted by artificial means, a condition of things which is not to have place in a city where the ground remains the property of the Government; regulations also as to the location of all buildings, and for providing ample means of escape in cases of panic; devices for equalising temperature in especially hospitals, so that warmth can be supplied from central sources in winter, and a cool air service provided in summer by some such means as liquefied air; again, the use of gas and electricity, both for lighting and for power; and for laying wires and pipes underground in suitable conduits; questions of street verandahs *v.* awnings; and for permanently fixing the boundaries of blocks of land; and an important question of housing temporarily the armies of men who will be employed in building the city; these, and many other important subjects, may well form topics for discussion at this and at subsequent conferences.

Compared with so vast a programme the proposals which were presented at the Congress must appear as no more than indications of what was required. The first paper was by Mr. McDowall, the surveyor-general of Queensland, and was on "Standard Marks of Reference for the direction of the Line of Streets." It is well to remember that in the East, water is prized, and hence the importance attached to fountains as public monuments. Mr. McDowall suggested that a highly ornamented drinking fountain should form the central standard mark of reference, so that a pedestal could be set over the centre and plumbed over to a reference mark below the surface of the street, with less than a foot of water in each of the radiating streets. They might be copied if desired.

Mr. H. Broadhurst read a paper on the laying out of the new capital. He said:—

"In designing the streets there are several points that I should be borne in mind. The first one is that long straight lines of street in the direction of prevailing winds are generally pervaded with clouds of dust, and should therefore be avoided even at considerable cost. Another is that there are great disadvantages to streets running east and west, being that the high buildings on the north side throw shadows across the street, and in winter this prevents the sun from drying it satisfactorily, lightly constructed streets often suffering seriously on this account if subjected to heavy traffic; the other being that passengers travelling in the early morning and westwards in the evening are blinded by the sun's rays. A third point is being urged more earnestly by the authorities on sanitation, and the desirability of having sunshine in all the rooms of a house. It has been stated that sunlight is a certain antidote to the germs of consumption, and that as long as we continue to live in rooms in which the sun's rays have not been for two hours during the day they are absolutely safe from infection by that deadly disease."

These considerations point to the desirability of creating streets running at an angle of 45 degrees with the true north; for as the prevailing winds in Eastern Australia, where the capital will be situated, are north and south, they will follow the course of a street running at these angles and so to raise clouds of dust such as we used to have in London and still have in some of its suburbs. When the streets are parallel to the course of such a street he is too close to the horizon for his rays to dazzle the passengers, and during the course of the day he shines fully on to every side of a house built to face any street forming the angle indicated by the true meridian.

He would adopt 100 feet as the width of the streets; this, allowing plenty room for an immense traffic, is not too narrow for pedestrians to cross from one side to the other, and it gives a good view of the architectural features of the buildings abutting thereon. In residential portions I would discourage the construction of any lanes, as they more than make up the expense of scavengering; every description of lane is being continually thrown into them, which, if they exist, would be put into the rubbish bin. At the rear in the parts I would make lanes 20 feet wide, putting a limit on the title to prevent them being used as frontages. A minimum allotment must be fixed, as people, if given a chance, will build on anything that the house will stand on, and so of ventilation and everything else. The Victorian Act lays down 1,650 square feet as a minimum, but it appears to be too small—it works out to 16 feet by 100 feet. Now ventilation in a house built on a plot of 16 feet 6 inches cannot be otherwise than defective. A plot of 25 feet by 125 feet is quite as

small as should be permitted. This would allow for a single-fronted house and a cart entrance, the latter being a necessity owing to the absence of back lanes. With a minimum depth of 125 feet it will generally be possible to have the stable, if one is required, at a reasonable distance from the dwelling.

In his paper on "A Twentieth-Century City," Mr. J. F. Noble Anderson sketched a site like that of Athens or Edinburgh, which probably would be difficult to acquire in Australia:—

In the architecture (the term architecture is here used in its widest sense) of the city the two artistic essentials are the strong citadel, the presence of which gives that sense of rest and security which is so essential to the happiness and the health of the population, and the emporium which gives that sense of civic importance and self-respect which is essential to the proper health of the commercial spirit. In most of our nineteenth-century cities, more especially those in Australia, it is the second element alone which has been properly developed. To secure the first element it is almost essential that there should be in the precincts of the city some rocky or mountainous eminence. In these hills (of which, using the Hebrew simile, we may say, "from whence cometh our salvation") are naturally placed the cathedrals and temples of justice; the statues, monuments and record offices, and in the modern town, following the precedent of the later development of the Roman Empire, we may place also our public granaries, our service reservoirs for water supply, our fuel stores, and possibly stored electricity, liquid air and whatever else can be fitly stored, so as to regulate those fluctuations in the current prices which have always proved so detrimental to the interests of the public at large, and the monopoly of whose storage by the few has been the chief cause of the growth of a wealthy idle class in the community. At the foot of this citadel the emporium should lie, on as level land as can be obtained; here the streets should be broad and straight, broken up with numerous open spaces which would be utilised for the growth of flowers, and in the larger squares, where there would be fountains and patches of grass for the disporting of the old people and children. Outside this emporium, and within easy access of the citadel, would lie the larger recreation reserves of the public parks. The great bulk of the population would of course reside in the emporium, only the official class and those having business in or around the citadel being provided with quarters in that select and guarded ward. Whereas in the emporium a wide discrimination would be given to individual taste in the selection of sites and styles for building warehouses and dwelling-houses, official regard being had mainly to such questions as the avoidance of shutting up the poorer quarters in back slums, and the provision for ample daylight in all dwellings and the means of safety in all emergencies, in the citadel, on the other hand, the buildings would be erected by the State, and should be in accordance with one artistic and predetermined motif.

Mr. G. Sydney Jones in his paper insisted that the architecture should be essentially Australian, but subservient to such conditions as the following:—

It should, I think, be insisted on that, without necessarily producing a dull monotony, some uniformity of spirit of design should be compulsory. Nothing worries the eye more than in many of our modern cities to see maybe a Gothic front here, having perhaps on one side as a neighbour a Moorish design, and on the other a fantastic Renaissance front in cement. Each kills the intended effect of its next door neighbour, and the combined effect is remote from pleasant to the passer-by. To avoid this the haphazard planking down of slavishly copied styles should be prevented. Otherwise we shall have in our city a magnificent variety instead of the varied magnificence which should be our aim.

The heights of buildings within certain street lines should be limited. Who that knows New York or Chicago can admire the "sky-scrapers" (in themselves, no doubt, good) whose lines interfere with and largely dwarf buildings which are by no means insignificant; in the vicinity of these "sky-scrapers" the relative lines of nearly all buildings are spoilt. In our Federal city this should be impossible.

I should like to see it one of the building conditions of the city that the main cornices and main string-moulds of buildings in street blocks, while not necessarily being of the same profile, should be at the same level. The value of this, though perhaps seeming to some but a small thing, is really great. If one has in one's mind's eye the extraordinarily eruptive and zigzag effect, and in consequence the disconnected and restless effect which emphasise so many of our modern street fronts, the dignity of a street block is impossible under such circumstances. I would not advocate the dull uniformity of a Regent's Crescent, for instance, or that of the Rue de Rivoli in Paris, where long blocks are treated as in one design; but it is possible to obtain connected and distinct dignity, at the same time retaining individuality in each building by doing what I have

advocated. Instance as examples of what I mean, where good effect is gained even where two or three buildings only which are adjacent are treated in this manner, the National Liberal Club and Whitehall Court in London (Thames Embankment front), as to large buildings, and in a smaller but equally effective manner, Heath's shop in Oxford Street, London, and Duveen's next door to it—the features of each separate building are distinct, and at the same time they are connected, but not too prominently so, by the cornices and string-moulds being run through at the same level; a series of connecting lines is thus obtained which very much helps the effect of each and of the two combined.

I should like to see the side path arcade a compulsory feature in the streets, excepting in special instances. Who that knows Bologna, "the city of arcades," and its arcaded streetways, is not aware of the artistic value of such? In a hot climate like ours these are necessary from a utilitarian point of view. The Federal city should surely be free from such ugly effects as are produced by the ever-varying design and height of the iron-roofed, covered footpaths which offend the eye in all our State cities. I would make it a building condition that all arcades, though in each street they might be distinct and might vary, should be substantial and necessarily part and parcel of the design they front.

Another architect, Mr. Cyril Blacket, treated mainly of the building covenants to be adopted in the new city, and in their preparation he considered that architects, surveyors and engineers of Australian training and experience were best fitted to advise.

Among the "few suggestions" of Mr. G. C. Inskip, past-President of the Royal Victorian Institute of Architects, were the following:—

The site should be convenient as regards Melbourne and Sydney, in a healthy position, on high ground, with picturesque surroundings, and one that can be easily supplied with water and easily drained. If on the bank of a flowing river so much the better. Any attempt to remodel an existing town would be unsatisfactory. The width of all streets and the height of all buildings should be regulated. Perhaps straight streets would be best, but it would not be advisable to have all straight; graceful curves might be given to some. No buildings except public buildings should exceed say 80 or 85 feet in height. The public buildings should be grouped together and placed in a commanding position, and all should have large clear spaces in front of them, especially the railway stations. In these open spaces fountains should be placed in prominent positions, and drinking fountains for man and beast should also be placed in various parts of the city. Private houses should, as far as possible, be detached, with room to move round about them, letting in light and air. The housing of the working classes is a question not to be overlooked in the erection of the new city. The height of the buildings in each street should be regulated according to the width of the street. All very lofty buildings should stand by themselves, so that light and air would be obtained on all four sides, and so that proper means of escape in case of fire would be provided. By keeping the very lofty buildings separate and away from other buildings the appearance of the streets would not be destroyed as is the case in Melbourne. Tree-planting in the streets is of great importance in a climate like this, but the trees should not be planted too near the buildings, as they would shut out the light and air. In very wide streets the centre would perhaps be the better position for them. Open spaces should be provided in a systematic manner. The old fashioned mode of building squares with fenced-in gardens should not be followed, but all spaces should be left entirely open as is now being done in Victoria Parade, East Melbourne, laid down with grass and planted with shrubs and flowers. The public would soon become accustomed to this mode of laying out the ground and neither shrubs nor flowers would be destroyed. The city should also be surrounded with woods, parks and recreation grounds. Kiosks of ornamental design for the sale of newspapers, &c., should be erected in all the principal streets, and comfortable seats should be provided for weary pedestrians. Public conveniences and lavatories, easily accessible, but not thrust into prominence, should also be provided. Electric power should be supplied wherever possible, and coal should only be used where absolutely necessary. Factories should not be permitted within the city, but should be kept at a distance, and confined to one locality, so that the atmosphere of the city would not be polluted. All pipes for water, electric wires, &c., should be placed in subterranean passages, out of sight but easily accessible, and so prevent the roadways from being continually broken up as is now the case in most towns. Verandahs, lamp posts, &c., should all be erected under proper control. Advertising should not be permitted upon any public building or railways.

The paper by Mr. G. Higgins, C.E., on "Eyesores in Modern Cities," showed more recognition of actualities. Pack

buildings close together, he said, and you make land value rise, but through telephones, trams and good pavements the necessity for concentration is now much less than formerly. While advocating a more liberal spacing of buildings Higgins said that "to limit the height of any building, or to enact that its height shall be at least so much, would interfere with industry, seeing that the purposes for which buildings required determine their heights and shapes," and he is strongly of opinion that it would greatly impede advancement in the art of designing buildings to prescribe any fixed style of architecture whatever.

The director of the National Gallery, Mr. L. Bernard Fry, spoke about the "Beautifying of a City." He referred to local examples of the reverse process. Among his remarks were the following:—

In the beautifying of a city an artist's work only begins where the architect, and after him, the sculptor, leaves off. The beauty of a city depends upon the finest natural sites being chosen, and then—these having in the meantime been converted into architectural ones—decorated with sculpture. A painter's province lies in thereafter decorating the interior walls and spaces of such buildings.

According to the architectural origin of all decorative work, the principles which guide the artist are identical with those upon which the architect depends, modified only by the nature of the material used. Symmetry or balance, variety, unity, economy of means, colour, scale, repose, richness of detail, breadth and manly sentiment are all qualities common to architecture and painting. Incidentally it may be noticed that exactly the same qualities go to the formation of style, whether in literature, dress, manners or anything else. A sculptor should be half an architect in order to realise the decorative value of a sculptural site in relation to its surroundings. This is the virtue of decoration, that it is interdependent—that it must be regarded not as an entity (as a merely illustrative picture might be) but, as Ruskin puts it, "related, either in subordination or in command, to the effect of other pieces of art." The wants and necessities of the State must be clearly grasped before we play our parts as artists and beautifiers, and it is well that it is so. It is well that men's manifold requirements constrain us to diversity both in scale and material. It tends to freshen and vary and to humanise all art effort. It is the excuse for differentiation, and the original source of forms. Beauty applied to the thing of use in its simplest form, and beauty applied in its most magnificent measure is developed in identical lines, which differ only in degree of ornamentation and cost of material. From the artist's point of view it is necessary to point out that painting is a representative art, while architecture, like music and dancing, is a presentative art.

If one of the Australian Ministers of Finance were present at the Congress, it would be interesting to hear his remarks about the papers which he heard. All undoubtedly expressing generous sentiments, a desire for the convenience of future generations as well as for the living, and aspirations towards improvements which are not always of the material kind. If it were as easy to lay out symmetrical roads with open spaces at specified distances as to write papers about them, the Federal capital would present few difficulties. But is it certain that the people who are to come would be satisfied if they were constrained to adopt a plan which was fixed for them at the beginning of the twentieth century? Much of the interest belonging to cities is that they resemble organic beings in their growth. That signifies there are periodic changes, and what becomes obsolete is removed. Indeed, at the present time there is an excess of efforts to preserve what takes that form. Why should not a similar law be recognised in Australia? The country is too indebted to be able to provide for more than existing wants in the new capital. The old Parliament Houses of England were on a modest scale, and yet how many events of historic importance were transacted in them? When, through the fire on October 16, 1834, the old buildings became necessary, the sum assigned for the work was only 800,000*l.*, including land, embanking, &c. Australia has too many unfinished public buildings to be prodigal of its Federal capital.

Mr. John Brickwood, a well-known brewer, has offered to present a chapel to the Sanatorium at Midhurst, the foundation-stone of which was recently laid by the King. The chapel will, it is estimated, cost about 20,000*l.* Mr. Knollys has written, on behalf of the King, assuring Mr. Brickwood that His Majesty sincerely appreciates the proposal, and that it affords him much pleasure to take advantage of it.

COUNTY COUNCIL BUILDING SITES.

property committee of the London County Council reports that land on the northern side of Aldwych, between Catherine Street and Drury Lane, has been sold to the Duke of Bedford, and that the sum of £8,000 has been paid into the county fund. It will be remembered that at the auction held in October last certain building plots in the Strand, Kingsway and Aldwych were offered on lease, but no bids were made for them. In consequence of this result, the corporate property committee of the London County Council have been carefully considering the building conditions relating to the leasing of the Council's surplus land acquired in connection with various improvement schemes should be modified with a view to the disposal of the land more expeditiously. As the conditions at present there is no provision made for arbitration. The conditions provides that in the event of any dispute between the Council and the lessee in connection with the erection of buildings, such dispute is to be settled by the Council's architect, whose decision should be final. The committee now report that they are of opinion that, although there are bidders for the plots of land in connection with the Strand improvement at the last auction, the Council do not experience any difficulty in eventually disposing of plots under the existing conditions. They were, however, impressed with the desirability of securing a speedy recoupment in connection with the improvement, and they thought the Council would be well advised to make some concession so as to facilitate the letting of the surplus land. They accordingly commend:—"That the building conditions attached to the letting of the Council's surplus lands in connection with improvement or other schemes be modified, so as to include the following provision:—If, and so often as the same shall happen, any dispute shall arise after the plans and specifications have been approved between the Council and the lessee as to any matter connected with the erection of the said buildings, or the foundations or drainage thereof, or the preparation, laying out, fencing or otherwise dealing with the said land, which matter is not provided for by the said plans and specifications, or any additions to, alterations or omissions from, the same authorised as aforesaid, or the conditions or conditions of approval, every such dispute between the parties do not agree, be decided by an arbitrator named by the President of the Royal Institute of British Architects, whose decision shall be final."

Howell Williams said that the suggested amendment to the conditions would be of very little help to builders who were to build on the Council's land. There had been no reason for this land because of the onerous and irritating conditions attached to a whole. Somehow or other the eighty years' system had got in of recent years, and he would suggest that in order to get this land leased quickly they might offer it for a long lease, say ninety years, and let lessees understand that there would be no trouble about the extension of the term. It was to the credit of the Council that every inducement should be made in connection with this land, for while it was remaining unoccupied as at present they were adding no less than 3,000l. a week to the cost of the improvement.

Mr. White also said the conditions were onerous, and that it was a measure of relief offered by the recommendation was to be throwing dust in the eyes of those who were desiring to build on this land.

The recommendation, however, was adopted.

THE STANWAY VIADUCT DISASTER.

EVIDENCE was given by the contractor at the inquest on the bodies of the four men who were killed or succumbed in the viaduct accident on the Cheltenham and Great Western new railway, at Stanway, on November 13. Mr. J. T. Middleton, managing director of Messrs. W. & A. Scott, of Westminster and Newcastle-on-Tyne, and who gave the evidence to the *Birmingham Daily Post*, said he had been in charge of the construction of public works for upwards of twenty years. The contract for the construction of the new Great Western line from Honeybourne to Winchcombe was given by his firm, and this work had been in progress for about a year. Mr. C. T. Scott was the director immediately in charge of this work, and resided in the vicinity. He said that he had time to time visited the works with Mr. Scott, and that the works had been carried out in accordance with the plans and specifications of the engineer of the Great Western Railway Company, under the supervision of Mr. C. T. Scott, the company's resident engineer. There was not anything special about the works. They included the construction of a viaduct in the parish of Stanway, 2,100 yards in length, consisting of fifteen arches, the span of each arch being 16 feet, having a rise of 16 feet and a width of 27 feet, and being about 40 feet from the ground. On the morning of

the 13th, out of the fifteen arches Nos. 1 to 9 inclusive had been completed, and all the centreing removed from them. No. 10 was completed, and the centreing (or woodwork) was in course of removal. Arches Nos. 11 and 12 were completed, and the centreing still remained in, and about two-thirds of No. 13 was done; No. 14 was being built, about one-third being done, and the centreing in course of removal from No. 10 was being set for No. 15 arch. The arches were built of Staffordshire blue bricks of five rings, and the courses each 4½ inches thick, making altogether 1 foot 10½ inches in thickness. The bricks are banded together right through the whole thickness of the arch in three places, one on each side and one at the crown of the arch. The whole of the work was built with mortar composed of Warwickshire blue clay, lime, sand and furnace ashes, that being in accordance with the specification. As to the method adopted in building the viaduct, this was to turn the arches commencing at the north of the Honeybourne end, and for that purpose five sets of centres were provided, each set consisting of six ribs, these being covered with 3-inch planks. The centres were first fixed in openings Nos. 1 to 5 inclusive, and when these arches were completed the centres were taken out one set after another, and carried forward and fixed in the five spans ahead. A steam crane was used on the top of the viaduct for hoisting materials from the ground, and was stationed generally at the fourth pier behind where the forward arch was being completed. On the 13th inst. this crane was standing on No. 8 pier, No. 12 arch being then completed. The crane was carried on heavy timber, and was supported by trestles on each pier, and on the adjoining arches by four sleepers, two of which were placed on each side of the crown of the arch. Rails were then fixed to allow the crane to travel over a distance of 36 yards. The course adopted for removing the ribs of the arches throughout the viaduct had been that, after the lapse of a suitable period and the arch being completed, the timber roadway had been extended on to that arch and the crane travelled forward to such a position as to be able to reach the rib, which had previously been moved from its position under the arch to a point outside it. The rib was then lifted off its supports and brought to the ground by the crane. The crane had not become attached to the rib at the time the accident happened. After dealing with one rib in this way, the crane returned to its hoisting station, to proceed with its ordinary work, and was brought back again on to the arch, when the next rib was ready for removal. This operation had been successfully carried out during the construction of all the arches already built, the total number of times it was required to be done during the construction of the viaduct being sixty, and it had actually been carried out fifty-eight times, when the workmen were preparing for the fifty-ninth operation and the accident took place.

The weight of the crane was 13 tons, and the rib was about 1 ton 12 cwt. in addition. The proportion of the weight of the crane road resting on arch No. 10 was about 2 tons. The spandrel, and practically the whole of the backing (including brickwork and concrete), was in at the time of the accident. The collapse of No. 10 arch occurred at 8.15 A.M. on Friday, the 13th inst. Four of the ribs of this arch had already been taken away, leaving two to be removed. He understood from the foreman in charge of the work that he had called the crane up from its station, and that it had been on No. 10 arch a short time, when the whole thing collapsed and came down. When No. 10 arch fell the adjoining arches on the north side, having lost their support, speedily followed, No. 9 falling ten minutes afterwards, and No. 8 twenty minutes later. No. 7 did not fall until the following day, and by this time they had been able to support the remaining piers, and thus to prevent any further arches coming down. The completed arches—Nos. 11 and 12—on the south side of No. 10, having the centre still in, remained intact. The building of No. 10 arch was commenced on October 6, and it was finally completed on October 29. The plan described was the usual plan adopted for work of this kind. There was not anything unusual in the design of the arches, or any other part of the work.

Asked if he had been able to form any opinion as to the cause of the accident, Mr. Middleton said:—"I have formed an opinion, and it is that, owing to the extreme wet weather which prevailed during the building of the arch, the lime mortar did not set as quickly as might have been expected, and that it is possible that the working of the crane on the arch on the previous day, when there were three ribs taken out, might have caused the inside ring to slip down a bit. This would probably be followed by the second arch slightly slipping; this would so reduce the strength of the arch that when the crane came on again on Friday morning and began to work the vibration caused these internal rings to drop out. The remainder of the rings would not then be strong enough to bear the weight upon them, and the collapse of the arch was then inevitable. If this were so, the drop of ring after ring would be almost instantaneous, and not observable to the man in charge of the work. They would, in fact, fall like a pack of cards. I cannot account for the collapse in any other way. The arch could not have

come down bodily; it would have had to spread 2 feet to do so, and the only way to do that was to push the piers out of the perpendicular, but it could not have done that in the case of No. 10 arch, because the centreing was in the adjacent arch on the one side and a row of completed arches stood on the other side. The arches on either side, as a matter of fact, kept in position. We have had the piers examined since, and find them perfectly plumb, as they were built, showing that nothing had happened to them which could account for the collapse. I may mention that there has been a slight vertical settlement of these piers, which is accounted for by the saturated foundation, but the amount of the settlement, only about an inch, is not enough to account for the collapse of the arch.

The rule was to remove the rib when the adjoining arch had been keyed in. In carrying out this programme conditions of weather were taken into account. In this case the time that elapsed between the keying of the arch and the removal of the first rib was thirteen days, and two days elapsed between the removal of the first rib and the collapse. Previous centreings had been removed within ten days. Having regard to the weather that was a reasonable time. The fixing and removal of the centreing was done under the immediate supervision of Thomas Sharp, who had had great experience of this kind of work.

In reply to the jury witness said he did not think the accident would have happened if cement mortar had been used instead of lime mortar.

Mr. J. Dee Bank, sub-contractor for the labour of the brickwork, stated that the materials used were sound and of good quality, but he thought the wet must have got into the middle rings of No. 10 arch. Had the rings been set in cement the accident would not have occurred.

Mr. J. C. Blundell, resident engineer of the Great Western Company, deposed that the work was carried out according to the specification, and that he considered the mortar good.

Mr. Middleton, re-examined with reference to the quality of the lime mortar, said he took a sample on the day of the accident, and submitted it to Mr. Bertram Blount for analysis. He now produced the analyst's certificate, which stated that the figures arrived at were those proper for blue lias lime mortar. Witness also stated that he had had the arches gauged, and found that the joints were $\frac{1}{4}$ -inch thick and at the collar $\frac{3}{8}$ -inch. This disposed of a suggestion by one of the jury that, according to a piece of set mortar now produced, the thickness was never $\frac{1}{2}$ -inch.

The jury, after consultation in private, returned a verdict of "Accidental death" in all four cases.

Royal Hibernian Academy Winter Exhibition, 1903-4.

SIR,—A few weeks ago a single letter from me, commended sympathetically to the public by the Dublin press, has been operative, without solicitation or advertisement, to bring to the Royal Hibernian Academy such spontaneous contribution of works of the late Walter Osborne as would constitute in itself a charming and sufficing exhibition. It has been a revelation to his artist brethren to realise the widespread affection of so many persons solicitous for the memory of a deceased friend, as well as to find a large number of works produced in a too short life by an earnest and thorough artist. The paintings and sketches now being hung will exceed in number 250. They illustrate in most interesting sequence the artist's development from the sketches and etchings of Antwerp student days of 1872, to his latest powers in exhibited portraits such as those of the Rev. Canon Smith, Archdeacon Scott, and the Recorder of Dublin of last year.

The exhibition is intended, as promised, to embrace some representative works of the late Catterson Smith, P.R.H.A. A few old master portraits not timed for last year's exhibition, such as two interesting Raeburns kindly offered by Mr. Jameson of Portmarnock, will find a place.

Within the last few weeks have come, from some interested in the revival of miniature painting, suggestions that a show of even a few old master miniatures would be appreciated, and could not hurt the other exhibited works. That is true, and there would seem to be no difficulty about it if even some few of the many private families who hold really fine Irish miniatures painted between 1750 and 1830 would be as generously helpful as other contributors. The Academy knows from its traditions and old catalogues of exhibitions how popular was this beautiful art during a past period, how miniature painters flourished, and how miniatures of the highest merit abound and survive in Irish households unappreciated.

I should be very happy to receive such at 22 Clare Street (used as a collecting office by the Academy for the convenience

and reference of those to whom resort to remote. Lower Abbey Street has been found a trouble). I might add that the Committee of the Academy should have concession, in the case of miniatures, to exercise an expert discretion in selection of those which may be offered for exhibition, and to show a preference for those of which the artist and subject are known, or which indicate intrinsically the high qualities of, as for example, the Irish miniaturists as Comerford, Hone, Robertson, Chinnery, Lover, &c., or of such English artists as Cosway and his followers, specimens of whose work are known to be up and down Ireland.—Yours truly,
THOMAS DREW, P.R.H.A.
Dublin: November 26.

GENERAL.

The Distribution of Prizes to the students of the Royal Academy will take place on Thursday next. The gallery containing the competition works submitted for the prizes will be open to the public on the 11th and 12th inst.

The French Chamber of Deputies on Saturday rejected the motion to remove the cross on the top of the Pantheon by 322 votes against 203.

M. Sortini, the Italian sculptor, who resides in Paris, has been awarded the grand prix and gold medal at the International Art Exhibition at Rome, to which he sent two marble statues and four bronzes.

The Basement of the Petit Palais in Paris was flooded on Sunday owing to the heavy fall of rain. M. Bouvard, architect in charge, had the water pumped out and has repaired the fissures in the foundations.

The Remains of a large Roman bridge have been found at Aschaffenburg. They consist principally of the foundations of piers as well as of piling. Some of the latter are shod with iron. It is supposed the bridge was carried on nine piers.

The French Minister of Agriculture has obtained authority to use three-quarters of the Galerie des Machines for agricultural exhibitions. The remaining portion has been let as an arena for sport. The demolition of the galleries is therefore postponed.

The City and Guilds of London Institute will hold their annual meeting at the Mansion House on January 25. William White, F.R.S., president of the Institution of Civil Engineers and formerly director of Naval Construction, will deliver the address.

An Exhibition of French art of the eighteenth century will be opened in Brussels on January 15. The French Government will lend several remarkable examples of Gobelin tapestry, as well as other varieties of work.

Mr Seale-Hayne has bequeathed about 150,000*l.* for the establishment of a college of science, art and agriculture in the neighbourhood of Newton Abbot, for Devonshire.

An Interior Perspective View of Burgos Cathedral by Mr. A. H. Haig, was sold on Tuesday at Christie's for thirty-guineas.

A New Chain Cable Store and Testing-House is to be erected in Portsmouth Dockyard at a cost of 7,800*l.* The requirements of the Fleet render the present establishment inadequate.

The Stained-Glass Window erected to the memory of Mr. John Hungerford Pollen in St. Mary of the Angels, Bathwater, has been reproduced from those designed by him in 1876 for the Marquis of Ripon's chapel at Studley Royal.

M. Gorguet has been awarded the first prize of 1,000 francs in the competition for the 1904 programme cover of the Paris Opera House.

The Berlin Town Council propose to expend 500,000*l.* year for eight years on wall-paintings, showing scenes from German history, for the elementary schools.

At a Council Meeting of the International Society of Sculptors, Painters and Gravers, held on December 2, Monsieur A. Rodin, the distinguished French sculptor, was elected president, in succession to the late Mr. James McNeill Whistler.

Baths are to be erected on the St. George's Dock side from plans by Mr. A. Saxon Snell, at a cost of about 75,000*l.*

Mr. F. Matcham has been commissioned to prepare plans for another Empire Theatre in Glasgow, which will accommodate about 4,000 people.

The First Prize in the competition for the Carnegie Library at Rawtenstall was awarded to Messrs. Croucher, Butler & Savage, of Birmingham. The second was divided between Mr. A. T. Butler and Messrs. Stones, and the third between Mr. E. J. Williams and Mr. A. E. Dixon.

The Society of Oil-Painters, Piccadilly, have elected the following members:—Mr. Charles Sims, Mr. H. Van der Weydon, Mr. E. Reginald Frampton, Mr. A. D. McCormick, Mr. Philip E. Stretton and Miss Dorothea Leandau.

EDITORIAL NOTICES.

One of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Our Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

A great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

IRE.—Dec. 10.—The Clare Rural District Council invite applications from a competent water engineer to advise them as to a scheme of water supply for the town of Clavering, population, 1,582. Mr. J. Bigmore, clerk, 24 Queen's Road, Clavering, Suffolk.

BIRMINGHAM.—Feb. 1.—The Urban District Council general committee invite designs for new council house and sanitary buildings, to be erected at the junction of Mason's Lane and Banbury Roads, Erdington. Premiums of 50%, 30% and 10% will be awarded for the designs placed first, second and third respectively. Mr. Herbert H. Humphries, district architect and surveyor, Public Hall, Erdington, Birmingham.

LONDON.—Dec. 16.—The Lambeth Borough Council are erecting a public library, with residence for librarian, in the Hill ward of the borough. Architects residing in the borough of Lambeth are invited to send in designs for a public library, with residence for librarian, in the Hill ward of the borough to Mr. H. J. Smith, town clerk, Lambeth Town Hall, Kennington Green, by 12 noon on Dec. 16. General information as to the extent and the accommodation required in the proposed library can be obtained on application to the town clerk.

GLoucester.—Dec. 7.—The Elgin Landward School Board invite competitive plans and estimates for the erection of a school building at New Elgin capable of accommodating 100 pupils. Mr. Hugh Stewart, clerk to the Board, New Elgin.

TRADE NOTES.

THE Governor and Company of the Bank of England have, we are pleased to learn, adopted Uralite for ceilings and Uralite fire-resisting doors.

THE additions to the Wilts County Asylum, Devizes, are being warmed and ventilated by means of Shorland's patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. A. W. PENROSE, electrical engineers, of 109 Farringdon Road, E.C., have secured the entire order for generating-plant, including engine, dynamos, &c., and also that for the two passenger and one goods lift for the new building of Messrs. Harvey, Greenacre & Co., Johannesburg.

THE new baths at Litchurch in the borough of Derby are now approaching completion, and a large turret clock has been erected on the front by John Smith & Sons, Midland Clock Works, Derby. The same firm have recently erected a large chiming clock in the parish church tower at Irby-on-Humber, near Grimsby, both clocks being to the designs of Lord Grimthorpe.

MESSRS. WM. POTTS & SON, clock manufacturers, Leeds and Newcastle-on-Tyne, have received instructions to make and fix a large illuminated clock with four illuminated dials at the Emmerson Buildings, Newcastle-on-Tyne, and a large chiming clock for the West Indies; both of the above will have Lord Grimthorpe's latest improvements inserted.

THE value of expanded steel in fireproof construction is well known to our readers, but architects and others will no doubt be able to derive some useful and suggestive ideas from a perusal of the handsome volume entitled "Expanded Steel in Armoured Concrete and Plaster Construction," which is being issued by the New Expanded Metal Company, Ltd., of York Mansion, York Street, Westminster. This book, which appropriately enough opens with a brief history of concrete construction as employed by the Romans, contains a large amount of valuable information on concrete construction generally and the important part played in it in modern times by "expanded metal," as well as a number of reports of tests of various descriptions, including those of the British Fire Prevention Committee, &c., and is copiously illustrated by diagrams, views of buildings and works in course of construction and finished, in which expanded metal has been successfully employed.

BUILDING AND BUILDERS.

AT the last meeting of the Folkestone Chamber of Commerce Mr. W. White presented elaborate plans for the proposed winter gardens on the sea-front, at an estimated cost of 30,000*l*. The whole scheme is to be brought before the Town Council at an early date. It is estimated that the main hall will accommodate 3,000 people.

SIR RALPH LITTLER presided at a meeting held at the Middlesex Guildhall, Westminster, specially convened to consider the question of the establishment of an open-air sanatorium for incipient consumptive patients in Middlesex. Sir William Broadbent, in supporting the proposal, said that London was the worst provided of any large town in the kingdom with sanatoria. A sanatorium for Middlesex would be a great advantage, but to share it with London would be of no use, as London's demands were overwhelming. On the motion of the Bishop of Kensington it was decided to establish a sanatorium for Middlesex, and a committee appointed to procure the necessary funds. Lord Rothschild and Mr. Leopold de Rothschild have given 200 guineas to the fund.

THE Royal Waterloo Hospital for Children and Women, Waterloo Bridge Road, S.E., is now being rebuilt in three sections, the first of which is rapidly approaching completion. If the necessary funds are forthcoming this portion will probably be in full working order by next May. Owing to the very rough weather the Board have not been able for some weeks to utilise their illuminated captive balloon. They trust, however, that during bad weather the new building itself, which now towers over the surrounding houses and is visible from the Strand and Thames Embankment, will probably draw attention to the noble and urgently necessary duty of helping the poor sick children of this densely-populated and poverty-stricken district. When the roof, which is now being put on, is completed, the balloon will reappear, weather permitting.

A MEETING of the Metropolitan Asylums Board was held on the 28th ult, Sir Robert Hensley presiding. With respect to the proposed establishment of sanatoria for persons suffering from consumption, a proposal arising out of a conference of metropolitan Poor-law authorities in October 1900, the various borough councils and certain boards of guardians of the Metropolis having expressed opinions on the proposal, the general purposes committee had given the question consideration. They were of opinion that the matter was of such vital importance to the community at large, and a proposal which,

acted by the Managers, would entail so considerable an extension of their duties and responsibilities and so large an increase in their expenditure, as to call for some authoritative opinion of opinion from the Local Government Board before the Managers were asked to take any definite action in the matter, or to make any further inquiries in regard thereto. Mr. C. Scovell said it was a large and difficult question, and he would lay all information on the subject before the public. However, this matter was to be undertaken at the expense of the ratepayers, the Asylums Board was the only authority to whom to do it. Among other difficulties, one would arise from the preference to pauper and non-pauper tuberculosis persons. An amendment was moved that the question be referred to a sub-committee of the Board. The amendment was lost, on voting for and thirty-seven against it, and the motion was adopted.

A special meeting of the Perth Town Council held in committee the question of the fever accommodation for the town was considered. The report of the sub-committee, who were appointed to make inquiries regarding the erection of a hospital, was read. Ex-Bailie Grieve moved the approval of the report, and that the local authority erect a hospital of brick or rough-cast or stone for infectious diseases at the Friarton Farm, on the site approved of by the Local Government Board, having accommodation for 50 beds and the usual arrangements for the proper administration of the hospital, and it be referred to the cleansing and sanitary committee to prepare a set of general instructions and conditions to be observed by architects in preparing competitive plans, and report to the authority. The Convener, in a lengthy speech, pointed out the necessity for the erection of such a hospital. Bailie Grieve suggested that they should consider whether they should erect a hospital or not, and leave the latter part of the question alone, and this the mover agreed to. After some discussion, it was agreed by a large majority to erect a permanent hospital. The question of the site was next considered, and the Convener of the cleansing and sanitary committee moved that the Friarton site be adopted, and this was seconded. An amendment was moved to the effect that certain sites in the town district should be considered, but after an animated discussion the Friarton site was adopted by a large majority. A question arose as to whether the hospital should be built of brick and iron or brick, rough-cast or stone, and on a vote it was agreed by a large majority that it be the latter.

It is understood that the cost of erecting a hospital for 50 beds will be at the utmost 15,000/.

THE foundation-stone has been laid of the new mixed school for St Saviour's parish, which is being erected by the Norwich Church Schools' Aid Association. The site of the buildings is at the junction of St Paul's Opening and St. Paul's Avenue, Norwich, the latter being a continuation of St. Saviour's Lane. The plans for the buildings have been prepared by Mr. A. J. Lacey, diocesan surveyor, and a light, well-ventilated and up-to-date school will be erected. The work is being carried out by Mr John Hurn, Surrey Street, and it is expected that with the internal fittings the total cost will be about 2,000/.

The main elevation of the building faces the existing infants' schools towards the south and has a frontage of 75 feet. The school will consist of one main room with accommodation for 104 children and two classrooms, each to accommodate 48; while at the north-west corner there is a vacant site for another classroom when necessary. One of the classrooms will be divided from the main room by Wilks's patent sliding partition. The boys and girls will each have a well drained and gravelled playground. Round that portion of the building that faces the playground a plinth of blue Staffordshire bricks will be erected, with glazed bricks round the other portion. The school itself will be built of red kiln bricks and blue lias stone. The pitched roof will be secured with iron tie rods, and the roof will be covered with permanent green slates. The fireplaces will have glazed and tiled chimney-pieces and hearths, and the walls will have a pitch-pine dado 4 feet high. The floors will consist of solid coke-breeze concrete covered with boards, and inlet and outlet ventilators will be provided. A dwarf wall will be built in front of the school surmounted by an iron palisading, and the playgrounds will be enclosed by a brick wall about 7 feet high.

ELECTRIC NOTES.

THE ancient flour mills at Greenham, Newbury, well known to fishermen on the river Kennet, and those at Whitchurch and Pangbourne, equally familiar to Thames anglers, have ceased to be used for the purposes for which they were erected, and both have been purchased by electric-lighting companies, who need water-power to carry out their undertakings.

**"INDIAN" QUALITY**

FOR INSIDE USE. FOR OUTSIDE USE.

~~~~~

The attention of ARCHITECTS, BUILDERS, DECORATORS, &c., is directed to the following points in the use of these special Enamels:—

BRILLIANT GLOSS AND HARD SURFACE.
EASY FLOW AND MANIPULATION UNDER THE BRUSH.
ENORMOUS COVERING PROPERTIES.

AND SATISFACTORILY BY MOST OF THE LEADING DECORATING FIRMS IN THE KINGDOM.

Made in any Tint or Colour required, or may be Tinted with Tube Colour Stainers.

MANUFACTURED BY

PINALL'S ENAMEL, Ltd. New Cross, London, S.E.

LINCOLN and district were suddenly plunged into darkness shortly after five o'clock P.M. on the 26th ult. The scene in the streets was extraordinary, large shopping establishments being temporarily illuminated by candles only. Of course all the street arc lamps failed. It has been discovered that the failure of the electric current is due to a short circuit in the main, an accident which has resulted in serious damage to one of the large dynamos.

A PAPER on "Electric Power Stations" was read on the 26th ult before the Glasgow University Engineering Society by Mr. P. D. Ionides, the more recent developments of this important subject being ably dealt with. Interesting contrasts were made between the Glasgow stations, which are the highest of their class, and turbine stations such as are now being erected in London, and it was shown that the latter could be completed at a capital outlay of about half that required for the slow-speed engine system. An interesting discussion followed, in which Messrs. Chamen, Pocock & Blackley took part, and it was agreed that turbines represented the best modern practice.

It has been decided to take advantage of the opportunity afforded by the St. Louis Exhibition to show to America what the electrical instrument makers of Great Britain can accomplish in the latest and most delicate applications of modern science. A collective exhibit of great variety will be formed, under the guidance of the Royal Commission, and sent in its complete form, in one consignment, to St. Louis. The best possible position in the electrical section of the Exhibition has been secured. Among the exhibits is a platinum resistance thermometer, from the Cambridge Scientific Instrument Company, capable of measuring temperatures, from that of liquid air to 1,400 degrees Centigrade.

THE recent important improvements in the construction of electrically driven pumps has brought them to the front in connection with fire-extinguishing installations, the ease with which they may be started and the small amount of attention required being great points in their favour. The Midland Railway Company has recently ordered from Messrs. Merryweather & Sons two sets of their electric "Hatfield" pumps, each of a capacity of 700 gallons per minute. These are to be fixed at their new depôt at Heysham harbour in connection with a complete system of fire-mains and hydrants, and the whole will form a very efficient and up-to-date installation.

A GREAT BUILDING AMALGAMATION.

THE announcement of the formation of a limited liability company, with the title of "George Trollope & Sons and Colls & Sons, Ltd.," has excited unusual interest. The standing of each firm is known not only throughout the Metropolis but elsewhere. It would be superfluous to recall their claims to confidence. The reasons given for the amalgamation are the recent deaths of partners and the wish of the survivors, who are all thoroughly practical men, to secure the benefit of each other's assistance in the management of the businesses. As the whole of the ordinary share capital of 250,000l., with the exception of 3,000l. taken by directors for qualification, has been taken by the vendors in part payment of the purchase money, all that can be offered to the public (and more especially to customers) are 20,000 cumulative preference shares of 10l. each, to bear 5½ per cent. dividend. There can be no doubt the whole capital will be at once subscribed for. The success of the two firms in the past is the best guarantee of the future, for both firms have a reputation for excellence to which the majority of architects in the Metropolis would willingly testify.

VARIETIES.

THE Academy of Music, the largest theatre in Brooklyn, has been destroyed by fire.

A NEW school has been opened by the New Monkland School Board at Gain, near Glengoig, N.B. It affords accommodation for 120 pupils, and has been built to a design by Mr. John M. Arthur, architect, Airdrie, on a site immediately adjoining the old school, which it is proposed to take down.

IT is intended to remove the Catholic church now adjoining Prudhoe Hall, Northumberland, and to rebuild it at Prudhoe-on-Tyne. The church is a handsome building of stone throughout, interior and exterior, complete with sacristies, tower, gallery, baptistery, chapels and donor's vault, &c. The direction of this work is in the hands of Mr. Charles Walker, architect, Newcastle-on-Tyne.

THE Society of Architects has removed from St. James's Hall, Piccadilly, W., to its new premises in Staple Inn Buildings (South), Holborn, London, W.C. The second ordinary general meeting for the Session 1903-4 will be held in the new premises on Thursday, December 17, at 8 P.M.

THE Manchester Society of Architects will hold its sessional papers meeting in the board-room of the Chamber of Commerce, No 44 Mosley Street, Manchester, on Thursday next, December 10, at 6.45 P.M., when Mr Ellis Esland will read his paper, entitled "The Statutory Registration of Architects."

THE Vienna *Vaterland* publishes an interview with the Emperor, who said:—"They say I am turned into a Grand Seigneur because by my order two apartments were prepared for me. Now it is true that Leo XIII was content to live for forty-five years in one small room, in which he slept, dined and worked, but I cannot understand how he was able to do it in such an airy, roomy apartment. But, above all, I must breathe fresh air."

AT a meeting of the Lambeth Borough Council the finance committee submitted an interesting report from the town clerk respecting the new town hall site, in course of which Mr. Smith remarked that the vendors may be in a position to offer vacant possession shortly after Christmas next, and it is therefore necessary for the Council to consider at once the question of purchasing the purchase money payable to the vendors. The site is at the corner of Brixton Hill and Acre Lane.

MESSRS. NEWNES ask us to explain to our readers the delay in the issue of the first part of their technological directory. Owing to the numerous references and verifications which had to be made the publishers are compelled to delay the publication of the first number until January. Readers of our advertising columns will have seen their advertisement, but for the benefit of those who have not done so, Messrs. Newnes will send a complete prospectus on application.

AN open competitive examination for not fewer than twenty-five situations as assistant examiner in the Patent Office will be held by the Civil Service Commissioners in January next. The examination will commence on the 5th of the month, and the date of application for admission to it will probably be ready in the course of a few days; they will be obtainable on request addressed by letter to the Secretary, Civil Service Commission, Burlington Gardens, London, W.

AT Ettington, near Stratford-on-Avon, on Tuesday, Bishop of Worcester consecrated the new parish church erected chiefly through the munificence of the Shirley family. The material is the buff-coloured oolite stone so familiar at Broadway, and the windows are modelled upon those in the old church at Ettington. The passages in the nave are of marble

mosaic, laid by Italian workmen, and in the chancel the floor is laid with black and white marble, the special gift of Miss Shirley. Stalls for the clergy and choir have been given by Mr. Shirley, and the font and pulpit are those which stood in the old church.

WE note that Messrs Robt. W. Mann & Son are holding an important auction sale at the London Mart on the 10th inst., when the following properties will be submitted:—No. 42 Eaton Place, S.W., a town residence with excellent accommodation which has been occupied for many years past by the late Lord Colville of Culross, who was Chief Equerry to Her late Majesty and Master of the Buckhounds, as well as Lord Chamberlain to Queen Alexandra's household for 1901; also No. 17 Draycott Place, Cadogan Gardens, S.W., a modern long leasehold red-brick residence of medium size, having six bedrooms and four reception-rooms, held direct from the freeholder at a moderate ground rent. The same firm will also offer four charming double-fronted detached villa residences at Ealing within a few minutes walk of the Great Western Railway and the London United Tramway Company's service of electric trams, held on long leases with option to purchase the freeholds; and an investment at St. John's Wood, in a capital position near Marlborough Road station, of 57½. 10s. a year net, let to and occupied by a good tenant.

PROPOSED WELSH SCHOOL OF FORESTRY.

A CONFERENCE of Welsh county councils representatives on the question of establishing a school of forestry for Wales and Monmouthshire was held at Haverfordwest last week. The movement, which was inaugurated by Mr. Edward Robinson, of Boncath, had secured the support of the county councils of Pembrokeshire, Glamorgan, Monmouthshire, Camarthenshire, Cardiganshire, Breconshire and Merionethshire. Sir Charles Philipps presided over the meeting. Mr. Robinson explained that the object was the planting of waste and at present unproductive woodlands in Wales. A school could be established with 100 to 200 acres of land to start with, and the option of acquiring a further 500 or 800 acres, and the total capital outlay at the outset ought not to exceed 5,000£ to 8,000£, which could be contributed by the councils according to their rateable values. It devolved upon the councils to take the matter up,

for the Government had not yet acted on the recommendations of three committees on the subject. He believed the Government would contribute about half the amount required, and he assumed that an annual grant of 100*l* or less from each of the councils would be sufficient to cover all out-of-pocket expenses and give a good return on capital. There were about a million acres of waste land in the Principality which could grow timber. Of the owners half might require assistance and the planting would cost not more than 6*l* an acre. Spread over thirty years that would require a yearly grant of 100,000*l* from the Government, the money to be repaid in that period by half-yearly instalments, and by the end of that time they should have plantations worth from 30,000,000*l*. to 40,000,000*l*. In the whole country there were 21,000,000 acres of waste land and quite 8,000,000 suitable for planting, which in fifty years would be worth fully 650,000,000*l*. sterling. At present we depended on foreign countries for our timber, whilst at least 8,000,000*l*. per annum might be saved if our waste lands were properly afforested. It was proposed to teach forestry on a very limited scale at Aberystwith College, but what was wanted was a bold and comprehensive scheme. He moved that it was desirable to establish a school of forestry for the whole of South Wales and Monmouthshire. Mr. David Jones (Monmouth County Council) seconded. The Chairman pointed out that under the Settled Lands Act money might be borrowed at 4*l*. 16*s*. 11*d*. per annum (principal and interest), spread over forty years, for the improvement of land, subject to the control of the Board of Agriculture, and the planting of trees was included in the definition. The resolution was unanimously carried, and it was decided to hold a further conference at Swansea.

HOBBS, HART & CO., LTD.

ALTHOUGH over half a century has elapsed since the first great triumph of Messrs. Hobbs, Hart & Co., Ltd., caused excitement, no efforts have been spared by the company to add improvement to improvement in their numerous specialties. Their latest catalogue of locks, casement bolts, cash, deed and jewel boxes, lock furniture and other aids to security is enough to suggest the causes of the vast and merited success of the firm. There must have been careful deliberation of experts before selecting the manufactures of Messrs. Hobbs, Hart & Co. for the rooms containing the gold and silver plate, as well as the whole of the locks under mastership at Windsor Castle, at St George's Chapel, and the treasure and plate depositories at Marlborough House. In the Bank of England, the Treasury doors and the reserved bullion safes and special suites for different departments and main building are also the work of the company. The variety that is shown in the catalogue is amazing, for in it are represented locks for all requirements. The schedule of patents, which it should be noted is only a selection, contains no less than twenty-six separate "improvements," and each is important. There are locks made *en suite* for hotels, mansions and public buildings, locks for hospitals, infirmaries and asylums, and numerous classes of locks for doors and gates. The "Victoria" casement bolts illustrated are all of excellent design. The combination bolts and lock which are adapted for external doors are produced to "insure certainty of bolting by a turn of the bolt handle on the axis. The bolts are then thrown up, down and horizontally into the door frame, when they may be securely locked in position with the key." Even if burglars contrive to conceal themselves on premises where the bolts are used, they cannot open the doors. There are also automatic panic bolts, which are found to be efficacious. The New Century rim night latches are both strong and simple. There are many infallible locks for the use of bankers. A special class of locks is also manufactured for police-stations, Government prisons, &c. Smaller in size, but no less serviceable, are the locks for tills and drawers, cupboards, boxes, desks, portmanteaus, books, letter-bags. In connection with the locks we would draw particular attention to the character of the "furniture." Knobs and plates are adapted to different styles of rooms, and are all pleasing in form. It is satisfactory to have so comprehensive a collection of aids to security and safety on which reliance can be placed available for general use. The examples

also genuine English manufacture, for the photographs produced of the several departments in the works atington Street reveal not only how numerous are the trained assistants employed, but how intricate is the machinery which is needed in order to obtain results that will be ingenious and efficient examples of mechanism, no matter how small may be the scale of the lock, while also enduring in quality and without the least cumbrousness.

INSTITUTE OF BUILDERS.

CHARLES HEATHCOTE delivered a lecture to the members of the Institute of Builders, at the rooms of the Society of Arts, on Tuesday evening, in which he stated that Americans are not better, but not necessarily more skilled than we are, in the construction of buildings. They had the pull over us because their employés were more keen upon their work. The whole attitude of the working-man was in the master's favour, because he knew that the better he worked the better it would be for him, whereas here we had trades unions with aims which seemed to compel the members to do just as little as would pass muster. The system for the education of the young of America was designed to be of advantage in a business life. Thus, in early manhood a youth was trained for his career, which he entered without the suspicion that he was deceiving himself. Hopeful enterprise was the spirit with which he began, he believed in his work, and he was proud to do it. Yet in spite of these advantages England was maintaining her reputation for quality. Being struck with the excellence of the plumbing work of an hotel in New York, the speaker made inquiries, and found that the whole of the work had been done by a London firm. Speaking generally, the Americans had methods ahead of us, but in many ways they had as much to learn from us as we had to learn from them. Our cousins, who were employers of labour, were more considerate in regard to the health and comfort of the workmen, many works each man being provided with a locker for his clothes.

In the discussion which followed, Mr. Holloway described the American system of building as showy, temporary and without genuineness. Skyscrapers were mere architectural monstrosities.

Other speakers followed and the meeting concluded.

A NEW FIREPLACE LINTEL.

A NEW lintel which is being introduced by Mr. Louis J. Newton, of 21 Ellers Road, Leeds, is worthy of the attention of architects. It has several points to recommend it, among which may be enumerated:—Its cheapness (its cost varies with

its size, from 3s. 6d. to 8s.); that it meets the requirements of the London Building Act and the Local Government Model by-laws; that it reduces the risk of smoky chimneys and draught; and that it obviates all risk of settlement, and can be fixed by any ordinary labourer, as no cutting of brickwork is required.

BIRMINGHAM HOUSING SCHEME.

ON Saturday the Lord Mayor of Birmingham inaugurated an important block of buildings erected for the accommodation of the working classes. Something more than a year ago a number of prominent citizens, who believe that the housing problem can be solved by private enterprise, promoted a company under the title of "Homes, Limited," for the purpose of providing clean, sanitary and cheap dwellings for the poor. In their prospectus they pledged themselves to build flats suitable for those earning small wages, and to take steps to insure their

being occupied by tenants of that class. If they succeed in this respect they will have overcome the great objection to housing schemes—that they displace the poorest of the poor and provide for a class of comparatively well-to-do artisans who are not in need of help. The bonâ-fides of the attempt to benefit the submerged tenth was guaranteed by securing as directors Councillors G. H. Kenrick and F. G. Whittall, Messrs. W. B. Kenrick and A. Wilson, and by limiting the dividend, if any, to 5 per cent. The capital was fixed at 25,000*l.*, of which 15,000*l.* was issued for public subscription. After some searching a suitable site was secured in the heart of the poverty-stricken district of Deritend. A piece of land abutting on Palmer Street, Little Edward Street and Little Barr Street was cleared by the demolition of a dilapidated chapel. Plans were prepared by Messrs. Hipkiss & Stephens, and two blocks of flats, four storeys high, have been erected by Messrs. T. Elvins & Sons, of Handsworth. The buildings are divided into sixty tenements, twenty-eight of which consist of one room each, to be let at 3*s.* per week; sixteen of two rooms each, at 4*s.* 3*d.*; and sixteen of three rooms each, at 5*s.* The flats are built on a plan which combines convenience and economy in an unprecedented degree. The materials have been carefully chosen with a view to making the walls and floors proof against fire and vermin, and to prevent the accumulation of dirt and the penetration of sound. The system of refuse disposal is a great improvement on the ordinary type of ash-shoots, and there is a private lavatory attached to each tenement. On every floor is a washhouse containing two boilers. There is a ventilated cupboard for food, and water is laid on to a sink in each tenement. The ends of the corridors are open to the air, and through these big openings coal and bulky furniture can be hauled by means of pulleys fixed in a convenient position. Fire-escapes can be attached to each tenant's balcony in case of panic. Gaslight is provided in the corridors and staircases; whether gas or oil is used in the rooms is left to the discretion of the tenants.

BRITISH URALITE COMPANY, LTD.

ON Tuesday, November 24, a fire test of Uralite was carried out in Edinburgh by the British Uralite Company, Ltd., on ground granted for the occasion by their Scotch agents, Messrs. Currie & Co., Ltd., of Edinburgh.

The test consisted of an ordinary partition, protected Uralite, against which a fire was made and raised to a temperature of 1,950 degs. Fahrenheit. The other side of the partition on which a thermometer was placed, only reached a temperature of 47 degs. Fahrenheit. In the middle of the fire-wooden box protected by Uralite was placed; inside the box were deposited a quantity of papers and crucibles containing sulphur, wax and fusible metal. A small platform was erected of wood, and half of it was covered by Uralite, the other half being left bare. The unprotected portion was completely consumed in twenty minutes, whilst that portion having Uralite covering remained intact. After the fire was over the box was opened, and the inside was found to be quite cool to the hand, and the wax had not even melted. The demonstration was witnessed by the firemaster of Edinburgh, and representatives were present from the leading architects' office, insurance companies, builders and contractors.

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening November 30, Mr. J. Patten Barber, president, in the chair, a paper was read on "Mechanical Stokers for Electric Generating Stations," by Mr. Albert Gay, M.I.E.E., and which the following is an abstract:—

After referring to the general desire and the various attempts to bring about the more economical utilisation of energy in general and of electrical energy in particular, the author proceeded to show that in order to obtain the best results from coal perfect combustion was essential. He pointed out, however, that though that result might be possible in the laboratory under ideal conditions, the means of obtaining it in everyday practice had yet to be discovered. He observed that good work, however, had been done, and he proceeded to describe the necessary requirements of an ideal mechanical stoker. He then described various appliances of the kind, the aim of the makers of which was to approach the ideal as near as possible. He divided the different kinds of mechanical stokers into two main types, viz. top-feed and under-feed, the former being divided again under the subdivisions of sprinkler and cokers. As their names imply, the fuel in the former is fed above the bars. In the case of the sprinklers, small

quantities of fuel at a time are sprinkled into the furnace, and in the case of the cokers the fuel is dropped just inside the face door on the dead plate, and allowed to coke before being pushed forward into the furnace. The under-feed type is loaded with fuel below the bars, the fuel being forced up through the fire.

Tables of tests of hand firing and mechanical firing were given, some having been conducted by the author and others by makers of the appliances, and there was seen to be a general agreement between them. The tables indicate that in coal having a calorific value of 12,000 to 13,000 B.Th.U. lb., fired mechanically, the result is nearly equal to coal fired by hand, having a calorific value of 14,000 to 14,500 B.Th.U., that by using a lower-grade coal than could be economically fired by hand, a saving of from 6s. to 7s per ton might be effected. The author left for discussion the problem of the use of high-grade and low-grade coal where railway carriage (as in London) forms a large part of the actual cost delivered.

The advantages claimed by makers and the disadvantages claimed by some users were also dealt with, and the opinions of central-station engineers of experience were quoted. Diversity of opinion characterised these opinions, and while the author generally indicated his appreciation of the improved economy of mechanical over hand-firing, he apparently is not generally satisfied with the reliability and cost of up-keep.

FIREPROOF CONSTRUCTION.*

It would seem to indicate almost mental aberration to seriously question to-day the efficiency of the better types of fireproof construction. No better proof can be wished for of the fact that fireproof construction really does reduce the fire loss than is afforded by the favourable premium rates granted by fire insurance underwriters on superior types of construction.

More thrifty men than these same fire insurance underwriters may not be found, and when they approve any adjunct to their business to the extent of even a temporary subtraction from the profit column of their ledgers, it may be asserted with

* From a paper by Hon. Perez M. Stewart, late superintendent of the Department of Buildings, borough of Manhattan, New York city, read at the annual convention of the International Association of Fire Engineers.

the greatest confidence that such approval is based on an exceedingly firm foundation.

Without more ado, therefore, I shall assume the efficiency of fireproof construction as demonstrated, and pass to a consideration of some of its phases as they are presented to an official of a building department.

Fire protection is a term broad and elastic. Roughly speaking, like "All Gaul," it may be divided into three parts. First, the protection from without afforded by the municipality; second, the ability of the building itself, in consequence of its structural excellence, to withstand the effects of fire, either from within or from without; and, third, the multitude of fire-detecting and fire-fighting devices installed in, but not integrally a part of, the building itself.

Concerning the first division, it would be presumptuous for me to speak to this audience. Anything like a comprehensive review of the third division would run far beyond the limits of a paper such as this, besides involving a technical familiarity possessed only by the specialists.

A careful consideration of the matter of fire protection should convince every owner that the introduction of safeguards against fire will bring a fair return in reduced rates on the increased outlay, besides fulfilling a moral obligation which he owes to his lessees, tenants, neighbours and himself.

Several theatres in New York have had their insurance rates materially reduced because of changes in their construction made at the instigation of the Department of Buildings. That the fireproof character of a hotel is a most desirable advertisement is indicated by the fact that some proprietors who cannot honestly claim that characteristic attempt to deceive their patrons by untrue representations. One of the large hotels of New York maintains a room in a burnt condition, as an indication of what can happen in a fireproof hotel without the knowledge of any of the patrons or the proprietor. A fire that originated in this room nearly burned itself out before anyone was aware of it.

In considering the manner in which construction tends to reduce the fire hazard, we find that the subject naturally divides itself into three heads:—(1) The use of incombustible and fireproof material. (2) The manner of combining the materials of construction. (3) The provision of devices and forms of construction that afford protection against fire from the outside.

The advantage in the use of incombustible materials is almost self-evident, as thereby the food for fire is reduced in the same ratio in which incombustible materials are used.

WILLIAM GREEN & CO. (Ecclesfield), Ltd., ECCLESFIELD, near SHEFFIELD.

Among the materials most commonly used in building construction which are generally considered incombustible may be enumerated the following:—Brick, stone, terra-cotta, wire-glass, iron, steel and concrete. By such incombustible materials is meant those which will not burn or produce flame when subjected to a heat of 2,000 to 3,000 degs. Fahr. Incombustible materials are not necessarily fireproof. It is important that this should be kept in mind.

By fireproof materials is meant such as not only do not burn, but which under the action of fire remain intact and preserve their strength or the strength of those parts which they protect.

As a notable example of what has been done in eliminating combustible materials in the furnishing of a building, St. Bartholomew's Clinic, in New York city, may be mentioned. In seeking to make the building as absolutely germproof as possible, the architect also made it as fireproof as it is possible to make it. The furniture throughout the building is made of incombustible material, except in the trustees' offices. Even here the architect was desirous of having only iron or stone furniture used, but the trustees were too solicitous of their comfort, and had their rooms fitted up with hardwood furniture and a soft rug on the floor. As it is, there is probably less combustible material in this building than any other building in the country.

As an illustration of the distinction between incombustible materials and fireproof materials, we need only refer to the unprotected as against the protected or fireproof column. Cast-iron certainly will not burn, yet the effect of the heat of a fire is well shown in the bulging and collapsing of the unprotected columns of the Hackett-Carhart building at the corner of Broadway and Thirteenth Street, in New York city, last winter, causing nearly the entire roof and part of the floor below it to fall in. As against this may be mentioned the case of the McMahon Building in Chicago. This was a building occupied as a cracker bakery. One-half of the building was of the so-called slow-burning construction, consisting of columns, girders and floors of yellow pine material. At one end was erected a bakery, consisting of brick walls and steel beam and column construction, all protected by concrete.

A fire destroyed entirely the portion of the building of slow-burning construction. As exemplifying the splendid protection afforded to steel construction by a properly applied envelope of concrete it may be stated that, notwithstanding the intense fire existing in the slow-burning section, which abutted on the

section occupied by the bakery, the bakery ovens, weighing in the neighbourhood of 1,000 tons, and supported upon the concrete-protected steel columns, remained in position at the end of the fire at their original height, extending from the third to the fourth storeys.

A more spectacular example of the efficiency of properly protected ironwork against the inroads of fire has seldom been afforded.

It will thus be seen that the manner of construction or the disposition and arrangement of parts of construction is even more important than the use of incombustible material. It is contended by many, and with a good show of justice in the claim, that with the proper use of ordinary combustible materials (which practically means wood) for the interior work of buildings, a structure can be made as safe against the spread of fire as if nothing but incombustible materials were used. Where wood is used and is exposed, it should be so placed that as little surface is exposed as possible. A fire will spread with greater difficulty when the flames have only one side to work on and the supply of air for the combustion is limited. The selection of wood is of great importance. Hard woods are much more difficult to burn than softer woods and sustain the flames less readily. Oak and yellow pine make the best structural materials among the different kinds of wood. Ordinary paints, and especially varnishes, should be avoided.

The danger of the spread of fire in a building increases first, with the increase in area covered; and second, in greater degree with the increase in height.

The danger is met in the first instance by providing fire stops in the way of brick walls or fireproof partitions. Any openings that may be necessary in these partitions should be provided with fireproof doors and windows.

The spread of fire in a vertical direction is undoubtedly more effectively guarded against by making the floors continuous and unbroken; that is, eliminating all openings in the floors and placing the necessary means of communication, such as stairways, elevators, pipes, shafts, belts, &c., in shafts entirely separated from the rest of the building by brick walls. A close attention to this detail is very important. In one of our early fireproof office buildings there occurred a fire some years ago in which the greatest damage was done in an office two storeys above the one in which the fire originated. The flames in the lower storey burned away the woodwork casing around the smoke or drain pipes and were drawn up through the opening in the floor for the pipes, and in this way ascended to the upper

Imperial Buildings, Ludgate Circus, E.C.

storey, where they destroyed the pipe casing and set fire to the contents of the room.

In this incident, too, is shown the danger in the use of furring and casing, especially when of wood. Air spaces are thus formed which constitute channels through which fire, by creating draught in them, is spread. All casings, wainscoting, trim, &c., should be solidly backed up with some incombustible material; or in case it is impracticable to so back them up, good and sufficient fire-stops should at least be provided at intervals. In non-fireproof buildings where wood floors or stud partitions are used, a judicious use of fire-stops is very desirable. In the spaces formed by wood floor-beams the floor and ceiling act as a flue through which the fire spreads very rapidly; so do the spaces between the treads in the soffits of stairs. In the case of wooden stairways it is very desirable that fire-stops of some incombustible material should be provided. Steam-coal ashes or similar incombustible materials placed flush with the floor-beams make not only an excellent fire-stop by protecting the floors to a great extent, but serve the additional purpose of deafening or preventing the transmission of sound. In fireproof floors where wood flooring is used secured to wooden sleepers, it is very important that the space between the sleepers up to the underside of the flooring be filled in solidly with some incombustible material.

Reference has already been made to the elevator shaft as a very frequent means of spreading fire. The shaft in its construction constitutes a flue up which a fire is drawn with great force. On account of the necessarily large openings at each storey, particularly in the case of freight-elevators, the danger of communicating fires is great. The construction of the shaft and enclosed apparatus, therefore, becomes a matter of great importance. The shaft walls, in the first place, should be absolutely fireproof and constructed of incombustible materials. The requirements of the Department of Buildings of New York city, to which any construction before being approved or use as enclosing walls for elevators must be submitted, cannot be said to be too severe. These requirements are that the proposed construction shall practically remain intact after being exposed to a fire maintained for one hour at a temperature of 1,700 Fahr, and then subjected to a stream of water at 10 lbs. pressure for five minutes. Any construction that is used should be self-supporting. Such ironwork as is necessary for the construction of the shaft should be thoroughly protected by fireproof covering. No woodwork whatever must enter into the construction. The necessary openings must be provided

with fireproof doors. For this purpose the Fire Underwriters' door is the best, although for offices and residence buildings it is generally regarded as impracticable on account of its unsightliness. In such cases doors and frames of metal or wood covered with metal, the so-called Kalimined process, which are now being produced in a variety of shapes and finish, can be well used. Door openings should be the only ones allowed in shafts. Where it is necessary to provide light, and it cannot be obtained by windows opening directly to the outer air, it can be secured by window lights in the doors; or if that is not sufficient, by stationary metal sashes set in metal frames. In all cases the windows should be glazed with wire-glass.

What has been said of elevator shafts applies equally well to interior light and vent shafts, except, of course, that in such cases the window sashes cannot be made stationary. Pipe shafts should be solid for their full length. Provision should be made for expansion and contraction, so that the openings for service pipes at each storey can be completely filled up by the pipes without danger of damage to either pipe or partition.

But, coming to the third division of our subject, in a closely built-up location, no matter how much care or money has been expended upon a building to make it safe against fire within itself, there still remains the danger of fire damage, if not destruction, from the outside. Insurance underwriters generally regard a brick wall increasing in thickness from the top down as the most satisfactory protection against the attacks of fire from the outside.

If a building can be enclosed in solid brick walls on all sides, carried 3 feet above the roof-level, it would be practically safe against fire from the outside. But the public is not yet ready to sacrifice the space necessary for the interior courtyard that would be required for light and ventilation purposes under such conditions.

One of the most potent natural conditions tending to augment the fire loss is what is known as the exposure hazard. This defines the likelihood of a building to become ignited by a fire from without the walls. Tables of fire loss, covering a number of years, show that nearly one-third of the fire loss of the country is due to the exposure hazard. Fire is communicated from one building to another in almost every case through wall openings, through doors or windows, and to provide against this danger fire protectionists have devoted some of their best endeavours.

Since wall openings must normally be open more or less of

the time either to traffic or to the passage of light, the first form of protection took the obvious form of a sheet-iron door or shutter, arranged to be closed at night. Practical experience, however, soon showed that any considerable amount of heat warped the sheet-iron shutter to such an extent as to seriously impair its usefulness. A great improvement on the iron shutter came with the design of the tin-clad wooden shutter, a device without a superior for many forms of wall-opening protection. As applied to the windows of mercantile establishments, however, the tin-clad shutter shared with the sheet-iron shutter several defects. It did not admit a night fire in a building to be seen from the outside; it did not lend itself readily to the adaptation of devices to close the shutter automatically in the event of fire, and it was very unsightly.

A substitute which eliminates these weaknesses, besides possessing many added advantages, is to be found in the fire-proof window glazed with wire-glass, set in sash and window-frame covered with metal. This window is made in a number of different styles, some with sash of wood covered with metal, some with hollow sash of metal.

Wire-glass is made either with an opaque or polished surface, and the wire reinforcing, embedded in the glass itself, although keeping the window intact against the attack of a fire of almost any intensity, may be broken readily by the fireman when it becomes necessary to enter the building or introduce a fire stream. Among the recent important fires showing the efficiency of wire-glass windows in reducing the exposure hazard may be cited the Armour Lard Refinery, Union Stock Yards, Chicago; the Case Plough Works in Racine, Wis., and the Mitchell Wool Warehouse in Philadelphia. In each of these instances the spread of fire to very valuable properties standing but a few yards distant was prevented through the resistance offered by wire-glass windows in the walls of the adjoining building.

The walls of buildings, wherever practicable, should extend 2 or 3 feet above the roof-level. This is absolutely essential in the case of parapet walls or walls adjacent to other buildings, to prevent the creeping of fire along the roofs.

Roof coverings must always be of some fireproof materials such as tin, iron, slate or tile, and where openings exist a filling of wire-glass skylights. These materials best resist the passage of heat from falling embers, or flames lapping over the parapet walls. The tile and slate are slower in transmitting heat than the iron or tin, and for this reason, perhaps afford a better protection.

Only the barest outline of what is essential in the construction of fireproof buildings has been given in the preceding paragraphs. To attempt more would be outside of the purpose of this paper. A careful application of the general principles herein mentioned will undoubtedly reduce the fire-hazard. This is not a mere idle statement based on deductions from laboratory experiments, but one confirmed as well by facts obtained from actual fires. Fires do, and probably always will, occur even in fireproof buildings, as it is impracticable if not impossible to eliminate combustible furnishings in our dwellings, offices and even our workshops. In addition to the instances already given, others could be cited where fires originating in fireproof buildings have been positively confined to the lofts or rooms in which they started, and in which the buildings themselves suffered no further injury than a discolouration of the paint, breaking of the window-glass, &c. Such cases, it seems to me, undoubtedly prove that the fire-hazard is reduced by proper fireproof construction and added protection given.

NATIONAL REGISTRATION OF PLUMBERS.

THE opening lecture of the session was delivered in the Plumbers' Library, 30 St. Andrew Square, Edinburgh, on the 26th ult., by Mr. T. P. Henderson, his subject being "Plumbing Work in Australia, as carried out by the Melbourne Sewage Board." Mr. J. K. Paterson, Elm Row, presided. Mr. Henderson narrated his experiences amongst the plumbers in Australia during a visit which he paid to the Colonies, and described the system practised in such places as Melbourne, Dunedin and Wellington in training young men in sanitation and allied crafts. The colonial methods and materials, he said, were very different from those known in this country, and galvanised iron, which was specially adapted to the climatic conditions, entered largely into the composition of work there. They had a very elaborate drainage scheme in Melbourne, the sewage gravitating through a sewer of large dimensions into a well at a station six miles out, from which well it was pumped by two immense pumping-engines to a higher level, and thence discharged on a sewage farm three miles distant. In Mr. Henderson's opinion, however, the Melbourne Sewage Board was a huge octopus, and like many other institutions under the Government, it was made the means of obtaining promotion for one's friends and relatives. Mr. Henderson was cordially thanked for his lecture.

E.G. METALLIC PAINT (E.G. SOLUTION).

The ONLY RELIABLE SUBSTITUTE for Silver Paint or Galvanising Solution.
Bright, lasting, silvery appearance. Unaffected by heat (up to 400 deg. Fahr.), cold, water, or weather.

Established A.D. 1774.

AUSTIN'S

NEW IMPERIAL PATENT

SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in its consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.
N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

Vol. LXIX. of THE ARCHITECT. Handsomely bound in Cloth. Gilt Lettered.

Price 12s. 6d. Office: Imperial Buildings, Ludgate Circus, London, E.C.

ST. LUKE'S CHURCH, BIRMINGHAM.

THE church of St. Luke the Evangelist, Bristol Street, Birmingham, has been reopened for public worship after rebuilding. The new church is considerably larger than the old one, and has seating accommodation for about 800 worshippers. It is 135 feet long and 80 feet wide, consisting of chancel, nave and transepts. The Perpendicular style has been adapted to the site, with due regard to proportion and stability. To increase the apparent length of the edifice the usual chancel arch has been dispensed with. The roof of the nave is supported on slender arches, which give a light and graceful appearance to the interior. Beneath the organ-loft are three vestries for clergy, choir and churchwardens. Another novel feature is a room for parochial meetings under the chancel. The schools are also connected with the church. Hollington stone has been used for the building and the woodwork is of oak. A lofty square tower with pinnacles is to be added, with a clock and eight bells. At present the bell for the old church is used. The old font and communion table have been replaced, and a pulpit from Haghenden Church has been lent by the authorities of St. Andrew's, Bordesley. The brass of the old foundation-stone, laid by Bishop Pepys, has been affixed to the wall of the south-west porch. It records the names of the architect (Mr. Harvey Edginton) and the builder (Mr. George Horton) of the old church. Five memorial slabs from the demolished building are to be seen at the west end of the new church.

THE "DUMPING" OF GERMAN STEEL.

THE following letter has been addressed to Mr. Chamberlain:—
Dear Mr. Chamberlain,—A communication in a London newspaper of October 29, headed "From our own Newport correspondent," claims great advantage to both manufacturers (sheetmakers and tinplate works) and their workmen from the free import into this country of cheap German steel, and may be taken as expressing the views of the free importers and doubtless of many manufacturers who use steel billets and bars as their raw material. Similar articles have appeared in various London Radical and South Wales papers, and as the manufacture of steel forms so large and important an industry in this country, or at any rate has done up to recent times, it is desirable the subject should be investigated and the real facts of the case ascertained.

The correspondent correctly states that Newport is at present the port at which the greatest quantity of this German steel is imported, nearly 200,000 tons having been discharged since the commencement of the present year, and that it is used by manufacturers in South Wales and Monmouthshire, as also in South Staffordshire and the Birmingham district, for rolling into sheets and converting into corrugated iron sheeting, tinplates, rivet rods, wire and other things, the difference in price between German and British steel being from 5s. to 7s. 6d. a ton. He, however, then proceeds to state that the importation of the cheaper article makes all the difference to the English and Welsh manufacturers, who are thus enabled to retain their trade and compete at a profit in the markets of the world, as but for the fact that they are able to buy German steel they would long since have been compelled to close their works. He concludes by stating the reason why Germany is able to produce steel so much cheaper than the makers of South Wales (which he describes as the "home of the British steel industry") is that the plant of the Blaenavon Company, the Tredegar Company and the Ebbw Vale Company has been allowed to become antiquated, and if British steel makers generally would aim at efficiency and equip themselves with up-to-date machinery their cost of production could be so reduced as to enable them to compete with the Germans without the aid of any protection.

Now, sir, if the alleged reasons for the cheaper price of German steel were fairly stated and were correct, I should at once admit that the English steel makers had no just claim to any protection; that "dumping" was an advantage; that the ignorant and effete English steel makers must go to the wall, and the many thousands of workmen in their employ must look to emigration or the workhouse, as I fear furnacemen and steel rollers would prove but indifferent makers of jam and pickles. Such reasons, however, are unfairly stated and are incorrect, as I will now endeavour to show.

They conveniently assume that the German selling price in this country is a fair commercial price based on the cost of manufacture.

They scrupulously ignore the fact that on the contrary the German price is fixed by an enormous number of trusts (independently altogether of cost) composed of Belgian and German makers, who in turn constitute a huge "ring" or "cartel" to maintain their own home prices; that their home price is enormously higher than their English selling price; that a tariff wall of 30s. per ton secures them in this home price, and

their surplus products can be remuneratively sold in England at less than cost; that an elaborate "pooling" arrangement exists by which all the German makers contribute from their excessive home profits to a common fund from which a tonnage allowance is made for all steel sold abroad at less than cost; that the fact of England's trade being protected is at once the cause and object of the "ring's" creation and the sole reason for its success; and, finally, that it is only a matter of a few more months (it has already continued for over three years) before the English steel makers will be crushed out of existence and the English market will be at the Germans' mercy.

The free importers and such of the English consumers of German steel as share their views (many of the latter do not do so, as they have either already themselves experienced German competition in their finished products, or frankly acknowledge the real facts and the looming danger) look no further than the present moment. They take no account of the near future, either as regards English maker or English consumer, as it is manifest that so soon as the former has been crushed the German price to the latter will be at once heavily increased. On the other hand, the English consumer's continued immunity from German competition cannot be relied upon.

Again, what evidence is there that the British manufacturer is enabled to carry on his trade only in consequence of being able to buy this cheap German steel? Are we to understand that the alleged ignorance, supineness and antiquated machinery are the sole proclivities of the English steel makers, and not of the English manufacturers? If such be indeed the case, and if for the English manufacturer to keep his works going it is absolutely needful for him to buy his steel billets and bars at less than cost to compete with the foreigner at home and abroad, his industry is surely in a parlous state, and he should look rather to obtaining proper protection for the finished article by a policy of retaliation and by preferential trade with our own colonies. He cannot surely imagine he will be able to buy his billets at less than cost in perpetuity.

The actual reason for the low price of German steel sold in England is not far to seek. There is no mystery about it. Our machinery has been modernised, or we should have been long ago out of the running. Our managers have made themselves conversant by personal visits and inspection with the equipment of continental mills and methods of manufacture. Our workmen are not drunkards (as an eminent politician has alleged), and I believe both managers and workmen are as

capable of designing plant and of making steel as any foreigner I have ever seen. It has been contended that high rents, royalties and railway rates are responsible; but how can high rents hurt Dowlais, Cyfarthfa, Ebbw Vale and other large makers who have owned the land on which they stand for a century? Railway rates would scarcely be much less if the railways were State owned and worked. Nor are our mineral royalties responsible, as they are not in any way excessive, and we do not want to steal our coal. Indeed, most of us own our own freehold coal, so that rent and royalties are both out of the question. In any case, if we add the possible rent, royalties and railway charges together, the total is less than the difference between the Welsh price and the carefully regulated undercut of the foreigner. We are fairly conversant with German costs, and find little or no difference between us—certainly not sufficient to overcome the freight, carriage and insurance from abroad—and I say definitely that steel is not made cheaper abroad than in the South Wales district.

The reason, sir, is simply and solely owing to the preposterous system of one-sided free trade which has obtained in this country for the last fifty years, the direful consequences of which are only now maturing and coming into full operation, as opposed to the high protective tariffs of other producing nations and the combination or conspiracy of their manufacturers by means of "rings" and "trusts" to take advantage of the protection of these tariffs and of the undefended English industries.

The prices speak for themselves:—Price of U.S.A. sheet bars at Pittsburg, 5*l.* 12*s.* 6*d.*; price of German sheet bars at Düsseldorf, 6*l.*; price of U.S.A. sheet bars at Wolverhampton (England), 4*l.* 5*s.*; price of German sheet bars at Wolverhampton, 4*l.* 5*s.*; price of Welsh sheet bars at Wolverhampton, 4*l.* 10*s.*

In normal times, if the Germans have surplus products to dispose of (even a small quantity), by selling them here, under cost, they upset the market price and seriously disturb trade, and whenever there is a slackness of trade in either America (as in 1900) or Germany (as in 1900-3), or in both (as to-day), there is no certainty when the best is done that our price will not be undercut by the necessary 5*s.* a ton. Indeed the handsome profits which the foreign "rings" must be realising should enable them to repeat the operation if it were necessary again and again.

The Ebbw Vale Company are fairly typical of other large South Wales makers. They possess and work their own coal

having their own small coal ready for coking on the spot. They make their own coke; they smelt their own pig-iron; they convert it directly into steel, and roll their own billets and bars. They have an output of upwards of 3,000 tons of finished steel per week, and employ some 3,000 men in their iron and steel departments alone, exclusively of the collieries. They produce finished steel in the shape of ingots, billets and bars, rails, sleepers, channels, angles, &c. It will be seen that virtually their finished material represents four distinct trades or manufactures. During the last few years the company have held their own by keeping their mills employed to their utmost capacity, by the variety of their manufacture, and by the crumbs of business which the foreigner has left them, but have done so at a profit which would be regarded as an inadequate one upon any one of the four industries carried on to produce the finished steel.

In October last 28,753 tons of sheet bars and billets were received at Newport from abroad for consumption in the South Wales and Midlands districts, and during the same month only 16,109 tons of iron ore were received at Newport in place of four or five times that quantity a few years ago. Large quantities of German steel have been received at other ports in this country. The total quantity for the ten months of the present year imported into Newport was 200,000 tons, and according to the carefully worked out figures of Mr. T. E. Watson, of Pyman, Watson & Co. (set forth in detail in the *Western Mail* newspaper of June 17 last), the importation of this quantity of steel as compared with its manufacture on the banks of the Usk involves a loss to our shipowners of 39,000*l.*, to the dock company of 5,000*l.*, to the railway company of 32,400*l.*, to labour of 326,000*l.*, and a loss to the public revenue of nearly 60,000*l.*, which has to be made up by an equivalent taxation of other matters in this country.

There is nothing that I am aware of to prevent foreign manufacturers who are at present exporting their surplus sheet and tinplate bars from carrying their operations the necessary stage further and exporting their surplus in the shape of finished corrugated sheets or tinplates to this country and to our colonies. Those who are acquainted with the facts know perfectly well that this process has already commenced, and if allowed to continue, will speedily shut up most of our finishing works, as they have shut and are shutting our local steelworks. In various other branches of finished steel products the process has been going on for some time. Girders and structural steel of all kinds are exported from Belgium and Germany to

nearly every English town, including such steel centres as Sheffield and Middlesbrough. Finished steel buildings are now being erected by German manufacturers in Manchester and elsewhere. The Staffordshire market has been invaded by German light steel plates for galvanising at about 1*l.* per ton below Staffordshire and North of England prices; large plates 6 feet in length from 14 to 10 gauge selling at 6*l.* 5*s.* per ton delivered at Birmingham, as against 7*l.* and upwards for Staffordshire qualities, large contracts being under negotiation. (See *Western Mail* newspaper of July 24, 1903.) Agents of foreign works are establishing themselves in large numbers in London and our great centres for the purpose of more readily dealing with inquiries. Let any workman glance through the pages of *Engineering* and the *Engineer* and he will see for himself how severely foreign works menace the productions of this country. The 28,000 tons of steel above alluded to is practically equal to the output of Dowlais, Cyfarthfa and Ebbw Vale if working full time, and would have found employment if made in this district for some 85,000 tons of coal and for some 10,000 workmen, equal to a total population of 50,000 persons, and this without counting tradespeople, housebuilders, and the hundred and one classes of individuals necessary for and dependent upon the working-class population.

The steel trade is not only going—and going rapidly—but a great deal of it has already gone. A newspaper column would hardly be sufficient to record the names and descriptions of those iron and steel works which have been closed during the last thirty years of one-sided free trade in our own district. It is, however, only during the last 3½ years that the German and American competition has developed and become systematised. My own opinion is that even now we have only had a preliminary taste of the “dumping” policy, and that it is only now the German trusts have had practical and profitable experience of their methods of operation, and have, so to speak, “felt their feet,” that we shall know what organised and systematic dumping really means.

It is during the last three years that several of the largest of our works, including Tredegar and Blaenavon, have had to close down—some for very long periods, some permanently—and of the workmen once employed several have emigrated to America and elsewhere, where they are in active competition with their brothers at home. It is worthy of note that more money is now being spent on the new workhouse than in works development in the Tredegar valley.

Seeing that the Germans and Americans have for purposes

of their own decided to dump surplus products at a loss in order to maintain their own home prices, we should be only too pleased to exchange courtesies and sell a few sheet bars delivered Pittsburg at 5*l*. 12*s*. 6*d*., but that we are met with an import duty into America of 2*l* 6*s*. per ton (which I am not so foolish as to suppose the Americans would pay for us) in addition to the freight, carriage and insurance from South Wales to Pittsburg. In fact, during the height of the American "boom" last year, at a time when our own market was being invaded by Germany, we could have sold hundreds of thousands of tons of steel for America but for their protection tariff. They knew how to take care of their "booms," and not allow it to be suddenly swamped, as was ours by the Germans in August, 1900.—Yours faithfully,

JOSEPH BRAILSFORD, Chairman of the Ebbw Vale Steel, Iron & Coal Company, Limited.

November 27, 1903.

GERMAN CEMENT.

A REPORT recently prepared by the American Consul-General at Berlin describes cement manufacture as one of the great and long-established industries of Germany, in which the capacity for production is excessive and disproportionate to the normal consuming power of the people. In 1901 Germany consumed 14,600,000 barrels of cement, while the producing power of the factories was 29,000,000 barrels per annum, so that production is double home consumption. What the production really was is not known, but it is believed the excess in 1901 was ten to twelve million barrels, of which the export only reached 506,652 tons, "leaving a large excess, which broke down the market, reduced profits to a pittance, and brought on a crisis in the industry from which it has not yet recovered." During the decade ending with 1900 all kinds of construction operations, especially canals and river improvements, requiring cement were carried on, and the consumption of cement was enormous and increasing. The postponement of the work on the Rhine-Elbe Canal, for which the cement factories had prepared, contributed to over-production. Efforts were made to form an all-embracing cement trust to restrict production, but in vain, and war between the competing syndicates and factories was bitter and unrelenting; 1902 brought no substantial relief, the supply everywhere exceeded the demand; the general industrial and financial depression caused

building to slacken, while labour and fuel—two main elements in cement production—remained as high as before. Exports formed the only resource, and these increased from 497,780 metric tons (2,205 lbs. each) in 1898 to 641,520 tons in 1902. Of this the United States took 246,726 tons last year, the Netherlands 66,837, British South Africa 36,720, Great Britain 33,534, and Brazil 18,209 tons. To shut out an import of about 50,000 tons from points immediately over the frontier in adjacent countries a duty has been imposed on imported cement, which was formerly free of duty. The Consul-General concludes by saying that only the oldest and largest German factories, with every advantage of position, are able to earn substantial profit at present, and many of the newer and smaller establishments are working at a loss. At a meeting of the cement manufacturers of Germany, held in Berlin early this year, a commission was appointed to report on a scheme for organising the whole industry so as to control the production and manage the market. The long silence of this commission has been construed to mean that the differences between local syndicates and individual factories have been found irreconcilable, and that no basis of general combination can be found.

ST. BARTHOLOMEW'S HOSPITAL.

THE suppressed report of the Medical Council and the opinions which they placed before the Mansion House Committee on St. Bartholomew's Hospital has appeared in the *Hospital*. It is as follows:—

The Medical Council desire to point out to the Lord Mayor's Committee that, whilst they have cordially approved of most of the proposed new buildings themselves, they have always expressed the opinion that the site dealt with is as a whole insufficient. They have constantly kept in view the future rebuilding and expansion of the hospital, and it was with this object that in their report upon plan No. 2 they suggested that "there should be in existence some plan dealing with the whole site at present available, quite irrespective of any existing buildings."

In the reports hitherto quoted the Council have dealt almost entirely with the new buildings proposed to be erected, and with the insufficiency of the proposed area.

The present ward blocks also require consideration. Any scheme of building must have regard to the future, because the

Fire-Resisting Construction

IMPORTANT NOTICE TO ARCHITECTS, BUILDERS & CONTRACTORS.

Completely equipped Joinery Works, fitted with the latest and most improved Woodworking Machinery, have now been installed in connection with our Plant for Rendering Wood Fire-resisting, and we are prepared to contract or sub-contract for all the Woodwork (Carpentry and Joinery), complete and fitted up if required, for Buildings where Protection from Fire is desired.

THE COST FOR DOORS, STAIRS, WINDOW-SASHES, MANTELS, AND OTHER JOINERY MADE OF FIRE-RESISTING WOOD IS ONLY ABOUT 15% MORE THAN WHEN MADE OF ORDINARY WOOD.

We are authorised to announce that the **FINE ART & GENERAL INSURANCE CO., Ltd.**, of 90 Cannon Street, London, E.C., will allow, subject to survey, a Rebate of from 10% to 30% off the current rates for risks in which our Fire-resisting Wood is used.

Fire-resisting Wood Joinery is indistinguishable in appearance from ordinary wood, and when furnished by us does not differ in any respect from ordinary wood, except in the one feature, that it will not by itself sustain or spread flame.

ESTIMATES AND SAMPLES FURNISHED FREE ON RECEIPT OF SPECIFICATIONS.

Address—**THE NON-FLAMMABLE WOOD & FABRICS CO., LTD., TOWNMEAD ROAD, FULHAM, S.W.**

time is probably not far distant when all the existing ward blocks will have to be replaced by others more in accord with modern medical requirements. They do not forget the efforts which the Governors have made to improve the existing wards in many ways; but the final limit to further improvement of the present buildings must come, even if it has not come already. The modern treatment of disease requires a much more liberal allowance of light, air and space, in proportion to the number of patients, than was considered to be necessary when the present hospital was so ably planned 160 years ago. It has also been found to be of great advantage to the patients that isolation-rooms, day-rooms, and other adjuncts should be provided. The modern "ward unit" cannot be evolved from the existing ward buildings.

As a result of the foregoing considerations it becomes evident that the present area of six and a half acres is insufficient for the erection of the whole of the buildings required by St. Bartholomew's Hospital. To cope with this difficulty several alternative plans may be suggested.

1. The acquisition of more adjoining land.
2. The erection of the nurses' home (which occupies much of the site) as well as of the college elsewhere.
3. The diminution of the number of beds.
4. The removal of the hospital to another site.

Of these alternatives the Medical Council are strongly in favour of the first, which would enable the hospital to be retained in its present position.

As regards the second alternative—namely, the erection of the nurses' home outside the hospital area, as has been done by other London hospitals—the Medical Council believe that although this would not be so satisfactory as obtaining more land, it would, nevertheless, permit of the retention of the hospital on its present site. It is manifest that it would be desirable to build a nurses' home at the hospital itself if enough land is obtainable, but if it be impossible to build it without seriously diminishing the number of beds, then there is no other proposed new building which could be placed elsewhere with so great advantage, and would at the same time supply more room by its removal than would this. For it must be noted that, as at present designed, the nurses' home presents a longer frontage in its three blocks than do the three ward blocks for about 600 patients, which will constitute nearly the whole in-patient department, and may fairly be considered the chief portion of the hospital, to which all other departments should be subservient.

The third alternative of diminishing the number of beds would be the ultimate and necessary consequence of proceeding with the plan now before the Governors (plan 3). For there would be a loss of from 100 to 200 beds, if, after the proposed new buildings were erected, the rebuilding of the wards were undertaken on the same site as that they now occupy. As already mentioned, the modern treatment of disease requires a much more liberal allowance of light, air and space per patient than was considered necessary when the hospital was built. Such a diminution of the number of beds would probably seem as objectionable to the Governors as it does to the medical staff.

The fourth alternative of a new site is one the Medical Council can only regard as a last resort; and it may be pointed out that whatever advantages may be claimed for other sites, the gravel soil, the excellent drainage and the open space of West Smithfield combine to make the present site one which is in many respects quite ideal. The situation also is admirable and most convenient for patients; indeed, far more so than any other place could be. For St. Bartholomew's is not only the hospital for the City, with its immense day population, but is also the only large hospital for the adjacent districts of Holborn, Clerkenwell and Finsbury, and serves in addition the whole of the north and the north-east of London, including parts of Hoxton and Hackney, as well as the more remote districts—Islington, Dalston, Pentonville, Walthamstow and Leytonstone. It is further most accessible, being placed very near the stations of the Central London, Metropolitan and District Railways, whilst it is also close to many large railway termini and to the numerous omnibus and tram lines which converge towards the City.

This accessibility is of importance, for it is altogether too narrow a view to take that a hospital should be limited in its work to the district in which it is placed, for St. Bartholomew's Hospital is free without payment or letter of recommendation to all poor people, and its reputation is so widely spread that it necessarily draws patients, not only from all parts of London, but from much further afield. It may with truth be said that there is probably no part of the United Kingdom or Colonies which has not sent patients to this charity. The benefits of St. Bartholomew's Hospital are, indeed, in another sense even yet more widely diffused, for the medical men who have for so many years issued from its school in a constant stream have extended the fame of their hospital to every quarter of the globe in which they have practised the profession they had learnt within its walls.

DURESCO

THE IMPROVED WATER PAINT.

For the Treatment of Walls and Ceilings, either for Plain Work or Artistic Decoration.

Dries Flat and is not Absorbent like Common Distemper.

THEATRE ROYAL, BIRMINGHAM.

It is proposed that the new Theatre Royal shall be an imposing building, suitable in style and construction to its prominent position in the principal thoroughfare of the city. A representative of the *Birmingham Daily Post* was shown the plans of the new building, the erection and equipment of which is to cost upwards of 50,000*l*. The architect, Mr. Ernest Rüntz (of the firm of Rüntz & Co., Walbrook, London), is a gentleman of great experience in the preparation of designs for theatres. Some of the best theatrical houses in the kingdom, and notably the Gaiety, Adelphi and Crown in London, have been erected in accordance with his plans, and his experience is a guarantee that the arrangements of the new building will be made with a view alike to the comfort and the safety of the audiences to be accommodated. From the point of view of safety and ease of exit the circumstance that the front of the site is so much higher than the thoroughfare at the rear makes it a simple matter to so arrange the various parts of the house that the entire audience may have easy access to the open air. The building will be five storeys in height and of red brick or terracotta with stone facings, the elevation to New Street being in a free treatment of the Renaissance period surmounted by a group of statuary. The principal entrance—that for the dress circle and stalls—will be at the corner of New Street and Colonnade Passage, while the four front shops with offices above will extend from this point towards Temple Street. The entrance leads into a crush-room, 22 feet by 19 feet, from which a staircase on the right will afford access to the dress circle, and another on the left will descend to the stalls. The box office is placed on the right of the crush-room. The stalls and dress circle have a wide corridor at the back, in which are conveniently arranged commodious retiring-rooms, and from which are the stairs to the lower exits. The area of the house is divided into stalls, pit stalls and pit, with two exits from the former and three from the latter, as demanded by the watch committee and the magistrates. There are also large refreshment-rooms—one immediately at the rear of the pit and the other approached from the stalls corridor. Behind the dress circle is a large foyer, in which a special feature will be a raised alcove or recess. The upper circle is approached by a separate entrance from Colonnade Passage, with a corresponding exit on the other side of the building, and the staircases have been so arranged that there is not only easy exit at the highest level but also at the low level of the various tiers. The gallery is

reached from the private 20-feet way leading from Stephenson Street, and has two exits on the other side into Colonnade Passage, three staircases being demanded by the official regulations. This portion of the house is also provided with a large saloon and the usual retiring accommodation for the audience.

From these particulars it will be noticed that the position of the auditorium has been changed. In the old theatre the audience sat with their backs to Temple Street and faced the stage, which was on the Colonnade Passage side, but in the new building the stage will be on the Stephenson Street side, and the audience will sit with their backs to New Street. The seating accommodation is for 2,265 persons, and is approximately as follows:—Stalls 230, pit stalls and pit 520, dress circle 350, upper circle 440, boxes 48 and gallery 672. Provision is made for 12 private boxes, three on each side of the stalls level, and three on either side on the dress circle level. The proscenium opening is 34 feet, and the stage itself is 73 feet wide, with a total depth of 48 feet. In the old theatre the stage was the largest in the country, with the exception of the one at Drury Lane, but the new stage will not be so big, although it will be much larger than is regarded as necessary in the majority of theatres. Ample dressing-room accommodation is provided for the largest companies, and they are protected by means of fire-resisting staircases to the street, so that there will be no necessity in any emergency for the actors and actresses to pass across the stage. The house is to be lighted by electricity, and heated and ventilated on the latest Plenum system. The proscenium will be fitted with a fire-resisting curtain, and there will be an extensive installation of hydrants on the various floors, both behind the curtain and in the auditorium. The house is to be handsomely upholstered and decorated, but the details have not yet been decided upon. It is satisfactory to know that the whole of the staircases will be of fireproof construction, with suitable handrails and enclosed on all sides by brickwork walls. The large number of exits will give confidence to the public, and their comfort is further considered by the resolution to provide an awning in Colonnade Passage to protect the queues from the weather. In fact, Mr. Davis is anxious if the authorities will give him permission to cover in the whole of the Passage by means of an awning, thus transforming that thoroughfare into an arcade. So completely have the general details been worked out that it is estimated that the largest audience the theatre will hold can pass into the street within two minutes.

The Architect.

THE WEEK.

FRENCHMEN believe that enormous sums are forthcoming in England to pay the expenses of archaeological explorations. Their own countrymen, it appears, do not show much liberality towards similar enterprises. The State is supposed to vote whatever money may be required, but the finances will not at present allow of expenditure for that purpose, and in consequence the excavations by M. GAYET at Antinoë and those by M. AMÉLINEAU at Abydos were doomed to be suspended. In order to prevent so undesirable a termination to labours which have proved to be successful a society has been formed to continue the excavations in the two ancient cities, and if sufficient support is forthcoming to take up the examination of other places. The excellent work performed by M. GAYET, and by which the Guimet Musée has been enriched, was accomplished by means of a modest subvention of 4,000 francs. Without enthusiasm it may be said that the exploration of ancient sites cannot be carried out. The small sums allotted are barely enough to pay native labourers, and the exercise of the superintendent's office has in most cases to be its own reward.

On the invitation of Mr. W. CLARKE, the registrar of Cambridge University, M. JULES TRUFFIER, of the Comédie Française, has witnessed the performances of "The Birds" (ARISTOPHANES) by the students. He was surprised on a rainy and cold afternoon to see the performers clad in the light vestments of ancient Greece. He considered the scenery, decorations, properties and costume in the Cambridge theatre as archaeologically exact as a member of the first troop of players in the world could desire. The orchestra consisted of flutes, oboes, harps, and the overture was suggestive of the singing of birds. The old play is extremely difficult to produce, and M. TRUFFIER doubts whether the whole of the audience who applauded the actors were able to comprehend the Greek text, and were not simply carried away by the action. Sometimes he found that too much emphasis was given to certain characters, which was detrimental to the *ensemble*, a fault which in the Théâtre Français would not be tolerated a second time. But he makes many allowances, for youth, he says, is omnipotent, and he never before realised so well the power of the Greek dramatist's words.

THE death of Mr. WILLIAM FREDERICK HEMSOLL, architect, took place at his residence, 40 Southbourne Road, Sheffield, on Saturday. He had been an invalid for several years and unable to attend business since March last. Mr. HEMSOLL was a Sheffield man, son of the late Mr. GEORGE HEMSOLL. He was apprenticed to the profession of architect, surveyor and valuer, and started on his own account in Figtree Lane when quite a young man. He was for ten years in partnership with Mr. JOSEPH SMITH, and with him designed and superintended the erection of the Reform Club, various chapels and other buildings, and afterwards was associated with Mr. H. L. PATERSON in the erection of the Woodfin Convalescent Home and several council schools. His partnership was dissolved with Mr. PATERSON twelve months ago, when Mr. F. W. CHAPMAN joined him.

SOUTH KENSINGTON appears to be resolved to call a new world into existence to balance the loss of the old. The evidence given before the departmental committee on the Board of Manufactures shows what Scotland, in spite of its fertility, thinks of the system. In the principal towns of England it has ceased to be a power for good or evil. But a new region has been seized, and where, for a time at least, a semblance of authority may be exercised. That favoured land is the Transvaal. A provisional code of regulations for schools has been issued, which could only be inspired from one place. According to the *Transvaal* *Critic*, Standard I. of the Government schools will include, among other subjects, brushwork, using blobs and lines

and simple floral forms such as can be built up from them, and finally modelling in clay or plasticine of simple forms such as can be used in free armwork. The writer pertinently asks, "What is the price of plasticine in this country that we can afford to give it to babes to make mud-pies or mud-animals with?" In other standards it is expected the children will practise modelling in clay or plasticine, of floral and animal forms, applied design, human heads, masks, hands and feet. Plasticine, it will be observed, is provided by the ton. The *Critic* further says:—"Schedule V. gives a list of art material to be supplied these elementary schools, sufficient to raise the hair. It embraces such things as water-colours in 4-inch tubes, some of which cannot possibly cost less than 14s., or even 28s., here in Johannesburg. When I state that cobalt blue and French ultramarine are included, anyone acquainted with the subject will grasp the situation." And all this is in a country paralysed for the want of labourers. We have heard of ORPHEUS with his lute overcoming savage beasts, but South Kensington, with its drawing and shading, brushwork, water-colour, tempera and plasticine, endeavouring to Anglicise the young Boers, is a still more amazing spectacle.

It seems incredible that the cross surmounting the Panthéon in Paris could weigh six English tons. The Minister of Fine Arts stated in the Chamber that it weighed 6,000 kilos, which, reduced to English quantities, would be nearly six tons. Probably the minister includes in the weight a part of the lantern. What was said about the cost of a scaffolding to allow workmen to remove the cross being 20,000 francs is less questionable. It is strange that opposition to the cross should be so persistent when it is known to all that without the symbol the history of the temple would not be suggested. When Louis XV. laid the foundation-stone in 1764 the building was intended to be a church in place of another dedicated to Saint Geneviève. In the early days of the Revolution it was declared to be a Panthéon which was to perpetuate the memory of illustrious men. Hence the inscription, "Aux Grands Hommes la Patrie Reconnaissante." In 1822 the building reverted to its original use and another inscription was engraved. From 1830 to 1851 it was treated as a secular building, and afterwards as a church. When the decoration of the walls was undertaken the ecclesiastical history of France was to be illustrated, and the majority of the works have that object. Those desirous of the removal of the symbol should be consistent. A great many buildings in Paris are permitted to recall the LOUIS, HENRI and NAPOLEONS, and *fleurs-de-lis*, bees, &c., are tolerated. No work of the demolisher can prevent citizens from knowing that Paris has had a tumultuous history, and it seems no more than childishness to desire the substitution of a Gallic cock on the summit of an edifice which was so long recognised popularly and officially as a church.

WESTMINSTER HALL, of which the historic importance is universally recognised, has been utilised in a novel way. The standard yard measure has been long deposited under a window on one of the staircases of the adjoining House of Commons. There are also standard measures of length available for testing in Trafalgar Square. But it was considered advisable by the Standards Department of the Board of Trade to have a length of 100 feet exactly set out in some place which would be free from atmospheric influences. Westminster Hall was accordingly selected. The 100 feet are marked on the floor. Some surveyors, especially for large engineering works, prefer that measure to the ordinary 66-foot chain, and unquestionably the longer length lends itself more easily to calculations, for it enables the decimal system to be employed without any special organisation or running any risks. The position of Westminster Hall is convenient, for it will enable chains of 100 feet to be periodically tested by the numerous engineers of the district without much loss of time. TROUGHTON, the optician, on one occasion was asked to test two chains in a case where there was a great difference in a survey by the owners of them. One was found to be 3 inches too long and the other 2 inches too short.

HERBERT SPENCER.

THE death of HERBERT SPENCER on Tuesday morning is not merely a national loss. Philosophers like him belong to the world rather than to one country, and as his works or translations of them are known in all civilised lands, the regret for his removal will be wider than was excited by the close of lives which appeared more important to the general public. Although he had suffered for a long time from weak health—and, indeed, absolute repose was often insisted on by his physicians—yet he continued to labour assiduously in the hope of completing the work which he believed it was his mission to execute. In fact, it might be said that it was only through the strong sense of duty he had imposed on himself he was able to go on with his onerous labours. Although Englishmen were able to share in his reputation, he received at first little encouragement. He was philosophically moderate in his desires and adopted a most inexpensive course of life. Yet his works, which were produced with so much toil, did not bring him in sufficient revenue to meet his expenses. A few friends, however, fortunately came to his rescue, and it is through their admiration and generosity his system of philosophy reached its present state. It is not complete, but as the materials are prepared the final courses can be laid by his disciples.

He was born in Derby on April 27, 1820. His father was a schoolmaster, whose whole life was engaged in education. The son testified to WILLIAM SPENCER'S extensive and accurate knowledge and able teaching. Few men of genius are disposed to follow established systems, although supported by parental influence, and HERBERT SPENCER was to a great extent his own instructor. Metaphysicians commonly appear to be drawn early to mathematics; for with their instinctive desire for establishing laws relating to intangible subjects they discover ideal examples in that science. The eagerness to cover the country with a network of railways was supposed to give opportunities to young mathematicians. HERBERT SPENCER did not realise that in the early days of engineering mathematics formed a very small factor in construction. He wrote a large number of abstruse papers about earthworks, arches, surveying, &c., which, like other exercises of the kind, were not adopted as guides. He never cared to publish them, and we may assume he attached no importance to them.

About 1848 he apparently had had experience enough of engineering, and we suppose he found he was not sufficiently combative to force his way in such a calling. At a later time, when structures on a grand scale became necessary, he might have made his mark in calculations of strength. But like many men of all professions who failed in gaining the success they anticipated, he turned his attention to literature. He was fortunate in obtaining an appointment on the *Economist*. The journal was then controlled by Mr. WILSON, a very able man, who worked his way up until he became a member of the Government. His influence was extensive, and HERBERT SPENCER soon discovered there was no difficulty in getting his articles accepted by the larger reviews. An essay by him on "Railway Morals and Railway Policy," which appeared in the *Edinburgh Review*, was a characteristic example of his competence, and, indeed, it deserved to be accepted as a monitor by investors. There were passages in it which suggested that he could think of something else besides finance, and the meekness of shareholders in submitting to any man who posed as an autocrat was described in a manner becoming a reformer of the social state.

For a man like him, who was not contented with the spectacle which the life around him presented, the *Westminster Review* of those days offered the best means of finding a sympathetic circle of readers. In its pages some of his most interesting essays were published. The germ of the system associated with his name is to be found in one entitled, "Progress: its Law and Cause," and the article on English style has been used as a manual in schools and colleges where the author was considered to be an arch-heretic. The *Review* was then reported to be the property of JOHN CHAPMAN, who posed also as editor. But the duties of the office, as well as others of a more servile kind, were performed by MARY ANN EVANS, who afterwards won renown as GEORGE ELIOT. SPENCER was kindly disposed

towards the over-burthened woman, who was a few months older than himself, and who also came from Derbyshire. In one of her letters she mentions how, soon after making his acquaintance, she was going with him to the Opera, and adds:—"We have agreed that there is no reason why we should not have as much of each other's society as we like. He is a good, delightful creature, and I always feel better for being with him." In the course of the year she gave another friend an anticipation of what the biographical dictionaries of 1954, or a century afterwards, would say about him, viz.:—"SPENCER, HERBERT, an original and profound philosophical writer, especially known by his great work . . . which gave a new impulse to psychology, and has mainly contributed to the present advanced position of that science, compared with that which it had attained in the middle of the last century. The life of this philosopher, like that of the great KANT, offers little material for the narrator. Born in the year 1820," &c. SPENCER'S remark that he felt better for reading "Adam Bede" was felt by her to be praise worth treasuring. The friendship was upheld to the last. G. H. LEWES was less willing to acknowledge SPENCER'S influence. In his diary he wrote:—"My acquaintance with him was the brightest ray in a very dreary, wasted period of my life. I had given up all ambition whatever, lived from hand to mouth, and thought the evil of each day sufficient. The stimulus of his intellect, especially during our long walks, roused my energy once more and revived my dormant love of science. His intense theorising tendency was contagious, and it was only the stimulus of a theory which could then have induced me to work."

The theorising tendency which impressed LEWES was exhibited in SPENCER'S "Social Statics." The title of the book was reminiscent of engineering. All efforts in philosophy are attempts to discover the meaning of life, and in the work the influence of the founders of the *Westminster Review* could be traced, for, as they believed, the happiness of the greatest number should be the aim of all government. SPENCER also suggested that the end of all creation was similar. In it, as in other writings, it was necessary to be analytical, and as the old philosophers considered everything of which we know and see and speak to arise from the motion and union of atoms, with SPENCER there were similar evolutions of social atoms which were not always of a material kind.

It was said by SCHILLER that artists, including, of course, poets like himself, were children of their times. With more truth the expression can be applied to philosophers. SPENCER was only one of a series. When he began to speculate he may often have heard in the streets the popular song, "There's a good time coming, boys," and in a humble way it expressed the aspirations of thinkers for at least a century. The first French Revolution was only a premature effort to attain that result. Even the victims of it were sometimes able to be indifferent to what it entailed. Thus we find CONDORCET, although sentenced to the guillotine, still confident in the approaching perfectibility of his countrymen, and expressing his hopes about the future Utopia. Soon after COLERIDGE published a letter, in which it was said, "The faith in the perpetual progression of human nature toward perfection will, in some shape, always be the creed of virtue." Several German philosophers had come to the same conclusion in different ways. What were COMTE'S stages for the explanation of phenomena—first by supernatural agencies, then by metaphysical abstractions, and finally by displaying the succession and similitude of phenomena without attempting to explain the why or wherefore—but a summary endeavour to present development, evolution, progress, as a series of facts which could not be questioned? How SPENCER was distinguished from his predecessors was that he went to work like a parliamentary engineer. He accumulated an enormous amount of information from all quarters, and then he arranged facts in such a way as to become mutually serviceable in upholding his conclusions. Foreigners who believed in ideas announced theories as if they came by inspiration, and were on that account to be accepted. SPENCER'S data were as immeasurable as if he were the head of a Government department, and had unlimited control not only over collectors, but over all sources of information which were to be found in the world. His

manner of obtaining and contrasting facts is almost unique, not only in philosophy but in literature.

Attempts have been made to explain HERBERT SPENCER's system in a volume, but they can hardly be considered as more successful than similar abstracts. It would be absurd to imagine that a single article could serve as a clue. Metaphysicians, theologians, politicians, physiologists, historians and others have applied special tests to his theories, but it is impossible for anyone to formulate a system which will be universally applicable and yet infallible. We can only glance at his theories as they appear from the point of view most familiar to our readers.

According to MACAULAY, the key to the Baconian philosophy is to be found in the two words "utility" and "progress." The magic words for the Spencerian system are "homogeneous" and "heterogeneous." He has shown how throughout creation simple things are changed by the operation of certain causes into others which are more elaborate. Architecture affords numerous illustrations of the law, although in a restricted sense, and to exemplify it adequately would be to write the history of architecture. Whether the changes are always improvements need not be considered. The majority of people would prefer a Corinthian column to a Composite. But the latter is such a development as would be approved by a people who were wealthy and powerful and ostentatious. As happens in our time, an excess of ornament which can be readily purchased is imagined to be evidence of superiority, perhaps of good taste. The fluting and cabling of columns were illustrations of the law. We also find that the mouldings were sometimes elaborately carved instead of trusting to the beauty of the contours. That still greater richness was imparted to columns is proved by the drums surrounded by figures in relief from Ephesus we can see in the British Museum. Without knowing what had been done at Ephesus some Renaissance architects worked in the same direction, and adorned their shafts with bands of figures, wreaths of leaves and other decoration.

For a long time Classic art was believed to be exceedingly severe, while Mediæval art was vulgarised by the exuberance of its ornament. The difference between the styles was simply in degree. There was more restraining power among the Greeks and the Romans. The Mediæval masons were able to yield to the evolutionary instinct. The Gothic periods are mainly examples of progress from the homogeneous to the heterogeneous. The severe Norman arches in course of time were cut into mouldings or covered with ornamentation, the pattern being repeated as long as a space was found. The capitals of the piers were also changed, and the piers in some cases covered with zigzags. Then in course of time the piers were completely transformed, and instead of a cylindrical mass presented the appearance of a cluster of columns. The pointed arches formed lines which should be sufficient to satisfy the most fastidious. But they are sometimes to be found changed into foils or cusps, and the cusps may be recusped, by which the principal lines are confused. What can be more elaborate than a rose window in which very little is left that can be considered as plain? Panels and spandrels were formed. Stone was wrought with diapers, which were painted and gilded, and as it were there was a continuous effort to make the simple appear as complex. In foreign examples the original ideas of construction were set aside, and efforts made to cause the stone to appear as flexible as branches of trees.

If we take up a series of plates or photographs of Moorish architecture we seem to have a parallel experience. Religion imposed limitations on the Moors which were obeyed. But compensation was found in elaboration of other kinds. The lines of arches were emphasised by bands of carving. Panels were introduced as if in order to render the ornament more pleasing by enclosing it in a frame, and efforts were made in order that the elements in a panel might not be too apparent.

When it is found that in all styles we have exemplifications of similar laws, it seems absurd to enter into contests about which is the most deserving of admiration. Indeed it seems to us that one of the consequences of the writings of HERBERT SPENCER has been a greater tolerance among men who assume to be the representatives of different forms. When all

seem to be under the operation of like laws it is absurd to be advocating the adoption of any one style or the style of any period as perfect. They are all in a transition state, and hereafter some sober-minded evolutionist, assuming that system is not superseded by another, as is usually the case in philosophy, would be able to demonstrate that our twentieth-century work, which so often appears unsatisfactory, is evidence of the power of a law which has been enforced during many centuries. SCHILLER was supposed to have been the first to insist on the principle of play or pleasure in art. SPENCER also has recognised not only its influence but its necessity. The Cistercians, who were so rigorous in excluding representations of leaves and flowers, may therefore have enjoyed their beautiful but unadorned capitals and mouldings in exactly the same degree as the men who carved birds and plants as if for a solace.

All evolutionists consider the present, and it may be the future, rather than the past. SPENCER was also influenced by the modern engineering spirit, which rarely can find models in ancient work which are adapted to modern needs. It was therefore inevitable that he should class architects with lawyers, because they respected precedent, which they appealed to as "being a greater authority than any abstract principles of beauty or fitness," and "uniformly persist in copying the designs of the ancients, however unsuitable they may be to the habits of the present day." He asserts that it is sadly derogatory to the dignity of the profession "to have to acknowledge that out of all the arts practised by the moderns, architecture forms the only case (with the exception of sculpture) in which the ancients have not been outshone," and he asked, "Is it, then, to be wondered at that there should be that want of public respect towards the profession frequently complained of by architects?" If he had reconsidered the subject in his later years, HERBERT SPENCER must have recognised that exact copying was less in favour than when he wrote. There are many causes which enable some freedom to be exercised, but as in his own sentences and treatment of subjects there is seen respect for former masters of English style, so in architecture it is inevitable that traces of the past should survive. The immense stations and bridges of the railway engineer, although almost entirely inspired by the present, would not, we suppose, be recommended by him to be models for imitation in the improved cities of the nineteenth and succeeding centuries. SPENCER took such wide views, he was liable to overlook much which deserved attention, and in all branches of his philosophy he fell into errors which, like those we have alluded to, seem to be incredible.

Allowance must, however, be made for the almost limitless extent of his undertakings. Varieties of knowledge of which BACON could have no perception, as well as those which the Elizabethan philosopher scorned were considered by SPENCER, and he endeavoured to submit them to the sway of his principles. He disowned allegiance to COMTE, but he was the truest successor of the Frenchman, and the one who carried out his work more broadly. Of both it could be said, "Thus far shalt thou go and no farther." COMTE was unable to cast a light upon the future, and to suggest what coming races may know or do, and it must with greater regret be owned there is the same deficiency in Mr. HERBERT SPENCER's numerous volumes. The gift of prophecy was denied to both.

HERBERT SPENCER AND "THE ARCHITECT"

AMONG the "Tesseræ" which appeared in *The Architect* in 1888 was an extract from one of the late HERBERT SPENCER's writings, in which he condemned "the notorious gullibility of JOHN BULL" for venerating old pictures which were in technical excellence not equal to modern works, and especially those by JOHN MARTIN and EDWIN LANDSEER. The following letter was received from the philosopher, and was printed in *The Architect* of February 24, 1888:—

Sir,—A friend has drawn my attention to a paragraph which appeared in *The Architect* some three weeks ago,* purporting to be an expression of my opinions concerning the Old Masters.

* *The Architect*, January 27, 1888.

In my published writings I have not anywhere expressed either the opinions ascribed to me or any other. Necessarily, therefore, some utterances of mine, either to friends or to an amanuensis, must have originated the statement.

In its general drift the statement is correct, but, as might be expected, it is incorrect in detail. Certainly among the characteristics to be recognised in the paintings that have come down to us from past times, I should never have named transparency of shadow as a usual one. Chiefly, however, I wish to say that I did not make the comparison alleged between ancient and modern artists, and still less did I single out as examples the modern artists named. HERBERT SPENCER.

Athenæum Club: Feb. 21, 1888.

The compiler of "Tessera" having seen Mr. Herbert Spencer's letter, desired that the following note should appear at the same time:—

It is somewhat gratifying when a humble explorer like myself is rewarded occasionally by the discovery that he knows more about an author's writings than the author himself. I am too much indebted to Mr. Herbert Spencer's books to ascribe anything to him without authority, and have too much reverence for the philosopher to attempt an imitation of his writing. The paragraph in question was reprinted from an essay on "Precedent in Architecture," which appeared in January 1842, when the writer, Mr. Herbert Spencer, was a civil engineer in Derby. I have often fancied that in his articles of that time the germs of part of Mr. Herbert Spencer's later philosophy can be discerned, and, indeed, they deserve to be republished in full. One thing is seen from some of them, that with Mr. Spencer, as with Carlyle, mathematics can become a preparative for philosophy. But, unfortunately, neither mathematics nor the most perfect method of analysis—for I hold Mr. Spencer's to be superior to Aristotle's—will compensate when memory fails. The foregoing letter is therefore sad enough to every admirer of the architect of the evolution theory. Although Mr. Spencer recognised the correctness of the general drift of the extract, and, as I perceive from his manuscript, did at first say it rightly expressed his belief, yet he is positive that his own writing is no more than a vague recollection by somebody of what was said in conversation. Who knows but Descartes was simply describing a similar case of forgetfulness when he talks about his friends misrepresenting his doctrines:—"Toutefois lorsqu'ils les ont redites, j'ai remarqué qu'ils les ont changées presque toujours en telle sorte que je ne les pouvais plus avouer pour miennes?" and he adds that the ancient philosophers were also "mal rapportés." I fancy the old reporters were as faithful as myself in garnering expressions and thoughts which impressed them. We are like the devotees who ran after the leaves of the forest when the Sybil wrote her prophecies upon them. We try to preserve things which otherwise would be lost or forgotten by their originators. There is, however, another question raised by the letter. Philosophers ought to know something of human nature, and therefore need not be surprised at its changes. The prophetic fury of the Sybil was not always, we may be sure, of the same intensity. Was not the original matter out of which all things are made, including philosophers and compilers of "Tessera," once called Proteus, or Protea, and supposed to be endowed with the capacity to change itself into all forms—

Omnia transformat sese in miracula rerum,

or, as we say now, the homogeneous becomes the heterogeneous? Why, then, should Mr. Herbert Spencer be surprised if his thoughts about transparency of shadow and the like in 1888 differ from those which inspired him nearly half a century ago. Most of us drift much further from our early beliefs in art and philosophy.

The challenge thrown out by the compiler on the relation between the Lucretian or Epicurean system and the Spencerian was not taken up. At the time HERBERT SPENCER was afraid the state of his health would not enable him to complete his "Synthetic Philosophy," and he was not on that account disposed to enter on a controversy which might not be satisfactory to himself or his admirers. In other subjects besides Old Masters he was not disposed to attach importance to what was accomplished during early ages in the endeavour to solve cosmic problems which were similar to those he treated.

Dr. Were, Bishop of Derby, visited the village of Calow, Derbyshire, on the 1st inst. for the purpose of dedicating the newly-erected vicarage. The foundation-stones were laid last Easter. Mr. E. Winder (Sheffield) was the architect of the building, which is in the Domestic Gothic style, and has cost £4,000.

THE DECORATION OF BUILDINGS.

THE papers relating to the building and beautifying of the Federal capital of Australia, from which we gave extracts last week, will doubtless be considered as no more than academical exercises. For many reasons they deserve to be accepted as indicating the trend of thought relating to architecture, decoration and other matters. It was not to be expected that the congress of engineers, architects and surveyors at which the subject of an Australian capital was discussed would correspond in its manner of treating the subject with a similar congress in Paris, Berlin, Rome, or, we may add, in London. Melbourne is remote from the great centres of civilisation. It can possess no inspiring examples of ancient art. It is deprived of traditions. There are no important commissions to attract artists of high standing, and efforts to attain the ideal are hampered by the tyrannical necessities of the struggle for mere existence.

Under such conditions, although the words may represent only aspirations, it is gratifying to read the remarks of Mr. L. BERNARD HALL, the director of the Melbourne Gallery, about the beautifying of the future city. Speaking of painters' works in the decoration of public buildings, he maintained that they should be identical with those of the architect, the only modification being in the nature of the material used. As he said:—"Symmetry or balance, variety, unity, economy of means, colour, scale, repose, richness of detail, breadth and manly sentiment are all qualities common to architecture and painting. Incidentally it may be noticed that exactly the same qualities go to the formation of style, whether in literature, dress, manners or anything else. A sculptor should be half an architect in order to realise the decorative value of a sculptural site in relation to its surroundings. This is the virtue of decoration, that it is interdependent—that it must be regarded not as an entity (as a merely illustrative picture might be) but, as RUSKIN puts it, related, either in subordination or in command, to the effect of other pieces of art." The conclusion to be drawn from the principles is that if there be so much identity in aim, it must follow that there should be the closest co-operation on the part of the painter and sculptor with the architect. In a new country like Australia, which happily can be emancipated from ancient and obnoxious prejudices, that conclusion may seem to be as obvious as any of EUCLID'S. But in Europe it is impossible to record many precedents which are favourable to the desirable co-operation; and, indeed, the belief is general that independence is always to be preferred.

A memorable instance is afforded by the history of the British Houses of Parliament. The style adopted, and which was prescribed to the competitors, being what may be designated Tudor Gothic rather than Tudor Classic, comprised the use of sculpture and painted decoration. That necessity was not, however, fully considered. At the time the Germans were introducing wall-paintings to an extent that recalled the period of Italian Renaissance. Influences were exercised in favour of the imitation of the examples set in Munich and Berlin regardless of Tudor practice. There was a Fine Arts Commission appointed in 1841, consisting of an ex-Lord Chancellor, various peers, members of the House of Commons, officials and writers. But diverse as was its constitution no room was found to allow of the presence of the architect of the building at the deliberations. BARRY, it is true, was permitted to give evidence and to prepare a report, but the whole of the arrangements were carried out as independently as if his connection with the building came to an end as soon as the wall surfaces were available for the use of the painters.

CHARLES BARRY would not be a true architect if he failed to feel acutely the slight which was cast not only upon him, but upon his art. By no act or word of his was it suggested that as decoration was unnecessary it would be better to leave the building alone. It would be impossible for him not to realise that without the aid of sculpture and painting as auxiliaries his building regarded merely as an illustration of a style was incomplete. He was also aware of the consequences of allowing painters and sculptors who had never bestowed a thought on the subordination of their respective arts to architectural requirements to exercise unrestrained liberty. BARRY was not ignorant of the short-

ings of the German wall-paintings, which except in size offered little in treatment from ordinary easel pictures. The suggestions are to be found in a report, but as sixty years have elapsed since they appeared an extract from them will help to recall the spirit of the architect's scheme:—

I would suggest that the walls, the several halls, galleries and corridors of approach, as well as the various public apartments throughout the building, should be decorated with paintings having reference to events in the history of the country, and that those paintings should be placed in compartments formed by such a suitable arrangement of the architectural design of the interior as will best promote their effective union with the arts of sculpture and architecture. With this view I should consider it to be of the utmost importance that the paintings should be wholly free from gloss on the surface, so that they may be perfectly seen and fully understood from all points of view; that all other portions of the plain surfaces of the walls should be covered with suitable architectonic decoration or diapered enrichment in colour, occasionally heightened with gold and blended with armorial bearings, badges, cognisances and other heraldic insignia emblazoned in their proper colours. That such of the halls as are destined should have their vaults decorated in a similar manner, with the addition occasionally of subjects or works of art so interwoven with the diapered ground as not to disturb the harmony or the effect of the architectonic decorations generally, and not to interfere with the elementary features of the architectural composition. That such of the ceilings as are flat should be divided into compartments by moulded ribs enriched with carved heraldic and Tudor decorations. That these ceilings should be relieved by positive colour and gilding, and occasionally by gold grounds with diaper enrichments, legends and heraldic devices in colour. That the screens, pillars, corbels, arches, dressings of the windows and other architectural decorations should be painted to harmonise with the paintings and diapered decorations of the walls generally, and be occasionally relieved with positive colour and gilding.

The floors were also to be enriched with colours by means of tiles. The walls to the height of 8 or 10 feet were to be lined with oak and present armorial bearings correctly emblazoned. The windows were to be doubly glazed in order to prevent the direct rays of the sun from interfering with the effect of the internal decorations. The statues were to be placed in niches surmounted by enriched canopies, and the niches to be painted in such colours as would give the best effect to the adjoining paintings. The whole report is evidence that BARRY had clear ideas about securing unity in his colour decoration, and if they were realised the building would assume a nearer relation to mediævalism in character than it does at present.

The Royal Commission had likewise its definite ideas, which unhappily were evidence of the partial acquaintance with art which prevailed among men of taste in the forties. They took it for granted that architecture meant building in its severest or most utilitarian form. Everything beyond that, whether known as decoration, ornament or art, was supplementary. Accordingly, they assumed that carving, whether on a large or small scale, metalwork, painting, stained glass, and so on, became their special province, or, in other words, the architect had no right to interfere with any class of work which could be more properly ordered by amateurs. They seemed aghast at the discovery that decorative works were specified by BARRY as if they were as necessary as brickwork or masonry, and were evidently annoyed that by that kind of forestalling they were deprived of a still larger field to revel in.

The adoption of fresco by the Commissioners partly arose from a desire to please the PRINCE CONSORT by imitating the German practice of the time, but partly also from a wish to cover a wall with a single painting. It was acknowledged that English practice mainly consisted in producing pictures of cabinet size, but it was expected that a school would be formed under the auspices of the Commissioners devoted altogether to mural work. We find Sir CHARLES EASTLAKE, the secretary and technical adviser of the Royal Commission, writing:—"In the present instance the chief decorations in painting will be required to be on an extensive scale. The difficulty of keeping large masses of canvas well stretched during all changes of weather has been considered an objection to the employment of that material under such circumstances. The evil here alluded

to may be seen in its worst form in the ceiling of the chapel at Whitehall, owing to the surface of the paintings being highly varnished. The fittest kinds of painting for the decoration of architecture are those which can be applied, when required, to every surface, curved as well as plane, and for such general decoration, fresco—recommended as it is by the example of the great masters—appears to be better adapted than any other method." Now, in BARRY's project, which we have mentioned, not a word is said about colossal paintings, and the objections to canvas when used on a gross scale do not apply. BARRY's pictures would be placed in architectural compartments in which, of course, proportion to the size of the room would be observed. They evidently would be subordinate to the scale of the building. As a painter and the representative of painters, EASTLAKE could not appreciate planning or direction which failed to allow each of the painters to make his work as prominent as possible, and BARRY's views were therefore frustrated. The fiasco of the "go-as-you-please" system, which the Houses of Parliament now exhibit to astounded visitors from abroad, testifies to the consequences of following two systems which were inimical, viz. the painter's, which was merely personal, and the architect's, which was national. It is strange, too, that a theory about the relations between sculpture and painting with architecture, which can be now announced in a remote city like Melbourne as if it were a truism, was not sixty years ago comprehensible to some of the most refined men in England.

HALLAM, KNIGHT, ROGERS, MACAULAY, who were members of the Commission, would have maintained that in Italy paintings and other works were executed in public buildings without much regard to the architect's anxiety for unity and fitness. In some of the cases the original architect was no longer in this world. It should also be remembered that the Renaissance painters had generally made a study of architecture as part of their education, and were therefore likely to submit to limitations in order to enhance the general effect. No architectural decoration surpasses GIOTTO's in the church of Assisi. It sometimes happened, also, that the rooms to be decorated were without any architectural value, and a painter may have considered he was justified in covering the wall with figures. The Sistine Chapel is an example. But eminent as were the painters, and skilled as they may have been in architecture, there is no doubt they often executed frescoes which are excessive in area, and are not suggestive of the repose or the stability which architecture demands. Their example should be taken as a warning by those who are indifferent about the necessity of a controlling power that will not admit excess of any kind within a building although sanctioned by a great name.

The painters' rebellion against restraint has sometimes been overcome by forming panels, as in some of the French seventeenth-century salons, and in larger buildings, by dividing the wall space by means of pilasters. Even in such cases harmony is not insured unless a single painter is employed. What a different and more logical aspect the Panthéon in Paris would present if the authorities could have persuaded PUVIS DE CHAVANNES to paint the whole of the walls! He initiated a decoration that was not only as simple as if painted in monochrome, but which made the architectural lines stand out with more effect. The charm and suitability of his treatment were recognised by other artists who received commissions for continuing the decoration. They knew it would be an advantage if a close correspondence with his work could be accomplished, but not one of them dared to use similar colours or to introduce figures as simple or composition so apparently artless, for they knew that any approach to resemblance would be fatal to their own reputation. The consequence is that now we can see a great many experiments in wall-painting produced under exactly similar conditions, but there is an absence of unity, and the decoration as a whole fails in its effect. We have as if we were a gallery of paintings uniform in their dimensions, but greatly varied in composition and colouring. It is true there was an architect having charge of the Panthéon, but he was unable to exercise any controlling power. When such a failure can arise in a city like Paris where there are so many able artists and so elaborate an organisation for

insuring success, what is to be expected in places less favoured?

In Australia there exists, as we have remarked, a satisfactory theory about what should be done for the decoration of public buildings. If the means which are necessary for the Federal capital were by some magic power to arise in our time, would it be certain that the mistakes committed at Westminster would be avoided in the new Southern city? Will the Australian members be wiser than were LYNDHURST, ABERDEEN, PALMERSTON, PEEL, HALLAM, STANHOPE, MACAULAY, CARLISLE in 1841, who would not allow the architect of the Westminster Palace to have a place among them? No one who is acquainted with political life would reply in the affirmative. Knowledge is, however, increasing, and from the numerous failures in decoration more importance may be attached to the position of the architect as chief of the artists. Several years may have to elapse before the Federal capital becomes visible, and by that time the wisdom of the ancients may be respected, and some happy architect allowed not only to build the halls of assembly and the committee-rooms for the people of Australia and their representatives, but may enjoy the good fortune which was denied to CHARLES BARRY of inspiring and directing their adornment.

NATIONAL PORTRAIT GALLERY.

THE Trustees of the National Portrait Gallery have received from Mr. G. F. Watts, R.A., as part of his original gift to the nation, an excellent portrait of the late Right Hon. William Edward Hartpole Lecky, O.M., painted in 1878. This portrait will be placed immediately on exhibition in the Galleries.

The Trustees have also accepted the following portraits as donations, viz:—

Henry Crabb Robinson, the well-known journalist and diarist, painted by Henry Darvall, and presented by Mr. T. Smith Osler.

John Pyke Hullah, the musical composer and teacher, a pencil-drawing by Sir William B. Richmond, R.A., K.C.B., presented by his son, Mr. Francis Hullah, and other members of his family.

Mary Ann Paton, the eminent English *prima donna*, married first to Lord William Pitt Lennox, and secondly to Mr. Joseph Wood; an unfinished sketch in oils by Thomas Sully, presented by her representative, Mr. Robert H. Wood, M.A.

The Trustees have also acquired by purchase an interesting portrait of Henry Purcell, the famous English musical composer, painted by John Closterman.

EXCAVATIONS AT DELPHI.

THE Classical Society met on Friday afternoon last, at 5 o'clock, in the Senate House, Cambridge, Sir Richard Jebb in the chair. The Chairman opened the proceedings by referring to M. Homolle, Membre de l'Institut, &c., as the distinguished director of the French School of Athens, an institution which for many years has contributed most effectively to the advancement of Hellenic studies. As the excavator of Delphi and Delos, M. Homolle stood in the very forefront of archaeologists.

Dr. Waldstein said that there was perhaps some appropriateness in that he had been chosen to introduce his friend M. Homolle. For not only had they been colleagues in Athens for many years, but they had been in friendly rivalry. At one time it was very doubtful whether he or M. Homolle was to excavate Delphi. In 1891 and 1892 it looked as if the concession was to be granted to him (Dr. Waldstein). Though he could not deny that the loss of Delphi, after years of labour and after he had collected large sums in America, was a serious disappointment to him, he wished now to say sincerely that he did not regret that this most important task in archaeology had been entrusted to the hands of M. Homolle. He felt this when he saw the splendid way in which the work had been carried out by his French colleague, when he realised the generous help which the French Government gave to the archaeologist, not only in the furnishing of adequate funds, but also in the direct support it gave by sending able assistants in every department, as well as all the costly machinery for such work. Even in the publication of the results the Government liberally supplied the cost of printing an illustration in a form which we could never produce in this country. When he realised how we here had to expend most of our energies in the raising of funds and the material preparation for work and study before even we arrived at the

arduous scientific labour itself, he felt that such a great work of science and learning could only be undertaken in countries where the Government realised the utility and claims of such higher intellectual attainments. He wished to congratulate their *ami loyal* on the brilliant results of his work.

M. Homolle began by thanking the chairman, Sir Richard Jebb and Dr. Waldstein for the cordial introduction. The character and the associations of the great University—its majesty—had so much impressed him that he felt awed by them. But he felt himself supported by the friendship of his former colleague at Athens, Dr. Waldstein, whose friendship was the surer from having arisen out of rivalry. Sir R. Jebb's acquaintance he had made while he was excavating Delos more than twenty-five years ago. He could not undertake to lecture on the whole of his excavations at Delphi; for this much time would be required even for the enumeration of the numerous finds in buildings, works of sculpture, inscriptions and works of minor arts, numbered by thousands. He would make it his task to give a more thorough exposition of one monument, the Treasury of the Cnidians, which would illustrate the nature of their discoveries and the method of excavation and study which they applied. Before turning to this special subject the lecturer, by means of photographic lantern slides thrown on a screen, showed the actual state of the site of Delphi since the excavations of the last ten years, as well as the restoration of the building made by the skilful architect, M. Tournaire. He then, using the itinerary of Pausanias, pointed out the chief buildings and monuments along the sacred road, most of which they were now able to identify. Turning to the Treasury of the Cnidians, he gave his reasons for identifying the remains found by them with that building and with the ruined foundations, together with fragments of architecture found chiefly about there, and other fragments found scattered about the whole site. He began to build up, by means of illustrations, before the eyes of the audience the whole of this interesting small edifice. Step by step he took the podium, the stylobate, the central portion of the portico, the door, the entablature with its sculpture frieze, and every cornice, until he showed the pediment surmounting these and the acroteria, with figures of victory crowning the pediment. Every point in the profuse decoration was carefully considered, and it was shown how these formed part of that building by their relation to one another and their peculiar style. These arguments were supplemented by the study of similar structures found at Delphi, of similar date and origin, while the fortunate discoveries of inscriptions with the Ionic alphabet from Cnidus threw a direct light upon this very building. Even the singular caryatides from the porch were built up before the eyes of the audience out of the fragments found at different spots and pieced together with infinite care. The result is that we now have before us a complete building fully illustrating the style and characteristic features of Ionian art of the sixth century B.C., in architecture as well as sculpture, and thus yields important information concerning that interesting period in the history of Greek civilisation.

The lecturer was often applauded when he ingeniously brought out a striking piece of evidence with convincing clearness, and the vote of thanks, humorously proposed by Professor Ridgeway, was cordially given him.

HOSPITAL SITES IN LONDON.

A PAPER on "London Hospitals and Medical Schools and their Sites" was read at a meeting of the Hospital Association by Sir H. C. Burdett. The sites of the London hospitals, taken collectively, represented, he said, the best and the worst features which could attach to hospitals in densely crowded neighbourhoods. The thing to be aimed at was to have a site of sufficient area to provide at least 300 or, to meet modern hygienic requirements, 450 superficial feet per bed. Each site should be so placed as to prevent the hospital from being deprived of light and air by contiguous buildings. At St. George's the area per bed was 191 feet, at the Westminster Hospital 134 feet, at the Royal Free Hospital 253 feet, at the Middlesex 267 feet, at St. Mary's, when the new wards were finished, the area would not exceed 200 feet, at Charing Cross Hospital it was only 86 feet, and when the rebuilding of University College Hospital was complete the area per bed would be about 160 feet. With regard to the four Greater London general hospitals, the area per bed at the London was 310 feet, at Guy's 364 feet, at St. Thomas's 652 feet, and at St. Bartholomew's, taking the original site, 300 feet dead reckoning. With the additional land recently purchased the area was brought up to 420 feet dead reckoning, if the total of beds was brought up to 700, as was proposed. He used the expression "dead reckoning" in this respect because the site was so crowded with buildings. Thus no London hospital, with the exception of St. Thomas's, and probably Guy's,

filled the requirements of modern science in this respect. In London, again, with the exception of St. Thomas's, the medical school buildings had been added from time to time. In the case of one hospital 56 per cent. of the site was occupied by buildings, although the ward blocks, theatres, &c., occupied less than 16 per cent. of the whole available area, while the medical school and kindred buildings covered 20 per cent. In these circumstances he welcomed the scheme proposed by the Institute of Medical Sciences committee of the University of London which provided for common courses of instruction for internal medical students, not only in chemistry, biology and physics, but in anatomy, physiology and pharmacology, and which would ultimately relieve the hospitals of the necessity of providing accommodation, appliances and teachers for these subjects, and enable them to devote their whole energies to the teaching of clinical subjects of medicine and surgery. It would also greatly improve the hygienic condition of the sites of most of the great London general hospitals, by freeing them from existing blocks of buildings. It was estimated that 375,000*l.* would be required by the University to build and equip the various institutes and provide professors. Any person of large means had here presented to him a splendid opportunity for wisely expending some of his money. Turning to the present position of St. Bartholomew's Hospital, Sir Henry said that the architect who originally planned the buildings deserved their admiration for his foresight and ability. The four ward blocks were unique in arrangement. Each block was self-contained and separate from the others, and they were so arranged as to facilitate the free circulation of air round each and through the hollow-square formed by them. The plan provided that sun and air should have free access to each block; but the continuous growth of the work of the hospital had caused the wards to be rendered gradually less and less desirable as a residence for patients by the addition of other buildings. If the plan of the Mansion House committee was to be carried out, 350,000*l.* would be spent in new buildings which would render the old wards double-packed and terribly faulty, in regard to the hygienic requirements of sunlight and air, which were made so prominent a feature by the original designer in 1730. What was the alternative? The addition of about an acre and a half to the present site. On an 8½-acre site St. Bartholomew's might be made perhaps the finest general hospital in the Metropolis. Sir Henry here explained a plan carrying out this project, and proceeded to say that he was advised that, apart from the cost of the extra land, the hospital could be brought up to date in every respect at an inclusive cost of 350,000*l.* Yet it was proposed to waste that sum under the scheme of the Mansion House committee, which would in practice lead to the ultimate destruction of this great institution with 700 beds and the largest medical school in London, for such a plan could not last for more than a few years relatively, when the institution must fall into discredit hygienically and popularly.

ACADEMIC TRAINING IN SCULPTURE.*

I HAVE been asked to express my ideas concerning the Roman Academy. What I have to say can be said in a few words, and I take pleasure in so doing, not only from a sentiment arising from my early associations with the Ecole des Beaux-Arts and its organisation, but more because I am of the firm conviction that an institution such as that is an admirable one.

My reason for thinking it admirable is my belief that the strenuous competition required to gain access to the Villa Médici, as well as the four years of study in that wonderful spot, tend to a more earnest and thorough training than could be gained under the present conditions of life in our times.

I am not one of those who believe that only the few who possess marked talent should attempt to be artists, although I do not think that there are but a small number in the world who are gifted and who possess that indefinable quality, that elusive something, which makes the great artist. In art, as in everything else, only the fittest survive. But in our civilisation certain of the population will go into the fine arts "willy nilly," and sooner or later fall back to what the law of the survival of the fittest brings them to. However, this great band of the fittest have their work to perform, their love of the beautiful contributes to happiness and tends to a wider enjoyment of life in the revealing of beauty where otherwise it would have been ignored.

I know it is a question whether such a knowledge increases the general happiness and morality of a community. I firmly believe that it does, as I believe that any effort to do a thing as well as it can be done, regardless of mercenary motives, tends to the elevation of the human mind.

The result required by the system of the Ecole des Beaux-Arts and the School of Rome, however, from the serious education, is that they will be better workmen in each of the various vocations they finally fall into. In our period of hurry and of gaining ends, no matter how superficial, in the quickest possible way, no one will dispute that this is a healthy fight to make.

In the repeated attacks that are made on the Roman Academy and on the Ecole des Beaux-Arts and in the incessant cry for greater freedom in the development of the artistic mind, there is a certain truth. But in the reaction the pendulum swings too far and the real question is lost sight of. There is a middle ground on which to stand. It seems to be rarely realised that the very men who are shown as examples were, if not actually brought up in the School of Rome, all men of a thorough academic training. Only after such training does the mind become sufficiently mature and the individual personality so developed as to be able to indulge in unqualified freedom and liberty of expression.

Rodin, one of the leaders of the movement against academic training, had had a most thorough and arduous training during the early years of his career, and I am of the opinion that that training, instead of dwarfing or minimising his extreme power of expression, has been of enormous assistance to it. Leaving out of the question the exhaustive early study of the great masters of the past, Michel Angelo *et al.*, and coming to our own times, to the brilliant men of the French School, we find that all have had the same early experience. Paul Dubois, one of the masters of French art, who although not a member of the Villa Médici, had a training fully equal to that which could be gained there, was one of its strongest supporters. Houdin, Rude, Falguière, men whose work lives and breathes with Divine fire, were trained there: Puvion de Chavannes and Baudry, to enter another domain, I may add to my list. It is needless to say that none of these were injured by it.

Sculpture is no more exempt from the necessity of a thorough preparation than is music, architecture or any of the arts and sciences. Only constant diligence and earnest application in early years, harnessed with a natural talent, give us our master workmen.

The disastrous results to those who ape the mannerisms of such masters as Rodin and follow in their wake are pathetic in their futility and weakness, when they are not comic, and their failure leaves them not only bad artists, but (and here I come to what I consider the main point of my contention) weak and crude workmen in whatever else they do. I am inclined to think that if it were not for this class and this condition of things, I should not be so proud a partisan. But the betterment of this class and at the same time the help that is given to the young master makes it worth while.

In the American Academy founded in Rome the plan is to follow the same lines as the French Academy, but, in profiting by their experience, to better it, in that much greater liberty and freedom are exercised in the selection of the students who are to partake of its benefits and in allowing them to the student in his life, and the execution of his work while there.

It cannot be denied that the four years of undistracted attention, apart from the temptations of a large city, devoid of pecuniary worries and surrounded by a sympathetic environment where the whole thought is directed to the highest artistic achievement possible, in the formative years of a young man's life, can be anything but an enormous assistance and of vital importance to the few who have the Divine gift. If it were but one in a century who was helped in this way the institution would be worth while.

THE ARCHITECTURAL ASSOCIATION OF IRELAND.

THE members of this Association paid a visit on the 3rd inst. to the engineering works of Mr William Spence, at 107 and 108 Cork Street, Dublin. They were received by Mr. Spence, his son, Mr. Arthur Spence, and by Mr. H. J. Lundy, M.R.I.A.I., his son-in-law, through whom the visit had been arranged. Mr Spence accompanied the visitors through the extensive works, explaining the uses of the various machines, while Mr. Arthur Spence illustrated his remarks by practical demonstration. Having inspected a new row of houses erected by Mr. Spence for his workpeople, and also a large fitting shop which is in course of construction, the members were conducted to the foundry, where the various processes of casting were explained. Several large castings were made in connection with work Mr. Spence has in hand for Guinness's brewery. The president, Mr. Charles H. Ashworth, thanked Mr. Spence for his kindness in allowing the Association to view his works, and Mr Spence replied. Having partaken of refreshments the members separated.

* A paper by Mr. Augustus St. Gaudens read at the Thirty-seventh Annual Convention of the American Institute of Architects.

NOTES AND COMMENTS.

THE controversy about the relative advantages of town and country hospitals is too important to be treated as if there must be a one-sided conclusion. As in many other important affairs, compromise is essential, and the basis on which it can be determined has been suggested by Mr. JONATHAN HUTCHINSON, the eminent surgeon. He is of opinion that each of the large London hospitals should possess its country branch. In cases of chronic disease should be treated, while cases of acute disease and those requiring serious operations should remain in town. He adds:—"The plan of divided hospitals, one-half in town and the other in the country, would not probably lead to any reduction in the present number of our London institutions, nor of their size. It would, however, by greatly diminishing the number of patients which now crowd them, enable them to fulfil their purposes in the best possible manner without necessitating any costly additions." In all large cities cases arise through accidents, and other causes which demand immediate attention, and serious consequences might arise if patients had to be conveyed to a distance. It may seem unfavourable to recovery when buildings are in confined situations. But there are advantages in city hospitals which should not be lightly set aside in order to satisfy those who like to see the stern work take place amidst pastoral surroundings.

IN his "Præterita" Mr. RUSKIN gives a delightful description of the Geneva he loved, which was, he says, "SAUSSURE'S school and CALVIN'S—ROUSSEAU'S and BYRON'S—TURNER'S—and of course, I was going to say, mine." The later Geneva, with its polypous knots of houses, was unsatisfactory to his eye, because the impressions received in 1833 and 1835 were not effaced from his mind. So many eminent men have from time to time found a refuge in the Puritanic, but independent city, there must be some difficulty for even a native to recall the houses in which they lived. Mr. ROBERT HARVEY, a brother of Mr. LAWRENCE HARVEY, who, a few years ago practised as an architect in London, has endeavoured to preserve the associations by preparing a record of "Geneva as Intellectual Centre," which can be consulted in one of the halls of the University. In the same spirit he has used his influence to fix memorial tablets on the houses occupied by celebrities. Among those who co-operated to that end is Professor KLING. He was desirous to have a plaque set up on a boarding-house in Mornex, in which he was a fellow guest with RICHARD WAGNER, the composer, in 1856. Mr. HARVEY had also ascertained that JOHN RUSKIN lived in the same house in 1863, and was eager the English writer should also be remembered. By an arrangement they have placed a plaque which will recall the German and the Englishman, and more recently they have hung portraits of the two in the interior of the pavilion. In no city is there more scope for similar aids to memory, and the presence of the tablets would become testimonies to the unique character which Geneva has held for many years.

THE announcement that the roof of the cathedral of Toledo is in danger must excite alarm, not only among lovers of architecture, but also of the legends of romantic Spain. According to tradition, St. JAMES the Apostle was the first bishop, and he appointed as successor ELPIDIUS, who was a hermit of Mount Carmel. The early bishops enlarged the original building, and "Our Lady of the Assumption" is believed to have been an important structure when the persecution under DIOCLETIAN burst out. The church was destroyed, but it was one of those expressly rebuilt by order of the Emperor CONSTANTINE. It used to be popularly believed in Toledo that the cathedral assumed its present form in the thirteenth century, and yet is a copy of the Temple of Diana at Ephesus. It is needless to say the style refutes that tradition, for in plan the church is more suggestive of Notre-Dame in Paris. Parts date from the fourteenth and parts from the fifteenth century, and they recall work of the same

period which is found in France. The exterior is not equal to that of Burgos in richness, but the interior, with its double aisles, makes a remarkable impression on the visitor. There are splendid windows, and the choir is large enough to form a church. The total length of the building is about 400 feet, and the nave is 100 feet in height. The experts who visited Toledo last week have found there is too much reason for the alarm. The church contains so much wealth in the form of metalwork and wood-carving, which always appears sound, it is possible adequate attention has not been given to the structure itself. The wealth of Spain is different from what it was in the fifteenth century, and offerings to churches are only sparingly made. It will, however, be discreditable if so glorious a building should collapse, especially in a country where cathedrals and churches contribute so largely to its greatness.

THE German painter, GUSTAV MILLER, who died in Rome in June 1901, bequeathed to the German Government a sum of 12,000*l.*, with the intention of providing a fund for the purchase of works of art which would be a memorial of his twin-brother EDOUARD MILLER, the sculptor, who died in 1895. The control of the expenditure will rest with the German Government. The works are to consist alternately of oil paintings and pieces of sculpture, and are to be selected from those exhibited in some international exhibition in Rome. The artists are to be in turn Germans and Italians. In every instance the purchase will be arranged directly with the artist, for dealers must have no share in the transactions. Both artists, we presume, suffered through middlemen. The choice of works will rest with a committee, with the German ambassador in Rome as chairman. The next exhibition will be held from January to May 1904, and the money is to be expended on oil-paintings by German artists.

ILLUSTRATIONS.

CATHEDRAL SERIES.—EXETER: EAST END OF LADY CHAPEL.

THE Lady Chapel which is the subject of our Illustration is not the original one. There is mention in the records of an earlier structure, of which some parts still exist. It is supposed the present chapel was provided by Bishop QUIVIL (1280-91), who was buried within it. The chapel is 60 feet in length. For a hundred and sixty years it was used as a library for the Dean and Chapter, but in 1822 it was restored according to the fashion of the period. At a later time it was brought to the condition now seen in the course of the restoration under Sir GILBERT SCOTT. The employment of grisaille glass in the windows is testified by an entry in the Fabric Roll of 1317-18, which records that 629 feet of "albo vitro" were bought at Rouen for 15*l.* 4*s.* 9*d.*, or about 6*d.* per foot. The coloured glass—203 feet—cost 10*l.* 3*s.*, or 1*s.* per foot. The prices were higher than for the glass used in the choir. The decoration of the chapel is based on fragments of original work.

SKETCH FOR COMPLETION OF JAMES ALLEN'S GIRLS' SCHOOL DULWICH.

THE original buildings of this school were erected nearly twenty years ago, and have at various times been added to, and the proposal now illustrated, when carried out, would, it is expected, reach the limits of accommodation required or possible in connection with the central block. The wings now shown as additions carry out the original intention of having one-storey wings to the main building; this intention was abandoned for considerations of cost when the original building was erected. The architect is Mr. ARTHUR J. GALE, F.R.I.B.A., of 4 Serjeants Inn, Fleet Street, E.C.

THE STATUTORY REGISTRATION OF ARCHITECTS.*

THE protection of the profession of architecture from unqualified practitioners is by no means a modern conception. So far back as the days of Vitruvius, the celebrated architect, complaint is made of irresponsible and uneducated men practising the art. He says in the introduction to his eighth book:—

"When, therefore, I see this noble science in the hands of the unlearned and unskilful, of men not only ignorant of architecture, but of everything relative to buildings, I cannot blame the proprietors who, relying on their own intelligence, are their own architects."

And in his tenth book, referring to the manner in which the Council of Ephesus dealt with incompetency, he says:—

"Would to God that such a law existed among the Roman people not only in respect of their public, but also their private buildings, for then the unskilful could not commit their deceptions with impunity, and those who were the most skilful in the intricacies of the art would follow the profession."

I do not propose to occupy your time at any great length in evening, but desire to point out as briefly as possible the main features and progress of the movement we are now met to discuss. In introducing my subject, I must necessarily go on some ground with which some of you may be familiar, for the benefit of those to whom the question is new I should like to define

What we mean by Registration.

In the present it means that every man practising architecture shall be enrolled in an official register under an Act of Parliament and be responsible for his professional actions, and that no one be allowed to practise until he is duly enrolled. In the future it means that no one be allowed to practise architecture until he is duly qualified and has been found so by undergoing a qualifying examination. It means, in fact, little more than making the Institute examination compulsory by Act of Parliament. It is a matter for surprise that this obvious benefit should not have been secured to the profession long since seeing the advantage a qualifying examination has been to the learned professions of law and medicine.

Why is the Reform Necessary?

There is a vague notion among the general public that architecture is one of the fine arts. This is all very well as an abstract theory, but when it comes to the practical application of architecture, and the actual individual who is to translate the theory into practice, the public know very little how and by whom it is done, and, I think, care less.

The profession, as it is styled by courtesy only, is not looked upon and respected, contrary to the learned professions just mentioned, and I think if we look at the present position and practice of architecture in this country we shall find a reason. A person with or without a fair general education, any ruler, builder's foreman, clerk of works, clerk in a local council office, auctioneer, undertaker, &c., with the sole qualification of being able to provide a brass plate, is at liberty to advertise himself as a person qualified to give advice to the public in the science and art of architecture.

We in London suffer from builders, decorating firms and others who, going out of their proper province, boldly proffer their services as architects to their customers gratis, and the present saving of 5 per cent. is not to be resisted. Some even go to the length of announcing that a competent architect is kept upon the premises—I suppose like the shopkeeper. Can it be a matter for wonder that architects are still recognised while such a condition of things exists? for at present the public have no guarantee that the class who call themselves architects are any better qualified to plan and erect their buildings than the contractors who erect them, and should they employ an architect they have no means of ascertaining that his knowledge is greater than that of the builder, and the only certainty about it from their point of view is they will have to pay the professional charges.

Who is to carry out the Reform?

I have no hesitation in saying that if this thing is to be done the Institute has to do it. It is not my intention to-night to say one unkind word against the Institute, but I would like to venture on a little friendly criticism and point out how far it is one in the direction of registration. The Council of the Institute, in its session of 1859-60, drew up a special report on architectural examination, from which the following is an extract:—

The ultimate result should, in their opinion, be the establishment of a system of compulsory examination, extended to all architects, whether members or not of this Institute."

A paper read before a meeting of the Manchester Society of Architects by Mr. Ellis Marsland, on December 10.

It also states in the "Kalendar":—

"The R.I.B.A. desires to obtain for all those entering the profession a systematic course of education . . . thereby laying a foundation of artistic and scientific knowledge upon which to cultivate any natural gifts and develop any aptitude for invention or design he may possess."

On May 30, 1890, it passed the following resolution:—

"That while not opposed to the principle of compulsory examinations as applied to those about to practise architecture, the Institute is of opinion that the difficulty of restricting by statutory powers the practice of architecture to those who have passed an examination is at present so insuperable, that it is undesirable to make an immediate application for such powers."

To what does this resolution amount but the admission that the principle is a good one, and that the difficulties in the way are the only bar to progress?

Why do we band ourselves into societies and associations unless it be for the express purpose of overcoming difficulties and bringing about reforms for the general good?

More than two years ago the then President of the R.I.B.A., in his inaugural address, urged the Institute to follow the lines of the Incorporated Law Society as regards solicitors. Again, Sir William Emerson, P.P.R.I.B.A., is reported to have publicly stated that:—

"What was wanted was that the status of the architect should be more clearly defined, and to this end it would be a good thing if Parliament were able to pass some measure by which their town and country should be prevented from being disfigured by the work of builders without guidance, or by men who had absolutely no justification for practising as architects."

The latest presidential announcement is, however, of a passive resisting type, and states that "inaction on the part of this Institute has been deliberate and intentional." This inactivity is placing the Institute in a false position, and is causing a vast amount of dissatisfaction, especially among provincial members, as the want of such a measure of reform is felt far more keenly by them than by London men.

The necessity for a higher standard of professional excellence and public confidence is of essential importance to provincial men. There is a feeling—a mistaken one, if you will—that local architects are all very well for the ordinary work of the town, but as soon as any work of primary importance is to be executed architects from outside are invited to compete. Does not this arise partly from a want of confidence, there being no guarantee in employing a man who is styled an architect that he really knows his business? but nine cases out of ten it is the local man who, from his knowledge of the materials of the locality and the special requirements of his fellow-townsmen, is more likely to carry out the work satisfactorily than an architect from a distance.

Of what use is it for the Institute to say that its examination is a panacea for the existing evils, unless this examination is made compulsory? Until men find that by undergoing a course of study and passing an examination they are placed in a better position in the eyes of the public than the man who possesses no qualifications at all, it is very unlikely that an appreciable number of men will voluntarily come forward and avail themselves of this means of entering the profession.

The Attitude of the "Memorialists."

I can quite understand the attitude, although I do not agree with the opinion of the coterie of art men who, in a memorial addressed to the Institute in 1891 and quoted by the President in his address, said:—

"That a diploma of architecture would be a fallacious distinction, equally useless as a guide to the public and misleading as an object for the efforts of the student, and that no legislation can protect the public from bad design."

The attitude of these gentlemen is at least logical because they don't believe in any examination at all. But where an examination is a settled policy it is absolutely illogical to bind heavy burdens on the backs of its student members in the way of a difficult and prolonged course of study and examination, and then to offer them nothing in the way of protection from the man who has passed no examination at all.

The only logical sequence of education and examination is protection and registration, or why have any examination at all? Did it ever strike you what an incalculable amount of harm this voluntary examination is doing? You know as well as I that by far the larger number of candidates fail to satisfy the examiners, and what becomes of these? They are not debarred from practising as they would be under a Registration Act, but they are let loose half educated, and a menace to the public and a discredit to the profession for which they have imperfectly fitted themselves.

The Attitude of the Profession towards the Movement.

We are informed, but upon what authority I do not know, that there was a considerable body of opinion strongly against the movement, and that it is outside the realm of practical politics. This I deny. What are the facts? From a recent poll of the profession—i.e. of all members of any recognised

architectural society—more than two-thirds replied in favour of registration, only 170 replied as opposed to it, and the balance, I think we may fairly assume, were either indifferent or had not sufficiently thought out the subject, and therefore did not reply. Your worthy President has taken the trouble to obtain the general opinion of the allied societies, and I quote from his address:—

"In order to ascertain the general feeling on the subject, I have invited the opinion of the various societies in different parts of the country, and out of twelve from which I have received replies six were in favour of registration, one against, two were divided in opinion and three had not discussed the question."

The president of the Northern Architectural Association, Mr. J. Walton Taylor, F.R.I.B.A., in his opening address, says:—

"With regard to registration the allied presidents were in favour of it, but thought the Institute was the proper body to take the subject up."

Mr. Butler Wilson, president of the Leeds and Yorkshire Architectural Society, said in his opening address:—

"I hope at the next election of the Institute Council that the question whether candidates are in favour of registration or no will be rendered even more acute than at the last election, when, without organised effort, we succeeded in placing thirteen declared registrationists. There are still about a score members who are neutral. But we must insist on their declaring themselves one way or the other, so that we know which way to vote. You cannot get anywhere by neutrality. It is not a quality which makes for advancement. To render the co-operation of the allied societies effective, I shall propose an association between us which would make registration the crux of the next elections."

Again, meetings have been held in the following towns—Cardiff, Bristol, Exeter, Leeds, Liverpool, Manchester, Birmingham, Newcastle, Sheffield, Edinburgh, Glasgow—at all of which resolutions were passed, with some few dissentients, in favour of the proposal. The Royal Institute of Architects of Ireland has decided in its favour, and has intimated that if the English Institute will not do it they will do it themselves.

The Feeling on the Continent.

What are our continental brethren doing in the matter?

1. The fourth International Congress of Architects, held at Brussels in 1897, by a unanimous vote agreed to the following resolution:—

"That the architectural societies should unite and conduct an energetic campaign to obtain from their Governments the institution of the diploma."

2. The fifth International Congress of Architects, held in Paris in 1900, passed a resolution which was unanimously adopted to the effect:—

"That Governments should take steps to protect and secure respect for the title of architect by reserving it for the future, and without retrospective action, for architects provided with a certificate of capability, or by forbidding its use by others; and, further, should place such certificate within the reach of all by the spreading of special architectural education and training."

3. The States of Iowa, Illinois and California have passed such a law, and other of the American States are seriously considering the question. The Province of Quebec has adopted a similar policy.

4. Germany and Hungary oblige all public architectural officials (State or municipal) to have a Government diploma. In France the method of appointing Government officials approaches that of making a diploma necessary. In Italy, Spain and Russia our profession is a closed one.

Surely, then, the matter is ripe for us and the season opportune, and it is within the realm of practical politics. The longer the matter is left the more growing is the evil and the harder it will be to accomplish.

The Advantages of Registration.

To put the matter shortly, the advantages arising from registration are these:—

Closing the doors to incompetent men.

Raising the standard of the profession.

Obtaining the confidence of the public and State recognition.

It is not proposed for one moment to say all who desire to build should employ an architect, but what we do propose is that henceforth, in the interests of the public, no person shall be entitled to call himself an architect whose name is not enrolled as qualified under an Act of Parliament, and any person wishing to employ an architect may, by consulting the official register, ascertain what men are qualified.

Some Alleged Objections.

I will now deal with the objections.

And I think I may first venture to deal with those raised by the worthy President of the R.I.B.A. (which I have no doubt

you have all read), as this is the first time that an opening address has dealt at all exhaustively with the subject Registration.

We are told by him that "Protection is in the air," and without wishing to introduce any political element into a discussion to-night, I agree with him, but for us it is Architectural Protection. He says, "Protection is in the air, I know, and I am not rash enough to express any opinion upon it." I have, however, whether rashly or otherwise, a strong opinion on the subject, and say that we have suffered sufficiently long from free trade in architecture, and it is time we tried a little protection in the way of education and registration.

We are told "that an artist is born, not made; no questions and answers admit him into the fold." Now, gentlemen, I ask what fold? What is a fold? It is a place of safe enclosure within a high wall where protection is offered against the wolves that raven. Where is this fold offered to the architectural sheep who seek to come within it for shelter and protection against the architectural wolves? I say it does not yet exist; and if, as some say, it does exist, it only partly surrounds the fold in the way of the Institute examination, which is not compulsory, and is therefore useless for the purpose. What we aim at by our registration is to make the wall complete, and then it will become an architectural fold.

Again, referring to the expression "an artist is born, not made," I want to know who was the author of this catch sentence. I say it is a fallacy. Horace, I think, says, "*Poet nascitur, non fit*"—a poet is born, not made; but a poet is very different man to an architect. I won't refute the fallacy myself but quote to you the words of the President of the Ontario Association of Architects. He says:—

"Nor is there any real force in the stock objection, that architecture is an art, that an architect must be an artist, and an artist cannot be made by examination. . . . But there is much in the way of putting a thing, and I am not afraid to take the highest type of architect as a subject for the examination theory, and affirm that the saying that an artist is born, not made, is only half a truth. That one cannot be made an artist who is not born an artist, is true; but it is equally true that one who is born a potential artist must also be made an effective artist. An artist must be both born and made, an examination—which is but a short form of expression for the education which the examinations are instituted to test, and even compulsory examination, is the only sure road to make a heaven-gifted artist able to make use of his gifts."

In the President of the Institute's address we are treated to a little parable of the two undergraduates who were trying to induce a tortoise to put his head out of his shell by holding some tempting bait without result, and an Oxford don, after watching them for some time, quietly said, "Don't you think gentlemen, you had better try the other end?" Now I am going to interpret this parable to you, but not in the way the President did.

The allusion to the tortoise very aptly typifies the Royal Institute of British Architects in its attitude towards registration. The don is the President and we are, in order to draw off the scent, asked to leave the educational end that we have been pegging away at so long and invited to "try the other end;" but we must decline the invitation, firstly, because we are sure we have got hold of the right end to start with and by a little more perseverance we shall get the Institute to move and, secondly, the only other end would be to put an end to the examination altogether as a logical sequence to partition with registration. No, gentlemen, this matter is not to be lightly brushed aside by such specious arguments and fallacies as I have endeavoured to expose.

Objection has also been urged against the movement that it will create a monopoly, and thus be opposed to the principle of modern legislation, but there cannot be a monopoly created where it is made possible for anyone who proves himself qualified to share the rights.

Another objection is that it will be necessary at the outset to register some of the very men who have caused all the mischief. This is very true, and unless this is done it will be found that Parliament will not listen to you. That you must respect vested interests is an axiom of Parliamentary practice and where a man can show that he has practised architecture Parliament will say you must not deprive him of his rights, and the obstinate attempt to exclude this principle from the Medical Act was the chief cause of delaying its passage through Parliament for thirty years.

Another conscientious objector is the art architect, and there is of course a good deal to be said from his point of view but I think he looks at the question from his point of view only.

He would be quite in favour of registration if all incompetent and inartistic persons could at once be debarred from practising, but if the inartistic and incompetent are still to be tolerated and even recognised until time has worked the necessary change, he prefers matters to remain as they are and to leave the public to discriminate between the good and the bad.

But the practice of architecture is a composite one, and includes not only the artistic but the constructive, hygienic and scientific, and therein lies its difference from the sister arts, and the need of special training in addition to the artistic spirit.

I cannot agree with the purely art architect that you are lowering the dignity of architecture by making it a profession and that it requires none of your registration.

I maintain that at the present time architecture is trailed in the dust at the heels of many men utterly unworthy of the title of architect, but by a scheme of education and registration we shall raise it above its present unsatisfactory surroundings to such a height as will at least bring it to the level of the learned professions, and after this has been attained, then develop and foster the artistic side as much as you will, and the more the better.

That you cannot examine a man as to his artistic attainments is partly true. But a painter is no less a painter because he has been instructed in the science of perspective, in the proper manipulation of his colours and their chemical composition. Or a sculptor is none the worse for a complete course of study of the anatomy of the human figure.

We do not, of course, claim that architects can be manufactured from study and examination, but what we do claim is that there is a constructional, hygienic and scientific side to this profession, which is of quite as much importance as the artistic, in which, unlike the arts of painting and sculpture, affects the comfort, health and well-being of the community, and this being the case, the men who take upon themselves the responsibility could prove themselves competent.

When we dislike a picture or a piece of sculpture it is easily got out of our sight. But it is a much more serious matter with our buildings if, when erected, even with or without artistic merit, they are found unfit by reason of the wrongful disposition of the rooms or fireplaces, or are unsound by reason of faulty construction, bad ventilation or sanitary defects.

Architectural taste is always a changing quantity, so that it need not be pretended that it is desirable to examine on the strictly artistic side of architecture, even if you could find examiners who would be agreed on any one point, but the scientific, practical and constructional side is one to which examination may be applied, as also in the principles upon which architecture is based, and its rise, progress and development.

I will not to-night go into the details of the Registration Bill; suffice it to say that it follows on the lines of the Medical Bill. Difficulties to be got over there undoubtedly are, but as the medical profession overcame the difficulties that beset them with regard to the chemists and apothecaries, so also shall we overcome difficulties with regard to surveyors, engineers, &c., and it is not for us to raise difficulties, but to overcome them as they arise.

The first effect of a Registration Act would be to put a stop to any further increase in the number of incompetent practitioners, and thenceforth they would become a diminishing quantity.

I appeal to-night to the young men to assist in this matter, for in life the question will soon have no interest, but we have a abiding interest in our art, and are still willing to assist you in carrying through a great reform which will be to your benefit and that of all good architecture in this country.

THE GLASGOW SCHOOL OF ART.

EVIDENCE was given by Mr. F. H. Newbery, headmaster, about the teaching in the Glasgow School of Art before the departmental committee on the Board of Manufactures:—

With regard to the constitution of the Glasgow School of Art, will you tell us that?—Only two years ago the Glasgow School of Art was one of the old South Kensington schools. We passed a lot of examinations and sent up works and so on about two years ago the Scotch Office took us over, and they did more than that—they established the Continuation Class side, but under Clause 87 they exempted certain institutions on the conditions of the clause, and submitted a series of proposals for the working of this school. We had no examinations and have no examinations. Our works no longer go to national competition. All restriction as to methods, means and scales is done away with, and the school is free to carry on the work in its own way, producing work which in the estimation of the teachers is educational and tends to develop the student and not to meet the needs of an official kind. From that moment the governors set to work to reorganise the staff, and the school is divided now into an upper and lower school. The second master is in charge of the lower school, and the upper school is divided into four departments, painting and drawing, architecture, sculpture and decorative art. Those are the four. At the head of each is a

professor. I am using the term professor advisedly because technique is not a strong point over here, and the governors sent to the Continent and brought over a man from Brussels, who at first was so incapable of using the English tongue that an interpreter had to be used between him and his students. This last year the governors have brought over another man. They were so satisfied with the work of the first professor they brought over that they brought over a second man and put him in charge of the antique school. The work has gone on in the last two years with leaps and bounds. All restrictions as to size and method being withdrawn, the individuality of the student is sought for, the personality of the professor enters into the work, and the result has been marvellous to me, and I have had some experience in these matters. Then our modelling man is a Dutchman. I will not say we have gone out of our way to get foreigners, but we wanted to get the best teaching experience, and we found over here that the painter who is engaged in making pictures and so on will not give it up for teaching. On the Continent they are far more ready to do so. A skilled man will leave his academy and turn his attention to teaching, and I think the governors have been very much justified in their experiment. The architectural school is managed by a practising architect, a man who is in business for himself, and who comes in so many times a week to conduct his classes. The technical studios take up twelve subjects—roughly, they take up stone-carving, wood-carving, stained glass, interior decoration, enamels, brasswork, bookbinding, china painting—and the plan the governors adopted is to get the expert. In bookbinding, Messrs. Maclehose & Sons, the bookbinding publishers, send a man from their firm to the school twice a week. He does not trouble about designs; he is a workman. We associate with every instructor a design master or mistress whose forte is this particular subject, and these two work together. We have the same in enamels, and we have the same in brasswork and in china painting. We have everywhere a linking together of the practical men working in the trade every day and all day long, and the design master and mistress bringing in the art properly required. That is the organisation of the school. Then these four departments, although perfectly independent in their work, are yet inter-independent, as we encourage students to cross over—that is, the students for drawing and painting take modelling. The modelling students take drawing, and the students in drawing and painting go up to the technical studios. There is an interchange of work, the idea of the governors being this, that whereas painting and sculpture are two channels by which the artist may express himself, a school of this nature should put before its students every method, means, material or medium whereby art can be expressed. Then it may interest the committee to know that we, where possible, abstain from teaching office-work. Take our architects: the old plan with the architect was to let him learn building-construction, orders and all that sort of thing. But we have come to the conclusion from experience that the office-work gives a man all that; that it is unnecessary on our part to go to an architect and instruct him how to train his students in building and things of that sort. But they do have, as far as instruction is concerned, instruction in composition and design, and above all they have life drawing, antique drawing and ornament drawing, and all other methods of education which the office cannot afford, and we do the same almost everywhere—rule off the things that a school need not trouble its head about and teach the things the students ought to learn in architecture. We go for the artist, and we are quite sure the architect will be made. We have, of course, large day and evening classes, and we have as many as six life models sitting at a time, and the committee might be interested to know who they are. We used rather for a long time the ordinary ice-cream man and organ-grinder that came to Glasgow, but we gave them up, and for the last few years the governors have imported models from the Continent. They are attached to the school at a weekly wage, and they live in Glasgow for the purpose of sitting for the students. We find by that means an enormous gain. For example, we have two men at the present time who are really superb. That encourages not only the art instincts of the students, but it gives them the finest possible form to study. Then, to return to the technical studios again. The influence of the technical studios is spreading, and the governors are hoping really to establish in Glasgow and its neighbourhood two or three distinct industries, especially for women. We find, for example, that in embroidery, where pupils are taken charge of by two lady instructors, the class at the present time is absolutely full of commissions, and we receive invitations to send our work everywhere on the Continent to the various art exhibitions which are held there. To Turin, for example, a very large consignment went, and the students received medals in Turin. We have sent to Munich, to Venice, and we purpose sending to America, and we likewise send our bookbinding. There are two students who have gone out from the school and have started bookbinding in the place—two women

workers—and we are very glad to know they are encouraged by no less a person than a partner in the firm of James Maclehoose & Sons. Then, as regards enamels, the furniture people have recently been adding enamels to decorate their furniture, and there are three women engaged in producing enamels for the purpose of insertion in the furniture. Then there is a small trade growing up in enamels for personal use—for personal adornment and personal belongings, and so on—in which two or three women are engaged. There is, in other words, a big field opening up for women, and I should say that in the school we have nothing whatsoever to do with the decision of the artist or the student as to what he is going to do. We believe that a man who is going to be a glass-stainer should have drawing and painting from the life because he is to be a glass-stainer; and we find that the old weakness practically does not exist any more, namely, a man growing up as a glass-stainer and then turning to picture-painting. A man is receiving his education, and he sticks to glass-painting. We do not, in other words, say to this man, "Now, you are going to be an artificer, and here is your line and you stop there," and to the painter, "You can go on as long as you like." They can go on as far as they like; our rooms are full of architects, designers, draughtsmen and men who intend making art their profession. They can decide for themselves what they are going to do. Then about the staff. The Scotch Office have been extremely good to us there. They simply say to the governors, "Let us have your men that you want to appoint submitted to us; we insist upon that. You have no appointment of your own, no powers of your own; send your man to us, send his qualifications, tell us that you, by experience or by knowledge of him, trust him and would have him, and we will make up our minds on the matter," and the Scotch Office have not declined.

They practically endorse your choice?—Yes; they have never refused it as yet, but they have insisted, and quite rightly too, that the men should be submitted to them. There is nothing of the old South Kensington business, that no man can be appointed who had not a certificate. The certified men are practically a dead quantity so far as we are concerned. Under the old arrangement professors could not have been brought over from the Continent, for example. Our aim has been to give the best education that the world can afford, with the result that by bringing continental technical skill over to Glasgow, the tide of students that used to go over to Paris has absolutely ceased, and in the last five or six years I have only known two students who have gone from Glasgow to London. They can get at their own doors what they want. Perhaps I am looking at this through rather rose-tinted spectacles, but they can obtain the finest education which can be obtained by an art student anywhere. As far as the students can go we are pushing them.

What about the bursaries and scholarships? What is the fee? What fee does the ordinary student have to pay?—A 10% fee covers the fees in the school per annum—that is, for the day classes. In the evening class our highest fee is 2%, but the pupils who pay fees in the evening classes are in the minority. For instance, the Haldane people offer 120 bursaries for the evening classes. When the school was under the old South Kensington system there were thirty to forty granted by the South Kensington people to free students, to artisan students. The sum thus paid was included in the amount received from the Scotch Office. The governors have taken over the payment themselves, so that there are 150 free studentships granted to the evening classes. There is no maintenance attached to the sum. They simply get their fees and that is all. Then, acting in conjunction with the Scotch Office—

Before you pass from the student, are most of those people engaged in their profession as apprentices?—Yes. There is rather an absurd idea that schools of art teach people who have to enter art; schools of art are teaching people who are in their profession—that is, they are glass-stainers or designers or whatever it may be, and our object is that they do not do in the school the exact work they do in the day; it must be something else. There is a special fee for apprentices. There is a half fee charged for apprentices under sixteen. We do not get many of those. We start with an entrance examination. The Scotch Office in one of their resolutions insisted upon that. This test examination consists of a piece of drawing from some solid object—a cast or other solid object—and the test is one which enables a man to start light and shade at once. That is the test we insist upon, and the Scotch Office compel us to make that test, because they say they do not want us to do the elementary work; that is cared for by the Board schools. They want us to be fed by the various schools under the School Board, and that is slowly being done. Then in conjunction with the Scotch Office they give the governors pound for pound; that is, if the governors vote a certain sum, say 50%, for local bursaries and scholarships, the Scotch Office cover our money. But they make the stipulation that they shall pay the money.

We have to send our cheque to the Scotch Office, and they cover the money there and send the money down.

Is that included in the amount you have given us for the income?—No, that is an additional sum. We divide them up in this way. We have two classes. We have what we call bursaries and we have scholarships. The scholarships are 20% and the bursaries are 15% and 10%. The bursaries are given for work done during a session. There is no examination for it. We call in judges from the outside, and the work is judged. Except the competition of students among each other there is no question of a standard set value. When a man gets a bursary we insist upon two things in connection with it—that he shall come back to the school in the succeeding session and that he shall visit some art centre other than Glasgow, Paris or London, or whatever it may be. This last time, out of eleven people, four went to Paris, two went to Holland and Belgium and Paris, and seven came to London and worked in the museums and studied the galleries. And they did that on 10%, and some on 5%. Then the scholarships are to enable us to assist a scholar who says he is too poor to go on longer. The governors then, if his work is worth it, grant him a 20% maintenance scholarship, and the fees are granted him as well.

Are these bursaries for one year?—For one year.

And these maintenance scholarships?—Also for one year. But it may be continued if a man gives promise. That is a matter which has not arisen yet. The Scotch Office may possibly have a say in that, but if a man deserved one at the end of the first year, he would probably get it for the second year. The object of the Scotch Office is to give them for three years. I think, but that has been arrived at very slowly.

What is the actual expenditure upon bursaries and maintenance scholarships?—125%.

On your part?—We may possibly get some money from the Scotch Office, but the matter was not quite in order as far as we were concerned. We are hoping to get back half the sum we spent last year. The Scotch Office have taken the goodwill of the governors into consideration, and have gone back to find money to cover the outlay.

You were saying just now, when the last witness was giving his evidence, that you had a difficulty of getting casts in this country?—A great difficulty.

You get your casts from abroad? Yes, chiefly from Brussels. The Musée d'Echanges is a magnificent institution and we get them from there. They are much lighter, and far better and cheaper. On the Continent the various nations take an interest in casts, and over here they do not.

What arrangement do you make for their preservation? Do you colour them in any way?—No.

You simply use them for their purpose and then throw them away?—We have not got to that stage yet. We have been in possession of them for three years. Of course, they gradually go out to decorate the road in time, but with regard to the casts we have bought, I should say the collection is really unique.

But you go upon the principle of using the cast as long as the surface is all right, and then have another?—Yes. We never paint, because it destroys all form. We keep certain ones for museum purposes. Our idea is to get unconscious education all through the school afforded by seeing beautiful things. We have the casts arranged so that the education of the students is gone on with all the time. The Haldane Trustees grant every year an additional scholarship of 50%, which is open to all schools of art and art classes in Glasgow, and which has been taken for sixteen successive years—in fact ever since its inception—by a student of the Glasgow School of Art. He is compelled to go to Italy. That is one of the conditions of his getting it. He has to do very, very stiff work. The demand upon him is the very highest. The Haldane Trustees say all the education in the shape of instruction—technical instruction—that a man wants shall be got before he takes their scholarship, and that he shall go abroad as a real improver.

How long is that held for?—One year. A man who has just come back, a man named Dowle, who went out last year, was there about thirteen weeks for 50% on the Continent. He went out by P. and O. boat to Gibraltar in order to see Spain. I have mentioned here once the question of judges and examiners. We have really had one set of examiners only; but what we do is to call in the best artists in Glasgow, or Edinburgh, or, in fact, in Scotland, to judge these works. For example, Mr. Guthrie has acted as judge for the last three years, and also Mr. Roche and Mr. Leiper; and anywhere where a strong figure man comes in we get his services. Last year, to judge our sculpture we got Mr. Rhind, of Edinburgh. Then, with regard to our figure composition, the whole of the compositions were sent across to the Continent, and were judged by a jury of Belgian artists; and the returns came back. We think of troubling Paris some day, but we want to get the best expert skill we possibly can, and we do not care whether the judges are teachers or not. But the man must be a sound artist. We think we get a more catholic outlook upon the work in that way.

is the Belgian professor a professor of painting?—Yes. Who is his master?—Portaels; and M. Artot, a man just right over, is a pupil of Portaels as well. They were both there when Van der Stappen was director. Van der Stappen was a sculptor, and they were both under his direction. Is a student entirely under the control of your professor?—Absolutely under his control.

So that if you have got a professor of painting who has got particular strong point, it would be reproduced in the student?—I will not say that.

It would tend to be so?—There may be a fear of that, of course; I quite see that. You mean a mannerism?

Yes, but a Belgian is not likely to be a good colourist. What effect do you find upon your school?—We cannot comment.

One thing I must say. A very interesting thing happened last week, for example. We had a show, and we at the Fine Art Institute of Glasgow, and we took the whole of the rooms, and devoted three rooms to the work of the exhibition done by the club, and completed the cycle by putting the nine months' work of the school, so that we had a complete year's work. We had a few examples of the professor's work in one part of the room, and I had some of my own, so you have the work of the man and of his students practically in the same room. Some of us made practical investigations of this particular point of the mannerisms, but we did not find them; we saw faithful copies of the model. I see the error, of course.

You have not any special provision to guard against that?—Yes, the judges who come in to judge the bursary work under this man give their opinion.

At you do not have visits from Glasgow artists during the year anything corresponding to the visitors to the Royal Academy in London?—No, we do not. The field is limited of men that you can call in. It may interest the committee to know this: there is a list of examiners for prizes and studentships, and we publish the list of men who are selected as judges.

There are two systems, practically, of teaching painting at the Royal Academy in Great Britain. One is the control of one individual by the student from start to finish, and the other is the succession of teachers?—We do not believe in the latter.

Have you by any chance any scheme for combining the two of those two systems?—We have the visitors who come to check the bursary work, whose opinion is transmitted to the governors, and, in turn, submitted by me to the professor. When a thing as mannerism comes into existence, then that is taken of by the judges. Last year, for example, there was a question about the shading in one case, and that was transferred to the professor.

What is the policy of your school to appoint the same professor?—Yes; this is the third year the man has been there.

Is any policy been decided upon—would you naturally appoint a professor?—No.

Do you thought of change occasionally?—We should change occasionally, yes. That, I think, would be the policy of the governors. The art atmosphere in Glasgow is very strong. It can direct an artistic opinion in ten minutes on a thing, and this atmosphere creeps into the school and does a lot of work. You mentioned about the Belgian and colouring. I am with you there, but I believe one strong point of the Glasgow men is that very point of good colour.

Is there a risk of its becoming less so?—No, I do not think so. We do not anticipate any such danger at the present time.

How long do the pupils generally stay in that school of painting?—We have them in that school nine or ten years, or in some cases.

Can you tell us exactly what share you have in the school?—I first take the general superintendence of the whole school. I do not interfere with the architects, as I am not an architect, nor with sculpture because I am a sculptor, but the professor of sculpture, and I take charge about his work, the models and things of that sort and I am in architecture. But in drawing and painting the professor and I are in almost daily communication as to work. This is there for six months. The school has a session of six months, and the work of drawing and painting falls into two hands for the remaining three months of the year. And I give a check, because our two styles are absolutely opposed. For those students entirely in my hands for those three months, and for the six months he is there I usually find that the thing is to leave him alone—we do find a great drawback of two men going to the same student, and I have found that wherever I can, and if I have anything to say to the professor, he comes into my room and we talk it over.

Are you there in charge of the life classes? Do you go in the evening?—Yes, I go there in the evening, but he is there in the evening; he is there day and evening.

What salary are the professors paid?—This professor is paid at a salary of 440*l.* for six months; at the end of that

six months he goes away and comes back. The governors strained themselves to pay the money. They wanted to get the best man they could. The antique man, who has come for the first time this year, has a salary of 200*l.*, and he comes for eight months; but the governors believe in giving the professors a fallow time to go and to do their own work and to gain their knowledge. A man at the end of six months is played out.

Mr. Fleming.—The man said he would come for 250*l.*; I think if we had known it would be over we would have hesitated. But having got him here, we found that 250*l.* was not enough, and we had to give him a rise. We found he was really a valuable man. But it is straining our finance to give it.

Mr. Newbery. The man runs, roughly, a life class of nearly 100.

What is his name?—Delville. He took the silver medal in the Belgian section of the Paris Exhibition last year.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr H. T. Hare, president, in the chair.

The following were elected as members:—Messrs. C. J. Stewart, B. H. Collcutt and P. G. Crawley.

Mr. F. R. TAYLOR read a paper entitled—

Photography for Architects.

It must be stated at the outset that as the question of photography and sketching is to be considered at a joint-meeting of the Architectural Association Discussion Section and the Architectural Association Camera and Cycling Club, no discussion on that is intended to-night. The work of the Club is in itself sufficient evidence to show that photography has a useful sphere of action in architectural work. There are, however, many in our midst who consider that photography is opposed to the best traditions of the study and practice of architecture. It is therefore the purpose of this paper to put before you facts which will prove that photography for architects possesses a value both in the study and practice of architecture which cannot be overlooked.

The subject will be dealt with under two main heads, viz:—The utility of photography in (1) the study of architecture; (2) the practice of architecture, and the apparatus and appliances for architectural photography will then be briefly considered.

The Study of Architecture.

The usefulness of photography in the study of architecture will be considered with reference to its value in educational work, and also to its value as a record of old work. Photography in its application to the study of architecture is simply a means of delineation, and it is the finished photographic print or lantern slide which is the valuable aid to study.

Photography should not be considered as antagonistic to sketching. It has a utility in the education of the architect by producing an accurate delineation of old buildings unattainable by a sketch. It must not be forgotten that, however valuable a sketch or measured drawing may be to the individual student who prepared it, there is the personal error to bear in mind when this method of delineation is applied for general study.

Photographs in conjunction with measured drawings undoubtedly form the best means for architectural study and research. It may be mentioned that in the Architectural Association Sketch Book there are examples of measured drawings, together with a photograph of the work. This method of illustration might be employed with advantage to a much larger extent not only in the Sketch Book, but in all architectural publications. Whenever any old building of interest is to be pulled down to make way for modern improvements or for other reasons, a set of measured drawings with a series of photographs form the best record of the old work. In record work research should be made as to how the building has fulfilled its purpose and how its environment affected its design. To obtain this knowledge the employment of photography is a valuable assistance.

The method adopted for the training of architects by a system of instruction in classes has its value considerably enhanced by using photography as one of the means of illustration. The use of the lantern slide in lecture work is a great step in advance of the ordinary lecture diagram. It is essential, in order to make the instruction imparted by lecture work of the greatest value, that the illustrations employed should receive concentrated attention whilst the various points are being explained. Diagrams specially prepared for lecture work are in the majority of cases of but little avail, and it is impossible for the lecturer to satisfactorily explain from them, even to an average-sized class or meeting, the various points dealt with, simply because they cannot be properly seen from every part of the room, and besides in most instances are

badly placed for the lecturer's use. Frequently the walls of the room are smothered with measured drawings, plates from the building papers and similar illustrations, and an attempt is made to explain some points when only one or two present can see the illustration referred to. One does not object to illustrations of this kind on the walls if they are simply intended for those present at the meeting to see for themselves before or after the lecture, but to use them as lecture diagrams is really the height of absurdity. But all these difficulties are obviated by employing photographic means. Lantern slides of the actual work, of measured drawings, of illustrations from books and other publications—in fact, of illustrations from every available source can be thrown upon the screen, can easily be seen by everyone, and enables the lecturer's explanation to be understood by all.

Lantern slides for architectural lectures should be made with a view to suitability of purpose. Photographs of buildings, both externally and internally, would be useful to illustrate the grouping and general effect, and then should follow photographs of towers and spires, of piers and arches, of caps and bases, of doors and windows, of vaulting, &c., to illustrate the treatment of the parts; and, lastly, of mouldings and ornament. If a systematic sequence is followed, the slides would be of immense value in promoting the study of architecture.

In illustrating constructive subjects, the same principles should be adhered to—explanatory lantern slides to illustrate the manufacture and uses of the various materials, and then slides showing the different methods of construction. Measured drawings, sketches, book illustrations, and, in fact, every process of delineation can be brought within the scope of the optical lantern. The possibilities of the usefulness of lantern slides in educational work are practically unlimited. The slides themselves should on no account represent more than is required. Simplicity should be our guide in these matters. All diagrams, book illustrations, &c., should be represented on the screen as large as possible. The attempt to crowd many illustrations in one slide should be condemned. A lantern slide for lecture purposes should not consist of a confused jumble of details with meaningless letters or figures. It is bad enough in a text-book, but infinitely worse in a lantern slide. The object of all study is to gain knowledge, and not to cause confusion.

The use of telephotography in the study of architecture is one which should receive our careful consideration. In many instances parts of a building well worth studying are inaccessible for measuring, and in those cases an ordinary photograph gives a general idea of the composition and a telephotograph the details.

The Practice of Architecture.

The utility of photography in the practice of architecture might receive far more attention than it does. In many instances the only use to which photography is put in architectural practice is in the reproduction of drawings by the ferrogallic process. In this process the reproduced drawings are either on a thin paper, or on a paper similar to Whatman's, and a black or brown line is obtained on a white ground. The advantage of the process is that the reproduced copies can be coloured similarly to an original drawing. A great saving of time is effected, because from one complete set of tracings any number of reproductions can be obtained. If the reproductions are to be kept for a considerable time, as in the case of copies for the authorities, care must be taken in the selection of the paper owing to its tendency to fall to pieces after a time. For this reason the authorities will only accept photographic reproductions on linen. The makers of the paper might consider the best means of surmounting this difficulty. It may be mentioned here that some of the papers used shrink slightly in the process of obtaining the reproduction—this emphasises the necessity of fully dimensioning all drawings. The ferroprussiate process with a white line on a blue ground is sometimes used, but as colouring is then out of the question, it is not so suitable for general architectural work. Its use is limited to drawings where colouring is not essential, as, for instance, in details of steel construction.

Besides this special application, the use of photography in architectural practice is generally limited to what may be termed the legal phase of our profession, although a wider application would be a distinct gain. No one will deny that photographs of buildings about to be pulled down are valuable records, and in ancient light, easement, party structure and such-like cases would always be useful on one side or the other. If the building happens to be one of considerable architectural interest, then the value of the record cannot be overrated.

In modern work photography could be used to increase our knowledge and experience in a way little thought of, and the wonder is that it has not been more generally applied for the purpose. Photographs of a building at its various stages of erection, with the dates, and in some instances the time noted thereon, would be a valuable record of the class of work, and, in addition, would be very serviceable in the valuation of certificates. Photographs of special works of construction in

buildings of a distinctive type would be most useful for future reference when dealing with similar works. Photographs of the finished building should in all cases be obtained, and a comparison made by showing the photograph side by side with the perspective drawing. With reference to comparison, a collection of photographs of similar detail and ornament of old and modern work would prove of use both in the study and practice of architecture.

The practical use of photography in delineating the progress of a structure from time to time is employed by engineers for the best results, and there is no reason why we should not do likewise. In a few isolated cases it is done, but it rests with the profession at large to avail itself of the opportunities within its grasp. This legitimate use of photography in our everyday practice would assist in grappling with many difficulties with an ease at present unknown. The utility of photography in the study and practice of architecture having been called in question, it now remains to deal with the technical part of the subject.

It is evident that in order to obtain the best results in the application of photography to the study of architecture that the taking of the photographs should be performed by one who is otherwise the photographs or lantern slides will not express the subject in the best way. It is impossible for a professional photographer to know exactly what is wanted unless he happens to have made a thorough study of architecture, and we know that in the majority of cases he has simply a rough smattering of our requirements. If his specialty is architectural photography, his knowledge of architecture may in a general way be said to be peculiar and not by any means extensive. Consequently, if the work is to be done well, the photographs and lantern slides should not be left in his hands for selection of subject. There may be exceptions, but such exceptions prove the rule. It might, of course, be urged that the professional photographer could do the work under our guidance, but it will be found that this method is expensive and is in reality only applicable in those instances where the selection of subject is not required to any great extent.

It is desired to make a thorough record of an old building. Here the best way to proceed is to make measured drawings of the building, and a complete series of photographs. Which is the most capable of taking the photographs? Unquestionably the architect who undertakes the recording of the old work. Again, detail and ornament, who knows which is best to select for architectural purposes? Certainly not the professional photographer, for he would be in a state of bewilderment, whereas the architect would not have the slightest hesitation about the matter. In the many requirements of architectural practice where the question of architectural selection does not arise, the photographic work can with advantage be delegated to a professional photographer.

The architect who decides to use photography as an aid in his study and practice should understand certain technical details of photography. The questions which present themselves are:—What is the best camera for architectural work? What lenses should be used? What photographic plates and papers should be employed?

Dealing with the questions in order:—Firstly, What is the best camera for architectural work? Before anything can be done, the size of the camera must be decided upon. The ordinary sizes are: $4\frac{1}{4}$ inches by $3\frac{1}{4}$ inches (quarter-plate), $6\frac{1}{2}$ inches by $4\frac{3}{4}$ inches (half-plate), $8\frac{1}{2}$ inches by $6\frac{1}{2}$ inches (whole-plate), 10 inches by 8 inches and 12 inches by 10 inches. It is generally agreed that the larger sizes are the best for architectural work. But the larger the size the more expensive it will be. Besides this, the weight of the camera is a serious matter, especially as in the majority of cases the work will be done at a distance from home. For these reasons it may be conceded that the half-plate is the most serviceable. When lantern-slide work is contemplated, the quarter-plate is generally selected, as that is the most suitable size for the purpose. If a good lens is employed, the quarter-plate size might be used for all work, as the photographs can be enlarged with satisfactory results.

The requirements for a good camera are:—1. Lightness with rigidity. 2. Rising and falling adjustment to the front of the camera. 3. A reversing and swing back. 4. A long extension. 5. Parallel bellows, or only slightly conical. 6. Focussing screen and focussing adjustment. 7. Double dark slides. The lightness of a camera is necessary for convenience in carrying about, and rigidity is required to prevent movement whilst the photograph is being taken.

The rising and falling adjustment allows the position of the photograph on the plate to be varied. In architectural work a considerable rise is frequently required. The reversing back is essential in order that the photograph can be taken in a horizontal or vertical position. In many cases the camera must be tilted to include the whole of the building; hence a swing back must be provided, for the plate must be kept vertical, otherwise the vertical lines of the building would converge in the photograph. A long extension provides

use of a long focus and telephoto lenses. Parallel bellows prevent the cutting off of the edges in the photograph when a short-focus lens is used. The focussing screen is the sheet of glass upon which the photograph is depicted. It is adjusted to obtain a clear, sharp image by means of a rack and pinion movement. The double dark slides hold the plates for exposure, and at least three or, better, six double dark slides should form part of the outfit. The questions to decide in the selection of a tripod stand is one of rigidity, compactness and stability.

Secondly, what lenses should be used? It is best to provide in an outfit for architectural work a set of lenses of different foci and of a good make. The lenses should be of a rectilinear type. For average work the rapid rectilinear of about 7-inch focus is most serviceable on a half plate. Long-focus lenses are useful in detail work, and wide-angle lenses are essential in confined positions. The telephoto lens would be a most valuable acquisition in the equipment. Some of the best examples of detail work are at too great a distance from the position available to give a photograph of a satisfactory size, but a telephoto lens enables you to obtain it to a larger scale with the same extension of camera. As this lens is not of a fixed focal length, the scale of the photograph can be altered at will.

Thirdly, what photographic plates and papers should be employed? Ordinary plates of a good make are the best for architectural work, especially for interiors, although in dark interiors, where very long exposures are requisite, rapid plates may be used with advantage. Isochromatic plates are useful where the lighting of the interior is yellow. In interiors where light from windows, &c., would be likely to cause halation it is necessary to use backed plates.

The development of the negatives requires care on the part of the operator. The developer which the majority of workers prefer for negatives is one of the pyro formulae, either pyro-anthra or pyro-soda, and there is no doubt that a very wide latitude is given by the use of pyro. Hydrokinone is a cleaner developer, and for that reason is the one generally selected for lantern slides; it has not the wide latitude of pyro, but in lantern-slide work this is not so important. The method of procedure cannot be discussed now. It may be mentioned, however, that the architect-photographer should do his own development, and not follow the advice expressed in the well-known advertisement phrase of "You press the button, we do the rest."

The chief printing processes can be classified as follows:—

1. Printing-out processes.
2. Processes requiring development.

Printing-out processes include all the processes in which printing-out is resorted to. The albumen silver paper is an example, and at one time was the one generally employed. The gelatino-chloride of silver printing-out paper commonly called P.O.P. has, to a large extent, superseded it. The P.O.P. of various makes, with suitable toning and fixing, produces very effective results. The processes requiring development are best exemplified by platinotype, carbon and bromide. If permanent photographs are required, then platinotype or carbon processes should be decided upon. For enlargements bromide papers are most satisfactory.

The architect-photographer being fully equipped now sets forth to take photographs. He makes a selection of some old building, and if he be an earnest worker he does not, as is often thought, make a headlong rush at it. Whilst long exposures are being given, he devotes his time to finding out all he can about the building, and maybe he measures details and obtains full sizes of the mouldings.

It seems to be a stock argument for the opposers of photography for architects to refer to the inverted image on the focussing screen as if that were the important part in studying detail work. That is only a means of obtaining a good photograph, and as to the inverted image, one gets used to it in precisely the same way as our minds have been able in infancy to correct the impression of the inverted image which is produced on the retina of the eye.

In conclusion, it is hoped that the various points raised will be fully discussed in an impartial spirit. The great question before you is the utility of photography in our study and practice. The question of photography and sketching is not to be considered, for if you are fired to enthusiasm on this matter there will be ample scope for your eloquence at the meeting on the 6th of next month, previously referred to. The value of combining photography with measured work should receive a large share of your attention, and encouragement is much needed for architectural research and in giving it every method of delineation should be recognised, together with a clear description of the work and its history.

Lantern slides made from photographs taken by members of the Association Camera Club were shown on a screen during the reading of the paper, and comparison was made with other slides prepared from sketches and measured drawings.

Mr. ARNOLD MITCHELL, who proposed a vote of thanks to

Mr. Taylor, said in listening to the paper he was struck with the remark, "The object of all study is to gain knowledge and not to cause confusion," and he supposed the discussion which took place after the reading of the paper had a similar end in view, so that if speakers were critical their criticism must be taken in the vein in which it was meant. There were two points he would like to deal with. In the opening of the paper they were told that as the question of photography and sketching was to be considered later in the session by the Discussion Section, it was not intended to hold discussion that evening. Later in the paper, the author had discussed photography and sketching, and had even gone to the extent of making comparisons between sketches and photographs. Then in the conclusion they were asked to discuss the points raised in an impartial spirit. The paper seemed therefore to contradict itself. He was a hopeless opponent of the author's views, for it seemed to him that sketching was absolutely essential to the student of architecture; photography was an anathema to such a student. To the older man the camera would have use. He advised those who took up photography to become proficient—to be photographers as well as architects.

Mr. G. SCAMELL seconded the vote, supported by Messrs. H. Stannus, J. D. Crace and E. W. M. Wonnacott.

The PRESIDENT, in putting the vote of thanks to the meeting, said Mr. Mitchell had been rather severe on the author of the paper, but they must remember Mr. Mitchell was par excellence a sketcher, and he might have taken an extreme view. Photography could be employed as a medium in their work, and in that way might assist the young architect. Perhaps it would be best for the very young man not to touch photography, at all events not until he was out of his pupilage. The value of photography in restoration work was unquestionable; in no other way could a more reliable record of the state of the building be obtained, and when dealing with brickwork a good photograph could save hours that would otherwise have been spent in measuring.

PRESERVATION OF INDIAN REMAINS.

A BILL has been introduced into the Viceroy's Legislative Council by Sir Denzil Ibbetson for the purpose of giving Government powers for the preservation of privately owned ancient monuments. The first clause gives Government the power to declare any particular object a "protected monument." The owner will then have the option of making it over to the guardianship of a Government official, on condition that it is managed as a public trust and maintained at the cost of the State, and that the public shall have free access to it, or of making a mutually satisfactory arrangement with Government. When neither of these courses is possible, if an endowment exists for the purpose of the maintenance of the monument the collector is to be empowered to invoke the aid of the Civil Court to enforce its application to that purpose; or, as a last resort, Government may acquire the place or structure under the Land Acquisition Act, subject, however, to the important exception that no place of which any part is periodically used for religious observances can be so acquired. The Bill also confers on the State the right of pre-emption whenever a protected monument is being sold otherwise than within the family of the owner, or within any religious association to which he may belong. A penalty is provided for damaging or defacing a protected monument. The Bill also deals with antiquities of a movable nature, and empowers the Governor-General in Council, whenever he has reason to believe that antiquities are being sold or removed to the detriment of India or of any neighbouring country, to prohibit or restrict the importation into or exportation out of any part of British India of any specified class of antiquities. It is not proposed to follow the example of Italy and to attempt to prevent the removal from India of all antique or artistic objects, this being regarded as impossible and as involving inquisitorial measures which the circumstances of the case would fail to justify. The definition of "antiquities" is, therefore, confined to objects which, by reason of their historical or archaeological interest, the Government deems it proper to protect. The third part of the Bill is designed to prevent the removal of archaeological remains from the vicinity of the site or building to which they belong, and upon their connection with which their value to the student depends. The Government lays down the condition of being compelled to purchase such objects at the option of the owner, and of compensating him for any loss that may result from such prohibition. Finally, the measure empowers Government to restrict or regulate excavations within any local area, subject to the payment of compensation for resulting loss.

The Grand Duke of Weimar has decided that Goethe's house and garden are to be preserved in their present condition.

TESSERÆ.

Ralph Aggas and his View of London.

IT is not known when Ralph Aggas was born, or whether he was only a surveyor or combined that occupation with topographical representation and engraving. His views of English cities are valuable. The earliest, it is believed, was one of Cambridge which appeared in 1578. According to Ames, the plan with views of Oxford, measuring 3 by 4 feet, was produced about the same time, but it is also said to date from 1588. In 1589 the map of Dunwich appeared, and about the same time the great plan and view of London. Vertue, in describing it, says:—"This was reported to have been done in Henry VIII. or Edward VI.'s time, but from several circumstances it appears to be done early in the beginning of Queen Elizabeth's reign about 1560, being cut in several blocks of wood. The prints thereof being now of the greatest scarcity, no copies perhaps preserved, being put up against walls in houses, therefore in length of time all decayed or lost. 'Civitas Londinum.'—Probably this was published by Ralph Aggas, as he himself mentions in that plan of Oxford, done after this was begun. But it must be observed that this very impression is a second publication with the date 1618, and that there are several alterations from the first in this, and particularly instead of the arms as Queen Elizabeth bore them, those of King James I. (England, France and Scotland) are put in the place of them. And in the first have been explanations of the remarkable places in the City and suburbs, as may be observed in many places by letters of reference. The length of this printed plan, 6 feet 3 inches by 2 feet 4 inches, contained in six sheets and two half-sheets, I believe the full extent in length; but I apprehend the notes of explanation were at bottom printed on slips of paper to be added." Vertue specifies buildings or absence of buildings which affix this plan to the era in which he concludes it printed originally, as the water-gate at the Palace of Westminster, called the Queen's Bridge; Northumberland House wanting, which was not erected in 1560, but was before 1618; Paget Place, so-called in 1563, &c. Vertue had taken much pains to ascertain the ancient extent of London, and the site of its several large edifices at various periods. Aggas was unable to obtain permission to publish his plan until after the accession of James I. Whether he engraved it or prepared the material for Augustus Rytter to work from cannot be determined. The plan was afterwards engraved on copper and more recently was lithographed. Aggas is supposed to have died about 1617.

Strengthening Vaults.

The Romans had strengthened their vaults with semi-circular arched ribs, *i.e.* portions thicker than the rest of the vault, and appearing inwardly as flat bands projecting slightly from the inner surface, and harmonising well with the similar forms of pilasters in the walls; but they did not place these ribs where they were most needed, *viz.* along the elliptic groins, which bear all the rest of the ceiling. The early Freemasons took care to strengthen these important lines, and (on the same principle that modern joists are made deep and narrow) they gradually converted the broad shallow Roman band into a deep narrow rib, by first simply diminishing its width and increasing its projection or depth, then chamfering the edges till its section became a semi-octagon (as may be seen in the newer Romanesque portions of Winchester transept, but not in the older portions, which are examples of the Roman manner unaltered). They also beaded the two edges of the rib, and then enlarged these beads till the whole became a double roll with a mere fillet between them, whence the transition is easy to the deeper and more variously moulded vault-ribs of the early and complete Gothic.

James Barry as an Etcher.

Barry, whose impetuous ardour and fiery temper were well known, submitted to the drudgery of etching and engraving plates from his own paintings of the "Elysian Fields" and others presented by him to the Society of Arts in the Adelphi, which, from the size and weight of the plates and the way he used to work upon them, became a work of manual labour and strength. Instead of placing them on a board, the plates were held on his lap; and in the posture of a cobbler, with the copper slanted to receive the light, he would dig and strengthen the lines to the required depth and effect. In this way and in this attitude his friend and countryman John Dixon, the mezzotint engraver, found him employed, breathing like a pavior between every stroke he made. When the veteran Stothard—whose genius was as vivid and his pencil as ready, at the time when employed in etching the Wellington shield, with its centre and compartments, from his own design—was asked how he could undertake so long and laborious a task, he answered, in his usual quiet way, "It was the enterprise." And so it must be with all who would gain a name in the annals of art.

GENERAL.

The King has conferred knighthood on Mr. James Knowl, architect, who is also editor and proprietor of the *Nineteenth Century and After*. Among his architectural works are Aldworth, the Surrey residence of Lord Tennyson; Kensington House, Albert Mansions, in Victoria Street, Westminster; and several churches. The public garden in Leicester Square was laid out by him.

The Royal Society of British Artists will hold a special election of painters in water-colours on January 11 next. Candidates can obtain all necessary particulars from the secretary, Suffolk Street, Pall Mall.

The General Committee of the Irish International Exhibition, which it is proposed to hold in Dublin in 1906, considered on Tuesday a report from a sub-committee on a suggested site for the exhibition near Clyde Road, in the Pembroke township. The matter was postponed for further inquiry. Messrs. Ashlin & Ryan submitted a general scheme for exhibiting buildings in connection with the Clyde Road site, estimating the total cost of the buildings and arrangement of the ground at 150,000*l.*

The London County Council have authorised an expenditure of 64,000*l.* on the compulsory acquisition of the freehold and leasehold interests in property required, and the provision of a site for the accommodation of persons of the working class to be displaced in connection with the erection of an electrical generating station in Pimlico for the working of the tramway in the western portion of the county of London.

The Mayor and other official representatives of the borough of Colchester were presented yesterday, the 10th inst., being the three-hundredth anniversary of William Gilbert, with an historical picture, representing Dr. Gilbert showing his electrical experiments to Queen Elizabeth and her Court, to the Institution of Electrical Engineers. Colchester is the town in which Gilbert was born in 1544 and died in 1603.

The Wesleyan Methodists propose to expend 18,500*l.* on new mission premises at Plumstead. The scheme comprises a large central hall on similar lines to the recently-built halls at Bermondsey and Deptford, with sitting accommodation for 1,500 persons; also a smaller hall for Sunday school purposes, &c.

Mr. Temple Moore has reported that the tower of A Saints Church, Derby, is in need of restoration. The vicar says as it was the pride of the county it was not unnatural to expect the leading families of the county whose ancestors were associated with the church to interest themselves in the work.

The Blackburn Queen Victoria memorial committee have instructed Mr. B. Mackennal, the sculptor, to proceed once with his marble statue of the late Queen, to be erected on the boulevard near the railway station. The statue, which will show Her Majesty in a standing position, is to cost 2,500*l.*

The National Association Master House Painters and Decorators of England and Wales will hold their eleventh annual convention at Manchester next September. In order to provide funds for the equipment of the new school of decorative painting and the educational work of the Association an Exhibition of Decorative and Applied Arts, Processes and Manufactures will be held at the St. James's Hall, Oxford Street.

The Consultative Committee of the Board of Education held a conference last Friday on the desirability and feasibility of the introduction of a system of school-leaving certificates for England. Among the professional societies were the following:—Institution of Civil Engineers, Institution of Electrical Engineers, Institution of Mechanical Engineers, Pharmaceutical Society, and Royal Institute of British Architects.

The Brighton Corporation have resolved to purchase Mr. Stanhope Forbes's *Christmas Eve* for the Art Gallery. Six examples of sculpture were lately presented by Mrs. Freeman Gell.

The First Prize in the competition for the Stockport Town Hall has been awarded to Mr. A. Bramwell Thomas.

Diaries, &c., for 1904—Messrs. Hudson & Kearns, Ltd., have by their efforts gained a monopoly of the business of providing certain classes of stationery for the offices of architects, surveyors and builders. They have been so consistent in upholding the character for excellence during a long succession of years, it is unnecessary to recommend their manufactures. All that is required is to announce that the usual variety of specially arranged diaries can now be obtained, as well as the pads for writing. Both classes of aids to business are now considered to be indispensable in all well-regulated offices.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

BRADFORD.—Designs and estimates are invited for the cleaning and redecoration of Christ Church, Bradford. The Rev. R. B. McKee, vicar.

ERDINGTON.—Feb. 1.—The Urban District Council general purposes committee invite designs for new council house and free library buildings, to be erected at the junction of Mason and Orphanage Roads, Erdington. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded for the designs placed first, second and third respectively. Mr. Herbert H. Humphries, district engineer and surveyor, Public Hall, Erdington, Birmingham.

ILKLEY.—Feb. 1.—Competitive designs are invited for free library, public offices and assembly hall, intended to be erected in Station Road, Ilkley. Premiums of 100*l.*, 50*l.* and 20*l.* respectively are offered for the three best designs sent in by February 1. Mr. Frank Hall, clerk, Council Offices, Ilkley.

LONDON.—Dec. 16.—The Lambeth Borough Council are about to erect a public library, with residence for librarian, in the Herne Hill ward of the borough. Architects residing within the borough of Lambeth are invited to send in designs and plans for a public library, with residence for librarian, in the Herne Hill ward of the borough to Mr. H. J. Smith, town

clerk, Lambeth Town Hall, Kennington Green, by 12 noon on December 16. General information as to the extent and nature of the accommodation required in the proposed library and residence can be obtained on application to the town clerk.

WINDSOR.—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l.* returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

ALNWICK.—Dec. 19.—For the erection of motor garage and cycle works in Bondgate. Mr. W. Robson Hindmarsh, architect, Alnwick.

BIRMINGHAM.—Dec. 14.—For the erection of the superstructure, internal finishings, &c., of the new university buildings at Bournbrook. Messrs. Aston Webb & E. Ingress Bell, architects, 19 Queen Anne's Gate, London, S.W.

BRADWELL-ON-SEA.—Dec. 28.—For the erection of six workmen's cottages (under the Housing of the Working Classes Act) at Bradwell-on-Sea, Essex. Mr. Horace G. Keywood, surveyor, Maldon.

BRISTOL.—Dec. 16.—For alterations and repairs to the workhouse at Clutton. Mr. W. F. Bird, architect, Midsomer Norton, Somerset.

BURY.—Dec. 22.—For the erection of a hospital at the workhouse, Jericho, Bury, Lancs. Mr. Alfred Hopkinson, architect, 15 Agur Street, Bury.

CAIRO.—Feb. 1.—For the construction of three steel bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CANTERBURY.—Dec. 15.—For the structural works and works of renovation in the old Board school, St. John's Place, Northgate. Particulars on application to the Town Clerk, Canterbury.

COLCHESTER.—For the erection of electrical works at Hythe Causeway, Colchester. Mr. Ernest R. Beckwith, architect, 10 Trinity Street, Colchester.

DARTFORD.—Dec. 14.—For drainage works at the children's home, Manor Gate, Dartford Heath, and for laying about 830 feet of 9-inch pipe from the entrance gate of the Manor Gate aforesaid to the main sewer of the Dartford Urban District Council at Leyton Cross, Dartford Heath. Mr. Harston, engineer, 8 Hythe Street, Dartford.

DURHAM.—Dec. 15.—For the erection of sewage-disposal works, with caretaker's cottage, adjoining the present sewage farm, near Shildon. Mr. C. Heslop, surveyor, Council Offices, Shildon.

DURHAM. Dec. 18.—For the erection of seven houses at Sacriston, co. Durham. Mr. Geo. Thos. Wilson, architect, 22 Durham Road, Blackhill.

GATESHEAD.—Dec. 16.—For the erection of a grinding-shop at the locomotive works, Gateshead. Mr. William Bell, the company's architect, Central Station, Newcastle-on-Tyne.

GILLINGHAM.—Dec. 22.—For the erection of a school at Napier Road, Gillingham, Kent, to accommodate 900 children. Mr. E. T. Atchison, secretary, 8 Waterloo Road, New Brompton, Gillingham.

HALIFAX.—Dec. 16.—For the erection of a pair of semi-detached villas in Moor Lane, Illingworth, Halifax. Mr. W. Clement Williams, architect, 29 Southgate, Halifax.

OATES & GREEN, LTD., HALIFAX, MANUFACTURERS.

LONDON OFFICE AND SHOWROOMS, 27 CHANCERY LANE, W.C.

HALIFAX.—Dec. 19.—For the erection of a villa residence on the Upper Greenroyd estate, Halifax. Mr. Arthur George Dalzell, architect, 15 Commercial Street, Halifax.

HAYWARD'S HEATH.—Dec. 18.—For plastering the walls of the female infirmary ward at the Brighton County Borough asylum, Hayward's Heath, Sussex. Mr. J. G. Gibbins, surveyor to the asylum, 3 Palace Palace, Brighton.

HORSHAM.—Dec. 30.—For the erection of stabling, sheds, mortuary, boundary wall, &c., on land adjoining Stanley Street, Horsham. Mr. S. Mitchell, 14 Market Square, Horsham, Sussex.

HOUNSLOW.—Jan. 4.—For the erection of public offices, public swimming-baths, &c., and public library. Messrs. Nowell Parr & A. E. Kates, architects, Brunswick House, Brentford, W.

HUDDERSFIELD.—For street and sewerage works of new streets at Honley. Messrs. Brook, Dransfield & Dyson, surveyors, &c., Estate Buildings, Huddersfield.

IRELAND.—Dec. 12.—For rebuilding shop premises at Waterloo Place, Londonderry. Mr. Daniel Conroy, architect, 21 Shipquay Street, Londonderry.

IRELAND.—Dec. 14.—For the erection of water-tower and pump-house, constructing filter-beds, &c., at the Ennis district lunatic asylum. Mr. John Enright, clerk of asylum.

IRELAND.—Dec. 14.—For the erection of a house at Carnmeen, near Newry, co. Down. Mr. Wm. James Watson, architect, Benvenue, Rostrevor.

IRELAND.—Dec. 14.—For the culverting of a portion of the river Blackstaffe, Great Victoria Street, Belfast. Sir Samuel Black, town clerk, Belfast.

IRELAND.—Dec. 16.—For rebuilding premises at Waterloo Place, Londonderry. Mr. T. Johnson, architect, 11 East Wall.

IRELAND.—Dec. 18.—For the erection of a coastguard station at Brandon Quay, co. Kerry. Plans and specification can be seen at the office of the Assistant Surveyor of Buildings, Cork.

IRELAND.—Dec. 21.—For the erection of Skibbereen new post office. Plans and specification can be seen at the Irish Lights Office, Dublin.

IRELAND.—Dec. 21.—For the erection of sixteen artisans' dwellings in the town of Mallow. Mr. Brian E. F. Sheehy, architect, 57 George Street, Limerick.

IRELAND.—Dec. 21.—For the erection of a church at Roseyards, co. Antrim. Mr. S. J. M'Fadden, architect, Queen Street, Coleraine.

IRELAND.—Dec. 31.—For the erection of two detached villas at Hillsborough, co. Down. Mr. Henry Hobart, architect, Dromore, co. Down.

KENDAL.—Dec. 15.—For providing and fixing a dado consisting of about 2,584 feet super white American figured oak, 855 feet lineal moulded cap and 855 feet lineal of skirting. Particulars on application to the Borough Engineer.

KENDAL.—Dec. 23.—For the erection of a mission hall, Sandes Avenue, Kendal. Mr. John F. Curwen, architect, 26 Highgate, Kendal.

KINGSTON-UPON-THAMES.—Dec. 17.—For the erection of a museum and art gallery in Fairfield Road. Mr. Alfred Cox, architect, 4 Adam Street, Adelphi, W.C.

LANCASTER.—Dec. 18.—For the erection of dining-room, dormitory and sanitary block at the County Lunatic asylum, Lancaster. Particulars may be obtained on application to the Clerk of Works at the Asylum.

LANCASTER.—Dec. 28.—For the erection of an assembly hall and classrooms for the Society of Friends in Fenton Street, Lancaster. Mr. Spencer E. Barrow, architect, Liverpool Bank Chambers, Lancaster.

LIVERPOOL.—Dec. 16.—For the erection of a coach-house and alterations to stable at Belmont. Mr. Chas. H. Lancaster, architect, Brougham Terrace, West Derby Road, Liverpool.

LONDON.—Dec. 15.—For the construction of a river wall and the foundations of a chimney-shaft at the proposed power station, Old Barge House Wharf, Blackfriars, S.E. Drawings, specification and a copy of the conditions and form of contract may be seen on application to Mr. J. Wager, His Majesty's Office of Works, &c., Storey's Gate, S.W.

LONDON.—Dec. 18.—For the erection of the superstructure of the parcel office, Union Street, E.C. Drawings, specification and a copy of the conditions and forms of contract may be seen on application to Mr. J. Wager, H.M. Office of Works, Storey's Gate, London, S.W.

NEW MALDEN.—Dec. 28.—For the erection of cottage homes at New Malden, Surrey. Mr. William H. Hope, architect, Seymour Road, Hampton Wick.

CORRESPONDENCE.

Australian Patents.

SIR,—It may be of interest to your readers to know that the Federal Patents Act, 1903, has now been passed, by which inventions will be able to be protected throughout Australia by one patent only, instead of needing six separate patents as heretofore. The Act is not to come into force until a date to be named by proclamation, but there are provisions by which a patent application commenced in or an existing patent in any of the six States may, under certain conditions, be converted into a Federal application, so that in effect we may say that even now it appears that a single application may be so framed that the patent will eventually be obtained thereon for all Australia. The Act is not in all respects ideal, for there are numerous doubtful points which will tax the ingenuity of those who may be called upon to administer the law, as well as those who may have to advise upon it.—Yours truly,

HERBERT HADDAN & CO.

18 Buckingham Street, Strand, W.C.:

December 3, 1903.

BUILDING AND BUILDERS.

STEPS are being taken to obtain the funds necessary for the building of a new parish church at Forres, N.I.

THE Nelson Town Council propose to borrow 27,000*l.* for the purposes of sewage disposal and town improvements. At a recent Local Government Board inquiry it was stated that in ten years the borough had increased by 118 per cent.

A LOCAL GOVERNMENT BOARD inquiry was held by Mr. P. H. Bicknell, M.I.C.E., in the National school at Bramham, Yorks, relative to the application of the Wetherby Rural District Council to borrow 4,000*l.* for sewerage and sewage-disposal works.

THE foundation-stones have been laid of new schools connected with the oldest Welsh Calvinistic Methodist chapel in North Wales at Adwyr Clawdd, near Wrexham. The schools will provide accommodation for over 300 scholars, and are arranged and furnished on the most modern and up-to-date lines.

THE memorial-stone of the new building being erected at the corner of Ann Street and Dobbie's Loan in connection

with the centenary of Elgin Place Congregational church, Glasgow, for the accommodation of the mission hitherto carried on in Clyde Street, Port Dundas, was laid on Saturday afternoon.

At the meeting of the Evesham Board of Guardians on Monday a report was presented as to the cost of various new buildings and alterations now completed at the workhouse. It appeared that the total amount of Messrs. Espley & Co.'s contract was 9,465*l.* and the architect's charges were 675*l.* The vagrant wards on the cellular system have now been opened.

MR. BIGNOLD, M.P., arrived in Wick, N.B., on Friday, and on Saturday he met the members of the Harbour Trust and discussed with them the proposed harbour extension scheme, which is estimated to cost about 150,000*l.* Mr. Bignold said that it will be futile to approach the Government with the view of obtaining a grant, but he will heartily co-operate with the Trustees in securing a loan.

ONE of the oldest churches on the borders of the West Riding of York and North Notts—a district which once formed part of Sherwood Forest—is that dedicated to SS. Peter and Paul at Todwick, near Rotherham, a small village of 300 people. The church dates from Saxon times, and is now in a deplorable condition. It stands close to the historic site of Torquillstone Castle and to the young oak which marks the spot where flourished the trysting tree in Harthill Walk, so frequently mentioned in Scott's "Ivanhoe." A scheme is on foot for the restoration of the church.

THE Mid-Cheshire joint isolation hospital authority have adopted plans for submission to the County Council and the Local Government Board of a joint hospital for the Northwich, Winsford and Middlewich Urban and the Northwich Rural Districts. Estimates were presented showing that the cost, including the site, but exclusive of the furnishing and outfall works, would be 13,537*l.* The County Council will bear one-third of the cost, and will obtain borrowing powers from the Local Government Board. A smallpox hospital will have to be provided in addition on a separate site.

BUILDING operations will very shortly be commenced in connection with the erection of the second and more important section of the Birmingham University new buildings, and within a period of about nine months, according to the terms of the contract, one portion of the main structure is to be completed. Messrs. Smith & Pitts, of Balsall Heath, the

THE PASTEUR FILTER

builders who secured the contract for the erection of the power station, have practically completed this work, and the more extensive work of putting in the foundations, which was let to Mr. Thomas Rowbotham, contractor, Small Heath, will very shortly be finished. The mere word foundations conveys but an inadequate idea of the actual extent and character of the work already accomplished towards the structure of the new buildings. A better idea can be gathered from the fact that the cost of these foundations will be something like 70,000*l*. The work includes the construction of the basements, kitchens and subways, these rising to a height of 13 feet 6 inches, and the superstructures thereon rise to a further height of 18 feet 6 inches. In fact, at the present time a considerable portion of the building is nearly half completed. The work has been in hand about fifteen months, and for a long time some 500 operatives were employed daily. To accelerate the job the contractor has now upon the ground a large and up-to-date machine plant, without which the progress made could scarcely have been brought about. The tenders for the further superstructures, internal finishings and other work will be dealt with by the architects during the present month.

ELECTRIC NOTES.

THE Islington Borough Council have decided, after correspondence with Sir George Bartley, their representative on the Royal Commission on London's traffic, to forward recommendations with respect to two new "tube" extensions in North London in connection with those nearing completion. The first scheme is for an extension from Highbury Corner to the tramway terminus at the Archway, and thence across the borough from east to west, giving greater facilities between the West End, Islington and Stoke Newington. The second scheme is to extend the "tube" of the Great Northern Railway, which terminates at Finsbury Park, to the Alexandra Palace, and so give greater facility for reaching London's municipal palace.

A SPECIAL meeting of the Rhyl Urban District Council was held for the purpose of dealing with the question of laying a cable along Brighton Road to enable the residents of that part of the town to take in the electric light. The electric-light committee recommended that a cable be laid in Brighton Road, the cost being estimated at 310*l*., and that application be made

to the Local Government Board for sanction to borrow that amount. The clerk reported that the Local Government Board had replied that, under the exceptional circumstances of the case, they would offer no objection to the work being commenced at once. The recommendation of the committee was adopted, and it was decided to proceed with the work at once.

THE electrical post invention by which letters and parcels are to be carried at 250 miles an hour is shortly, says the *St. James's Gazette*, to be put to a practical test. A syndicate has been formed with a capital of 150,000*l*., divided into 60,000 6 per cent. cumulative preference shares of 1*l*. each and 90,000 ordinary shares of 1*l*. each. Two-thirds of the amount wanted will be raised in Italy and France and one-third only in England. The syndicate is formed to take over the patents from Count Taeggi Piscicelli, the inventor, and to develop the system. Amongst the objects aimed at are the following:—

(1) To demonstrate the invention on a practical scale; (2) to negotiate with the Governments and railway companies of various countries for user of the system. The directors are the Duc d'Uzès, the Duc de Morny, the Marquis des Cars, the Comte de Pradere, Sir Theodore Fry, Mr. Charles Edwards, Mr. Henry S. Saunders (a director of the Marconi Company), Count Piscicelli and Mr. William Digby, the two last joining the board after allotment. England, Italy, France and Spain are represented on the directorate.

AT a recent special meeting of Inverness Town Council the draft agreement with the Edmundson Electricity Corporation Company, Ltd., London, for the introduction of electricity into the town was considered. The company are to carry out the work, which will cost at the outset 18,000*l*. At certain periods it will be within the option of the Corporation to purchase it. Mr. Alexander Fraser, of the electric-lighting committee, moved the adoption of the agreement, ex-*Provost* Macbean seconding, remarking that no responsibility rested on the Corporation, who were under the scheme to receive 2,100*l*., which had already been expended by the Corporation in connection with the electric-lighting proposal. He was glad that they were getting rid of a question that had stood as a barrier in the way of many reforms that the Council might have carried out. *Provost* Ross approved the views expressed concerning the satisfactory settlement of a vexed question in the community. It was agreed to accept the conditions offered by the company, who have stipulated to carry out the works within one year of its commencement.

WAPICTI

A SANITARY
WASHABLE DISTEMPER
OF BRITISH MANUFACTURE.

PRODUCES A MUCH MORE PLEASING EFFECT THAN FLATTED OIL PAINT, AT ONE THIRD THE COST.

At a largely-attended public meeting held in Pitlochry, 13, to consider whether an installation of electric light for the district should take place, it was explained that, provided the consent of the proprietors concerned could be obtained, a private company proposed to utilise the Falls of Tummel for motive power; that the necessary 2½ miles of cable would be laid to Pitlochry—underground, so as not to interfere with the scenery—and that, further, wires would be put into houses and shops free of charge, the owners supplying the requisite fittings and lamps. The cost was given at less than half the present gas rate of 7s. 6d per 1,000 cubic feet, or an equivalent gas rate of about 3s 3d. The company were also prepared to light the streets on the same terms. Should Pitlochry become a burgh, the community would have the option of purchasing the undertaking at certain times on certain conditions. Mr. J. Leonard, architect, hoped the adoption of the proposal would lead to Pitlochry becoming an autumn and winter, as well as a summer resort. The meeting unanimously approved of the scheme, and instructed the local district committee to act in their interest, but without incurring any financial obligation.

SIR OLIVER LODGE explained to the members of the Scientific Society of the Birmingham Midland Institute on the 21 inst. how the practical difficulty of dispersing fog by means of electricity seemed likely to be overcome. Electricity of the high tension required to produce any appreciable effect upon a

fog could only be obtained from a dynamo giving an alternating current, but to cause the particles of water composing a fog to cohere and fall only one kind of electricity was required. In fact the alternating currents would neutralise one another, and the effect on the fog would be infinitesimal. It was this difficulty which had prevented him going on with the matter in a public way during the last fifteen years, but the recent American discovery of the mercurial electric lamp had suggested to him a way in which the positive current and the negative current, giving an alternating current machine, could be separated and sent off in different directions. The tube of the mercury lamp would only allow a current of one kind to pass one way. By attaching sets of these tubes to the wire carrying the alternating current the necessary division could be effected, the positive current going on to the point of discharge in the fog or cloud and the negative going to earth, or *vice versa*. This, Sir Oliver Lodge claimed, would commend itself to engineers as a thoroughly practical means of applying his discovery, whether on land or from ships at sea, especially stationary vessels, such as lightships.

VARIETIES.

At a special meeting of Rothesay Town Council on Monday Mr. John S. Hepburn, assistant to the town clerk of Leith, was appointed to the vacant town clerkship.

HERMES LODGE, a fourteenth-century house, near Tewkesbury, belonging to Mrs. Bidduiph Martin, was last week destroyed by fire. No one was living there.

PLANS are being invited by the vicar and wardens of St. Peter's, Swinton, for new and more commodious day-schools to meet modern requirements. The cost will not be less than 10,000l.

A NEW American chapel in Berlin was consecrated on the 26th ult. in the presence of Mr. Tower, the United States Ambassador, and the Crown Prince representing the German Emperor. It has accommodation for 400 persons, and has been built at a cost of 20,000l.

THE Marylebone Council have published the necessary notices for the promoting of an amending Bill in the next Parliamentary session to remove the existing legal bar that prevents completion of the purchase of the Metropolitan Electric Supply Company's Marylebone property, and empower the

borough council to erect a generating station and provide a self-contained system.

It was decided at a meeting of local ratepayers held recently at the Freemasons' Tavern, under the chairmanship of Mr. J. F. Remnant, M.P., to form a deputation to wait upon the London County Council in order to point out the great inconvenience caused by closing one end of Great Queen Street during the progress of the Holborn improvement scheme.

At the monthly meeting of the Metropolitan Public Gardens Association, 83 Lancaster Gate, the Hon. Dudley Fortescue, vice-chairman, presiding, it was decided to protest against a proposal to extend Rosebery Avenue by way of Duncan Terrace to the Essex Road, which would have the effect of extinguishing one public garden laid out by the Association, as well as several green strips that it is hoped to eventually acquire as an addition thereto.

THE Countess of Warwick has just had erected at Easton Lodge, Essex, a dairy which contains all the latest twentieth-century improvements. Octagonal in shape, it resembles a bungalow in design, the roof being thatched with reeds and a verandah encircling the walls. In the centre of the interior is a circular fountain of Sicilian marble, and the floor is of polished Dove marble, while round the walls are double rows of shelves in St. Ann's marble. The walls are covered with old Dutch tiles depicting rural sports and pastimes, and adjoining the dairy is a suite of rooms for the use of milkmaids. The buildings are all lighted by electricity, heated by hot-water pipes, and are situated in the midst of a large and beautiful garden.

THE new Victoria Road U.F. church, Kirkcaldy, has been opened for public service. It occupies a beautiful site in Victoria Gardens. It is of massive proportions, and is in the Renaissance style of architecture, constructed of red stone from Dumfries. The main entrance is situated in Dunikier Road, the whole of the frontage being carved and panelled. The flooring of the vestibule is done in terrazzo, with a lovely designed border. The windows, which are plentiful, are filled with finely-tinted glass and light up the building very well. The church is seated for upwards of 700. There are two halls, which have accommodation for 350 and 180 respectively. The building is lighted with electricity and cost nearly 7,000/.

At a meeting of the joint committee of the Liverpool finance and parks and gardens committees, formed in connection with the laying out of St. John's Churchyard, held

recently, the Lord Mayor (Mr. R. A. Hampson) presented a report was submitted from Mr. Frampton, R.A., in which stated that the pillars which had been cast in plaster experimentally erected upon pedestals had been found not to harmonise with the surroundings, and had therefore been abandoned, together with the proposed bronze ships. In place of these features he suggested that four rising young architects should be commissioned to design pieces of sculpture to be placed upon the pedestals, the designs to be emblematic of the shipping and commercial progress of the port. The surveyor was requested to report on the subject.

THE new church of St. Mary Magdalene, Norwich, consecrated on the 30th ult. The walls of this building are of brick, faced externally with local flints and Monk's Park stone. The roof of the nave, which is of pitch pine, is covered with Broseley tiles, and that of the aisles with Cumberland gable slates. Inside the walls are covered with stucco, and there are stone columns and dressings. The floors under the seats are laid with concrete, covered with boards, and the paths of the nave with marble terrazzo, which also covers the chancel. There is a large east window with five lights. The other windows are glazed with cathedral glass. The church is lighted with electricity and seated with chairs.

THE improvements committee and the housing committee of the London County Council report upon the rehousing of the Millbank site of working men displaced in respect of Westminster improvement. The dwellings at Millbank have been completed, the former committee recommending that account of the Westminster improvement be debited with a sum of 50,000/ in respect of such accommodation. The latter committee recommend that the sum so charged be credited to the capital account of the Dwelling-house Improvement Fund and applied as directed by section 50 of the London County Council (Improvements) Act, 1900, towards the cost of acquisition by the Council of other lands under Part III of the Housing of the Working Classes Act. The housing committee also have a recommendation for the modification of Webber Row, &c., scheme, Southwark, so as to provide accommodation for 2,500 persons in lieu of 903.

SOME alarm was caused in Edinburgh on Saturday morning by a slight subsidence of a tenement at 216 Morrison Street. As it occurred a loud report was heard and this gave rise to the fear that it had been caused by a gas explosion. Examination by members of the Fire Brigade, which had been summoned, showed that the noise had really been due to the breaking of

iron beam supporting an unoccupied shop. The floor of it subsided about 6 inches, and cracks were made in the internal walls, while the floor of a dwelling-house was also affected. The uneasiness caused by the mishap was increased by a belief that it was due to the building being immediately above the Haymarket tunnel of the North British Railway. Examination by the railway officials, who meanwhile had taken the precaution to divert the traffic, showed that the roof of the tunnel was in no way affected, and the running of the trains was accordingly resumed. The staff of the Edinburgh engineer, having shored up the broken beam, were able to assure the alarmed residents that there was no further danger, and the excitement with the wild rumours it had generated soon abated.

THE Pyx chapel in what are popularly known as the dark chambers of Westminster Abbey is at last to be thrown open to public view. The credit for this innovation is due to the Office of Works, which recently took over the custody of the building from the Board of Trade. How great is the concession which is about to be made may be gathered from the fact that hitherto this historic apartment, with its double doors of oak, has been guarded by no fewer than seven keys, each in the keeping of a separate official. Now the chapel is to be electrically lighted, so that the various objects of interest which it contains may be seen to advantage. These include a curious stone altar, which is supposed to have been used for coining purposes, and several chests. In former days the Government standards and assays were stored here, and the inner of the double doors was also covered with human skin—a hint, no doubt, to the prospective burglar—but all trace of this has long since disappeared.

THE new pier station at Wemyss Bay was opened on Monday by the departure of the eight o'clock train. The new station, with the platforms leave the old line about 1,000 feet east of the old terminus, and take a sweep towards the sea on a gradient of a little over 2 feet at the terminus. There are two island platforms and a short side platform on the sea side of the station. The island platforms are 180 feet in length and an average of 31 feet in breadth. There is a covered way from the platforms 360 feet long and 31 feet wide, and there is a large recess on each side at the end with seats; there are stairs on each side to allow passengers to get on board steamers lying well up the sides of the pier, and there are three doors at the bottom to give access to the end of the pier. The waiting-rooms, officials' rooms and telegraph office are on the platform

at the head of the covered way. There is a wide entrance to the station from the village, and the booking-offices are arranged for speedy sale of tickets in a crush. There is only one of the island platforms ready for use as yet, and it will be the spring before the others are completed. It is stated that the new station will allow of the steamers starting seven minutes earlier after the arrival of the trains than formerly, and the luggage will be more easily conveyed to the steamers.

TRADE NOTES.

A FIRE broke out at Mr. William Clegg's, Albert Mills, Milnrow, on the 3rd inst., which was speedily extinguished by two "Titan" sprinklers, with practically no damage.

MESSRS. ARTHUR L. GIBSON & CO. (the B. & S. Folding Gate Co.), 19, 20 and 21 Tower Street, Upper St. Martin's Lane, W.C., have just supplied to the Manchester Corporation twenty-seven large Kinnear steel rolling shutters, this being the third order they have received from this Corporation.

A FINE new hour-striking clock showing the time upon one large external dial, with all Lord Grimthorpe's latest improvements inserted and made by Messrs. Wm. Potts & Sons, Leeds and Newcastle, for Lady Pearce, was set going for the first time on Saturday last in the Macgregor Memorial Church, Govan, Scotland. Messrs. Potts are also making a clock for the parish church, Grange-over-Sands, N. Lancashire.

THE Sieg Rheinische Basaltwerke G.m.b.H., of Oberdellendorf, a/Rhein, through their sole agents in the United Kingdom (Messrs. Everitt & Co., 40 Chapel Street, Liverpool), have secured the contract for the supply of 14,000 tons of basalt columnar stone from the Blackpool Corporation, for use in the construction of the extension of their sea-defence wall and promenade. This makes over 25,000 tons supplied by this firm to the Blackpool Corporation in connection with this work.

THE MUNICIPAL AND COUNTY CLUB.

SIR SAMUEL PROVIS, K.C.B., secretary of the Local Government Board, was the guest of the evening at the house dinner of the Municipal and County Club, Whitehall Court, Mr. Laurence Gomme, F.S.A., clerk to the London County Council, presiding.

Patent Interlocking Rubber Tiling.

ARTHUR L. GIBSON & COMPANY
(The B. & S. FOLDING GATE CO.),

19, 20 & 21 TOWER STREET,
UPPER ST. MARTIN'S LANE,
LONDON, W.C.

Among the members present there were also the deputy-chairman of the London County Council, Mr. E. A. Cornwall, Mr. Lewis Coward, K.C. (Recorder of Folkestone), Mr. C. S. Murdoch, C.B. (Assistant Under-Secretary of State), Dr. Shirley F. Murphy (medical officer of health), Mr. Brook Kitchen (architect to the Local Government Board), Mr. Alfred Spencer (chief officer, Public Control, L.C.C.), Dr. Dudfield (medical officer of health, Paddington), Dr. Sykes (medical officer of health, St Pancras), the town clerks of Camberwell, Fulham, Greenwich, Harrogate, Leeds, St. Pancras and Poplar.

Mr. Gomme, in proposing the toast of the club-guest, Sir Samuel Provis, referred to the unvarying courtesy always shown to officials and others when seeking the advice of the supreme authority of local government, and had pleasure in announcing that Sir Samuel Provis had expressed his willingness to become a member and one of the vice-presidents of the club.

Sir Samuel Provis, replying to the toast, which was most enthusiastically received, returned thanks for the honour the club had bestowed on him in entertaining him at their house dinner. He considered the Municipal and County Club distinctly filled a void, and was the beginning of a great institution. He was only too glad to have the privilege of joining the club, thereby coming into contact socially with those with whom he had official relations. As for the latter, sometimes they might be of a reprehensive nature; but they must understand in dealing with local government that the Local Government Board had the advantage of seeing the same questions dealt with by one local authority and another, and in this way it was able to give that consideration which they could not otherwise obtain.

Mr. Cornwall, vice-chairman of the London County Council, responding for the club as chairman of its executive committee, referred to local government as a science to be studied by every man in order to become a good citizen. In no other country in the world had local government attained such a position as in this country to-day.

A most successful musical evening followed under the direction of Mr. T. Noakes, and contributed to by Mr. Barclay Gammon, Mr. Wilson James, Mr. Harry Turnpenny, Mr. Robert Dennant and Mr. Owen Clark.

The club was formed at the beginning of the year and its success is already assured. The club-house has now been newly furnished and decorated and a grill-room added, and

the bedrooms for country members are a special feature. The executive committee enrolled forty-three new members at the election on Monday.

SIR LEES KNOWLES, M.P.

THE following is the text of the resolution passed by the committee of representatives acting with the County of London Plumbers at their meeting at Guildhall on November 18, 1900, conveying their congratulations to Sir Lees Knowles, M.P., "That the committee of representatives of the chief cities and towns of the United Kingdom appointed in general conference of plumbers and health and water authorities, held in Birmingham in 1900, acting in conjunction with the Worshipful Company of Plumbers in carrying out the national registration of plumbers assembled at the Guildhall, London, November 18, 1900, desire to offer their respectful and hearty congratulations to Sir Lees Knowles, Baronet, M.P., on the mark of royal favour conferred upon him, and to record their high appreciation of the public service rendered by him to the cause of public health by his advocacy in Parliament during the past ten years of the national registration of plumbers, as a necessary link in the chain of sanitary security, and particularly of his conspicuous services as chairman of the Select Committee appointed in 1897 wherein the necessity for the system was demonstrated and the subject exhaustively dealt with, largely owing to his ability and assiduity, as appeared by the Parliamentary report." Sir Lees Knowles wrote in reply to express his warmest thanks.

THE CRITERION RESTAURANT.

THE Criterion Restaurant, which was first opened to the public on November 17, 1873, has been altered and improved in many respects from time to time. Thus, in 1899, the 1st Room was reconstructed and, together with the West Room, decorated in a new style. A year later the new buffet, which is one of the sights of London, was opened. In pursuance of this up-to-date policy some important alterations tending further to the public comfort have just been completed, and were examined with interest by invited guests on Tuesday. The most noteworthy of these changes is the reconstruction of the King's Room, a handsome apartment 52 feet in length

width, which is approached from the wide staircase
 main, or Piccadilly, entrance. Special features of this
 the new oak panelling and the mode of ventilation.
 pelling, which possesses much appropriateness and inter-
 rounds the room to the height of 8 feet, and is the work
 es. Howard & Son, of Berners Street. Above is some orna-
 tencilled tapestry, having a zigzag *motif* in brown, with
 n pant and *fleurs-de-lis*. The ceiling is covered with
 ta decorations. The lighting is entirely from a number
 ic lamps fixed immediately under the ceiling itself, and
 ing a brilliant but not glaring effect. The modern
 ny which the King's Room is ventilated is due to the
 n of Dr. Glover Lyon. The air is filtered through
 inool and is thus freed from fog microbes and all solid
 es. It is then ozonised so that gaseous impurities are
 and the air vitalised. The air passes through a
 an 54 inches high and then to an electric heater. This
 is 6 feet high by 4 feet broad and 18 feet in depth.
 re sixty heat-radiators contained in it, absorbing a
 equal to 6,000 candle-power of light. The advantages
 is means of heating are:—(1) The small space required;
 igs have not to be brought through the building; (3) no
 boiler, or labour, is required; and (4) perfect control
 ained over the temperature of the air. There are five
 b, controlling various numbers of radiators, so that the
 ure of the air can be regulated to within 2 degs. Fahr.
 in allation was planned and carried out under the super-
 of Dr. Lyon and Messrs. Shone & Ault.
 In a few feet of the King's Room is the Edinburgh
 m for use as an ante-room to the larger apartment.
 ing the Edinburgh are the Chapter Room and its ante-
 . These three rooms are *en suite*, and can be used
 h or separately. They have all been newly panelled
 and fitted with the latest designs in electric lighting.
 Chapter Room and its ante-room—the former of which is
 long by 16½ in width—are especially useful, not only
 ivers, but for functions in the daytime, as they both face
 y Street. The well-known Prince's Room has also been
 sely redecorated. In connection with the latter and
 t. Edinburgh and Chapter Rooms it should be mentioned
 ctically private access can be obtained to them by
 ns of the covered entrance from Jermyn Street. There is
 senger lift on both sides of the Criterion to all floors. It
 further noted that a new kitchen, which combines
 eanliness and ventilation in perfection, has been con-

structed on the top floor of the establishment. By the additions
 the Criterion is now equal to the demands of the most fastidious
 and has become more firmly established as foremost among the
 institutions of its class.

MASTER PAINTERS' ASSOCIATION.

THE members of the above Association hold their eleventh
 annual convention at Manchester next September. To mark
 its importance, and provide funds for the equipment of the new
 school of decorative painting and the educational work of the
 Association, they intend holding an important exhibition of
 decorative and applied arts, processes and manufactures. For
 this purpose they have secured the St. James's Hall, Oxford
 Street, where the immense area will enable them to do justice
 to the project which they have in hand.

The exhibition will include furniture, carpets, hangings,
 furnished rooms, wall-papers, relief materials, paints, colours
 and varnishes, water-paints, tiles, pottery, sanitary appliances,
 &c., stained glass, &c. An important section of the exhibition
 will be devoted to "Processes," where various handicrafts will
 be seen in actual operation—a never-failing source of interest
 to the public. Good music will be brought to the aid of the
 sister arts, and the exhibition will have attractions to the
 general public equally with those more directly concerned.
 The Right Hon. the Earl of Derby, K.G., has consented to
 become patron of the exhibition. All particulars may be ob-
 tained from the registered offices of the Association, 26 Oxford
 Road, C.-on-M., Manchester.

LABOURERS' COTTAGES IN IRELAND.

THE following letter has appeared in the *Irish Times*:—

I read with much interest the report of Mr. Synnott's
 paper before the Statistical Society on this subject. I do not
 think that his suggestion that existing cottages should be pur-
 chased and repaired is at all a wise one. The farmer is prob-
 ably making 1s. per week out of the existing hovel, and would
 expect not less than 50s. for it. It would need new doors, new
 windows, new floors and a new roof, and all that is left is the
 old walls, made of small stones without any damp course,
 and quite unfit to carry a slated roof. Besides, a Board of
 Guardians can give a contract for the erection of a cottage and

Fire-Resisting Construction

IMPORTANT NOTICE TO ARCHITECTS, BUILDERS & CONTRACTORS.

Completely equipped Joinery Works, fitted with the latest and most improved
 working Machinery, have now been installed in connection with our Plant
 Rendering Wood Fire-resisting, and we are prepared to contract or sub-
 contract for all the Woodwork (Carpentry and Joinery), complete and fitted up if
 desired, for Buildings where Protection from Fire is desired.

COST FOR DOORS, STAIRS, WINDOW-SASHES, MANTELS, AND OTHER JOINERY MADE OF FIRE-
 RESISTING WOOD IS ONLY ABOUT 15% MORE THAN WHEN MADE OF ORDINARY WOOD.

We are authorised to announce that the **FINE ART & GENERAL
 LANCE CO., Ltd.**, of 90 Cannon Street, London, E.C., will allow,
 subject to Survey, a Rebate of from 10% to 30% off the current
 price for risks in which our Fire-resisting Wood is used.

Fire-resisting Wood Joinery is indistinguishable in appearance from ordinary wood, and when furnished by us does
 differ in any respect from ordinary wood, except in the one feature, that it will not by itself sustain or spread flame.

compare the cost with others, but it is impossible to check a contract for repairs.

Again, the aspect is of much more importance than is generally considered. The house should face the south, even if the gable be turned to the road in order to secure this. We consider ourselves more civilised than the Chinese, yet in North China, where fuel is dear, they have sense enough to face all houses to the south, and one side of a street is simply a dead wall. They say, "The heat of the sun costs nothing."

The windows should be very much larger than are being put into the recently-built cottages, and all should have sashes hung on pulleys. These are the only windows that can be opened more or less in all weathers. The great foes of health are want of cleanliness and want of fresh air. Darkness and dirt are inseparable, whereas sunshine not only reveals but purifies. Unless the inmates are encouraged to open their windows by making this easy to do the "model" cottages, with tight-fitting doors and windows, will be less healthy than the old ones, which let in air everywhere.

I have put a ventilator of my own construction in the roofs of all the cottages which our firm has recently built and in a large national school. The results are admirable, as there is no draught even in the most stormy weather. Besides it cannot be closed, at least not without much trouble. It is simply an inverted "V"-shaped opening through the ceiling made of wood, with an opening $1\frac{1}{2}$ inches wide above and 6 inches below and 5 or 6 feet long. This is equal to a hole 10 inches square, but no draught is felt from it, on the same principle that if a cone-shaped funnel of paper be tied to the nozzle of the bellows hardly any draught can be made with it. If a whitewashed board be nailed above the opening separated 1 inch from it so as to shut out the view of the slates, the result is not unsightly.

Each house should be built by itself; the windows can then all face to the south, the east, or the west, so that all rooms can get sun at some time of the day, the kitchen of course facing south. The saving in building two cottages together is very small when the cost of separating the back yards is taken into account, and from experience I know how much ill-will often comes from disputes between the children or from trespass of fowls.

I should like to see fruit trees growing all round each cottage. Where there are two together this would be more than likely to cause trouble, for if any were stolen the neighbour would probably be blamed.

The suggestion that model plans should be prepared by the Local Government Board is an excellent one. I wish to "enthuse" the architect with a love of sunshine and fresh air. Cottages that were really models in this respect would be a taste of our people in that direction, and do much to remove the stigma that while every civilised country in the world is rapidly reducing its death-rate from consumption, in Ireland it steadily increases.—Yours, &c.,
ROBERT BRIDGES,
Honorary Secretary of National Association for the Prevention of Consumption, Ulster Branch.

LONDON LYING-IN HOSPITAL.

A SPECIAL court of governors of this Institution was held at the hospital, City Road. The meeting had been convened for the purpose of receiving a report from the committee of management recommending that the old portion of the hospital be pulled down and a new building erected. The committee stated that the construction by the Great Northern and City Railway Company of a tube railway in close proximity to the hospital buildings had caused serious damage to the foundations and structure. The damage was so considerable that the committee, acting upon the advice of experts, had made a claim for compensation against the railway company. The protracted negotiation and litigation the railway company had admitted their liability, and in September last the matter was settled by the company paying the sum of 3,000l. It became the duty of the committee to obtain tenders for the restoration of the old buildings, in doing which they took advantage of the opportunity of including certain alterations and improvements that had become necessary. The lowest tender sent in was 100,000l. ever, for the work amounted to so much more than that the committee were advised to accept from the railway company that the question arose as to whether the time had not arrived at which it would be more prudent entirely to rebuild the old portions of the hospital rather than spend a considerable sum in partial restorations and attempts at improvements of a building which, in the opinion of the medical staff, had been found for some time past inadequate. The report mentioned that the buildings had been erected for over 130 years, and that not only were the ventilating and heating arrangements obsolete, but a considerable part of the buildings stood on the ground, without any cellars or arches. A committee was appointed, and, having considered the

ended the management to invite the governors to use the expenditure of funds to an amount not exceeding in the rebuilding of the old portions of the hospital. Berry asked if the committee had made sure of their ground on the present site. Dr. Langton said that the ground had been purchased from St. Bartholomew's Hospital, and was subject to a lease of 50/ a year and a "fine" of 50/ every 14 years. So they remained on the site St. Bartholomew's Hospital not turn them off. Mr. H. C. Gosness moved the following resolution:—"That the trustees be authorised to sell the land forming part of the invested capital not exceeding 500,000, to be applied towards the cost of the new building." This was seconded by Mr. F. G. Ivey and carried unanimously.

ROYAL EDINBURGH HOSPITAL FOR SICK CHILDREN.

On Tuesday last H.R.H. Princess Louise (Duchess of Argyll) opened the new out-patient department of the Royal Edinburgh Hospital for Sick Children. The new dispensary, which is situated to the west of the hospital and has its main elevation on Sylvan Place, differs architecturally from the hospital in that it is built of yellow freestone instead of red sandstone. No attempt has been made at ambitious architectural treatment of the design, which is a severe expression of the Renaissance with pillars and cornices of the Ionic order. It is a two-storey building, about 103 feet long by 43 broad. All patients enter by a gateway at the south end of the building. To the right is a covered verandah for perambulators in the like in wet weather. From the entrance hall there are three isolation rooms, where any children who are suspected of infectious or contagious disease will be placed so that they can be seen by the doctor. Medical patients are placed on the ground floor. Those requiring surgical, ophthalmic or electric treatment will be taken upstairs. The large waiting-room is a large apartment—36 feet by 38 feet capable of seating over a hundred persons. From it patients pass in turn into the dressing-room, where the children are stripped in readiness to be taken to the physician, the consulting-room is beyond. The doctor's room is large and airy and is flooded with light. To it there is a special entrance from Sylvan Place for the staff, and on the other side a passage leading into the hospital grounds, by which patients

who require indoor treatment will be taken to the main building. From the dressing-room the prescriptions are handed into the dispensary, which is fitted with all facilities for rapid and convenient working.

Upstairs the rooms on the south front are devoted to ophthalmic and electric treatment. These apartments include, besides waiting accommodation, a dark room with special apparatus for eye-testing, and an electric bath-room. Occupying a central position on the same floor is the laboratory for the experimental work of the staff, and adjacent is a photographic dark room, which will prove specially valuable in view of the large amount of Röntgen-ray work which is to be done. The north end of the flat is occupied by the surgical department, which includes a large waiting-room, a consulting-room, a chloroform-room, an operating theatre, a room where the little patients will lie in cots until they recover from the effects of the anæsthetic, a store for splints and bandages, and a "new-case" room. Though only minor operations will be performed—the more serious cases being admitted to hospital—the theatre is splendidly equipped with sterilising apparatus, baths, &c., and is beautifully lighted by windows both in the vertical wall and in the sloping roof.

No special effort has been made at internal embellishment. The whole attention of the architects (Messrs. Peddie & Washington Browne), in consultation with the directors and the staff, has been directed to securing its equipment in a thoroughly complete and up-to-date manner, combined with ease in maintaining freshness and cleanliness. The floors consist of concrete finished with cement, and in some cases overlaid with linoleum for warmth. The walls are tiled to a height of about 7 feet from the floor, and all corners at floors and ceilings alike are rounded, so that there are no nooks where dust can accumulate. The floors have "scuppers" so that they can be flushed and the walls hosed. All pipes are kept clear of the wall in order that they may be dusted and washed and no lurking-place be afforded for dust. The premises are heated throughout by steam in pipes on the low-pressure system, and ventilation is aided by electrically driven fans for extracting vitiated air. All sinks and slabs are made of enamelled metal, and the shelves are sheets of plate-glass resting on metal supports. A feature of all the rooms is the flood of light which pours in through the large windows. Electric light is also provided in abundance, and there are special lamps for surgical and medical purposes. Altogether the dispensary as now enlarged and improved will be an even more valuable adjunct

to the hospital than it has been in the past. It will enable the staff to overtake a still larger volume of work, and with even more efficiency. Its total cost has been about 6,000*l*.

AUCTIONEERS' INSTITUTE.

THE autumn meeting of the members of the Hants, Wilts and Dorset branch of the Auctioneers' Institute was held recently at Eastleigh. The chairman of the branch (Mr. J. T. Woolley, Salisbury) presided at the luncheon, and was supported by Mr. J. H. Townsend Green (president of the Auctioneers' Institute), Mr. Rowland Peck (past president and member of the Council), Messrs. T. Llewellyn Puttick (Gosport), W. E. Moory (Christchurch), R. L. Badcock (Lymington), Samuel C. Gale (Lee-on-Solent), E. A. Scammell (Eastleigh), Edwin Fear (Winchester), Percy Shenton (Winchester), E. H. Cooper, hon. treasurer (Portsmouth), John H. Drewitt (Fareham), James Clark (Portsmouth), and A. Godwin Pratt, hon. secretary (Bournemouth). The Chairman proposed "Prosperity to the Auctioneers' Institute," and spoke in cordial terms of the efforts of the Council to promote the interests of the profession and to raise the status of the auctioneer. Mr. W. Rowland Peck replied. Mr. W. E. Moory (Christchurch) contributed a paper entitled "Valuation: its Objects, Principles and Responsibilities," in which reference was made to the disabilities under various Acts of Parliament from which the profession suffered; the divergent scales of fees in different districts; the principles governing real estate, transfer, mortgage, estate duty, valuations, &c. Mr. Moory called attention to the anomaly that persons, oftentimes without any previous training, were enabled to pose as valuers merely by payment of 2*l*. for a license. A discussion followed.

THE NATIONAL REGISTRATION OF PLUMBERS.

DR. MATTHEW HAY, medical officer of health, presided at the annual meeting of the Aberdeen District Council for the National Registration of Plumbers, which took place on the 4th inst. at the Robert Gordon College, Aberdeen.

In submitting the report of the past year's work Dr. Hay referred to the satisfactory work of the plumbing classes held at the Robert Gordon College. He also referred to the conference of representatives of the Plumbers' Company, architects

and water authorities on the prevention of waste of water for domestic use, remarking on the important bearing of plumbing work on that subject as well as in connection with sanitation. An interesting lecture was delivered by Mr. Wm. K. architect, on "Early Plumbers and Plumbing," and illustrated by lantern-slides.

The District Council for the National Registration of Plumbers for the counties of Norfolk and Suffolk held its annual meeting on the 4th inst. The chair was taken by Alderman Dakin, who was supported by Dr. Newman and other gentlemen.

The Chairman referred to the excellent work done by the movement, and urged all plumbers to associate themselves with it. He said that often veritable death traps were created by bad plumbing. Dr. Newman said that the health of the community was at the mercy of the plumber. He referred to the admirable plumbing classes at the Technical Institute. He hoped the time was not far distant when all who took to the plumbing trade should be required to make themselves efficient as to carry out their work satisfactorily, and in any way as to insure due attention being paid to sanitation and general conditions of health.

The annual dinner was held on the evening of the 5th inst. at the Oxford Arms hotel, Norwich, under the chairmanship of the president, Mr. W. H. Dakin. Mr. A. E. Collins, in proposing "Success to the Registration Movement," said that in his opinion, registration of plumbers ought to be made compulsory, a thing which would insure plumbing being properly done. A trade whose work had such a great effect on the health of the public required to be registered for the protection of the public. During recent years an extraordinary improvement had taken place in plumbing work carried out in Norwich. He believed registration, together with the work of the Technical Institute, was responsible for that, and proposed the latter in a greater degree than the former. Mr. King, in replying to the toast, said that Norwich stood high in respect to its number of registered plumbers. G. H. Morse gave the toast of "The President and District Council," and Mr. Dakin and Mr. Claude King responded. Mr. C. Mase proposed "The Health of the Visitors," associated with it the names of Mr. E. T. Boardman and Dr. Newman. The remaining toast was that of "The Open Plumbers," proposed by the Chairman, and replied to by Mr. Murrell.

ELECTRICAL ENGINEERS.

Evening meeting of the local section of the Institution of Electrical Engineers was held on the 3rd inst. in the Physics Laboratory of the University, Edmund Street, Birmingham. There was a good attendance, amongst those present being Mr. J. H. Morris (local secretary) and Mr. Henry Lea (retiring chairman).

At the commencement of the meeting Dr. Sumpner proposed a vote of thanks to the retiring chairman (Mr. Henry Lea) and added that Mr. Lea, with Mr. Vaudrey and Dr. Brown, had been primarily responsible for the inception of that technical body three years ago.

Mr. Brown, of Walsall, seconded, and Mr. Lea then vacated the chair in favour of Mr. Vaudrey.

At the customary expression of thanks for the honour conferred upon him, the new Chairman went on to say that he was of the opinion that the time would very soon arrive when all the engineering societies of the town and district would be brought together and meet at some common centre. Proceeding, he pointed out that Birmingham and the district had been the home of engineering work for over a century, and rendered famous by the labours of Bolton & Watt at Soho. The first practical application of the use of electrical energy were to be found in the tramway works of Elkington's and the existence in the district of machine manufacturers and trained workmen undoubtedly had been a great help in developing electrical engineering. At the present time in Wolverhampton, Stafford, Walsall and Birmingham there were many works engaged in the manufacture of electrical machinery, and the importance of these and the immense variety of allied work to the city could hardly be over-estimated. The Chairman then emphasised that we were being continually beaten on our own ground by the technically educated German or American, but that we were applying to electrical enterprise. When electricity, as a source of illumination and later as a source of power, was available, the trammels that were found here did not apply in America. Most of our large cities owned and worked on gas systems, and could not but look with a certain amount of suspicion and disfavour on anything which would alter or modify the success of their own enterprise. The marks applied to power and traction, for before we had laid in this country hundreds of miles of electric tramways were laid and working successfully in America. The

reason of the great development by the Germans and the Swiss had been in part due to such natural advantages as the water-power available in those countries. But we were now making up for lost time, and making plants which were at one time entirely manufactured in Belgium and the United States. Standardisation was the next subject of comment, and he emphasised strongly the importance of manufacturers turning out thoroughly tried work. The engineering section of the University when completed should place at the disposal of engineers means of investigating and testing problems not readily solvable except in the laboratory. The use of electricity for tramway and railway purposes led the lecturer to express his views that the tramway problem in Birmingham was not yet properly solved. The system must be completed with full regard to the outlying districts, and for a radius of ten miles it should certainly be possible to travel without changing cars. The great branch of enterprise to be shortly opened up was the conversion of railways to electrical working, and there appeared to be no economic difficulty in working lines up to fifty or sixty miles long. Of importance at the present time was the need of an exact knowledge of the amount of power required in the district. There were vague statements to the effect that some 30,000 or 40,000 horse-power was required. The figures should be thoroughly investigated.

Professor Threlfall moved a vote of thanks to the Chairman, which Mr. Brown, of Walsall, seconded, observing that to his knowledge there were large works in the locality who were paying not twice or three times too much for their power, but actually ten times as much as they should do.

NEW TOWN HALL, CHELTENHAM.

THE new town hall which has been erected by Cheltenham's Town Council was formally inaugurated on Saturday last by Sir Michael Hicks-Beach. For the erection of this handsome edifice the Local Government Board sanctioned the borrowing of 35,000*l.*, and the Corporation selected as a site a portion of the Winter Garden enclosure, on the north-east of the big glass structure on the Promenade. Mr. F. W. Waller, of Gloucester, designed the building, and the chief contract was placed in the hands of Messrs. Collins & Godfrey, of Cheltenham and Tewkesbury.

The new town hall, in general design, is Classic, freely treated. An imposing façade, beautifully carved, meets the

gaze as the visitor turns out of the Promenade at the New Club corner, and a projecting carriage porch in the centre helps to relieve the massiveness of the exterior from severity. Here, on the north side of the building, is the main entrance, which gives access to the crush-hall, the dimensions of which are 40 feet by 20 feet. The floor of this hall is of marble mosaic, with borders of floral pattern; the ceiling is panelled and painted in cream and white, with circular decorations, and the semi-arches of the wall provide alcoves, also effectively ornamented. At either end of the entrance hall is an octagonal-shaped hall, measuring 24 feet across; adjoining that on the east side is the ladies' cloak-room, while similar accommodation is provided for gentlemen on the west side, and here also is one of the staircases to the galleries which surround the great hall or entertaining room. From the octagonal halls the main corridors, 92 feet in length and 12 feet wide, run the whole length on either side of the great room, and give access thereto at several points, as well as to the various other rooms mentioned. A series of six arches with spandrels add to the effect of the vistas, by dividing the corridors into sections, the flat ceilings of which are panelled and provided with square lights of muffled plate-glass.

Coming next to the great hall, which is designed to fulfil the double purpose of balls and of concerts and public meetings, its dimensions are 112 feet in length by 62 feet in width and 43 feet in height. It has a lofty and coved ceiling, which is panelled, and the room is divided into five arched bays on either side, with galleries in the arches and over the corridor below, while there is in addition a large gallery at the north end over the entrance hall. The interior of this, the chief room of the building, has been most artistically treated, and, with its balconied walls and scagliola columns and ornamental woodworks and tasteful decorations in coloured fibrous plaster, presents a charming appearance. At the south end is an elegantly designed proscenium and orchestral platform, 31 feet across, with organ loft, as yet empty, and at the opposite end the front of the gallery is elliptically treated to agree with the proscenium. A striking feature in the decoration scheme is the scagliola columns, sixteen in number, already mentioned. The warm red colouring affords a pleasing contrast to the softer tints of the walls, and the fluted columns, whatever may be said against them on other scores—for they are merely an imitation of marble—they certainly add dignity and impressiveness to a hall of noble proportions. The balconies, five on either side of the hall, are elegantly rounded quadrants

with elliptic fronts and turned balustrades. From the miniature galleries an excellent view of the floor space can be obtained, and this will be appreciated at the balcony; the view of the stage is largely obscured, and the balconies consequently will not be so advantageously used at concert public meetings. Behind the balconies run the promenade 12 feet wide, corresponding to the corridors below, and these will be convenient for lounges at social gatherings; they will lose their value to concert patrons, as from them nothing can be seen of either floor or platform. Surrounding the balconies are arches springing from the piers between the columns, and above the capitals of these columns are piers which help to support the roof principals. Over the key of each arch is displayed a handsome cartouche shield which gives variety to the bays of the frieze, and the cornices, &c., are richly treated with scroll, floral festoon and other decorations in fibrous plaster. In fact, the whole decoration scheme, which was modelled by Mr. H. Frith, of Gloucester, and is in the Renaissance style, freely treated, is most effective. Not the least delightful feature being the three capital columns are clustered above the balconies, with a background of gold, and with their leaves picked out in gilt. As to the great hall, it is obtained both from the ceiling and from circular-headed windows and bulls'-eyes in the gallery. The dancing-floor has been scientifically constructed, three feet of the best maple ($3\frac{1}{2}$ inches by $1\frac{1}{4}$ inch), carried on roller joists with patent springs. It is estimated the hall will accommodate from 1,200 to 1,500 people.

Subsidiary halls are the large drawing-room, 57 feet by 27 feet, the ceiling of which is curved, and the main ribs of which are carried on marble columns; the lesser drawing-room, 26 feet by 16 feet 6 inches; the card-room, with lavatory, 26 feet by 16 feet 6 inches; the smoking-room, 26 feet by 16 feet; the supper-room, some 55 feet square, the ceiling being carried on marble columns; and a room for light refreshments, 37 feet by 37 feet; while ample kitchen accommodation is given beneath.

It is only necessary to add that much care has been bestowed on the heating and ventilation, and that, for a full illumination, the building is wired throughout for the electric light.

A VOLUNTEER drill-hall, erected at a cost of 1,100, has been opened at Nuneaton.

The Architect.

THE WEEK.

EVERYONE who is even remotely connected with building must have a feeling of relief at the escape of the QUEEN from the effects of the fire at Sandringham on Thursday, the 10th inst. There have been many casualties from time to time which can be ascribed to building operations, but one which might be appalling was providentially escaped. The moral of the case however remains. The majority of accidents which have occurred in English buildings of late years, it evidently arose from the carelessness of a workman. There is no use in concealing the fact that our building operatives are deteriorating. Sometimes the men employed are little more than apprentices, and are wanting in experience. That is mainly owing to the operation of the Workmen's Compensation Act. The modern workman also satisfies himself that the responsibility for his work rests with somebody else, and when what he does is not always visible to the eyes of others, he has no scruple in leaving it in a worthless or dangerous state. At Sandringham alterations had to be effected while the house was occupied. In making provision for a new fireplace it was necessary to remove a part of a joist. The instructions were disobeyed; the joist was left and caught fire through the ignition of felt and rubbish. The fire thus commenced, which mercifully had no fatal consequences. No architect or builder was concerned on reading the report of the circumstances, for, unfortunately, the apprehensions of concealed dangers are not uncommon. We do not suppose that workmen commit errors culpably, although cases of the kind are known; but their negligence has become so general an evil it is impossible to put any limit to the consequences.

THE position of Trier or Trèves, in a valley of the Alps, with the Moselle running by it, must have attracted the Roman emperors who were compelled to visit that part of Europe in the course of the contest in Rhenish Gaul. They made of it a residence, and in that way it was a seat of empire. In the amphitheatre there is no doubt the Roman emperors and civilians enjoyed the destruction of Frankish people by wild beasts. As a consequence of the occupation there is a variety of Roman remains. Besides the amphitheatre, the basilica, which is now a church, the gate known as the Porta Nigra and other works, testify to the greatness of the place. The discovery in the course of carrying out the works in connection with the altar of a large piece of mosaic in the Constantine Platz near the basilica is suggestive of the importance of the site. The houses which were in Roman Trier. The subjects represented appear to be ATHENE and the Muses. The style of the mosaic is excellent, and the pavement is arranged in geometrical divisions, which form a framing for the figures and inscriptions. It is remarkable that another mosaic pavement was laid some twenty years ago, and now in the Trier Forum, is also suggestive of similar treatment, for it contains figures of muses, philosophers and poets. Unfortunately a large part of the mosaic must have been long ago destroyed. But sufficient remains to testify to the artistic importance of Trier.

THE exhibition in the Shire Hall, Chelmsford, of which Mr. A. FAWKES was promoter and honorary secretary, has been so successful we may assume it will be the first of a series. Enough was visible to give confidence to the people of their competence to take part in the efforts being made to elevate English manufactures through education in art and technical knowledge. Mr. FAWKES, as an exhibitor, and his doorway and section of room, showing application of enriched joinery and mouldings, of mantels and overmantels, exemplified a class of work which has made Chelmsford a familiar name in most parts of England. The model of the new Westminster Cathedral exhibited in public for the first time. The students of the local art school exemplified carpet and rug weaving, bookbinding, glazed tile making, china painting, pottery painting, stained glass, metal repoussé, pierced metal, enamelling, inlay and intarsia, gesso, embossed and deco-

rated leather, stencilling, production of woodcuts and colour prints, painted decoration, poker work, art needlework and lace, the whole forming a variety of production which must have amazed the majority of the older visitors. A school which has proved itself to be so extraordinarily successful merits generous support.

THE removal of sand is not now regarded with favour in the suburbs of London, and we suppose there is a similar prejudice in the neighbourhood of all large towns. Some people, in the interest of sanitation, would prevent the removal, for should the land from whence it is taken ever be adopted as building sites, what substance is to fill the void? A case came again before the Chancery Division on Tuesday which suggests that the removal may be attended with serious consequences to the conveyers. Messrs. WHEATLEY & Co. owned land at the end of Hartington Road, Chiswick. In taking away the sand by means of traction engines and trucks, the road was cut up, and the owners of the houses along it brought an action through the Attorney-General against the defendants, which was heard in July. The defendants undertook to repair the road to the satisfaction of the local surveyor. As the work was not done in October application was made to commit the directors for breach of their undertaking, and in the alternative to obtain an order to have the road made up within three months. The defendants pleaded that 1,500*l.* would be required to carry out the surveyor's plan, while when entering into the agreement they imagined the cost would not be more than 800*l.*, of which they were willing to contribute 500*l.* They further said they were unable to find the money. They sought that the order should be changed into sequestration of property rather than commitment of directors for breach of undertaking. Mr. Justice JOYCE made an order that the work should be executed within three months. He refused the application for commitment, but gave a warning that this would be without prejudice to any application that might be made against the directors in case the company did not carry out the order. From this it will be seen that injury to public roads may have consequences which are not always foreseen.

THE Local Government Board have a difficult task in dealing with proposals by local authorities for the erection of workmen's houses. The tendency at the present time is to make them of a costlier character in proportion to the rent to be charged than would be attempted by speculators who sought only from 3 to 4 per cent. on the outlay. The Brighton Town Council some months ago submitted plans for dwellings to be erected on the Spa Street area. In September a letter was received from the Local Government Board stating that "with regard to the proposed self-contained houses, they are too ambitious in character and design for persons of the labouring class, and the Board feel that upon the information before them they could not properly sanction a loan in respect of these houses as providing accommodation for persons of the working classes." It was pointed out in reply that the houses were not exactly for persons displaced by clearances, who would be accommodated elsewhere, but for houses which, from their position in a central part of the town, required to be of a better character than the ordinary class. After much deliberation the borough surveyor has prepared amended plans for thirty terrace houses, each with a frontage of 16 feet 6 inches, and containing parlour, living-room, scullery and usual offices on ground floor, and three bedrooms upstairs, at a total cost of 459*l.* per house. Originally it was proposed to repay the cost in forty years, but local authorities now usually seek to obtain a longer period before the debt is cleared. The sum of 459*l.* borrowed for sixty years would require for repayment of principal and interest per annum at 4 per cent. 18*l.* 7*s.* 2*d.* If let at 10*s.* 6*d.* a week, the house would produce 27*l.* 6*s.* per annum; and after one-third had been deducted for outgoings on value of house and land, there would remain 18*l.* 4*s.* It will be observed that the returns are calculated on a liberal basis, for it is assumed the houses would not be empty or stand in much need of repair.

MEMORIALS IN CHURCHES.

A LETTER appeared from the Bishop of SALISBURY on Monday, in which his lordship said:—"A certain parish in this diocese has a very generous, diligent and much-respected incumbent. Certain of the parishioners desired to mark their sense of his merits, and to co-operate with his efforts, by adorning the church with a stained-glass window. To this, after inquiry, I gave my consent. But when it came to a request to put up near it a laudatory inscription referring to the incumbent, I entirely declined to permit that addition. My principle is that to praise any man before his death is always dangerous, but to do so in an inscription set up as part of the fabric of the House of God is inadmissible. However eminent a man may be for piety or virtue, he may fail before the end." Gratitude is so rare a virtue it deserves to be recognised, although an occasional departure from precedent is involved. Besides, an inscription in or about a stained-glass window usually carries a date, and if a clergyman should fail subsequently, it would show that at one time he stood high with his parishioners. Would anyone now object to a window with a laudatory inscription, if it had been erected at St. Mary's, Oxford, at the time JOHN HENRY NEWMAN, the vicar, was delivering his famous sermons? It is often prudent to make allowances for the weakness of human nature. The sight of the inscription to which the Bishop of SALISBURY objected might be an incentive to the incumbent to endeavour to guard himself against a failure. The shrewd Vicar of WAKEFIELD composed an epitaph for Mrs. PRIMROSE and having got a fair copy in an elegant frame placed it over the chimney-piece. He tells us how "it admonished my wife of her duty to me and my fidelity to her; it inspired her with a passion for fame, and constantly put her in mind of her end." There is perhaps more gratification in a record of that kind, especially when placed before the eyes of living people, than the one sanctioned by his lordship, and which has been set up, but which "makes no mention of the incumbent."

A great many critics, including some architects, would go beyond his lordship, and would condemn all manner of inscriptions in churches, whether they relate to the living or the dead. A church, it can be argued, is not a place for commemorating people, and laudatory epitaphs, if they are noticed, which rarely happens, only serve to distract the attention of a congregation which should be concentrated on matters of a different kind. The abuses of monuments and monumental inscriptions have been often discussed and ridiculed, and indeed it now requires some courage to undertake the expense of engraving the praises of defunct people either in marble or in brass.

The philosophy of the subject may be very clear, and reason may say there is extremely little utility in seeking renown by the lapidary art. But the weakness of human nature should also be considered. There is no doubt that in all ages men have endeavoured to obtrude not merely their names but their virtues on posterity. Relatives have also endeavoured to make out that they belonged to a family who were worthy of affection. As Sir THOMAS BROWNE said:—"Who cares to subsist like HIPPOCRATES'S patients, or ACHILLES'S horses in HOMER, under naked nominations, without deserts and noble acts, which are the balsam of our memories, the entelechia and soul of our substances? To be nameless in worthy deeds exceeds an infamous history." The history of Christianity exemplifies not only a desire to be remembered, but willingness on the part of ecclesiastical authorities to gratify it. The catacombs abound in inscriptions relating to early Christians, and the study of them in the endeavour to identify the persons named now forms an important section of archaeology. There are monuments in churches of all ages, and some of the most successful efforts of Mediæval artists are memorials of ecclesiastics and laymen. The inscriptions on them are sometimes undecipherable. It cannot be asserted that they were always laudatory, but it would be difficult to find many examples like that nameless slab in Worcester Cathedral which bears the one word "Miserimus." A monumental mason would probably be unable to engrave lines which recorded that the remains beneath the stone were those of an ordinary sinner.

The illustrations which we have been giving of the English cathedrals show how often the prelates on coming

into possession of a see lost no time in arranging where they were to be buried. Sometimes they erected special chapels for the purpose, sometimes they appropriated existing chapels. At Exeter Bishop QUIVIL chose the centre of the lady chapel. Bishop GRANDISSON restored the chapel of St. Radegund for a like purpose. Bishop BRONESCOMBE selected the St. Gabriel chapel, and Bishop OLDHAM the St. Saviour's chapel. Bishop BRUERE'S tomb was in the middle of the choir at one time. Powerful laymen were also able to obtain possession of positions in churches which they desired, although all laws of fitness and propriety might have to be set aside. Our readers will remember long litigation which arose out of the construction of a wall by which the chancel of the parish church at Arundel became a distinct structure. It was believed by archaeologists that the walling was illegal, but the courts of law took an opposite view. In the chancel were tombs of the NORFOLK family, and they were considered to be evidence that the place was appropriated for private use, and a representative of the family was therefore allowed to use the building as a private chapel. This case by itself is enough to reveal how important in an historical and legal sense is the subject of monuments in churches. Ecclesiastical authorities should consequently be careful in their manner of dealing with it, for it is not one to be determined by the notions of good taste or of fitness which belong to any individual.

To an age like our own, in which nervous people about it may seem strange that in Mediæval or earlier times people adopted such a matter-of-fact treatment of monuments during their lifetime, Masons who produce a kind of work are aware that even at the present day men and women are to be found in England who have no tombstones prepared, and sometimes more than one in order to anticipate posterity and read their own praises. It should also be remembered there is little or nothing to cause a shock in arrangements of the kind, and that as especially so among the Mediævalists. Architecture is a very exalted art, but none is so limited in appealing to the emotions. A sense of grandeur could be excited by such a tomb as an Egyptian pyramid, but the actual monument chamber within it was after all only a commonplace resting-place and could move no one to pity. The Mediæval mortuary chapel was like any other small chapel. It was made up of elements familiar in shape, and associated with life rather than with death. There was no terror in the altar tomb, and as the figures of prelates, ecclesiastics, knights and other people were of determined forms, it was not possible for a sculptor to perform any feat that would excite terror. Occasionally a man who was ambitious about teaching rustic moralists to die might have himself represented as a *écorché*, or as a skeleton. But the common sense of the age was opposed to such efforts, and figures of stereotyped kinds were wisely preferred. It was not thought advisable that death should be made ridiculous.

BROWNING, who knew more concerning art than all other English poets combined, has in a mocking but profound manner suggested the spirit in which monuments were regarded at a time when art was supreme. A dying bishop relates how he fought to save a special niche in a Roman church, and, although he failed, the site obtained was not cramped. There were to be four columns on each side of him, and one at his feet, all of peach-blossom marble, rosy and flawless. He tells how he concealed under rotten fig-leaves in one of his vineyard a lump of lapis-lazuli "big as a Jew's head cut off at the nape," which was to be poised between his knees. The slab was to be black basalt in order to give effect to the relief in bronze placed under it. There was to be a common travertine employed in the masonry, but jasper alone, and his regret was that he could not use his bath, which was hewn out of a single block "pure green as a pistachio nut." This and much more was to be provided by his heirs. It may seem now unbecoming for a bishop to be possessed by such vanity in his last hours, but we should remember that in the sixteenth century art accompanied Italians from the cradle to the grave, and, as it was inseparable from life, it was likely to abide with the Roman prelate in his parting hours. It is possible that the bishop, with all his admiration for beautiful things, was as orthodox as was necessary.

It may be incomprehensible to us how in Italy they could contrive to rob death or its representations of many of the terrors supposed to belong to it in northern countries. But it was an old practice. The Etruscan artists were adepts in the use of "properties" that terrified; but the terra cotta sarcophagus in the British Museum, which is only one of a numerous class, on which a man and woman are shown enjoying themselves and playing a game, is evidence that they could believe the comedy of life did not end with the tomb.

Ecclesiologists have from time to time endeavoured to reform the character of monumental memorials, and those designed by some modern Gothic architects cannot be condemned as out of place in a church. But however quiet may be the form, it is not always possible to restrain the writer of inscriptions. It seems absurd to have it inscribed on the monument of a bishop in Salisbury Cathedral, "*De nobilibus primordia duxit principibus, propeque tibi gemma reluxit*," especially when there can be no identification of who his lordship was. But the Salisbury relate was not the only one who sought notice for other qualities besides episcopal virtues. On that account we limit it would have been advantageous if a stricter censorship had been exercised. What is said about ordinary monuments is applicable to some extent to stained-glass memorials. But when parishioners are willing to acknowledge their obligations to an incumbent the character of the inscription is altered from those which are read with criticism. The great defect of all the fulsome phrases found on memorials is that we are ignorant of the authority which certifies so many virtues. We can easily imagine them to be paid for by the letter, in the same way as the engraver's work. But when parishioners testify to benefits received, it is only an excess of scrupulousness which would condemn their expression and in that way turn a pastor's work into one of ordinary servitude for wages.

THE STUDY OF ANTIQUITY.

A MODERN reader cannot but consider it to be incredible that so simple-minded a student as JOHN STOW, the London tailor, and author of "The Survey of London," should have been reported to the Council of ELIZABETH as a suspicious person possessing many dangerous and superstitious books. On the information of his own brother he was a second time accused before an ecclesiastical commission. It is possible that the danger incurred by STOW arose from his humble position. In the reign of ELIZABETH popular education was very limited, and it could hardly be supposed that a tailor would investigate antiquity and other subjects to which no profit was apparently attached, unless he was inspired by ulterior motives. For people of a different class such studies were useful. Archbishop PARKER in 1572 founded a Society of Antiquaries. He realised the importance of the manuscripts which were likely to be destroyed owing to the dissolution of the monasteries, and there were meetings at which topics were discussed. JOHN STOW belonged to this body. An invitation to him to attend a conference on Friday, November 11, 1598, exists. The question for debate was "The Antiquitie, Etimologie and Priviledges of Frishes in Englande." The secrecy attached to the proceedings is shown by the notification on the document:—"It ys desyred that you give not notice hereof to any but such as haue the like somons." The Society appealed for a charter of incorporation under the title of "The Academy of the Study of Antiquity and History, founded by Queen ELIZABETH." It was also proposed to establish a library bearing Her Majesty's name. The death of the Queen put an end to the gatherings.

There was also an Antiquaries' College, which may have been the Society under another name, possessing members who used to assemble once a week. Sir WALTER RALEIGH was one of them. After the death of ELIZABETH some years elapsed before an effort was made to resume antiquarian studies in England. Members of both bodies then endeavoured to found a new Society, but JAMES I. took a prejudice against the meetings, and as it was dangerous in these Star Chamber days to do anything doubtful, the

project suddenly came to an end. JAMES was desirous to form a college of his own at Chelsea in order to train a body of theological controversialists, and some antiquaries were attached to it. It is believed by inquirers that members of the Society of Antiquaries continued to come together in secret, and in that way they resembled the astrologists and the freemasons. The Society of Antiquaries now existing commenced to meet in 1707, and the minutes date from 1718. The charter was not, however, granted until 1751. The Society has therefore a continuous history of nearly two centuries, and during that period it has rendered important services in nearly all branches of archaeology, including those which were not recognised as part of the science in the eighteenth century.

There arose a prejudice against the study. An antiquary was supposed to "love all things, as Dutchmen do cheese, for being mouldy," and his chamber was regarded as a kind of charnel-house. Some years after the granting of the charter we find the man who was treated as the embodiment of English common sense, Dr. SAMUEL JOHNSON, making little of antiquarian researches. Speaking of the subject as it related to England, he said:—"All that is really known of the ancient state of Britain is contained in a few pages. We can know no more than what the old writers have told us; yet what large books have we upon it, the whole of which, excepting such parts as are taken from those old writers, is all a dream." JOHNSON could not realise that writings are not the only source of historical knowledge.

The so-called Revival of Learning was mainly exhibited by means of books and manuscripts. But it was soon found there were records of other kinds which were also important. JOHN SELDEN in 1629 gave a description of the inscriptions forming part of the Arundel marbles, which are now at Oxford. They were chronological, but a number of treatises and disquisitions also appeared in the seventeenth century which likewise related to Greek and Roman life. A Dutchman named MEURSIUS is recorded to have written sixty-seven works, the majority of which treated of Grecian manners and customs, and many of his conclusions are still accepted as correct. It was not therefore likely that LOUIS XIV., who had founded an Academy for the promotion of French literature as well as one for art, should have been indifferent to the new interest shown in Classic antiquity. In 1663 an addition was made under the title of a "Classe d'Histoire et de Littérature ancienne," which in 1716 was altered to "Académie des Inscriptions et Belles-Lettres." The love of ancient art which the "classe" was expected to systematise had already taken root in France. LOUIS XIV. had done much to encourage the desire to enrich cabinets with ancient examples. The amateurs who bought statues and busts took care to have them restored before they were presented to the public gaze, and in that way occupation was found for some of the most prominent of French sculptors. The love of antiquity, which in England was a sign of pedantry, was accepted in France as an accomplishment in which fine gentlemen could indulge without any diminution of reputation. After the death of LOUIS XIV. the enthusiasm was continued, for the Regent was an amateur. The researches, it is needless to say, were not systematic, and a great many spurious examples came into France about that time. The Academy of Inscriptions was recognised as a centre, and more than any of the other academies it was distinguished by the zeal of its "correspondants." It was then directed by BOZE, a man whose name is now rarely heard, but who gladly sacrificed the reputation he might have won, preferring to encourage others to follow out his suggestions and in that way to gain some temporary fame for themselves.

The interest in antiquity which had been created by the agency of the Academy of Inscriptions is indicated by one circumstance. BERNARD MONTFAUCON, a French Benedictine, had published some works relating to ancient literature and ecclesiology, but he was carried away by the new excitement, and visited Italy in order that he might give some attention to antiquities. In 1719 he was elected a member of the Academy, and he signalled the distinction by publishing five great volumes entitled, "*L'Antiquité expliquée et représentée en Figures*," which in 1724 were followed by five additional volumes. They form a pictorial

encyclopædia which was intended to enable people who could not visit collections to realise the shapes of an infinite variety of objects. It was impossible to have anything better adapted to suggest the extent of connoisseurship at the time. There are some 40,000 figures, but no attempt is made to explain them in a way which would now be thought necessary in manuals intended for the higher classes of schools or of university students. In most cases the figures were expected to serve without further comment. The public were more pleased with the book than if it presented a great many erudite dissertations. Although at the time it was supposed to be necessary to have the text of a book on archæology in Latin, the observations of MONTFAUCON were given in French. His work, therefore, became widely known. But, indeed, the plates might be considered as being the most successful of all attempts to express an universal language, viz. that of the engraver. MONTFAUCON'S colossal store has been superseded by others in which typical examples alone are introduced, but his courageous effort will always be memorable as an endeavour to provide a substitute for costly collections and one which could be enjoyed by those who were curious about antiquity, but uninstructed.

MONTFAUCON died suddenly in 1741. Six years afterwards there appeared in London a most interesting folio by JOSEPH SPENCE, who had been Professor of Poetry at Oxford, and was a great friend of POPE. It was entitled, "Polymetus; or, an Inquiry concerning the Agreement between the works of the Roman Poets and the Remains of the Ancient Artists. Being an attempt to illustrate them mutually from one another." It is in the form of dialogues, and one of the speakers, who does not possess a collection, asks if he could not make a shift with MONTFAUCON'S work. The remarks made against the work show that in England there was some knowledge on the subject and capacity for criticism. The absence of method is alleged as the chief defect:—

That father's work is largely stocked with figures, and perhaps too largely to be of service in the design we are talking of. We are much obliged to him for his industry, but his choice is rather too loose and unconfined. He has taken in all the different figures he could meet with, of whatever age or country. You have, even in the better part of his collection, Tuscan gods mixed with Romans, old Gallic figures with those of Syria, and the monsters of Egypt with the deities of Athens. This must bring in a great deal of confusion, and strangely multiply the appearance and attributes of nearly every deity. As you see them there, the descriptions of them in the Roman poets do not agree with the artists, nor the works of the artists with the poets. As my view was a more particular one, I found myself obliged to confine my attention to the deities as received in Italy, and even in such parts of Italy only where they were uniformly received. This cuts off any figures that were not of the growth, or at least made free of Rome. The forms used in the different parts of Italy were not indifferently copies to the Roman poets. Etruria had certainly a manner to itself; and the figures used in the Cisalpine Gaul, for example, might have very great variations from the Roman. On the other hand, we are by no means to omit the figures of the true Roman deities because made by Greek artists. Almost all their best were so, for the Romans despised the practice of the arts themselves, and a Roman workman in the Æmilian square was probably pretty near on a level with our artists of Hyde Park Corner, even at the very time that they were bringing in all the most beautiful pieces of antiquity from Greece, and encouraging the best living artists of that country to come and settle at Rome. Hence many of the Grecian deities, together with the modes of dressing them, were in a manner naturalised at Rome, and after that may be looked upon as Roman deities. But there are some that never were so received there.

A critic of a different class arose in JOHN WINCKELMANN. His admirers still consider him to have possessed an instinctive insight into the causes of the beautiful which is found in Greek art. The only drawback to his skill in criticising works of art arose from his intimacy with RAPHAEL MENGES, a painter who was heavy of hand and not subtle in opinion, but who believed he was a genuine follower of the Greeks, and who was not above putting forth a painting of his own as if it were an antique. WINCKELMANN sometimes attached too much importance to MENGES'S counsels. But in judging MONTFAUCON'S book he appears to have relied on himself. He points out that MONTFAUCON

was compelled to trust to his artists and engravers, and accepted works entirely or partly modern as examples, some of the greatest of Greek sculptors. Most of the erroneous opinions spread abroad at the time, WINCKELMANN ascribes to inability to recognise the extent of clumsy restorations. It is also noticed that SPENCE was less liable to error than MONTFAUCON. Compared with French Benedictine, WINCKELMANN'S "History of Art" may be considered as deficient in illustrations; but, on the other hand, it abounds in theories, most of which are respected. His countrymen especially hold him in reverence for he was the first to suggest that a system evolved in Germany was applicable to the most refined creations of Greece.

A new critic appeared who was dangerous both to SPENCE and to WINCKELMANN. LESSING was described by GOETHE as the impersonation of sublime reason, and in his book on the *Laocoon* he grappled with the two writers of ancient art in a manner which was then novel. It became the more remarkable when we remember that he knew little or nothing concerning ancient sculpture, and his book is no more than a fragment hurriedly prepared in order to suggest that he was acquainted with literature under many forms, and was therefore competent to undertake the duties of a librarian. He opposed the theory of SPENCE, by which art and poetry were held to have a mutual interest,

The verse and sculpture bore an equal part
And art reflected images to art

LESSING insisted that each had its own laws, and exemplified this by comparing VIRGIL'S description of LAOCOON the priest and his sons with the well known group discovered on the Esquiline, and for which half the revenues levied at one of the gates at Rome were paid during several years. WINCKELMANN had said that the statue expressed no violence either in the features or in action, and that the priest of APOLLO did not shriek, but softly emitted a sigh. LESSING maintained that a Greek was not ashamed to give expression when he suffered pain, and if any restraint was suggested by the group it was owing to the resolution of the Greek sculptor to avoid everything disagreeable for the sake of the spectator. Consequently he remarks, "MONTFAUCON displayed little taste when he pronounced an old bearded head with a gaping mouth to be a bust of JUPITER, uttering oracles." WINCKELMANN, who was not wanting in self esteem, was at first disposed to pay no attention to the "Laocoon," because, as he said, the author was without knowledge. But afterwards he was able to realise LESSING'S point of view, and came to the conclusion that a reply was needed. For, according to him, "as it is honourable to be praised by the worthy, also it may be honourable to be considered deserving the criticism of the worthy." Soon afterwards LESSING resolved to make a journey to Rome, and, indeed, he marked an edition of "The History of Art" with annotations, which expressed his objections; but the two never met. WINCKELMANN was murdered in Trieste. LESSING never visited Rome.

The four men, MONTFAUCON, SPENCE, LESSING and WINCKELMANN, undoubtedly exercised great influence and gave an impetus to the study of Classic art. Photography has deprived the Benedictine of any trust which at the time might be given to his representations of antiquity. SPENCE, who deserved a better fate, for it was his volubility that gave rise to the "Laocoon" is now, we fear, forgotten in the dust. Considering the state of England at the time, SPENCE'S work was a most ingenious effort, and exemplifies so much Latin scholarship. WINCKELMANN must always be respected with respect, for the susceptibility of the cobbler's son coming in contact with the treasures of Rome is creditable to human nature. LESSING was the most vigorous of them all. HEINE did not exaggerate when he described him as the equal of LUTHER in stirring the German nation to its depths. HEINE said he resembled that fabulous Norman who inherited the knowledge, talent and faculty of the men whom he slew in battle. Controversy is essential for the development of his mind. His knowledge of ancient art was infinitesimal if compared with WINCKELMANN'S. But his sound sense supplied a canon of criticism which is never likely to be set aside, and which such men as GOETHE and MACAULAY applied to subjects of a different kind.

THE LATE HERBERT SPENCER.

ON Monday the remains of the late Mr Herbert Spencer were removed from Brighton by train and hauled to Folders Green, where cremation was arranged. The following address was delivered by Mr. Leonard Courtney:—

I am not worthy to be called to the most honourable duty which has this day fallen upon me. So much I am bound to confess in all simplicity and sincerity at the outset of the few words I may utter. I cannot claim to have been in any fit sense a student of Herbert Spencer's works. I cannot plead for recognition as one of the great company of his disciples. You know, indeed, that Herbert Spencer's first desire was that no other man, known and honoured of us all, should speak on this occasion. His consent had been sought and obtained, and his words would have been fitting memorial of the work and worth of the dead. But four years of unremitting and, towards the end, of exhausting toil have induced John Morley to seek recovery of health and strength by the Mediterranean Sea, and he news of Herbert Spencer's death overtook him as he reached the Sicilian shores of imperishable memories and ever-renewed beauties. His weariness has passed away, his normal vigour is re-established, but it would have been impossible for him to return here to-day had it been right to make the attempt, and it was represented to me that Herbert Spencer had expressed the wish that I should take the place of John Morley if he could not be present himself. This message was sent to me four days since, when I was in the Northern capital. I was immersed in another sphere of action and occupied with far other thoughts, but to such a call I could not be disobedient, and I am here to-day, craving all forbearance if I fail to satisfy the unspoken desires which attend this office. I am indeed borne down when I think how vast a concourse of learners and workers in all lands are, in spirit, if not in body, attending here to-day to testify with gladness and gratitude the depth of their debt to the departed. Yet I must not shrink from adding a few more words of a personal and private character. It is many years since I first became acquainted with Herbert Spencer, and more than a score since our acquaintance became more intimate and my opportunities of intercourse more frequent and more fruitful by my entering into a family of which he had been an habitual guest and honoured friend. Women of that family are here to-day in whose earliest recollection Mr Spencer's personality dwells, who passed from childhood to girlhood, from girlhood to womanhood, under his eye, and to whom his death is the passing away of the last survivor of the grown-up people into whose society they were born. Their memories have in some measure become my own and upon the advantage thus secured friendship grew and sympathy increased, a sympathy in respect to public affairs never so great, so animated and so helpful as in the years which have quite recently passed.

The first thought of every one musing over the life of Spencer must be that of admiration for the vastness of the work he planned for himself and of gratitude and even joy that he lived to see his self-ordained task completed. Rarely or never in the history of thought have we seen so vast a conception carried forward by a single man into execution. The *Albion* which he issued in the year 1860 inviting support to his undertaking must have appeared to many readers a dream that could never be translated into reality. A thousand chances, apart from a failure in the pertinacity or resolution of the planner, might be counted against the fulfilment of his plans. We know, indeed, that such evil chances soon asserted themselves. A delicacy of constitution of which, having regard to his long years, Spencer himself was perhaps too sensible, threatened to interfere with, if not to arrest altogether, the progress of his work. The support he received was inadequate to meet the charges of his undertaking, and his means were being consumed at a rate which would soon exhaust them. His second hindrance was more easily set aside than the first, a circular intimating that the work must be suspended quickly sought a sufficiency of help. Spencer had already obtained more readers and more disciples than he knew, and friends across the Atlantic united in offering aid substantial enough to remove anxieties. As the result proved, a continually growing sale of his books quickly afforded all needful support, and the special response to his appeal was scarcely necessary. Indifferent health proved a more lasting difficulty. He was reduced to working very few hours a day, and sometimes to abstaining altogether from work for considerable intervals. The wonder that with the moderate allotment that was possible so much work was done. Thirty-six years did indeed pass from the first announcement of the undertaking before the final volume was issued. But what a range of inquiry, what an accumulation of illustrations, what a width of generalisation do the volumes of the series not cover. All history, all science, all the varying forms of thought and belief, all the institutions of all the stages of man's progress were brought together, and out of this innumerable multitude of data emerged one coherent, luminous and vitalising conception of the evolution of the world. It is

this harmony issuing out of many apparent discords, this oneness of movement flowing through and absorbing endless eddies and counter-streams and back currents, that constitutes Spencer's greatest glory and caused the multiplying army of readers of Spencer's successive volumes to feel the joy of discovering a great and ennobling vision of progress hitherto unrealised. If in later years some sense of the limitation of the inquiry has supervened, if some feeling has arisen of the insufficiency of the explanations offered, of some steps in the proof, some apprehension of gaps uncovered in the synthesis, there still remains throughout all the varied populations of the civilised world the abiding, undiminished conviction of a great gain realised, of a new plane of thought surmounted and mastered, new footholds of speculation secured which will never be lost in the education of man and the development of society.

Admiration of the range of his inquiry, of the vigour of his analysis, of the scope and comprehension of his great theory, must be our first impression in reviewing Spencer's work; yet must it never be forgotten that his one overmastering and dominant purpose was practical, social, human. Let it be noted that when it seemed too probable that his life would not endure to complete his design in all its parts, he broke off the sociological analyses to reach forward to the right determination of the bases of individual and political ethics. To lay the foundation of these on bedrocks of truth had always been his ultimate purpose. It was indicated in the first sketch of his proposed labours, and when preparatory clearances threatened to overwhelm him he left these works to achieve the essential purpose of his plan. The leading principle of his previous inquiries gave him the clue to the solution of this final problem. The self-adjustment of forces which he had found explaining all cosmic movements had a parallel in the self-adjustment of the forces through the working of which has been developed the society of man. In Spencer's vision it seemed inevitable that this should lead him to the highest exaltation of the worth of individual freedom, and to contest with all his energy the interference of the rules of the many with the growth of the one. We may be permitted to cling to the faith that this conception presents a true aspect of ultimate evolution; and yet it must be admitted that not many of us could accompany Spencer in all the thoroughness of the immediate application of his principles to society as it is. If we know but imperfectly what we are, and know not yet what we shall be, we may still believe in the ultimate realisation of a perfect order without coercion, and of the service that shall be perfect freedom; and we may be bold to insist that meanwhile the presumption is against interference, the justification of which is a burden to be discharged.

Spencer, indeed, in his late years sadly took note of movements apparently in contradiction to the leading principles of his doctrines; and here I may recall a conversation within a week of his death between him and a friend who had once been wholly with him, but had latterly leant to Collectivist action. "We have been separated," said Spencer, "but if we have been moving along different lines I know we have both been moving to the same end." "Yes," she replied—it was a woman who showed that divergence of opinion could not detach her from offices of tenderness and of love—"and it may be that in time some other method of attacking the great problem will be adopted, which will be neither wholly yours nor wholly ours." "Yes, it may be," said Spencer, thus revealing, in the last week of his life a mind open to receive new suggestions and to accept new proposals of change. Standing here by these poor remains so soon to be reduced to "two handfuls of white dust," we are irresistibly drawn on to accompany Spencer in his last brave effort to scrutinise the implacable facts of life. The last chapter of his last book grapples with ultimate questions and propounds his final judgment on the "Riddle of the Universe." No record can be more candid, no confession more striking than that in which he is even appalled by the thought of space, with its infinite extension and everlasting laws enduring before evolution and creation declared things as they are. What is the place of man in this great vision? The brain so full and so powerful has ceased to act. There is no longer any manifestation of consciousness. Can consciousness survive after the organ on which it depended has ceased to be? Is the personality that dwelt in this poor frame to be admitted as in itself indestructible? Or must we acquiesce in its reabsorption in the infinite, the ever-abiding, the ineffable energy of which it was a passing spark? If indestructible in the future, must it not have been as incapable of coming into existence as it is incapable of ceasing to be? Our master knew not. He could not tell. The last enigma defies our question. The dimensions of the unknown may be reduced through successive ages, but compared with our slender discoveries, estimated at the best, a vastness that remains must ever overawe us. Some fringes of the unknowable may yet prove to be capable of being known, but the great central secret lies beyond our apprehension. Yet two thoughts remain. If the night cometh in which no man

can work, we may work while it is day. If we can work, it is somehow within our power to work for what is noble, for what is inspiring, for what is broadening, deepening and strengthening the life of man. We may devote our lives to the service of supreme goodness. Looking back on the years of Spencer we may say that he thus worked, he thus dedicated himself as truly and as bravely as any man enjoying the solace of a more definite creed. To this spirit, then, whose work survives, whose words yet speak, the wave of whose influence can yet pass from generation to generation, we may say in all the fulness of interpretation which the phrase can bear—"Farewell."

AN ACADEMY ADDRESS OF 1823.

THIS year the members and students of the Royal Academy were deprived of the anticipated address by Sir E. J. Poynter, owing to the indisposition of the President. The time may therefore be considered opportune for printing the address which was delivered by Sir Thomas Lawrence on December 10, 1823, or eighty years ago. The successor of Benjamin West did not over-estimate his own powers of literary composition, and he was disposed to consider the delivery of a biennial address as a voluntary task which could be omitted if the feelings or ability of any President prevented him from its execution. Lawrence did not take steps, like Reynolds, to preserve his discourses, and the following is therefore likely to be unknown to students of art:—

The Council and General Assembly have great pleasure in witnessing the number of candidates on this occasion, and are well satisfied with the general progress of the schools.

In adjudging the premium for the best historical picture, they have been governed by those principles of art which form its real dignity—they consider the successful work as presenting the most striking representation of the subject; a bolder character of composition; an effect well suited to poetic incident (though perhaps carried to artificial excess), with that approach to historic depth and richness of tone which appears in unison with the general design, and promises the future colourist. These are the merits which in their opinion have deserved the prize.

Your own good taste, gentlemen, will remind you that we are to judge of works by the presence of beauties, not by the absence of defect; and that even if it fully reached the faultlessness of the character, the picture which should exhibit only the "coldly correct" would with difficulty obtain our sanction.

It must not, however, be considered that we apply this term of negative praise to the pictures that receive the second premium: but as nothing can compensate for the entire want of original power, so the superior value we assign to it will command our decision in its favour, where considerable ability is not distant.

The works which have gained the silver medal have much in them to commend. They show that careful attention to the drawing and anatomical knowledge of the figure so desirable in academical studies, and they are not deficient in very pleasing colour: whether the tone of that colour be strictly appropriate is doubtful; the premiums were adjudged on other grounds, and the design, chiaroscuro and colour, proper to historical or epic subject, will probably be more deeply considered by the artists on future occasions.

Your judges, gentlemen, are but students of a higher form. Continuing our exertions at a more advanced station, the obstacles we have ourselves to encounter remind us of the difficulties that await you, and we limit our expectations of your success by the uncertainty of our own. It is part of the triumph of our art that it is slow in progress, and that, although there are frequent examples in it of youthful promise, there are none of youthful excellence. Even the early paintings of Raphael bear no comparison in finished merit with the juvenile productions of the poet, with those of our own country, of Milton, Pope, or Cowley. Proceed then with equal firmness, humility and hope; neither depressed nor vain; chiefly elated that you determine to do better; as knowing that in a state of reasonable progress the seeds of beauty are already sown if you retain the consciousness of defect.

The rising school of England ought to do much, for it proceeds with great advantages. It has the soundest theory for its instruction, the brightest example for its practice, and the history of past greatness for its excitement.

The paternal care of the revered founder of this institution, by the judicious selection of its officers and the assignment of their duties, provided the most effectual means of study; and the councils of this Academy have been watchful to extend them; while, as the establishment advanced, the care of its professors was seconded by the general exertions of the members, till in knowledge and ability it attained an eminence under its former and late President that more than placed it on a level with the most enlightened schools in Europe. The noble works of those celebrated artists and of others of their

time—the comprehensive labours of Barry—the Shakespear and Milton galleries—the many sublime designs by the great author of the latter (Fuseli), whose unapproached invention and high attainments enforce this tribute to living genius—the numerous illustrations of our novelists and poets, in the greater number of which the purest spirit of Raphael may be traced—the rich embellishments of Eastern fancy displayed by others, with as fine delineations of the pathos and comedy of Cervantes—the series of outlines from Homer and the Greek tragedians, which embody the principles of ancient art, and in the expression of sentiment as well as grandeur seem coeval with its brightest age—these various and unrivalled efforts of the pencil fully support me in the assertion; while in the sister arts the names of Banks, of Nollekens and Baccio, Sir William Chambers, Mr. Dance and Mr. Wyatt still more confirm it. We must be careful not to surrender this distinction; and although one obvious disadvantage presents itself in the inadequate powers of the individual who now fills the chair, I yet hope, gentlemen, that remembering by whom he has been preceded, and by whom he is surrounded, you will yourselves endeavour to make up the amount of honour; justice to the scene of your education and the expectations of the country, and perpetuate by your own the services of the great men who so largely contributed to its fame.

Except in less brilliant periods, when decision may be between equality of talent, the voice of a profession is usually just, and of those distinguished persons the pre-eminence must undoubtedly be given to our former and late President.

The elevated philosophy of Sir Joshua Reynolds, in the golden precepts which are now acknowledged as canons of universal taste, and that illustrious Society of which he was the centre, combined with his genius to give a dazzling splendour to his name which seemed to leave him without competitors; yet the powers and knowledge of Mr. West deserved not to contrast in their present fortunes.

At an era when historical painting was at the lowest ebb (with the few exceptions which the claims of the beautiful allowed the eminent permitted to the pencil of Sir Joshua), Mr. West, sustained by the beneficent patronage of His late Majesty, produced a series of compositions from sacred and profane history profoundly studied and executed with the most facile power, which not only were superior to any former productions of English art, but far surpassing contemporary merit on the Continent, were unequalled at any period below the schools of the Carracci. The picture of *The Return of Regulus to Carthage*, preserved with gracious attention in the palace of Buckingham House, and of *The Shipwreck of St. Paul*, in the chapel of the Royal Hospital at Greenwich, are examples that may securely be adduced in testimony of the fact.

Towards the close of an honoured and laborious life, and when his advanced age might reasonably have deterred him from exertion, he produced a large and interesting work, *Christ Healing the Sick*, which, meeting with liberal reward, so forcibly excited the admiration of the public as even by its attraction to add new means of patronage to the prompt benevolence that secured it. This was succeeded by others of still more arduous subject, of greater magnitude, and, if possible, more powerfully impressive. The display of such astonishing ability in age (for he was employed on them in his eightieth year) combined with the sacred importance of his subjects, gave him celebrity at the close of his life, far greater than he had ever before enjoyed, and he became (almost to forgetfulness of deceased greatness) the one popular painter of his country. What slight circumstances may retard the effect usually produced by death on the fame of the eminent and good. It is now more than three years that we have witnessed at his residence an exhibition of the accumulated labours of a venerable and great artist, whose remains were honoured with a public funeral, and whose loss was felt as a national calamity, totally neglected, and deserted the spacious rooms in which they are arranged, erected in just respect to a parent's memory and due attention to the imagined expectations of the public, destitute of spectators as the vacant halls of some assembly, and, but for the possession of other property of known value threatening to injure the remaining fortunes of the filial hand that raised them. But though unnoticed by the public, the gallery of Mr. West remains, gentlemen, for you and exist for your instruction, while the extent of knowledge that he possessed and was so liberal to convey—the useful weight of his opinions in societies of the highest rank—the gentle humaneness of his nature, and that parental fondness with which youth and its young aspirations were instructed and cherished by him, render his memory sacred to his friends and endeared to the schools of this Academy, while respect for worth and gratitude for invaluable service are encouraged in them.

For myself, indebted to his friendship for no inconsiderable portion of that service, I can truly say that I never estimate the comprehensive ability of that great artist so highly as when comparing his labours in my memory with many of the celebrated compositions then before me of the revived modern art, and were the revered friend now living to witness

letters were addressed his report would be evidence of that passion.

I hope it is impossible that the nation should long continue neglect, and seem to prove by this indifference that the general enthusiasm so recently excited by those fine productions, and the respect then shown to their venerated author, are but the impulse and fashion of an hour, dependent on the convenience of place and distance, instead of the rational tribute of the judgment and the feeling protection of an enlightened and just people.

Yet, whatever in extent of fame had been the successful career of Mr. West with his illustrious predecessor, the integrity of your late lamented President would still have added the chief honours of the English school to our beloved Sir Joshua, of whose works, character and conversation he often spoke in the last years of the intercourse I had the honour to have with him with that pleased and proud remembrance which great minds always hold of the competitor who had most severely tasked their powers, of the genius that had surpassed them.

With what increased splendour did that genius lately reappear amongst us.

Many of us must remember when, after long absence, the great tragic actress of our time, Mrs. Siddons, returned for a season to the stage, to correct the forgetfulness of taste and restore the dignity of her art: it was so with the return—the recovered glories of Sir Joshua. They who believed themselves best acquainted with his works and entitled by their knowledge to speak of them with enthusiasm, felt how much that knowledge had forgotten; how inadequate to their merits was the praise they had bestowed. The prejudices, so injurious to modern art, were gone—time seemed to have advanced the future with double speed, and presenting Truth, vested her with new radiance. The few remaining competitors and scholars of this great artist saw him then with the eyes of posterity, and beheld in their own narrow period the sure stability of his fame.

It is singular that the judgment, the unpretending sense and manly simplicity so generally acknowledged to have marked the character of Sir Joshua should have been impugned only on those opinions upon art which seem to have been the most deliberately formed, and were enforced by him with parental zeal as his last remembrance to this Academy. Efficient proof of the sincerity of his admiration of Michelangelo had previously existed in the actions of some of his best groups having been taken from him, but we want no other evidence of its truth than his picture of Mrs. Siddons, a work of the highest epic character, and indisputably the best female portrait in the world.

The link that united him to Michelangelo was the sense of ideal greatness—the noblest of all perceptions. It is this similitude of thought that marks the first-rate genius; this simplifying fancy, which has nowhere its defined form, yet everywhere its image, and while pursuing excellence too perfect to be attained, creates new beauty that cannot be surpassed. It belongs only to that finer sagacity which sees the essence of the beautiful or grand divested of incongruous detail, and whose influence on the works of the great President is equally apparent in the calm firm defender of the national Rock (Lord Bathfield) as in the dying Queen of Virgil or the grandeur of the Tragic Muse.

To a mind so enlarged and liberal as Sir Joshua's—who carried not the value of an art that gave the world its Shakespeare, and in whose society a Garrick and a Kemble lived in grateful intercourse with Mr. Burke and Dr. Johnson—we may well imagine how gratifying were the contemplation and progress of that divine work; and allowing much to anticipated fame, we may equally believe that part of the noble purpose was protection of the genius he admired; to pass to passing excellence an imperishable name, extend the justice withheld by the limits of her art, and in the beauty of that unequalled countenance (fixed in the pale abstraction of some lofty vision, whose "bodiless creations" are crowding on the view and leave in suspended action the majestic form), to vivify the testimony of tradition, and by the mental grandeur that invests her record in resistless evidence the enchantment of her power.

That the works, gentlemen, of this illustrious man should have the strongest influence upon you cannot be matter of surprise; that the largest style of painting that perhaps is known should captivate the scholar as it has charmed the poet is the most natural result that could have been produced in minds of sensibility and taste—but let it not mislead them. If they determine to make the labours of Sir Joshua their example let them first examine by what only means their excellence was acquired.

His early pictures bear evidence of the utmost delicacy of finishing, the most careful imitation. That sensitiveness of touch which probably from boyhood he possessed could never have permitted him to enter into the mean details of Denner, to content himself with the insipidity of Cornelius Janssen;

but in mere finishing he was inferior to neither, and the history of the greatest masters is but one. Truth is the key of art, as knowledge is of power; within the portals you have ample range, but each apartment must be opened by it. The noblest work that perhaps was ever yet projected, the loftiest in conception and executed with as unequalled breadth, is the ceiling of Michelangelo; the miniatures of Julio Clovio are not more finished than his studies.

On you, gentlemen, who, with the candidates of this evening, are entering on the first department of the art, the conduct of Sir Joshua should act with treble force. Mr. Burke says of him, "In painting portraits he appeared not to be raised upon that platform, but to descend to it from a higher sphere." To that sphere let his example guide you, and it will lead you to the highest—to Correggio, to Titian, to Raphael, to Michelangelo. To "those divine men, in whose presence" (to use his own eloquent language) "it is impossible to think or to invent in a mean manner; and by the contemplation of whose works a state of mind is acquired that is disposed to receive those ideas of art only which relish of grandeur or simplicity."

Tasks of great difficulty lie before you, and with them you have one essential duty to perform; fulfil the latter, and the former will more certainly be achieved. Be faithful at all times to the dignity of your art; let nothing tempt you to bend a noble theory to imperfect practice; be constant to it in failure as in success, remembering that the most insidious approach of error is masked by disappointment. There may be new combinations, new excellences, new paths, new powers (of which, to the glory of a sister country, we have fortunately high example); there can be no new principles in art, and the verdict of ages (unshaken during the most daring excitement of the human mind) is not now to be disturbed. The variety of nature has no limit, and in the subjects she presents there is ample scope for the utmost diversity of thought, but since the judgment of mankind has limited the circle of greatness but to few, be these your audience, your tribunal; reject all meaner association, assured that once admitted to the highest, the rest are at all times sufficiently at your command.

The present auspicious circumstances indicate an approaching era that may teach us to look with less regret on the splendour of the past—a people more and more informed on the subject of the fine arts, a Legislature alive to the importance of encouraging them, a Government adopting measures to secure for them the noblest examples, and a gracious Monarch to command its efforts—at all times the munificent patron of this establishment, and whose reign has not been more the glory of his people than their advancement and happiness are his reward.

MANCHESTER ART GALLERY.

THE members of a special sub-committee of the Manchester Art Gallery committee held a meeting on Monday at the City Art Gallery in Mosley Street to consider the present cramped condition of the gallery and devise a remedy. It has been the opinion of the art gallery committee for a long time, says the *Manchester Guardian*, that the gallery ought to be enlarged. To this end they secured a plot of land at the back of the building, and were preparing plans for an enlargement scheme when the proposal came from the City Council that the committee should stay their hands pending the result of the negotiations for the purchase of the Infirmary site by the Corporation. The committee fell in with the Council's request. It was then suggested that an art gallery and a free reference library might be erected where the Infirmary now stands. The committee felt the force of the arguments that were addressed to them. They were, in fact, attracted by the prospect of seeing the city's art and literary treasures housed in a fine building in the best position that could be found. It is clear to them, however, that much time must elapse before this desirable end can be attained. It is beginning to be thought, also, that there may after all hardly be sufficient room for a reference library and art gallery in Piccadilly, especially if Professor Royd Dawkins's scheme for having a great museum there as well finds favour with the authorities. Meanwhile the art gallery committee feel that no time should be lost in deciding whether to extend on the present site or not. The meeting on Monday was private as usual, but we are informed that in the opinion of the majority it will be better for the gallery to remain where it is and seek greater accommodation at the rear of the building. The arguments for and against were discussed at great length, and in the end it was resolved to ask the City Council to authorise the committee to let the gallery stay where it is and proceed with their preparations for enlargement. The prevalent feeling was that in any case good will be done by stirring up inquiry and discussion.

NOTES AND COMMENTS.

It is rarely a metropolitan magistrate orders the demolition of buildings in which the line of frontage has not been respected, unless there is good cause for exercising summary power. The case which was heard on the 10th inst. before Mr. CURTIS BENNETT is therefore the more remarkable. There is now a desire in a great many parts of London to erect shops, and the defendant proposed to put up two in Westbourne Grove. They would extend beyond the line of frontage, but the County Council consented on the understanding that 6 feet of the forecourt should be added to the footway. The defendant surrendered only 2 feet 6 inches, and the remainder of the 6 feet was enclosed by a hoarding and a wall. On behalf of the defendant it was asserted that the wall belonged to the owner of the adjoining property, and the hoarding was intended for the public protection. It was also stated that the defendant was prepared to fully comply with the stipulation of the County Council. The magistrate treated the case as one of fraud and issued an order for the buildings to be taken down. An appeal was made to him that defendant's surveyor might be heard. But the magistrate refused to do so, or to alter his decision. Land is so valuable in most parts of London it is no wonder the County Council find a difficulty in having the building line respected. But the Building Act is decisive in such cases, and the leniency of magistrates has no doubt led owners to imagine that rigorous measures could always be obviated.

ALTHOUGH the Bourse of Paris is considered by speculators to be the most important building in the city, it was reopened after enlargement on Monday in the simplest manner. The building, it will be remembered, consisted of an immense parallelogram, measuring about 220 feet by 165 feet. As it has been altered, the plan may now be described as cruciform, but with very short arms. The arrangements are changed. There is still the familiar central hall and two smaller halls. But several offices and special rooms for bankers and their clients have been introduced. In other words, there are parts of the building from which the ordinary public will be excluded. It has been recognised that the general public take deep interest in the operations, and the din usually heard under the front colonnade is deafening. By the new arrangements non-professional financiers will be able to share in the speculations with less discomfort on wet days. The original architect of the structure was A. T. BROGNIART, who was a pupil of BLONDEL, and architect to the king. The foundation-stone was laid in 1808, but at his death in 1813 the works were incomplete. They were continued under the direction of LABARRÉ; the building was completed in 1826, and cost about eight millions of francs. The additions and alterations have been carried out under the direction of M. CAVEL, and it is the general opinion that the building has been improved in appearance externally, while it is better adapted to the requirements of the time.

TROYON is by many people supposed to have been a brilliant animal painter. There is no question of his success in that line, for he was able to represent not only cows, but the pastures in which they were found. It is difficult to say whether the landscape or the figures should be preferred. The power he displayed seems the more remarkable when it is remembered that he was one of the artists attached to the porcelain manufactory at Sèvres, and practice of that kind is not favourable to breadth of treatment or depth of colouring. Living at Sèvres, he was acquainted with the locality, and therefore it did not surprise his friends when in 1838 he obtained a medal for a view of St. Cloud. The collections of the city of Paris did not contain any representation of the chateau, and accordingly inquiries were made about TROYON's picture, which had escaped notice for several years. The picture was in the possession of M. CHARVET, a well-known shop-keeper. He has with great generosity presented it to the Musée Carnavalet, of which it will form one of the ornaments.

ILLUSTRATIONS.

CATHEDRAL SERIES.—EXETER: THE CHOIR.

BRITISH LINEN CO. BANK, THREADNEEDLE STREET, E.C.—DETAIL FRONT.

LUXMORE, LEEK, STAFFS.

OCCUPYING a pleasant site on the Buxton Road the house is built of common local bricks covered with cement plaster, and dashed with yellow Loughborough pebbles washed clean. The base of chimney-tops are in pressed red bricks from local make, and the stone is red Roche. The sash windows and casements are all built in from the front, and have English sills. The bottom panes are polished plate, and top sashes lead glazed. The staircase and angle-nooks are in other joinery in pine. The roofs are covered with Basford red hand-made sand-faced tiles, and are already weathered down to a quiet green.

The general contractor was Mr. T. GRACE, and plumber Mr. STEVENSON, both of Leek, while the bronze rim-locks and furniture and the ironmongery throughout (bronze) was supplied by Messrs. ELGOOD BROS., Leicester, to the design of the architects, Messrs. W. SUGDEN & SONS, of Leek.

ST. MARY'S CHURCH, STONE, KENT.

AS Stone Church, near Greenhithe, was built about the same time as a large part of Westminster Abbey, it was the belief of the late Mr. STREET, R.A., that the architect designed the two. He found resemblances in the arcades, tracery and foliage, as well as in the employment of similar materials for certain kinds of work. The chancel, nave, aisles and western tower were probably erected during the episcopate of LAURENCE DE ST. MARIE between 1251 and 1274. In the next century the vestry and western windows were introduced. The Wilsch chantry is a sixteenth-century addition. It will be observed that one peculiarity of Stone Church is that the roof of the chancel is higher than the nave, and in the interior work will be found to increase in beauty and richness of detail on passing from west to east. The building was restored about 1860 by Mr. STREET.

MILTON HOUSE, 8 AND 9 CHISWELL STREET, E.C.

THIS building occupies a site having about 30 feet frontage to Chiswell Street and a depth of about 92 feet, and has a rear frontage on to the Honourable Artillery Company's ground. The buildings were designed primarily as supplemental premises to Messrs. RAPHAEL TUCK & SON'S, LTD., headquarters at Raphael House, Moorfields, and the name of Milton House was given to the buildings and a portrait of MILTON carved over the entrance by reason of his literary association with the district. The floors are of fire-resisting construction, and are served by a hydraulic lift. The elevation has been carried out in Portland stone. The general contractor of the works was Mr. HENRY LOVATT, of London and Wokingham, and the architect Mr. DELISSA JOSEPH, F.R.I.B., of 73 Basinghall Street, E.C.

HOUSE AT REIGATE.

THIS house, the sketch of which was published in the last issue, has been erected at Reigate from the plans of Mr. C. E. SALMON, architect, Bell Street, Reigate. It is situated at the foot of the North Downs, and has views of Leith Hill, Box Hill, and across the Weald to the South Downs. The elevations are faced with rough-cast and portions in half timber work, left rough from the saw and tarred. The roof tiles are hand-made sand-faced tiles. Messrs. S. & E. COLLIER, of Reading, and weather quick-set. All the woodwork for doors, staircases, &c., was supplied and executed by the contractors from details by the architect. Chimney corners, with arched recesses, are formed in two of the rooms, and in one bedroom an open-timber ceiling occurs, with all woodwork stained a dark colour. The contractors were Messrs. W. BAGALEY & SONS, of Maresfield, Redhill.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. Aston Webb, R.A., president, in the chair.

The Secretary announced the decease of the following members:—Mr. Charles Fowler, Mr. N. Y. A. Wales, elected 1901, and Mr. W. Warlow Gwyther, elected Fellow 1880.

In referring to the decease of Mr. Charles Fowler, the President said he would be known and be loved by a great many present that evening. He was elected as Associate in 1851 and Fellow in 1862. His father was one of the founders of the Institute, and had acted for some time, as honorary secretary. He held for many years the appointment of surveyor to the Portland Estate. He was an enthusiastic worker in the interests of the Institute, and had acted as Chairman of the Board of Examiners. On the motion of the President, a vote of condolence was passed to the widow and family of the deceased.

Mr. W. HENMAN read a paper entitled

The Royal Victoria Hospital, Belfast.

He said there was much that was unique in its inception, original in its design and novel in its equipment which had attracted attention to the Royal Victoria Hospital, Belfast. It seemed therefore advisable that an authentic description should be published of the reasons which had led to what had been termed a "revolution in hospital design," as well as of the methods and means by which it had been accomplished. If the plan was revolutionary in its tendency, he hoped to show that it was a serious endeavour to simplify and, if possible, to improve hospital design. Whether it was destined to secure permanent approval or be pointed at as an example to be avoided, depended upon, first, whether the essentials in hospital design had been properly appreciated and applied; secondly, whether those having the care and management of the institution would maintain it in efficiency. As regards the development of the design in question, distinct variations in hospital planning had been principally brought about as knowledge increased of the necessity for efficient ventilation and of the means by which it could be secured. Hence, with mechanical means at their disposal, an attempt was made at Belfast to design a hospital that could be efficiently ventilated by such means. The author acknowledged his indebtedness to Mr. William Key, of Glasgow, who had proved the possibility of securing efficient ventilation on the plenum system—the system which had been adopted at the hospital. The wards of a hospital are occupied both day and night by patients in a low state of health, and continuous change of air, with an equable temperature and freedom from draughts, secured without noise or dirt, is necessary to the cure of the patients. The question therefore is, How can hospital wards be designed and arranged so as economically and effectively to secure the desired conditions? Reference was made to correspondence which had appeared suggesting that in consequence of the proved success of plenum ventilation, combined with antiseptic treatment, it might be possible to dispense with the "pavilion" arrangement of wards, and advocating double wards divided longitudinally by dwarf partitions. This idea had seemed altogether wrong, and he had set forth his views in a letter in which he suggested that "instead of erecting detached pavilions of several storeys, it might be better to spread out the wards on one storey only, placed side by side and lighted by continuous lantern lights. Such an arrangement would secure greater comfort to the patients, simplify ventilation by mechanical means, and very considerably reduce corridor communication as well as dispense with the inconvenience of stair-cases and lifts, thereby facilitating administration. For the accommodation of the staff there would be no objection to buildings of several storeys, but with all the patients compactly arranged on one floor-level their wants could be easily supplied, and other difficulties of the pavilion plan would be overcome." The letter concluded:—"Only those who study what is possible with the plenum system of ventilation properly applied can realise the practicability of such an arrangement; yet by its employment I feel convinced that some such revolution in hospital planning will be accomplished, and do not doubt that in time it will be demanded, partly in consequence of the great cost of the pavilion plan, but more particularly in consequence of the excessive labour thereby involved."

When the author was requested to meet the committee of the Royal Victoria Hospital, Belfast, reference was made to the suggestions contained in the above letter, and he was questioned as to the practicability of constructing a hospital such as he had proposed. On attempting to fit together on entirely new lines the intricate requirements of a complete hospital for 300 patients and a large staff, he began to realise the difficulties he had imposed upon himself. With the assistance of his partner, Mr. Thomas Cooper, the plan in time, however, assumed the

generally symmetrical arrangement in which it now appeared in the erected building.

He referred to the opposition raised against the scheme before it was finally sanctioned by the committee. Professor Byers, member of Council of the British Medical Association and honorary member of the medical staff, averred that "when first he heard that it was proposed to place all the wards side by side without intervening open spaces, to light them principally from above, and to have no windows to open, it appeared to him so contrary to all his preconceived ideas on hospital design that he determined to oppose the carrying out of such a plan by every legitimate means, and to enable him to do so effectually, he set about independently to study the subject in all its bearings, but to his surprise, the more thoroughly he probed it the more and more convinced he became that Mr. Henman was right."*

The cost of the buildings, including all engineering requirements and a complete steam laundry, was but a trifle over 300*l.* per patient's bed—proof that the arrangement of plan is capable of being carried out at an economical figure. The site is six acres in extent, to which another six is to be added. The hospital stands comparatively high, has a pleasant outlook in every direction, and is readily accessible from most of the large manufactories and works and from the poorer parts of the city, whence the majority of the patients will come. From west to east there is a fall in the level of the ground of over 20 feet, of which advantage has been taken; by keeping the main floor level well above the ground adequate height is secured for the principal fresh air-duct, which runs under the main corridor, for the branch ducts conveying fresh air to the several wards and accessory rooms, also for a pipe-duct running parallel with the principal air-duct—a necessary provision, so that heat from the steam and hot-water pipes may not penetrate the buildings during the summer months, and that convenient access may be obtained to all piping.

Opening directly from the hall opposite the porch entrance runs the main corridor from east to west, some 450 feet long and 9 feet wide. Branching southward are seventeen short corridors, giving access to as many wards, each with fourteen beds, with their accessory rooms, all practically under one roof. The eight wards to the east are for medical cases, then come eight wards for surgical cases and one for gynaecological cases. To the north are two for ophthalmic cases.

A description was given of the general arrangement of the rooms—male and female wards, classrooms, clinical-rooms, operating-rooms, ward kitchens, store-rooms for clothing, nurses and cleaners' rooms, sanitary conveniences, &c.; also the "extern," or outpatients' department, with its waiting-hall and medical, surgical and specialists' consulting-rooms, examination-rooms, dispensary, &c. Intercepting lobbies between wards and conveniences are dispensed with. Open windows with plenum ventilation are objectionable, and without open windows intercepting lobbies are an anomaly. By simple adjustment air from sanitary turrets is prevented from entering the wards, air pressure in their direction being maintained from the wards outwards. To the ward-kitchens no doors are provided. With plenum ventilation an equable temperature and freedom from draught are secured, consequently inner doors are required only for the sake of privacy, or where difference of temperature is desired to be maintained.

Two small detached buildings at the west end of the site are for isolation purposes. They receive fresh air by a continuation of the main duct underground; and, although at least 600 feet away from the fans, are amply supplied with fresh air.

The author showed sections through a portion of the ward-block to give a general idea of the method of lighting and of the construction adopted. The windows are not skylights, as generally understood, but may be more properly defined as clerestory windows, slightly sloping, and glazed with $\frac{1}{2}$ -inch plate glass. The result is most perfect lighting to every portion of the building. Surgeons using the operating-rooms state that nothing could be better for their purpose; the light is ample, well diffused, and free from shadowing. An advantage of plenum ventilation is that the cubical contents of buildings may be very considerably reduced. Given sufficient floor area for nursing and teaching purposes, the height of wards need be no more than appearance demands, and when lighted, as they are in this instance, the cubical contents are much reduced, being not more than two-thirds of what is ordinarily required.

After referring to the administrative buildings, he described the various fittings and appointments of water-closets, sinks, bath-rooms, operating-rooms, post-mortem rooms, pathological and microscope rooms. The whole of the sanitary appliances

* Asked recently for his personal experience of the working of the hospital, Professor Byers said that the building "more than fulfilled his expectations, the plenum system worked admirably, and whether from the point of view of administration, ease and comfort of patients, or adaptability to clinical teaching, he knew no hospital equal to it."

were carried out from the architects' designs by Messrs. Morrison & Ingram, and fixed by Mr. John Dowling, plumber, of Belfast.

Mr. Henman concluded with a word of caution about plenum ventilation. It is, he said, essential it should be applied with full knowledge and by those competent to deal effectively with it. Distrust an engineer who will give a scheme for ventilating any building indiscriminately on the "plenum" or "extraction" system, or by what are termed natural means; but try to realise that every building should be designed for the particular method of ventilation intended to be employed, and that the means for procuring ventilation must be specially designed on scientific principles to meet the actual requirements of the building.

Mr. HENRY LEA, M.Inst.C.E., followed with a second paper, entitled

Engineering Work of the Belfast Hospital.

Speaking of the ventilation, he said that the design which Mr. Henman had originated facilitated to an extraordinary degree a simple arrangement of air-ducts of ample proportions. To emphasise the importance of this point, he mentioned two large buildings now ventilated by mechanical means, each having about 13,000,000 cubic feet of fresh air driven through them per hour. In one building, owing to the liberality with which the air-ducts are proportioned, the total amount of power required to drive the fans was 19 i.h.p.; in the other building, owing to the air-ducts being restricted and very crooked, the power required was 53 i.h.p. Putting this into money value, in one case the driving-power cost 766% per annum and in the other 2,164% per annum.

The main air-duct at the end nearest to the fan chambers has a height of 20 feet and a width of 9 feet. The full width is preserved to the far end of the wards block, a distance of 443 feet, but the bottom slopes upwards, so that the height is diminished to 6 feet at the far end. The total cubical capacity of the hospital buildings ventilated on the plenum system is 703,000 cubic feet. With seven changes of atmosphere per hour in the winter the velocity of the air entering the main duct is 7.06 feet per second, and with ten changes per hour in the summer the velocity is 10.85 feet per second. The proportions of the branch ducts and of the vertical air-flues are based upon similar liberal lines, as are also the air-ways through the fan chambers and the water screens. This accounts for the reduction of power for working the system.

Another point in relation to economical working is that the fans are driven by a steam-engine, the exhaust steam from which is utilised for heating the water for the baths and lavatories. The lecturer showed that there was a saving under this head of 275% per annum.

The main engineering features in connection with the ventilation of the hospital having been fully detailed, the lecturer treated of the arrangements for hot and cold-water supply. The supply of cold water is brought from the cold-water cistern in the roof of the east wing and is connected to the return-pipe, so that the cold water, after passing through the rotary pump, enters and is heated by the two steam calorifiers before it passes to the various portions of the building.

The general arrangement of the hot-water circulation includes two hot-water cylinders, each containing 900 gallons of water. To the system of circulation are connected eight subsidiary circulations under the ward block for the purpose of supplying the baths and lavatories in that block. Other subsidiary circulations are also provided for the ophthalmic block, the extern and the administrative block. All the hot-water mains and the branch circulations are covered with non-conducting composition. The effect of the rotary pump is such that the hot water is caused to circulate through the whole system about once every fifteen minutes, which insures evenness of temperature.

The system of cold-water pipes follows substantially the course of the hot-water pipes, with the exception that no circulation arrangements are provided. Wherever the cold-water mains and pipes are exposed to cold air they are covered with non-conducting composition to protect them from frost.

In each of the operating-rooms is an apparatus for sterilising water for surgical purposes. The water for these purposes is first warmed by means of a steam coil, and is then passed through a Berkefeld filter, which frees it from every kind of microbe, and is thereby rendered innocuous for surgical use. The temperature is regulated with the greatest facility.

The laundry is designed so that the articles to be cleansed go through the consecutive stages of treatment without being carried over the same ground twice. The ordinary type of machinery is employed. The exhaust steam from the laundry engine is used to heat the drying closet and water for the washhouse. A fan draws air from the ironing-room, forces it through the heating coils of the drying closet, and thence into

the washhouse, upon the steamy atmosphere of which it has beneficial effect.

Electricity for lighting is supplied from the town main. The system of wiring is that which is now well known and generally used, but which the author believes he was the first to use, namely, placing a suitable number of fuse-boxes about the building; using the same sized sub-mains throughout supplying the fuse-boxes; using the same sized fuses in all the fuse-boxes; placing not more than five 60-watt lamps on each fuse for 100 volts, or eight lamps on each fuse for 220 volts, and using the same sized lamp leads throughout the whole building. The total number of 16 candle-power lamps, or the equivalent, installed in the establishment, is about 1,100.

Sir JOHN HOLDER, chairman of the Birmingham General Hospital, proposed a vote of thanks to the authors of the two papers for the intellectual treat they had given the meeting. When it was decided, he said, to build the large hospital at Birmingham there was a limited competition for designs, the committee having as their adviser Mr. Alfred Waterhouse, R.A. The competition was fruitful, and he could say with confidence that Mr. Henman's successful plans were far ahead of those of the other competitors, and in the accomplishment the committee had every reason to be proud of their selection. The building was designed for natural ventilation, but after the plans had been accepted it was decided to adopt the plenum system of ventilation, and Mr. Key was asked to co-operate with the architect. In the working of the hospital the results of the system had been satisfactory, for in the coldest days of winter an even temperature could be maintained in the building. There was a constant supply of fresh air, which benefited both patients and nurses, and they found no contamination of diseases in the wards. If measles or scarlet fever broke out it was rarely necessary to close the ward in which it occurred. He had visited modern American hospitals in Baltimore, New York and Montreal, and an inspection of the institutions there made him the more satisfied with their hospital in Birmingham.

Mr W. E. RILEY asked whether the hospital at Birmingham was on the pavilion plan.

Sir JOHN HOLDER said the pavilion plan had been adopted and the building admirably constructed. In conclusion, he congratulated Mr. Henman on the result of his labour, and Mr. Key for the scheme of the ventilating and heating arrangement which he had so successfully introduced.

Dr CHILDS said though he was a believer in the plenum system of ventilation for crowded buildings, he must strike a discordant note when it was proposed as a successful arrangement for hospitals. He wished to know a little more about inlets and outlets, their position and size. He had never seen a satisfactory description of such details. They all recognised the necessity of having a sufficient quantity of fresh air in hospital wards, and it was the custom to gauge its purity by certain phenomena. If the air in a building contained too much organic matter, a condition which could be proved by chemistry, then they knew the air was not properly ventilated. They knew very little about the properties of fresh air. In a hospital with large floor area the question arose, Was the plenum system of ventilation really a necessity? Did it give the invigorating essence which they recognised was possessed by fresh air? This, to his mind, was the one thing wanting in the plenum system when applied to hospitals. The benefits by natural ventilation were not imaginary, and though a strong advocate of the efficacy of the plenum system for churches and crowded rooms, he questioned whether it was the best ventilation for hospitals.

Mr A. SAXON SNELL suggested that as the hour was late, and many would like to have the question of natural ventilation as opposed to the plenum system thrashed out, that the discussion should be adjourned for another evening.

Mr H. T. HARE seconded the vote of thanks.

The PRESIDENT, in putting the motion to the meeting, said if it could be arranged, a meeting would be held at which the question of ventilation could be fully discussed.

It was announced that at a business meeting to be held on January 4, 1904, Messrs. G. A. T. Middleton, Butler Wilson, J. W. Beaumont, John Woolfall, E. C. Down and H. Davis would move—(1) That this Institute is in favour of the general principle of the compulsory examination and registration of architects. (2) That a committee be appointed to consider what steps should be taken to give effect to this principle, and to report thereon to a special general meeting before the opening of Parliament. (3) To nominate this committee.

The meeting then terminated.

A Memorial to the late Bishop Creighton has been placed in Peterborough Cathedral. It consists of a slab of white Sicilian marble bearing a life-sized figure of Dr. Creighton in cope and mitre, and holding in his left hand the pastoral staff of Peterborough.

ROYAL ACADEMY SCHOOLS.

THE prizes awarded to the successful students of the Royal Academy Schools were distributed at Burlington House on the 10th inst. In the absence, through indisposition, of the President, Sir E. J. Poynter, the distribution was made by Mr. Ernest Crofts, R.A., keeper of the Academy. The following is the prize list:—Historical painting (the meeting of Diogenes the Cynic and Alexander at Corinth, *cf.* Plutarch, *lex. c. 14*), gold medal and travelling studentship (200*l.*), not awarded. Landscape painting (an express train at sunset), Turner gold medal and scholarship (50*l.*), John Hodgson obelisk. Landscape painting (a bank of ferns or bracken), reswick prize (30*l.*), Walter Percy Day. Painting of a figure from the life (open to male students only), silver medal, 1st, William Charles Penn; silver medal, 2nd, William E. Gladstone Solomon (disqualified owing to having received the same prize before). Painting of a head from the life, silver medal, 1st, Walter Percy Day; silver medal, 2nd, John Holman Vybrandts. Painting of a draped figure (open to female students only), silver medal, 1st Catherine Oules; silver medal, 2nd, Marjory Violet Watherston. Cartoon of a draped figure, silver medal and prize (25*l.*), William E. Gladstone Solomon. Design in monochrome for a figure picture (Elijah cursing Ahab and Jezebel in the Vineyard of Naboth, I. Kings, chap. xxi.), Armitage prizes, 1st (30*l.*), and bronze medal, not awarded; Armitage prizes and bronze medal, 2nd (10*l.*), not awarded. Design for the decoration of a portion of a public building, prize (40*l.*), Lilian Price Edwards; *proxime accessit*, Walter E. Webster. Set of six drawings of a figure from the life (open to male students only), 1st prize (50*l.*) and silver medal, William E. Gladstone Solomon; 2nd prize (25*l.*), William Charles Penn; 3rd prize (15*l.*), Thomas Dargan Philpot; 4th prize (10*l.*), William George Simmonds (disqualified owing to having received the same prize before). Drawing of a head from the life, silver medal, 1st, not awarded; silver medal, 2nd, Francis E. D. W. Fitzjohn Crisp. Drawing of a statue or group, silver medal, 1st, not awarded; silver medal, 2nd, not awarded. Perspective drawing in outline (open to painters and sculptors only) (Mr. Willoughby's temple in Sir William Chambers's "Architecture"), silver medal, no competition. Composition in sculpture (three generations), gold medal and travelling studentship (200*l.*), Arthur Charles White. Model of a design (David cutting off Goliath's head, I. Sam., chap. xvii. v 51), 1st prize (30*l.*), Leonard Jennings; 2nd prize (10*l.*), Frederick Brooke Hitch (disqualified owing to having received the same prize before). Set of four models from the life (open to male students only), 1st prize (50*l.*) and silver medal, Frank Ransom; 2nd prize (20*l.*), George Gilbert Walker. Design for a medal (to commemorate the Durbar with an allegorical figure of India on the obverse), silver medal, Henry William Page. Model of a bust from the life (open to female students only), silver medal, 1st, no competition; silver medal, 2nd, no competition. Model of a statue or group, silver medal, 1st, Louis Fritz vai Roselieb; silver medal, 2nd, not awarded. Design in architecture (a domed church), gold medal and travelling studentship (200*l.*), Lionel Upperton Grace. Set of architectural drawings (the interior of St James's Church, Piccadilly), silver medal, 1st, Leslie Wilkinson; silver medal, 2nd, James de Caynoth Ballardie. Set of architectural designs (upper school), prize (25*l.*), William Edward Brooks. Set of drawings of an architectural design (lower school), prize (10*l.*), George Forsyth. Plan of a building (a general hospital), prize (10*l.*), not awarded. Original composition in ornament, silver medal, no competition. Perspective drawing in outline (open to architects only) (interior of the hall at Eltham Palace, Kent, looking eastward), silver medal, Percy Ion Elton. The Landseer scholarships in painting and sculpture, of 40*l.* a year each, tenable for two years, have been awarded—in painting, to Walter Percy Day and Ernest Stafford Carlos; in sculpture, to Frederic Charles Chrisfield.

The secretary (Mr. Fred A. Eaton) read a communication from the President, in the course of which Sir Edward Poynter said that the Royal Academy had recently made some very considerable and important changes, which should have a very far-reaching effect in the conditions under which admission was granted to those schools, and in the course of study which they and future students would pursue while there. It was thought by many members of the Royal Academy that much was taught there with which candidates for admission should be conversant before entering the schools, and that by omitting the more elementary stages of instruction subjects of study could be introduced for which there had not hitherto been sufficient time or opportunity, and after long and serious consideration, extending over some two years, the Academy had formulated the system of study which was embodied in the new regulations, and which came into working for the first time at the beginning of the present term. The changes made were in some respects so sweeping that some little time might be required to get the system into working order, and it was con-

ceivable that some modifications in the direction of a return towards former arrangements might be found desirable. Much would depend on what capacity schools in which candidates received their preliminary instruction might develop towards meeting their requirements. The most valuable effect of this change, if the higher standard for admission which was demanded under the new rules was properly insisted on, ought to be in raising the quality of instruction in other schools of art.

THE ULSTER SOCIETY OF ARCHITECTS.

UNDER the presidency of Mr. W. J. Gilliland, the Ulster Society of Architects held their annual meeting in Belfast on the evening of the 8th inst. The hon. secretary (Mr. N. Fitzsimmons) read the report of the Council, which contained the following:—"The work of the past year, although not of the eventful character of previous years, has been none the less satisfactory in that the position of the Society has been materially strengthened, its influence extended, and the various matters affecting the welfare of the profession in this province carefully watched and its interests as far as possible safeguarded. The important question of the registration of architects was fully discussed at a general meeting, and the following resolutions were passed unanimously:—"That the absence of the restriction of the use of the title "architect" to those properly qualified to use same is a great injustice to architects who are so qualified, and seriously retards the progress of architecture in Great Britain and Ireland." "That it is the duty of the Council of the Royal Institute of British Architects, as representing the profession, to make an immediate and serious effort to obtain statutory powers for the purpose of establishing such restriction." Copies of these resolutions were sent to the Royal Institute of British Architects and to the Royal Institute of Architects in Ireland, and it is gratifying to be able to announce that the latter body, on the motion of one of your representatives, also carried these identical resolutions unanimously."

Mr. Seaver (hon. treasurer) submitted a statement of accounts, showing a satisfactory balance to the credit of the Society.

The reports were adopted and the following officers were elected:—President, Mr. W. J. Gilliland; vice-president, Mr. J. J. McDonnell; hon. secretary, Mr. W. B. Fennell; hon. assistant secretary, Mr. W. Hartley Patterson; hon. treasurer, Mr. H. Seaver; council, Messrs. N. Fitzsimmons, F. H. Tulloch and R. M. Young; associate members of council, Messrs. T. Houston and E. R. Kennedy; auditors, Messrs. J. St. J. Phillips and Vincent Craig.

The annual dinner of the Society was held later, also under the chairmanship of Mr. W. J. Gilliland.

The Chairman, on rising to propose the toast of "The King, Queen Alexandra and other members of the Royal Family," expressed regret at the absence, through indisposition, of Sir Thomas Drew, who should have taken the chair. Dealing with the toast, he said the Royal Family, from the King down, were all keenly appreciative of art and architecture. Some members of the Royal Family were themselves no mean artists, and had shown a power and an ability which, had they not enjoyed the elevated rank they did, would have placed them in a foremost position amongst the artists of the country.

The toast was received with musical honours.

Mr. Henry Seaver, in submitting the next toast of "The Learned Professions," said they were very pleased to have present with them representatives of the church, medicine, law and engineering. They had there the distinguished head of the Presbyterian church (the Moderator); a distinguished professor of the Queen's College, Professor Symington; their old friend Alderman Harper, who would remember the deputations of the architects to the law committee two years ago; and they had also Professor Fitzgerald, the head of the engineering school at Queen's College.

The toast was cordially received.

The Moderator, in responding, said he had always had a great sympathy with architecture. Ministers frequently came into friendly contact with architects in regard to buildings, and he thought there ought to be a very close harmony between the two professions. The time was when the buildings that the members of their profession were perhaps most proud of were those that were connected with the profession to which he belonged, and he did not think that the connection was by any manner of means falling away.

Professor Symington said he considered that a man to be a successful architect should be first of all an anatomist. They found in the human body the application of the principle of the best use of the best materials for the best purpose. There was a maximum of strength with a minimum of material. However high an architect might attain in his profession,

however complicated the buildings he undertook, he would never construct anything at all equal in perplexity to the structure of his own body. In the medical profession it was necessary that a man should give a proper guarantee of his qualification before he could practice, but it seemed that the State were quite prepared to allow anybody to put up a building without any real proof of his being fitted for the task. He thought the State should protect the public by seeing that the men who belonged to such an important profession were properly trained for their work; and the architect's profession would never be on a proper footing till this was done.

Alderman Harper and Professor Fitzgerald also acknowledged the toast in appropriate speeches.

Mr. W. J. Fennell proposed "Our Guests," the toast being responded to by Mr. Vinycomb, who referred to the great strides architecture had made in Belfast during the past half-century.

Sir Otto Jaffe, in giving the toast "The Ulster Society of Architects," said it was a gratifying circumstance, for which the architects deserved a share of the credit, because of the encouragement they had given to sanitary reform, that the death-rate in Belfast during the last two months had been only a little above 18 per 1,000. A funeral was a most expensive luxury, not only to the family directly concerned, but to the community in general. They heard a great deal nowadays about the fiscal question, and there could be no doubt that Great Britain had not made the same progress commercially as other nations during the last twenty years. Some people thought a duty on manufactured articles would provide the remedy; in his opinion, what they needed was an improvement in their educational system. He was recently on the grand jury, and after hearing some of the witnesses who came before that body he had to ask himself whether we were really living in a civilised country. The whole question of the progress of the nation was involved in the progress of education. Another matter which had hampered the commercial development of the country was tardy legislation, and the commercial laws were not adaptable to modern needs.

The Chairman, in responding, alluded to the Moderator's remarks on the association between architecture and religion, and said he would go further and assert that architecture was founded on the primal wants and aspirations of human nature. In that way their profession was closely allied to religion. He did not see any tendency to return to the conditions of the neolithic age and adopt the open-air treatment in practice. He complained that they had not the proper facilities for educating young architects; and even if they had those advantages what would it avail them when the absolutely incompetent could put up a brass plate on the door and label themselves architects? This was an anomaly against which they were struggling. The majority of the profession saw the desirability of State recognition of the status and position of the architect, and he thought the time was not far distant when this recognition would be given, and an end put to the intrusion of interlopers without any qualifications.

During the evening an interesting musical programme was rendered.

MANCHESTER SOCIETY OF ARCHITECTS.

AT the Manchester Society of Architects' annual dinner, which took place on December 11, Mr. Butler Wilson, F.R.I.B.A., the president of the Leeds and Yorkshire Architectural Society, in responding to the toast of "The Allied Societies," said:—

Mr. President and Gentlemen,—I must express to you my appreciation of the great honour which you have conferred upon me by your request that I should respond to this toast of the allied societies. I feel that we are allied in more senses of the word than one; we are not only allied to the Royal Institute, but we are, particularly at the present time, allied and bound to one another by a common interest, by a mutual desire which is shared by the majority of our profession in this country. Our desire is that the status of the architect should receive legal recognition, that those who practise our art should be duly qualified to do so. The architectural profession should no longer be a dumping-ground for those who are unfit or unwilling to properly qualify themselves for other recognised professions. One hears rather less nowadays of the fool of the family being destined for the Church. Well, this may or may not be significant so far as our profession is concerned. But there can be no doubt that matters have arrived at a deplorable pass when some of the designing which an architect should do for himself is being conveniently done for him by others. The unqualified architect is largely responsible for the offers of "designs free" on the part of the trade, whilst the client is paying twice over. When we insist upon qualification by examination we are told that the student cannot be examined in art, although the Institute finds no difficulty in examining him in design; but surely the artistic student can be made to

qualify himself in construction. When we insist upon registration we are told that education will solve the problem, education has not solved the question, and never will. When you have educated the student, and he starts practice as a qualified man, to whom has he to appeal for his commission? If to the public, then to a public who, the late Lord Salisbury said when asked to appoint a Royal Commission on art, do not care about art. They are a commercial people. Where public funds are to be expended in building operations—as, for instance, by boards of guardians, district councils and corporations—are the members of those bodies recruited from artistic members of the community? I would suggest to you that they are recruited largely from the people whom the late Lord Salisbury referred to as commercial, and can it be wondered at if they give the preference to the commercial architect? Our remedy is registration, which in due course will guarantee to the public the possession by all registered architects of a knowledge of both design and construction. We are rapidly nearing this goal. Motions in favour of registration will be submitted at the next business meeting of the Institute on January 4. Should these motions fail in being carried by those present at that meeting, then a demand must be made that the whole membership of the Institute should be permitted to voice their opinion by means of voting papers sent through the post. Should this not be feasible, then we could form an association of allied societies, with the object of nominating and electing registrationist candidates on the Council. Union is strength, and much may be accomplished thereby. I do not refer to the kind of union which the late Mr. Whistler had in his mind in a certain instance. A close personal friend who had quarrelled with the artist, was admonished in the following terms:—"My dear So-and-so," said Whistler, "you should remember that united we stand, divided you fall." Provincial members of our profession might seek a closer union, and as one means of bringing this about, I suggested to the President of the Institute in June last the holding of an annual congress in London and various other cities in turn—a course which is followed by many institutions with excellent results. I read that your worthy President has recently stated that competitive contracts did much to interfere with good architecture. Perhaps some of us are more fortunate than others in having contractors who will conscientiously interpret our designs. The most conspicuous instance of the careful workman that I know of was an Irish foreman, who was accompanying the architect on a periodical tour of the building. They came to a somewhat dark portion of a corridor and the architect suggested that a fanlight should be inserted so as to borrow light from an adjoining room. "Oh!" said the foreman, "would it be wise to do that, sir; there's none too much light in the room already?" I must thank Mr. Percy Worthington for the generous way in which he has spoken of the allied societies, and there is no doubt that of late years they have displayed some activity in forwarding the interests of the profession. I need hardly say how much we in Yorkshire envy you the possession of your chair of Architecture in Manchester, of your efforts for the advancement of our art and the difficulties which you have successfully surmounted. Surely there could be no more signal proof. We allied societies have done much and we hope to do still more, because we feel that by organisation, cohesion, by uniting our forces, there is no object which we could not ultimately achieve for the general good of architecture and architecture. Gentlemen, I thank you for the cordial way in which you have received this toast.

FEES IN AMERICA.

THE following schedule of minimum charges was adopted at the convention of the American Institute of Architects in Cleveland for the professional practice of architects:—

The architect's professional services consist in making the necessary preliminary studies, general working drawings, specifications, large scale and full-size details, and in the general direction and supervision of the work, for which the minimum charge is 5 per cent. upon the cost of the work.

For new buildings costing less than 10,000 dols., and for furniture, monuments and decorative work, and for interior cabinetwork, it is usual and proper to charge a special fee in excess of the above.

For alterations of and additions to existing buildings 10 per cent. of the cost of the work.

When heating, ventilating, mechanical, electrical and sanitary problems in a building are of such a nature as to require the assistance of a specialist, the owner is to pay for such assistance.

Chemical and mechanical tests, when required, are to be paid for by the owner.

Necessary travelling expenses are to be paid by the owner. The architect's payments are due from time to time during the progress of the work in proportion to the value of his

services to his full commission at the time. Sixty per cent. of the commission of the architect is due when the general drawing and specifications are completed.

Until an actual estimate is received, charges are based on the proposed cost of the works, and the payments are received in instalments of the entire fee, which is based upon the actual cost. The architect bases his charges upon the entire cost to the owner of the building, when completed, including all the fixtures necessary to render it fit for occupation, and is entitled to extra compensation for furniture or other articles purchased under the architect's direction.

If any material or work used in the construction of the building is already upon the ground, or come into the possession of the owner, without expense to him, the value of said material or work is to be added to the sum actually expended upon the building before the architect's commission is computed.

Consultation fees for professional advice are to be paid in proportion to the importance of the questions involved, at the discretion of the architect.

For alterations and additions to contracts, drawings and specifications, an additional charge is to be made for the time and services rendered.

None of the charges above enumerated cover professional or legal services connected with negotiations for site, disputed party walls, right of light, measurement of work, or services incidental to arrangements consequent upon the failure of contractors during the performance of the work. When such services become necessary, they shall be charged for according to the time and trouble involved.

The supervision of an architect (as distinguished from the continuous personal superintendence, which may be secured by the employment of a clerk of the works) means such inspection by the architect or his deputy of a building or other work in studios and shops, and in process of erection, completion or alteration, as he finds necessary to ascertain whether it is being executed in conformity with his design and specifications or directions. He is to act in constructive emergencies, to order necessary changes and to define the true intent and meaning of the drawings and specifications, and he has authority to stop the progress of the work and order its removal when not in accordance with them.

On buildings where the constant services of a superintendent are required, a clerk of the works shall be employed by the architect at the owner's expense.

The basis of settlement in cases of abandonment or suspension of the work shall be as follows:—Preliminary studies, a fee according to the magnitude of the work; preliminary studies, working drawings, 60 per cent. of the entire fee.

MEMORIAL TABLETS.

IN 1901 the London County Council took over the work, initiated by the Society of Arts, of commemorating the residence in houses in London of distinguished persons. From a statement lately issued by Mr. Laurence Gomme, the clerk of the Council, it appears that the necessary preliminaries in connection with the preparation of a design to be adopted for the memorial tablets, the obtaining of tenders for the work of making the tablets and the investigation of a number of houses which it had been suggested should be distinguished have occupied a considerable time, but now that these preliminaries are completed the work will proceed rapidly. The Council has already approved of the fixing of tablets on the following houses:—

1. Holly Lodge, Campden Hill—the house in which Lord Macaulay died.
2. No 122 Great Portland Street—which stands on the site of the house in which James Boswell died.
3. No. 67 Wimpole Street—a residence of Henry Hallam.
4. No. 48 Doughty Street, Mecklenburgh Square—a residence of Charles Dickens.
5. No. 22 Theobald's Road—the birthplace of Benjamin Disraeli, Earl of Beaconsfield.
6. No 4 Whitehall Gardens—the house in which Sir Robert Peel died.
7. No 56 Devonshire Street, Portland Place—a residence of Sir John Herschel.
8. No 1 Devonshire Terrace, Portland Place—a residence of Charles Dickens.
9. No. 12 Clarges Street, Piccadilly—a residence of Edmund Kean.

The necessary preliminary inquiries and investigations concerning a number of others are almost completed. Among the persons in commemoration of whom it is probable that the Council will, at no very distant date, be recommended to erect tablets may be mentioned Henry Cavendish, James Clerk-Maxwell, Charles Darwin, William Hazlitt, William Pitt, Samuel Richardson and Thomas Young. Of the tablets which the Council has already determined to erect, tablet No. 1 was

unveiled on the 26th ult. by the Earl of Rosebery, thus inaugurating the Council's work in this direction. Tablet No. 4 is ready to be fixed, and Nos. 3, 5 and 6 will be ready very shortly. Since the Council determined to affix a tablet in the case of No. 2, very careful consideration has been given to the question whether it is desirable to continue the practice, occasionally adopted by the Society of Arts, of putting up tablets on comparatively new houses which occupy the sites of the actual premises in which the persons to be commemorated lived. As a result it is probable that in the near future the Council will be recommended to abandon the proposal to erect a tablet on No. 122 Great Portland Street, and to indicate instead a house actually occupied at one time by Boswell.

The procuring of the necessary consents for the erection of tablets in the cases of the above houses has necessitated a correspondence with a large number of persons having interests in the premises, and the Council acknowledges the courtesy and consideration which has been extended to it in the matter.

The form of tablet has been designed under the direction of the Council's superintending architect, Mr. W. E. Riley, who advises the Council as to the position in which the tablets should be fixed and under whose supervision they are erected.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT the fourth ordinary meeting of the Glasgow Architectural Association, held in the hall of the Philosophical Society, Bath Street, on Monday last, a very interesting paper was read by Mr. Theodore Fyfe, architect, on "Dr. Evans's Excavations at Knossos, Crete." Excavations have been carried on at Knossos for four seasons since 1900 by Dr. Arthur Evans, and there is every probability of a fifth. Knossos is perhaps the most important of a series of palaces in the island of Crete of the Minoan period—a period anterior to that which produced the Mycenaean palaces on the mainland of Greece. Probably no other site, either in Greece or Egypt, has yielded such a variety of small finds, many of which, as well as the architectural features of the palace, are new and of the first interest. It is evident that at Knossos also we find the true solution of all legends about the Minotaur and the Labyrinth of Crete. The date of the existing palace stretches from about 2000 to 1500 B.C., as important evidence of Egyptian influence has corroborated. An earlier and a later palace can be traced, the first having connections with the Egyptian Hyksos, or Shepherd dynasties; the latter broadly contemporary with the Egypt of Thothmes III. It is highly probable that the Minoan races were the Keftid, or "People of the isles of the sea," represented as bringing tribute on an eighteenth dynasty wall-painting in a tomb at Thebes. Many of the other finds are of extraordinary interest. Some 1,600 clay tablets show a highly-developed system of writing in a hitherto unknown style. Vases and other utensils have been found in pottery and fine stone, exhibiting the most beautiful workmanship and design. An almost complete ivory statuette of a leaping youth, a lioness's head in alabaster and a life-size bull's head and foot in painted "gesso-duro" relief are among the most perfect specimens of ancient art, and can hold their own with Greek work. A capability of working to great perfection in almost any material is evident, such materials as ivory, crystal, gold, enamelled porcelain, pottery and fine stone, and the sum total of the discoveries enables us to know much that is interesting about life in a Minoan palace. The lecture was illustrated by a number of highly-interesting slides. A discussion followed the reading of the paper, in which Mr. Newbery, Mr. Bromhead and others took part.

THE CAERWENT EXPLORATIONS.

A SECOND tessellated pavement from the Roman excavations at Caerwent, near Newport (Mon), has been fixed in position in the museum of the Newport Free Library. It was found in what is known as House No. 7, from which the first was taken, and the two together form one of the most important discoveries of the kind yet made in Roman remains in England. Each is a very large example of tessellated floor-work, and the second is distinctly the finer and more perfect of the two. Busts of the seasons and figures of animals and cupids are conspicuous objects in the pavements. The chief features of House No. 7 were a small, partially-detached building, which may have been a shrine, and two rooms separated, no doubt, only by a curtain when the house was in use. It was these rooms that contained the tessellated pavements. One underlay the other, and the upper one was of later date and of inferior workmanship to the other, the latter being constructed with far more care as to detail and finish. Careful drawings and tracings of both pavements were made, and both have been removed in sections and admirably and successfully put together again in the museum, embedded on

cement so durable that they will probably remain in as good a condition as they are now for hundreds of years. In both the rooms of House No. 7 the walls were standing to a height of 3 feet above the floor level, and the plaster on them was nearly intact. It was therefore possible to recover to a considerable extent the colour and design of the wall decoration. It has been determined that the remains removed shall be housed at Newport, but so far the question of a separate building for their reception has not been decided, although there will in time be ample material to form a distinct Caerwent museum.

CONCRETE REINFORCEMENT.*

SO much actual work is being done at the present time with reinforced concrete, and in general the subject is receiving such universal attention from the engineering world, that the method of reinforcement described in this article, it is believed, will be of interest.

It is fairly well recognised among engineers that vertical reinforcement for concrete beams is quite as essential as the horizontal reinforcement, and in many cases the horizontal rods are surrounded by U-shaped stirrups of band-iron or twisted rods. It was noticed at first by European engineers that a concrete beam when tested to destruction under uniform loading invariably failed by shear at the ends, the lines of rupture corresponding closely to the lines of principal compressive stress for such a beam.

The writer also made a number of tests on beams rein-

granular composition was, of course, advanced by Rankine many years ago, and to the writer's knowledge, Captain Sewell was the first to make public the very close relation between theory and actual tests in reinforced concrete beams, when these were loaded to destruction. It is true that the article by Captain Sewell was severely criticised by other engineers. This was done, however, without bringing forward substantial tests to prove differently. In fact, the attempts to prove the contrary seemed to the writer very weak indeed. In one case a number of tests were cited, which, upon investigation, proved to have been centrally loaded beams. In another case beams of such proportions were tested as would be absolutely impracticable in the ordinary run of building construction.

If, then, lines of principal tensile stress exist throughout a beam, it is most natural that the concrete, being weak in tension, should open up at right angles to these lines, and this is what has occurred in all the tests which the writer has observed in well-proportioned concrete steel beams when tested to destruction under uniform load, and where the reinforcement was horizontal only.

As has already been noted, European engineers endeavoured to overcome the difficulty by placing stirrups throughout the beam, their distances apart varying, of course, in the inverse ratio of the shear. There seems no doubt whatever in the writer's mind that such stirrups accomplish a great deal of good, as they cross the lines of rupture at an angle and tend to hold the material together. If, however, they are placed in a beam, they should be placed in a direction inclin-

forced with plain and deformed rods on the bottom, and without one exception, all such beams when tested to destruction under uniform loading failed by vertical or longitudinal shear in exactly the same manner as originally pointed out by Captain John S. Sewell.

The matter of vertical reinforcement is certainly of more importance than some American engineers have been willing to grant to it. To the writer it seems most natural that rupture should occur in this manner; in fact, he can hardly conceive of its occurring in any other way. It must, of course, be remembered that a beam, when tested for both shear and bending moment, should be subjected to a uniformly distributed load, not to a concentrated centre load; for a beam loaded according to this latter method would only develop one-half the shear which exists in a uniformly loaded beam for a given bending moment.

Take, for example, a certain beam, as shown in fig. 1, and consider the cross-section AA. The tension strain on each fibre below the neutral axis varies in proportion to its distance therefrom. The vertical shearing strain is, however, practically constant. The resultant strain on any particle should therefore be a combination of these two components, producing a line of principal tensile stress, which is one of variable curvature from the bottom of the beam to the top.

This theory of lines of principal tensile stress in a beam of

to the horizontal, so as to lie more closely along the line of principal tensile stress, for if they lie in exactly this line they also cut the actual line of rupture at right angles, and are therefore of maximum efficiency in holding together the concrete where its natural tendency is to open up.

Furthermore, if such stirrups are to carry stress, they should carry it into some member capable of receiving it, and the bottom chord member or the horizontal reinforcement is there for that purpose.

In the first place, then, it seems to the writer that stirrups should be inclined to the vertical and preferably bent to a curvature to approximate the line of principal tensile stress, and secondly, these stirrups should be rigidly connected to the main horizontal reinforcing bar.

There is still another matter in connection with the steel reinforcement for concrete beams which is also of great importance, in so far as it affects economy in the use of steel. In a uniformly loaded beam the maximum bending moment occurs at the centre, whereas the maximum shear occurs at the ends, and if the same quantity of steel reinforcement is therefore placed along the bottom of the beam and extends the full length of it, it does seem to the writer that steel has been wasted so far as bending moment alone is concerned, and certainly the beam has been neglected so far as shear is concerned.

A steel I-beam for the same reason is not an economical construction for uniform loading; its top and bottom flanges are only required at the centre, and at this place only a very thin web whereas at the ends the stress is almost altogether

* From a paper by Julius Kahn, C.E., published in *The Engineering Record*.

hear, and web alone is required with very little top and bottom angles.

In the system of concrete reinforcement which it is the purpose of this paper to describe, these two matters have been carefully considered. The fundamental principles of this type of reinforcement are:—

1. Concrete should be reinforced in a vertical plane as well as a horizontal one.
2. The reinforcement should be inclined to the vertical, preferably with varying upward curvature, approximating the line of principal tensile stress.
3. The metal should be distributed in proportion to the strains existing at any place.
4. The shear members should be rigidly connected to the horizontal reinforcement steel.

It has been endeavoured to accomplish all of these results by taking a bar of cross-section, as shown in fig. 3, and shearing upwards into an inclined position the web on both sides of the main body bar, thereby forming substantially the tension members of the ordinary Pratt truss.

When such a structural member is embedded within a body of concrete, the latter unites firmly to the steel, and the combination of the two forms a trussed beam wherein the tensional members are made up of steel, and the missing compression members supplied by the concrete.

Concrete is excellent in compression, steel in tension, and thanks to the property of strong adhesion between the two, their combination makes a most ideal beam.

Neglecting for a moment the matter of vertical reinforcement, it is very evident that a bar sheared up as above described cannot possibly slip through the concrete. The writer has actually taken blocks of concrete, moulded to form the voussoirs of a flat arch, and then set them between the prongs. Such a beam, though set up without a particle of mortar between the joints, will carry a very large weight, and were it not for the large deflection which is caused by the poorly-fitting surfaces between the prongs and the blocks, such a beam would carry weights to the same extent and on the same principle as when steel and concrete are actually united together.

And this presents another way of looking at the reasons why this method of reinforcement is so efficient. As soon as a load is applied on top of the beam the concrete tends to arch itself, and a series of internal arches immediately set themselves up within the material, each arch finding its abutment in a set of prongs for which the bottom chord acts as a tie. The prongs receive the weight and carry it upwards, distributing it on the other arches of larger span, the horizontal reinforcement serving as a common tensional member, fig. 4.

It is plainly evident that with this construction the horizontal member might actually be placed outside of the concrete entirely, and the adhesion of the concrete to it entirely neglected, the strains coming into it being so largely the horizontal components of the inclined members.

Of course, for fireproofing purposes and to prevent rusting it is more advisable to embed the steel within the concrete, and when this is done advantage may be taken of both the adhesion of the concrete to the main bar and to the sheared-up members. In fact, with a given amount of concrete a maximum amount of steel may be used, since the strains which it takes up are due to the direct adhesion of the concrete to it, plus the horizontal component of the inclined members. When such a beam fails, assuming that good material has been used for its construction, one of two things must happen, either the steel pull in two, or the concrete crush on top. The top portion of a concrete beam when used in floor construction is largely the floor itself, and it is generally impossible for this to fail in compression. It would seem, therefore, that a very large quantity of steel could be placed in the bottom of the beam to balance the compression. In fact, in all tests which the writer has made up to date he has pulled the steel in two at the centre of the beam.

Another point of great advantage in this construction is the fact that a beam need not necessarily be very wide to carry a given load; depth alone counts to advantage. The steel reinforcement, depending entirely upon the stresses coming into it from the sheared-up members, may be one large bar. This is practically impossible with constructions wherein the stresses coming into the steel are due to adhesion only of the concrete to it. Where such adhesion is depended upon, a large body of concrete must surround the steel to be able to transmit all of the strain which the bar is capable of taking. Whatever strain exists in the steel must be transmitted into the upper portion of the concrete through the medium of the concrete immediately surrounding it, and any one can readily perceive the magnitude of the horizontal shear which must therefore exist throughout the body of the concrete and the necessity of giving this great width. With this new method of concrete reinforcement, however, the beam may be comparatively narrow; in fact, at the bottom it needs only to be sufficiently wide to encase the steel. It should taper upwards, however,

widening towards the top, so that sufficient area may be given to the concrete to receive the compression. This of course makes a remarkable saving in the amount of this material used.

The strength of steel is of course a definitely determined matter. As for the concrete, it is not very expensive, and it would be advisable in all cases to give a small surplus of this material on the top of a beam, so that it will not fail by compression. With shear thus properly cared for there is only one way in which the beam can possibly fail, and that is by the parting of the steel.

Where this result can be assured with certainty a concrete beam need no longer be subjected to a factor of safety of ten; the ordinarily adopted factor for steel, four, is sufficient, as such a beam is entirely dependent upon the steel and should be subject to close calculation in the same manner as a steel I-beam or truss. When a concrete beam fails by shear, as has occurred almost without exception in tests up to date, then, indeed, the engineer stands more or less in mystery.

In general it seems to the writer that whenever concrete is depended upon to carry other strains than direct compression, more or less risk is being assumed by the designing engineer, and a large factor of safety is strongly recommended.

TESSERÆ.

London's Triumphal Arches in 1603.

ACCORDING to Walpole, "Stephen Harrison, who calls himself joiner and architect, invented the triumphal arches erected in London for the reception of James I. They were engraved by Kip on a few leaves in folio: a work I never saw but in the library Chatsworth." In Nichols's "Progresses of King James I.," vol. i. p. 328, is mentioned Harrison's "Seven Arches of Triumph, 1603-4." These are prefaced by the remark that this King James I.'s memorable passage from the Tower to Whitehall was described in many contemporary publications, amongst the foremost of which should be noted "The Arches of Triumph erected in honor of the high and mighty Prince James, the First of that name King of England, and the Sixth of Scotland, at His Majesties entrance and passage through his honorable Cittie and Chamber of London upon the 15th day of March 1603; invented and published by Stephen Harrison, joyner and architect, and graven by William Kip, folio." The arches were seven in number, though only five were originally intended; the whole of these were devised by Harrison, and the workmen were employed on them from April 1603 till the end of August, when the exhibition was postponed. The work was recommenced in February 1603-4, and the arches at West Cheap and Temple Bar were then added and completed in six weeks. The publication alluded to above is the same mentioned by Walpole, and consists of the following nine plates very neatly engraved:—1. The title-page, at the top of which is "Exercitationes virtutum in omni ætate mirificos afferunt fructus," and at the bottom "Monumentum ære perennius." 2. A portrait of the King in his full robes of state, engraved by Lawrence Johnson. In one hand is the sceptre, in the other the regal orb. He has a large ruff, and his hat is ornamented with a circlet of flowers, and surmounted by waving feathers (wanting in Gough's copy in the Bodleian). At top in one corner of the plate are the royal arms; at the bottom "The High and Mighty Prince James, by the Grace of God, King of England, Scotland, Fraunce and Ireland, Defender of the Faith." 3. The arch at the east end of Fenchurch Street. 4. The arch in Gracechurch Street, by Italians. 5. One near the Royal Exchange on Cornhill, by the Dutch. 6. Above the great conduit, Cheape (at the end of Soper Lane, near Queen Street). 7. An arch close to the little conduit in Cheape. 8. One above the conduit in Fleet Street. 9. One at Temple Bar, representing the Temple of Janus. The engravings are accompanied with descriptive letterpress, over which are the royal arms and those of the City of London. The remaining arches may be found in Dekker, who has also given an abridgment of Jonson's share of the pageant. Many of the platforms were of an enormous bulk and height, as were several of the arches. It appears that the citizens began their preparations immediately on the decease of Elizabeth; they were interrupted by the plague, but resumed as soon as the danger was over and continued to the period of the royal entry. Exclusive of the moulders, plumbers, painters, smiths, &c., who were very numerous, there were employed eighty joiners, sixty carpenters, thirty sawyers and about seventy common labourers, who wrought without intermission. The whole of the machinery was under the direction of Stephen Harrison, the chief joiner as he is called. The name of Inigo Jones does not occur in the list of the architects given by Dekker.

Rubens, Vandyke and Reynolds.

An eminent physician of Charles I.'s time, Theodore de Mayerne, has particularly recorded many of the recipes which he obtained from Rubens and other artists of his own day; the

MS. is in the British Museum. Descamps has pointed out that the transparency of the shadows and the absence of all loading in these portions of the picture is one of the characteristic differences between the genuine works of Rubens and those of his scholars. The advice of this great master caused David Teniers to return to his original habit of painting his shadows thin and transparent. Rubens himself "painted in varnish," as Sir Joshua says of his "Battle of the Amazons." Eastlake observes:—"The employment of such a medium by Rubens was almost a necessary consequence of his adopting the original method of showing the ground through the deep colours, for in proportion as the pigment is thin the vehicle requires to be substantial. But the durability which the oleo-resinous medium insured, and the possibility of dispensing with a final varnish by its means, appear to have recommended it to Rubens in the execution of his work generally." Such a varnish, composed of some hard resin, admitted, of course, of being thinned and diluted with a rectified essential oil. "But this adjunct, if used at all in the earlier ages of the Flemish school, was not intended, as it afterwards was, to do away altogether with the gloss of the vehicle; for, had this been the case, the work would have required a varnish at last; and one of the recorded peculiarities of the early Flemish pictures was that the surface bore out without varnish." Rubens's works, when first executed, would not require varnish at all, but the gloss arising from the medium in which the colours were originally mixed disappears after a time, and a superficial varnish, such as mastic varnish, may become requisite. Vandyke's practice differed from that of Rubens; he employed a more liquid vehicle for his colours. We in England have to regret that our own great portrait-painter tried all sorts of experiments with reference to this matter, and that so many of his finest works have accordingly faded or perished. At the latter end of the eighteenth century an attempt was made to revive the ancient encaustic painting; this probably suggested the use of wax, which we find so often mentioned in Sir Joshua's notes of the materials which he employed. Sometimes it is wax dissolved in Venice turpentine, sometimes megilp (that is, drying oil and mastic varnish), sometimes a balsam such as copaiba, sometimes white of egg and gum tragacanth, which holds the prominent place in his own account of what he used. The beautiful picture of the "Strawberry Girl" appears to have been painted with a solution of wax. Cracks are sure to occur when the under layers of colour harden more slowly than the outer surface, and on the other hand, when the softer colour is outside, the picture becomes wrinkled or shrivelled, as is the case with the "Christ in the Garden" of Correggio, belonging to the Duke of Wellington.

The Coins of Athens.

If all ancient Athenian coins had been lost we should never have supposed that they were remarkable both for an extreme coarseness of engraving and the most hideous of all devices. The figure of a screech owl was generally chosen for such purposes, as if it had been intended to select the least graceful of animated forms; like those barbarous and gothic hieroglyphics, called arms by the nobility of Europe. The ancients were no less sensible than we of the bad taste which prevailed in the fabrication of Athenian money; for the philosopher Zeno has compared it to a discourse composed of rustic phrases and coarse expressions. What Spanheim and other modern authors have written on this subject is founded on no kind of probability. It appears that from a spirit of parsimony, very consistent in republics, the treasurers of the State allowed such trifling wages for coining that no capital artists ever offered their services. Although the Athenians possessed mines of copper at Colonos, yet they were so unwilling to employ this metal as specie, that they preferred gratifying their taste or vanity by cutting silver into such small portions that they were sometimes mistaken, as Aristophanes says, for scales of fishes. Money of that quality was very unfit for the purposes of commerce; it had the inconvenience of being easily mislaid, and could not be found without difficulty; besides, the expense of manufacturing such diminutive pieces by the hands of celebrated artists would have amounted to more than their intrinsic value. Among the monuments of Grecian numismatography we find still some spangles of silver representing the half of an Athenian obolus, and others of still less value must probably have circulated when the use of copper was exploded. Different demagogues who endeavoured to introduce that metal were forced by satyrs and epigrams to desist from their enterprise. Dionysius the orator was all his life surnamed the man of brass, because he made a long, and perhaps a good, discourse demonstrating the necessity of copper money. Gold was seldom brought into circulation by the republic, and then in small quantities, either for the commemoration of a victory or some such glorious event. It is even pretended that in all the memoirs of the Academy of Inscriptions, no golden medal of Athens now exists which can be considered as authentic. The Athenian golden medals which Winckelmann pretends to have seen in Italy, appear

to have been as false as that tetradrachma bearing the pretended effigy of Themistocles, the absurdity of which is evident from the barbarous inscription it contains, were we not well assured that no money was ever coined with the image of Themistocles. The false golden medals of Athens were cast in moulds taken from the silver medals, of which likewise a great number were forgeries, like that one said to be of the canton of the Scambonidæ cited by Goltzius.

GENERAL.

Sir Laurence Alma-Tadema, Sir E. J. Poynter and others have formed a committee with the object of inviting the scene-painters of the London theatres to an informal banquet on January 31, as a mark of appreciation for their admirable work.

Mr. H. F. Donaldson, M.I.C.E., chief mechanical engineer, has been officially announced by the War Office to be the chief superintendent of Ordnance Factories, *vice* Colonel Sir E. Bainbridge.

The Dean and Chapter of Winchester Cathedral are endeavouring to improve the acoustic properties of the nave to allow of it being used more frequently. The Jacobean pulpit has been changed from the south to the north side of the nave. It is at such an angle that the preacher will face William of Wykeham's chantry. Above the pulpit will be suspended a shell-shaped American made sounding-board, so hung that it can be tilted to direct the sound of the voice in any direction.

Signor E. Bondi has completed his design for the memorial statue of Pope Leo XIII. to be erected on the loftiest part of the Lepini hills overlooking Carpineto, where the late Pope was born. On a massive granite pedestal, with his face turned towards the sea, Leo XIII. will be represented in the act of blessing the world.

Mr. J. B. Yeats, R.H.A., is painting the portrait of Earl Dudley, the Lord-Lieutenant of Ireland. The picture will form part of a series commissioned by an Irish gentleman to illustrate the present epoch in Irish history. It is understood that the series will be presented to the nation.

The East Ham Technical College, of which the foundation-stone was laid last week, will cost 20,000*l.*, which includes the purchase of the site and furniture. It adjoins the Council's public offices, with which architecturally it will be in character. Above the basement will be rooms for building construction and kindred crafts and electrical laboratories; on the ground-floor there will be an assembly-room 35 feet by 30 feet, with the offices of the secretary and class, reference, study and common rooms; on the first-floor will be the headmaster's rooms, demonstration apartments and chemical laboratories.

The Will of Mr. Edward James Martin, M.Inst.C.E., F.R.I.B.A., late Secretary to the Government of Bengal in the Public Works Department, has been proved. The value of the estate is returned at 485*l.*

The Authorities of the Inner Temple are contemplating the substitution of the incandescent system for the present mode of lighting the staircases and thoroughfares of their Society. The Middle Temple might well adopt a similar plan, as the lighting of some of the staircases of their chambers is of the most primitive character.

Archdeacon Madden stated last week that the Liverpool Cathedral will be larger than York Minster and loftier from floor to ceiling than Westminster Abbey. Its twin towers would be 260 feet high, and on the Mount they would stand 400 feet above the level of the sea.

The Excavations at the prehistoric sites of Tinnivelli have produced during the past year over 4,000 objects, including twelve oval gold ornaments, 180 bronzes, and about 500 iron weapons and implements. Skulls and bones, some cornelian beads and bronze beads and necklaces were also collected. But most of the objects found in the excavations were pottery, including large urns with the skeletons inside. The archaeological reserve at one of the sites is 114 acres in extent, but only 5 acres have been touched. The smaller objects recovered have all been removed to the Government museum at Madras.

A Marble Panel was unveiled on Wednesday in the north transept of St. Paul's Cathedral as a memorial of Sir John Stainer. On the upper part is a representation of Christian Glory, and on the lower a portrait of the late organist of the cathedral. The panel is the work of Mr H. Pegram.

The New Roadway in the Mall, which is being formed in connection with the Queen Victoria Memorial, is making satisfactory progress; a portion was opened for traffic on Wednesday morning. It is confidently anticipated that the whole will be completed and ready for use by the King when His Majesty proceeds to open Parliament on February 2.

THE

Architect and Contract Reporter.**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

ELLESMERE—Dec. 30.—Plans and estimates are invited for a scheme for the disposal of the sewage of the town of Ellesmere. Mr. R. E. Lloyd, clerk, Urban District Council, Ellesmere.

ERDINGTON—Feb. 1.—The Urban District Council general purposes committee invite designs for new council house and free library buildings, to be erected at the junction of Mason and Orphanage Roads, Erdington. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded for the designs placed first, second and third respectively. Mr. Herbert H. Humphries, district engineer and surveyor, Public Hall, Erdington, Birmingham.

ILKLEY—Feb. 1.—Competitive designs are invited for free library, public offices and assembly hall, intended to be erected in Station Road, Ilkley. Premiums of 100*l.*, 50*l.* and 20*l.* respectively are offered for the three best designs sent in by February 1. Mr. Frank Hall, clerk, Council Offices, Ilkley.

ROCHESTER—Jan. 31.—Plans are invited, with approximate estimate, for the addition of chancel, organ-chamber and choir entry to the present church of St. Matthew, Borstal, Rochester. No premium offered. Architects can examine the present building and site at any reasonable hour. Plans must be addressed to Borstal Vicarage.

WINDSOR—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l.* returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

ADWALTON—Dec. 21.—For the erection of three through houses at Moorside, Adwalton, Yorks. Mr. Samuel Rushforth, Adwalton.

ASHBURTON—Dec. 31.—For alterations and additions to Lent Hill, in the parish of Ashburton, Devon. Mr. Fred. Wm. Vanstone, architect, Palace Chambers, Paignton.

BEAUMARIS—Dec. 30.—For the erection of an additional subway and of warehouse and other offices on the pier. Mr. W. O. Griffith, 1 New Street, Beaumaris.

BRADFORD—Dec. 28.—For the erection of shop and work-rooms in Darley Street and Piccadilly. Mr. C. H. Hargreaves, architect, Exchange Buildings, Bradford.

BRADWELL-ON-SEA—Dec. 28.—For the erection of six workmen's cottages (under the Housing of the Working Classes Act) at Bradwell-on-Sea, Essex. Mr. Horace G. Keywood, surveyor, Maldon.

BRIDLINGTON—Dec. 22.—For alterations to St. George's Hall and premises. Mr. J. Earnshaw, architect, Carlton House, Bridlington.

BRIGHTON—Dec. 23.—For the erection of a stand in Tattersall's enclosure, abutting upon the running track of the Brighton racecourse. Mr. Francis J. Tillstone, town clerk, Town Hall, Brighton.

BURY—Dec. 22.—For the erection of a hospital at the workhouse, Jericho, Bury, Lancs. Mr. Alfred Hopkinson, architect, 15 Agur Street, Bury.

CAIRO—Feb. 1.—For the construction of three steel bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CANTERBURY—For the erection of a new ward to be known as the "Blackman" ward, and for alterations and improvements, new flooring, plastering and other works at the Kent and Canterbury hospital. Mr. W. J. Jennings, architect, 4 St. Margaret's Street, Canterbury.

CARLISLE—For the erection of buildings and alteration to premises for the new Brampton branch of the Carlisle South End Co-operative Society, Ltd. Mr. T. Taylor Scott, architect, 43 Lowther Street, Carlisle.

CHERITON—Dec. 28.—For building an underground convenience at the junction of Cheriton Street and Risborough Lane, Cheriton, Kent. Mr. Arthur Atkinson, clerk, Urban District Council Public Offices, Cheriton, Kent.

DEVONPORT—Dec. 31.—For the erection of two small buildings at the gasworks, Devonport. Mr. Sidney E. Stevenson, engineer, Gasworks, Devonport.

EBCHESTER—Dec. 21.—For the erection of reading-room at Ebchester. Mr. W. T. Spence, architect, Shotley Bridge.

FARNHAM—Dec. 30.—For the erection of separation wards at the workhouse. Messrs. Friend & Lloyd, architects, Grosvenor Road, Aldershot.

GILLINGHAM—Dec. 22.—For the erection of a school at Napier Road, Gillingham, Kent, to accommodate 900 children. Mr. E. T. Atchison, secretary, 8 Waterloo Road, New Brompton, Gillingham.

ST. AUSTELL.—Dec. 23.—For additions and alterations at the workhouse, St. Austell, Cornwall. Mr. John Stephens, clerk, Cross Lane, St. Austell.

ST. AUSTELL.—Jan. 5.—For the erection of a goods shed at St. Austell station, Cornwall, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station.

SUNDERLAND.—Feb. 1.—For additions and alterations to Victoria Hall. Mr. John Eltringham, architect, 62 John Street, Sunderland.

WAKEFIELD.—Jan. 20.—Competitive designs are invited for free library buildings. Mr. Charles James Hudson, town clerk, Town Hall, Wakefield.

WALES.—Dec. 21.—For the erection of sixty-four houses at Tylorstown. Mr. D. C. Evans, Duke of York hotel, Tylorstown.

WALES.—Dec. 22.—For the erection of a master's house at Cwmystwyth, for Llanfihangel-y-Croyddin Upper School Board. Mr. J. A. Jones, architect, 7 Queen's Terrace, Aberystwith.

WALES.—Dec. 29.—For the erection of superstructure of the new Government offices at Cardiff. All particulars may be obtained at H.M. Office of Works, &c., Storey's Gate, S.W.

WALES.—Jan. 4.—For new roofs and supports and sundry alterations to general market, Neath. Mr. D. M. Jenkins, surveyor, Gwyn Hall, Neath.

WALES.—Jan. 4.—For the extension of Trinity Hall, Tonypandy, and for the erection of new classrooms, &c. Mr. R. S. Griffiths, architect, Excelsior Buildings, Tonypandy.

WHITEHAVEN.—Jan. 5.—For taking-down the Presbyterian church and manse, Market Place, Whitehaven, and the erection of a new church. Mr. J. S. Moffat, architect, 53 Church Street, Whitehaven.

WOKING.—Dec. 30.—For construction of an underground convenience near Woking station, Surrey. Mr. G. J. Woolridge, surveyor, Bank Chambers, Woking.

WOMBWELL.—Dec. 21.—For the erection of a villa in Hough Lane, Wombwell, Yorks. Mr. Jno. Robinson, architect, Park Cottage, Wombwell.

THE winter meeting of the British Association of Waterworks Engineers took place on the 12th inst. The thanks of the Association were recorded in the minutes for the reception of the summer meeting at Bolton, and the kindness shown by the waterworks authorities of Manchester and Liverpool on the visitation of their respective works. Mr. Alfred J. Jenkins read a paper on the new reservoir for Hoylake and West Kirby Waterworks. Hoylake, he said, with its golf-links of world-wide renown, and West Kirby, about a mile distant, were now fast becoming populous suburbs of Liverpool, and but for the tardy development of the railway service would have grown even more rapidly, but a new era had been opened with the electrification of the Mersey Tunnel.

BUILDING AND BUILDERS.

THE public health committee of Chelsea have decided in favour of an application being made to the London County Council for sanction to borrow 57,000*l.* for the erection of working-class dwellings in Beaufort Street.

At a meeting of the Eastern District committee of Stirling County Council held at Falkirk on the 11th inst., plans were submitted of the new County Council offices to be erected in West Bridge Street, Falkirk. The plans, which were approved, show a handsome building to cost 8,000*l.*, including the cost of the site and the price paid for the old properties upon it.

A TENDER has been accepted for 5,247*l.* to erect the Missions to Seamen church and institute for sailors of all nations at Wellington, New Zealand. The total cost, including the site, will be 7,805*l.* On the lower floor will be the social hall, library, kitchen, &c., and on the upper floor the church to seat about 450 sailors. The site is a corner one, near the Supreme Court, and not far from the shipping.

At a meeting of the Mossley Town Council on the 9th inst., the mayor (Alderman E. Iredale) presiding, a recommendation from the education committee was presented for the erection of a new Council school for the accommodation of 1,000 scholars, if the land (one acre) could be secured on satisfactory terms from the trustees of the Earl of Stamford and Warrington. The recommendation was accepted by the Council.

A PUBLIC meeting in support of the scheme for the erection of a consumptive sanatorium for Ayrshire was held on the 11th inst. in the Corn Exchange Hall, Kilmarnock. There was a large and influential attendance. Mr. J. H. Turner presided, and among the speakers were Dr. Chalmers, medical officer of health, Glasgow; Dr. Caverhill, Edinburgh; Mr. J. B. Fergusson, Balgarth, convener of the sanatorium committee; and Sheriff Mackenzie. Patients who had been cured by the new treatment were present with testimony as to its efficacy, and illustrative limelight views were exhibited. On the motion of the Sheriff, seconded by Mr. Frew, the meeting expressed its cordial approval of the proposed sanatorium, and commended it to the support of all classes in the town and country. A site of about 30 acres has been secured at Ashmark, two miles from New Cumnock, 800 feet above the level of the sea, and operations are about to be commenced. About 8,000*l.* of the 14,000*l.* required has already been subscribed.

VARIETIES.

THE new church of St. Peter, Ilfracombe, which has been
built at a cost of 6,500*l.*, was consecrated on the 9th inst.

THE new schools in Broughton Road for the parish of St.
Matthias, Salford, have been opened by the mayor of Salford
Mr. Alderman Stephens)

THE new church tower which has just been added to St.
Margaret's Church, Arbroath, N.B., was formally dedicated at
a morning service on Sunday last.

A NEW church at Landore was consecrated on the 10th inst.
The edifice, which has cost 10,000*l.*, will accommodate
1,000 worshippers. The design, in the Late Decorated period
Gothic architecture, was by Mr. E. M. Bruce Vaughan, of
Cardiff, and Messrs. J. & F. Weaver were the contractors.

A CONCERT was held on the 11th inst. in the St. Matthias's
new schools, Blackfriars Road, Salford, to celebrate the com-
pletion of the premises. The schools, which have been
erected to replace the old building at a cost of 6,500*l.*, contain
all the modern requirements for elementary education, and
will provide accommodation for 530 scholars.

At Littleborough, Lancs, the opening ceremony recently
took place of the free public library, which has been built at a
cost of 2,500*l.* by Mr. Carnegie. It is a massive stone building,
and adjoins the offices of the Littleborough Urban District
Council, and is pleasantly situated. It already contains 3,000
volumes, and there is shelf accommodation for 4,500 more.

THE First Garden City is commencing operations by
boring an artesian well in search of an ample supply of pure
water, which is of primary importance for such an undertaking.
The founders have placed this work in the hands of Messrs.

Le Grand & Sutcliff, of London, who started boring last week,
commencing with 16-inch tubes, at a high elevation on the
estate on the road between Baldock and Hitchin. A depth of
over 100 feet has already been penetrated into the lower chalk
formation, from which a copious supply is expected.

MR. BATSFORD has for some time had in preparation an
important folio volume entitled "Old Silver Work, chiefly
English, from the Fifteenth to the Eighteenth Centuries,"
edited by Mr. Starkie Gardner, F.S.A., with 120 collotype
plates, which he was about to issue to subscribers on the
12th inst. The edition was, however, so seriously damaged in
the recent fire at Messrs. Leighton's, the bookbinders, that he
is obliged to defer the issue on account of the reprinting which
has become necessary. The subscription price is five guineas,
but by some curious error it was mentioned in several news-
papers as fifty-four guineas.

AN open competitive examination for the appointment of
four assistant civil engineers in the Works Department of His
Majesty's naval establishments at home and abroad will be
held in London, commencing on January 26, 1904. The limit
of age for candidates is twenty-three to twenty-eight. The
salary commences at 200*l.* per annum, and rises by 15*l.* a year
to 300*l.* per annum. Assistant civil engineers will, on first
appointment, be on probation for two years, and will be eligible
for promotion (by selection without further examination) as
vacancies occur to the appointment of:—Civil engineer (mini-
mum 300*l.*; annual increment 20*l.*; maximum 550*l.*). Superin-
tending civil engineer (a) (minimum 600*l.*; annual increment
25*l.*; maximum 750*l.*); (b) (minimum 700*l.*; annual increment
25*l.*; maximum 850*l.*), to that of assistant director of works
(minimum 1,000*l.*; annual increment 50*l.*; maximum 1,200*l.*).
Successful candidates will be required to satisfy the medical
director-general of the Navy as to their physical fitness for the
service. The fee for the examination will be 6*l.*

TRADE NOTES.

THE additions to the General Hospital, Rotherham, are
being warmed and ventilated by means of Shorland's patent
double-fronted Manchester stoves encased in richly glazed
faience, by Messrs. E. H. Shorland & Brother, of Manchester.

ALSO AT LIVERPOOL, MANCHESTER, PARIS, AND CAPE TOWN.

APROPOS of the illustration of the Six Bells Public-house, King's Road, Chelsea, which we published last week, the Lift and Hoist Company, of Prince Street, Deptford, S.E., write us to the effect that two of their "Premier" service lifts and a cellar hoist were installed in the building, and others at the London County Council's Carrington House, Deptford; London City and Midland Bank's new branches—Richmond, New Cross, Westbourne Grove, Chelsea and Willesden Green; Palmeira Hotel and Mansions, Westcliffe-on-Sea, &c.

MESSRS. J. H. SANKEY & SON, LTD., merchants, shippers and exporters of cement, lime, bricks, slates, tiles, sanitary and fireclay goods, of Essex Wharf, Canning Town, have just got out a sectional catalogue (F) relating exclusively to the fireclay goods of which they make a great variety. Messrs. J. H. Sankey & Son, having made the firebrick trade a specialty for over forty years, claim to have one of the largest connections in the kingdom, and their practical and personal acquaintance with the experiences of such a variety of consumers, and the numerous purposes for which their fireclay goods are used, places them in a specially favourable position to know the class of fire-bricks, &c., most suited for their clients' particular purpose, and to advise if necessary. They have also had practical experience in the selection of clays and the manufacturing of various fire-resisting materials, and great care is taken by them to insure that the goods they supply shall be the best. Messrs. Sankey will shortly have ready a general catalogue comprising three sections—bricks, &c., sanitary goods, and fireclay goods, which will be forwarded on application.

A WINDOW to the memory of the late Mr. J. W. Stoupe M'Cance, J.P., and his brother, the late Mr. Henry J. M'Cance, D.L., of Larkfield, has recently been placed in Dunmurry Remonstrant Church, in which an admirable effect has been obtained by the skilful use of coloured glass, no colouring matter or paint being used. The subject of the window is based upon the text—"I will lift up mine eyes unto the hills from whence cometh my help." In the distance, at the left-hand side of the window, is shown the crest of a hill piercing the clouds, whilst a little lower is seen a small stream which gradually gathers strength till on reaching the centre it descends in two falls and becomes lost amidst a maze of forest-like growth, to reappear towards the bottom in a broad sheet of water, which flows in a most natural manner apparently over the base of the window.

The glass of different natures and makes, the marking and blending, and the various strengths of leads have all been selected and used with a full knowledge of the technique necessary to produce a mosaic window of such dimensions and from such a subject. The glass used consists of the choicest English antiques, American opalescents and Priors' slabs, while the finished window is undoubtedly one of the finest examples which stained-glass workers have produced. The work has been executed by Messrs. Campbell Brothers, Franklin Street, Belfast, from designs and under the personal supervision of their artist, Mr. R. J. Norman.

WALL DECORATION.

THE Holliston decorative cloths, lately introduced in the English market by Messrs Arthur L. Gibson & Co., will supply a need which has long prevailed. The canvases of coarse texture used hitherto served well on the walls of large halls or staircases, but for spaces of a more confined area a texture of a different kind is desirable. This is met by the Holliston crush and buckram cloths. They all have that manifestation of being a woven fabric, which is not to be imitated in paper. At the same time the surface is sufficiently smooth to prevent the accumulation of dust, which is one of the drawbacks of a coarser material. An immense variety of agreeable colours is available, and the artist and decorator can therefore obtain any kind of ground which he may seek in order to apply stencilling or other decoration. For ceilings and places where a coloured ground is unnecessary there is a white buckram. It should be noted that the colours are not dyed. Pigment colours are employed, and the cloth itself is consequently suitable for covering walls. The hanging is not difficult. The cloths are supplied in rolls 37 inches wide, and containing about 40 yards. A thicker paste than is used in papering is sufficient, but printed directions are given with the material. The new cloths lend themselves to all kinds of mural painting, as well as to stencilling and other processes. They have also the advantage of being effective in themselves, for a wall covered by them becomes pleasing in appearance, although there may be a delay before commencing the artist's work. The surface will, however, be so tempting it will be difficult for an owner to resist the applications of artists to operate upon such desirable grounds.

BATHS FOR SMALL DWELLINGS.

Under this heading we gave a description of, and illustrated a new system, of fitting baths to small houses and artisans' dwellings when it was first brought before general notice at the Sanitary Congress Exhibition of 1902. The favourable reception accorded to it there, solving as it did the problem of supplying a full-size bath with hot and cold water supply to this class of building, with little, if any, extra cost, has proved to be justified through its adoption by numerous corporations and borough councils, as well as property owners and others.

The accompanying illustration shows one of the latest patterns of "The Artisan" combination bath, sink and wash tubs, of which about one hundred sets have just been supplied to a block of artisans' dwellings at Stafford, and clearly shows the method of fixing. The bath is made to turn out in a circular path when wanted, bringing the extreme length into the room, but when not in use it is not only out of sight, but takes up no extra space.

The Kitchen Bath Fitment Company, Queen's Road,

Sheffield, who are the patentees and manufacturers, may be congratulated on the deserved success their system has attained.

EDINBURGH BUILDING EMPLOYERS' ASSOCIATION.

THE first annual dinner of the Edinburgh, Leith and District Building Employers and Allied Association, in conjunction with the Building Trades Exchange of the City and District of Edinburgh, was held on the 10th inst. in the Royal British Hotel, Edinburgh. Councillor Neil McLeod, the chairman of the Association, presided over a company of 160 gentlemen, and the vice-presidents were Messrs. W. Graham-Yooll, James Forrest and Thomas Hume. There was a good representation of the Corporation present, including Bailie McMichael, Bailie Douglas, Bailie Craig, Leith, and Councillors Forrest and McArthy, Edinburgh. Sir Thomas D. Gibson-Carmichael, Bart., hon. president of the Building Trades Exchange, was also present.

At the commencement of his address, the Chairman referred with regret to the death of Councillor Purves, who had been a member of both Societies. He was glad to see such a good representation present of both Societies. That was the first time they had sat down under their new name along with the Building Trades Exchange of the City and District of Edinburgh. They had left behind them the good old name of the Edinburgh and Leith Builders' Association. The reason they had changed their name was because they wanted all associated with the building trades to join with them, including joiners and merchants. In regard to the question of technical education he thought it would not be difficult for them as an Association to advance technical education. They were not advancing in that respect as they should, and he suggested the Association might give four or more bursaries for apprentices attending technical schools. If they advertised for a foreman or leading worker at the present time they would get replies from three or four men qualified for the position, but if they advertised for a clerk they would get from 200 to 300 applications. What they wanted was to induce more young lads to qualify as leading workers, which were more remunerative positions than clerkships.

In replying to the toast of "Our Imperial Forces," proposed by Mr James Miller, Colonel Bennett, Glasgow, said he was in favour of compulsory military training of our young men. If

they had military training added to the instruction that was given in their commercial life they would have better men, and men who felt more the responsibility they owed to their King and country.

The Corporations of Edinburgh and Leith were toasted on the motion of Mr James Moscrip. Bailie M'Michael, who replied for the Edinburgh Corporation, urged that in the election of their Lord Provost there was something to be said for the English system. He would not limit the term of office to one year, but he would have the election made every year. He suggested this because he thought the honours should go round.

Bailie Craig, who replied for the Leith Corporation, said there was one thing they could boast of in Leith, although they could not explain how it was, and that was that they were one of the healthiest towns in Scotland.

Councillor Forrest, who proposed the toast of "The Architects and Surveyors," regretted that because of the neglect by the Government of the architect in the past they had no national style of architecture of their own. Councillor M'Arthy and Mr. J. C. Hamilton replied.

The prosperity of both Societies was toasted on the motion of Mr. Alexander Webster. Mr. Thomas Hume, who replied for the Association, mentioned that in 1871 583,000 people were engaged in the building trade, while in 1901 the number was 945,000, or nearly double. Mr. W. Graham-Yooll, the president of the Exchange, replied. Other toasts followed.

ENGINES AND IMPLEMENTS AT THE SMITHFIELD CLUB SHOW.

As on former occasions, there was the usual varied display of machinery, implements and accessories at the great annual show which was held last week at the Royal Agricultural Hall, Islington, and those exhibits were interesting not only to the farmer, but to the manufacturer, the municipality, and, in a measure, to the community generally, since all are more or less interdependent upon one another.

Among the many other exhibitors on the ground floor of the large hall may be mentioned *Messrs Aveling & Porter*, of Rochester, who had two compound road locomotives, besides a compound traction-engine for light haulage, mounted on springs, and an 8 horse-power traction engine—the whole being up to the usual high standard.

Messrs. Blackstone & Co., of Stamford, were present with some serviceable-looking oil-engines, including a 14 horse power portable, besides three stationary engines of 2, 6½ and 14 horse-power respectively.

The Campbell Gas Engine Company, of Halifax, had also at their stand several horizontal oil-engines, including one of 13 horse-power and another of 15 horse power, besides capital little engine and pump combined.

Messrs. Clayton & Shuttleworth, of Lincoln, showed Stand 28 a large number of their leading specialties, including excellent specimens of their portable and traction-engines, thrashing machines, &c, also a new pattern horizontal stationary engine and some centrifugal pumps. The portable engine was of 8 nominal horse-power, of the makers' latest design, and formed a duplicate of that which they exhibited to the first time at the Paris Exhibition, where they were awarded the Grand Prix. The 7 horse-power single cylinder agricultural locomotive was a splendid example of *Messrs. Clayton & Shuttleworth's* new pattern engine of this type, embodying the most modern practice in its construction. The new horizontal fixed engine represented a novelty with this well-known firm whose object has been to combine in its construction high efficiency with simplicity. It was entirely self-contained, and eminently suitable for driving dairy machinery, small electrical installations and other similar plant. The thrashing machine upheld in every respect the high reputation which the firm enjoys in the manufacture of this class of machinery. The oil engine of the new patent safety class and having automatic ignition was of 6 brake-horse-power, and appeared admirably suited to the light work of a farm, or for a small electric-lighting installation.

Messrs J & F. Howard, of Bedford, had a steam waggon carrying 5 tons, with boiler of the water tube type, and having a compound engine, which can be converted into a high-pressure engine working at a pressure of 200 lbs. to the square inch, with two speeds (eight and five miles an hour), chain driven. This firm also showed an oil-engine of 12 h.p., using ordinary petroleum, and working on the Otto principle.

Messrs. E. S. Hindley & Sons, of Bourton, occupied their usual position with several horizontal as well as vertical engines well adapted for the work incidental to building operations and for electric lighting. *Messrs. Crossley Bros., Ltd.*, displayed not less than five of their well-known stationary oil-engines, one of them being combined with a dynamo; while *Messrs.*

AUSTIN'S
NEW IMPERIAL PATENT
SUPERFINE FLAX LINE.

The above article is now being manufactured and sold in large quantities for Greenhouse Sashes, Public-house Shutters, and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded). The Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines, of which they are now making six qualities, all of which they can strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years, and the Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are very superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and country.

N.B.—Please note that all our goods, as advertised above, are labelled either inside or outside with our Trade Mark—"The Anchor."

ing & Platt, Ltd., had also at their stand several petrol engines, including a 2½, 4, and 7½ brake h p., besides a 4 brake h p. petrol engine.

Messrs. Marshall, Sons & Co., Ltd., of Gainsborough, had and in their usual position with a various assortment of leading specialties. Foremost amongst their exhibits was a long-stroke horizontal engine fitted with Proell's patent governor and trip gear and of ample strength for 100 lbs. working pressure. Next there was a 10 horse-power independent compound engine fitted with Hartnell's governor and automatic expansion gear. Traction-engines have now come into extensive use, not only for agricultural work, but for general haulage purposes, and the 6 horse-power compound traction-engine shown this year was of their new type, constructed to work with economy in steam consumption and fuel, and embodies many important improvements. Messrs. Marshall also exhibited an open-fronted high-speed vertical engine fitted with Pickering governor. This is one of the new series of engines specially designed for direct coupling, or for driving belt-running machinery, such as electric lighting and similar work. The 10 horse-power single-cylinder portable engine of the firm's type, with cylinder having flat base bolted on to steel girders, and a stay between the cylinder and the crank-shaft carriage on the pump side.

Messrs. Ransomes, Sims & Jefferies, Ltd., of the Orwell Works, Ipswich, were present with a very serviceable 10 horse-power long-stroke engine, a 8 horse-power portable engine, a high-speed vertical engine, and a 8 horse-power road locomotive, the whole of which presented a very fine appearance.

Messrs. W. Tasker & Sons exhibited the "Little Giant" steam motor, capable of hauling a gross load of 5½ tons; while Messrs. Wallis & Steevens were present with their patent steam motor for general haulage, with users' own or with special trucks or trolleys.

In the gallery Messrs. John Bellamy, of Byng Street, Liverpool, had a good display of their well-known manufactures in the shape of galvanised and wrought-iron corn bins, as well as cisterns with a capacity ranging from 100 to 600 gallons, besides a safety tank for spirit or paraffin to hold 40 gallons, a wrought-iron barrel with a capacity of 200 gallons for oil or kerosene, a water-cart body holding 200 gallons, and several other things, &c.

Messrs. Barford & Perkins showed a 3 horse-power vertical steam-engine and boiler fitted with wheels and shafts

so that it can be easily removed from one place to another, besides a patent lever hay press, a patent combined crushing mill, and a steam food-preparing apparatus that is self-contained and easily fixed in a few minutes.

The Carron Co., of 15 Upper Thames Street, E.C., exhibited a set of stalls and loose boxes elaborately fitted in solid gun-metal, and a special feature was their patent manger with silent tying apparatus. The backs of the stalls were neatly tiled, and the woodwork was of teak and pitch-pine, while the flooring was made to represent Adamantine pavement with metal guttering and drainage. The stable fittings of various kinds had an attractive appearance, and it may be mentioned that the company, which is a very old established one, have show-rooms not only in London, but at Glasgow, Liverpool, Newcastle-on-Tyne, Bristol and Birmingham, with works at Carron in Stirlingshire.

Other exhibits of a miscellaneous character comprised the Economic Fencing Co., Ltd., the Cranstone Engineering Works, Ltd. (hoists, pulley blocks, &c.), Messrs. R. Haggie & Sons, Ltd. (wire rope), Messrs. T. W. Palmer & Co. (iron fencing, &c.), Messrs. Smith & Grace Screw Boss Pulley Co., Ltd., H. C. Slingsby (patent trucks), Jeyes's Sanitary Compounds Co., Ltd. (disinfectants).

THE DUBLIN MUSEUM.

A LECTURE was given by Colonel Plunkett, C.B., Director of the Dublin Museum, on the additions made during the past year to the collection in the Institution. Amongst other objects pointed out were a model of the famous Irish cross at Monasterboice and a copy of a well-known piece of sculpture by Michel Angelo. Also copies of two statues by Donatello in plaster, and imitations of various works of art from churches in Italy. He further showed examples of the Tuscan art, including a copy of an Etruscan arm-chair of sculptured marble from the Villa del Principe, Corsini, at Rome; also an interesting collection of objects from West Africa, including implements used by the natives for making fire and for purposes of war and hunting. He also referred to new specimens obtained of Irish book-binding, and remarked the beauty of style of some work executed in Dublin, and a collection of old Irish silver made formerly in Dublin and Cork, and for which there was now a brisk demand. The Irish gold ornaments were next pointed out, and Colonel Plunkett mentioned that Mr.

Coffey would deliver a lecture upon them in a few weeks. In the porcelain department were seen specimens of old Waterford cut glass, and also a small cup recently made at the Cork Exhibition, and the lecturer referred to the possibility of a revival of this industry in Ireland. Before concluding Colonel Plunkett showed the audience some magnificent specimens of Italian and fine point laces.

DUNFERMLINE OLD BUILDINGS.

AN interesting article by Mr. Thomas Ross recently appeared in the *Dunfermline Journal*, in which he dealt in an attractive manner with the ancient buildings of Dunfermline. The writer affirms that Dunfermline probably retains as much in its surviving architecture illustrative of its long history as any other town in Scotland. In the abbey church every century is represented since the eleventh. The palace front, he declares, has an overpowering and lordly effect, and is probably the grandest front of all the royal palaces in Scotland. Formerly the building could not be properly seen from the narrow path that skirts its base, but now it can be seen to great advantage from the opposite side of the glen, which has been handed over to the community. It is a very generally received opinion that the nave of the abbey church was the actual church built by Malcolm III. and Queen Margaret after their marriage in 1070, but Mr. Ross doubts if there was in the eleventh century in Scotland either the learning or mechanical skill necessary for the erection of such a building. Mr. Ross points out that it has been said that Malcolm was present at the laying of the foundation of Durham Cathedral in 1093, the last year of his life, and he adds that the resemblances between the abbey church and that building are many. He thinks it quite probable that the entire nave is the work of David I. Great churches were always commenced at the east end, and this nave in that case could never have been the east end of an abbey church. He thinks the view that the church built by Malcolm and Queen Margaret stood on the site of the present parish church is the only one that has any probability. Mr. Ross deals also with the re-exposed Norman doorway and the group of old houses opposite the west end of the abbey. The abbot's house, to the north of the graveyard gate, is described as a house built on the Z plan prevailing in Scotland during the latter half of the sixteenth century. It is the house of a

moderate well-to-do citizen, a class of which few examples remain. The inscription over the doorway caught the eye of Sir Walter Scott, and it is given in "The Fair Maid of Perth":—"Sen vord is thrall and thoct is fre, keip veill to tonge, I coinsel the."

INSTITUTION OF ELECTRICAL ENGINEERS.

THE Institution of Electrical Engineers, at its ordinary meeting on the 10th inst., which was held under the presidency of Mr. Robert Kaye Gray, the president of the year, celebrated the tercentenary of "Gilbert of Colchester," described by Dr. Sylvanus Thompson as the father of electrical science. Dr. William Gilbert, who was a physician to Queen Elizabeth, was born in Colchester in 1544, and died in the same town in 1603. He was the founder of the twin sciences of electricity and magnetism, and the celebration of the three hundred anniversary of his death took the form of the presentation to the Corporation of Colchester of a picture painted by Mr. Ackland Hunt representing Dr. Gilbert showing to Queen Elizabeth and her Court his electrical experiments. Mr. Ackland Hunt is himself a member of the Institution, and the picture, which is full of life and character, was displayed in a prominent place in the great hall of the Institution of Civil Engineers, where, by the kindness of the Council, the electrical engineers for the present hold their meetings. The borough of Colchester was represented by the mayor, Mr. E. H. Barnard, the ex-mayor, Mr. Wilson Marriage, Dr. Laver, Mr. V. Gurney Benham and the town clerk, Mr. Wanklyn. Among others present were the mayor of Westminster (Mr. Walter Emden), the president of the Royal Society (Sir William Huggins), the president of the Société Internationale des Electriciens (M. E. Hospitaller), the treasurer of the Royal College of Physicians (Sir Dyce Duckworth), Dr. J. Larmor representing St. John's College, Cambridge, Mr. Conrad Cooke and a large number of the leading members of the Institution.

The President briefly opened the proceedings by asking the Mayor of Colchester to accept the picture as a gift from the Institution, and requesting Dr. Sylvanus Thompson to say a few words about the man whose memory they had met with honour. Dr. Thompson and Mr. Conrad Cooke had worked hard to bring before them the memorial of Dr. Gilbert.

Dr. Sylvanus Thompson said a letter had been received from Lord Kelvin expressing his regret that he was unable to

Fire-Resisting Construction . . .

IMPORTANT NOTICE TO ARCHITECTS, BUILDERS & CONTRACTORS.

Completely equipped Joinery Works, fitted with the latest and most improved Woodworking Machinery, have now been installed in connection with our Plant for Rendering Wood Fire-resisting, and we are prepared to contract or sub-contract for all the Woodwork (Carpentry and Joinery), complete and fitted up as required, for Buildings where Protection from Fire is desired.

THE COST FOR DOORS, STAIRS, WINDOW-SASHES, MANTELS, AND OTHER JOINERY MADE OF FIRE-RESISTING WOOD IS ONLY ABOUT 15% MORE THAN WHEN MADE OF ORDINARY WOOD.

We are authorised to announce that the **FINE ART & GENERAL INSURANCE CO., Ltd.**, of 90 Cannon Street, London, E.C., will allow, subject to Survey, a Rebate of from 10% to 30% off the current rates for risks in which our Fire-resisting Wood is used.

Fire-resisting Wood Joinery is indistinguishable in appearance from ordinary wood, and when furnished by us does not differ in any respect from ordinary wood, except in the one feature, that it will not by itself sustain or spread flame.

ESTIMATES AND SAMPLES FURNISHED FREE ON RECEIPT OF SPECIFICATIONS.

represent that night, and his pleasure at knowing that it had decided in the way it had been to celebrate the tercentenary of Gilbert. He also said that the painter of the picture desired it might be mentioned that though he had spent a good many years over the picture, and had given the details a great deal of study, it was all to him a labour of love, and that he had been incited to the work by the late Sir B. Richardson, who was a great admirer of Gilbert and his works. The electricians owed an enormous debt of gratitude to Dr. Gilbert. Among all the famous men of the time of Queen Elizabeth, there were few whose names now stood out more pre-eminently. There were, no doubt, many others, for there were Cecil, Drake, Raleigh, Shakespeare, Spenser and Bacon. There were, however, no men before Cecil, naval heroes before Blake, explorers before Raleigh, poets before Shakespeare and philosophers before Bacon, but before Dr. Gilbert there was no electrician, and he also claimed their admiration as the founder of the science of terrestrial magnetism. They knew of him that he was in his time a busy physician, and that for thirty years he took a leading part in his profession, being at one time President of the College of Physicians, but he devoted a great part of his activity and his money (a sum of 5,000*l.*) to the experiments which resulted in the production of the book the critical copy of which he held in his hand, and which was described by his autograph to his friend and successor, Michael Browne, the book being now the property of the Society of Arts. In that book he laid the foundations of the science of terrestrial magnetism. But Gilbert not only laid the foundations of that science; he also dealt with astronomy, and he was the first to advocate in this country the views of Copernicus, and to him was due the first observation of the circumstance that the fixed stars could not all be at one distance away, while he also produced before the invention of the telescope the first known map of the moon. In addition to all this, he did much to advance the science of navigation, and he died on the three hundredth anniversary of his death, they gathered the various distinguished representatives of science to join them in doing honour to his memory. The house at Colchester where he was born and where he died was still standing, and should be the Mecca to which all electricians should go. His bones lay in the church of Holy Trinity, opposite to the house, and in that church was a heraldic monument recording his virtues and his career. He hoped in the near future many of them might go to Colchester to worship at his tomb.

The Mayor of Colchester, in accepting the gift on behalf of Gilbert's native town, said it would be treasured and prized by them. He also mentioned the fact, as a coincidence, that he (the Mayor) was the chairman of the electrical committee of the Corporation, and that from his boyhood he had been a student and admirer of Dr. Gilbert.

The Mayor of Westminster and Sir Dyce Duckworth, treasurer of the College of Physicians, added a few words expressive of their pleasure at being present and in appreciation of the memory of Dr. Gilbert.

The ordinary business of the evening was then proceeded with, a paper by M. E. Hospitallier, on "The Slow Registration of Rapid Phenomena by Strobographic Methods," being read and discussed.

BASINGSTOKE NEW RAILWAY STATION.

EXTENSIVE alterations amounting, in fact, to the rebuilding of their railway station at Basingstoke are being effected by the London and South-Western Railway Company. The new buildings are situated nearer the town and a little to the east of the old offices. The ground floors are on a lower level, necessitating the removal of an immense quantity of soil from the brow of the hill. The approach from the town will be as follows:—To the right will be the main block of buildings, some 80 yards long, comprising, on the ground floor, booking-hall and offices, subways and luggage entrance, &c. The booking-hall will give access by large doors to the subway, which is very spacious, lined with enamelled brick and divided down the middle for luggage or passengers. Lifts are provided to raise the luggage to the platform, while wide flights of steps lead the passenger on to the platform he or she wishes to reach. On the platform level are the waiting-rooms, stationmaster's, officials' and telegraph offices, cloak-room, lavatories, porters' and lamp-rooms, &c. Above them, again, is another range of offices and stores, and a clock turret facing the town. This will be illuminated at night, but it is unfortunately somewhat obscured by the chimneys of Messrs. Raynbird's auction offices, which adjoin. A broad open space on the same level as the booking-office will be left between this block and the refreshment block, and this will be roofed with glass, so that carriages, cabs or 'buses can take up or set down their fares in shelter. The refreshment block, which

forms the left wing, is equally complete. Kitchens, stores and other offices occupy the ground floor, spacious luncheon bars and dining-rooms the platform level, and the waitresses' apartments are above. There are six bedrooms, a sitting-room, bath-room and lavatory at their disposal. A little further to the left has been erected the station-master's house—a most commodious and perfectly equipped dwelling—and in the open space between the Junction hotel and the refreshment block will be arranged a cab rank. The present down platform will be swept entirely clear of the buildings now upon it, and converted into an "island" platform, with the necessary shelters, waiting-rooms and other offices. There will be two pairs of rails on either side of it. The new down platform will be of great length—about 300 yards—and entirely under shelter. On the up side there has not been so much to do, beyond providing exits and entrances to the subway, and the erection of some additional offices. The whole of the new premises will be heated with steam—a novelty tried for the first time by the London and South-Western Company—and fireplaces are therefore for the most part absent. It is intended eventually to light the whole by electricity. The old subway, which extends right under both the railway lines, has been rebuilt and renovated on the South-Western Railway side, and will be retained exclusively for pedestrians wishing to cross the two railways to the upper portion of the town.

The contract for the passenger station was given to Messrs. Kirk & Randall, of Woolwich, the amount, it is rumoured, being over 30,000*l*. The time limit for completion was eighteen months. They commenced work in March last, and appear to be progressing expeditiously and well, though they are now approaching that stage of the operations when the necessary duties of the railway officials have to be provided for, and the progress of the work may be difficult to arrange.

LIVERPOOL ENGINEERING SOCIETY.

The Liverpool Engineering Society held its annual dinner on Saturday evening, the 12th inst., at the Exchange Station hotel, Liverpool. The chair was occupied by Professor Hele-Shaw, and others present included Sir Charles Petrie, Vice-Chancellor Dale, Professor J. A. F. Aspinall, Mr. T. L. Miller (chairman of the Engineering Society), Professor Carey (chairman of the Engineering Faculty), Dr. Davidson, Dr.

Nathan Raw, Professor Strong, Mr. C. Ramsey, Dr. Pernew, Mr. Murray Bligh and Mr. Lloyd Barnes.

The loyal toasts having been honoured, Sir Charles Petrie submitted "The Faculty of Engineering." He believed that the Liverpool University was the first to possess such a faculty, and he hoped they would set an example worthy to be followed throughout the country. If they were not for the engineering profession, he remarked, and help it gave to sanitary science, the health of a great city like Liverpool would not be able to reach the high standard it did. He himself had had some hand in obtaining that faculty, and he looked back with pleasure to the time when he, as Lord Mayor, used to preside over the executive committee of the university. He was very much interested in the movement from the first, and he was glad of the success it had attained.

Professor Carey, in responding to the toast, spoke in terms of warm recognition of the assistance given to the faculty by the associate professors. He was not sure that the very existence of the faculty was not due to the support which Professor Hele-Shaw had obtained from those gentlemen. Their presence there that evening was a guarantee that the faculty of engineering would have a close connection with the profession of engineering, and engineers would know that as long as the associate professors were connected with the faculty its work would be directed to a very practical end. As to Professor Hele-Shaw he trusted that he would return to them from his labours in the Transvaal more earnest than ever to advance the cause in which they were so deeply interested. The success of the faculty depended not only upon the teachers, not only upon the associate professors, but upon the co-operation and support of the engineering students themselves.

Mr. Rimmer gave the toast of Professor Hele-Shaw. He said that the occasion marked the inauguration of the new faculty, and it was the first time that Professor Hele-Shaw had presided over the annual dinner as Dean of the Faculty of Engineering. He voiced the sentiments of the students who he thanked the dean for the strenuous efforts he had made to found the faculty; it was only one of the many honours which the Professor had brought to the university of which they were so proud. When they heard that he had been appointed the director of technical education in South Africa they felt that the honour done him was reflected back upon the university and upon that department in particular. On behalf of the students he had great pleasure in presenting to their dean a silver cigar-case as a memento of that occasion, and in wishing

and his family God-speed on their journey, a happy and prosperous season of work, and above all, a safe and speedy return to his students and the faculty.

The toast was drunk with enthusiasm. Professor Hele-Shaw, in acknowledging the compliment, remarked that he was thankful to say that his leavetaking was *adieu*, but only *au revoir*. When he looked back upon the years he had been in Liverpool, and remembered the first students with whom he began the work of the engineering department, and when he thought how the students had increased and multiplied, he could not but feel gratified at the number of friends he had had, and at the loyal way in which they had stood by him. He thanked Sir Charles Petrie especially for his kindness, and the able and sagacious way in which he had responded to the plea for that faculty. When he had come to consider the question of an assistant in the work in the Transvaal, his thoughts turned to his own country, and he could tell them that evening that Mr. J. H. Dobson had accepted the post of assistant lecturer in the new university of the Transvaal. Mr. Dobson, from an apprentice engineer, had fought his way upwards, and was some time ago appointed lecturer at St. Helen's. It was with great difficulty he persuaded the technical committee at that place to allow Mr. Dobson to accompany him. In conclusion, Professor Hele-Shaw expressed his heartfelt gratitude to them all, especially to the students, whose kind presence, he assured them, would always be treasured by him.

Mr. Mackenzie proposed the toast of "Our Guests." Mr. T. L. Miller replied, and emphasised the cultivation of observation, reason and imagination as important studies in the engineering profession.

Vice-Chancellor Dale, in also responding, re-echoed the wishes which had been bestowed upon Professor Hele-Shaw, and congratulated the faculty upon coming into existence. Divisions in the university, however expedient, were in his mind to be avoided beyond the point of absolute necessity. Of one thing he felt persuaded, that every member of that faculty, though recognising its existence as essential for the work of activity and development of those cities which it had to serve, recognised also that independence was not a question, and that throughout the years to come the faculty of engineering would always be distinguished by that large and generous public spirit of devotion to common ends which had characterised the school of engineering from its origin until

BELGIAN V. BRITISH RAILS.

WHEN the Belgians were asked to furnish an explanation for the undoubted fact that they are enabled to supply the London County Council with steel tram rails cheaper than they can be manufactured in England, one of the chief reasons given, says the *Daily Telegraph*, was that in Belgium basic, and not Bessemer, steel was employed. In reply to this contention, British makers of steel say that while the Belgians and the Germans have an advantage in respect of paying their men lower wages for longer hours, they have no monopoly of basic steel, as it is also made in quantities here, particularly in the districts in the north-east part of England, where low-grade ores are found, similar to those that are being turned to account by the Germans in Lorraine and in the Grand Duchy of Luxembourg. Figures are not forthcoming as to the present consumption of basic steel in making tram rails in this country, but inquiring of the largest customers for tram rails for electrical installations, it seems that when first the demand for them was created the British manufacturers, who had been turning out railway rails by the Bessemer process for years, would not readily adapt themselves to the requirements of the tram companies. They said, in effect, "You can take our Bessemer steel rails, or go elsewhere." The Germans, followed by the Belgians, saw their opportunity, and they set up works for the making of steel by the basic process—a system which was invented in England, but which had to live down a great deal of discredit excited by the prejudice of those who disbelieved in the utilisation of impure ores. These establishments in the neighbourhood of Liège, in Belgium, and at Düsseldorf, in Germany, have not been long established. Their methods are new to the district. The leading Belgian works—those of Messrs. Cockerill, at Seraing—on the eve of change, as yet procure all the basic steel they need of their neighbours. These firms owe their existence to the adoption of the basic process, and it is from their works that not only England, but America, is being supplied. No doubt the English makers are at length realising the virtues of basic steel for certain purposes, but they have nevertheless allowed the foreigners to compete in our home markets, to the extent that probably 50 per cent. of the tram lines now being laid have been imported.

A tram rail is very different from a railway rail. A section of the rail laid in the streets for the cars—electrically propelled

or horse-drawn—shows that the head of the rail, instead of being flat and simple, has a groove in which the flange of the wheel runs and a lip. This lip has to be rolled out flat and then turned up to form the groove. In the process of rolling the metal into this desired form the strain to which it is subjected is such that basic steel supports it better than Bessemer. The basic is much easier to handle. That is to the manufacturers' advantage. Then with regard to the wear and tear of it, the head of the basic steel rail is harder. It is not calculated to stand the shock which the Bessemer railway rail must bear; but the conditions applying to a tram and those applying to a railway rail are altogether different. On the railway line the metals have to be supported on "sleepers" at intervals, and there must be no risk of fracture. But on the tramway the rails are continuously laid on cement; they sustain no jolt or jar, and some of them which have been down for ten years show hardly any signs of wear. The Germans and the Belgians were prompt to satisfy themselves that basic steel was good enough for the purpose, and even better than Bessemer. Their interest was altogether in the direction of developing the mineral resources at their own doors of too low a grade to serve for Bessemer steel, whereas in this country the importers of Spanish ore and the users of Cumberland ore, who are chiefly to be found on the West Coast, have not had the inducements to take up the basic process. The steelworks of Yorkshire, with low-grade ore at local command, are in a different position, and it is from them that English rails, if they are to compete with the Belgian, must come, though at present prices buyers of rails assert that the foreigner holds the market to a considerable extent, having made good his foothold during the last four or five years.

A belief exists in some quarters that the engineer of the London County Council insists upon Bessemer steel. It is impossible to verify this statement at first hand, as the clerk to the Council courteously declines to divulge the terms of the specification in contracts for rails. Whenever a question becomes controversial the rule of the officials at Spring Gardens is to withhold all information. But in other quarters a specification was produced, and it did not appear to provide for none other than Bessemer steel, as the chemical constituents set forth would allow of the supply of basic steel. There is not much room for doubt, because during the present year the Council placed a further order with Messrs. Maclellan, of Glasgow, whose tender in March 1902 was accepted for a

portion of the rails required for the New Cross and Greenwich tramways. The necessary permission was given by the Council to the rails being obtained from the sub-contractors the Société Anonyme des Aciéries d'Angleur. This is one of the works in the vicinity of Liège, using basic steel of its own manufacture. The nuts and bolts are made at Sheffield. As regards track rails, no difference whatever exists between the conduit—the London County Council—and the overhead systems, but the conduit requires, in addition to the rails upon which the car runs slot rails and conductor rails, or "tees." Two slot rails form the slot between each pair of track rails, the slot being $\frac{3}{4}$ -inch width, through which the plough works. All three descriptions of rails were included in the same contract. Something of interest is to be learned by referring to the proceedings of March, 1902, when the contract was placed with Messrs. Maclellan, with permission to sub-let in Belgium. That firm put in two tenders; the one, which was accepted with the rails to be made by the present sub-contractors at Tilleur, near Liège, being nearly 8,000% less than the price quoted for rails to be made at the Barrow Hematite Company's works, for which 50,463% was asked. Presumably these were Bessemer steel rails. The Belgian works at Ougrée also competed, being third on the list; and the Phoenix Works at Ruhrort, Westphalia, Germany, were second. On that occasion the difference between the lowest British and foreign tenders was equal to about 18 per cent.

When the permanent way of the first completed section of the London United Tramways Company was opened in 1901 it was stated that the rails are of steel of the very best quality, made from first-class ores. The weight of the rails is 92½ lbs per lineal yard, and they are rolled in 36 feet lengths. The bed on which the rails are laid consists of concrete, 6 inches thick, covered with sand and cement, on which are laid wood blocks. The fish-plates are made from steel of the very best quality, and are very tough, with no brittleness, the bars being rolled from "blooms" of sufficient sectional area to secure this. No Bessemer steel rails are being used on the extensions of the overhead system. It may be noted that the London County Council's rails, of the girder type, are heavier, weighing 102 lbs. per yard; but the slot rails, also of steel, are only 62½ lbs. per yard in weight. The electric current is conveyed by conductors, which are T-shaped rails of soft steel, with specially high conductivity, carried within the concrete conduit. They are comparatively slight, for their weight is only 22 lbs. per yard.

ARMoured FIRE DOORS

Telephone,
No. 143 Westminster.

The Architect.

THE WEEK.

THE death is announced of Mr. CHARLES MCBRIDE, who was one of the few Scottish sculptors. Edinburgh possesses a collection of casts which were made by a landscape-painter in the beginning of the nineteenth century, as well as a remarkable assemblage of copies of busts. But their neglected condition reveals the general indifference to the sculptor's art. Anyone who follows it is therefore likely to possess enthusiasm which, under fostering conditions, might produce excellent work. The busts in which CHARLES MCBRIDE was engaged are not to be taken as the full measure of his ability. *The Murmur of the Shell*, a statue of a young girl, which now belongs to Mr. CARNEGIE, would by itself be sufficient to indicate that he was endowed with a sense of beauty aspiring towards the ideal. In Mr. CARNEGIE he discovered a patron who believed in his genius, but his delicate health prevented him from producing examples of art unless on rare occasions.

An ingenious effort at self-advertisement is seen in the small brochure entitled "Moot Points: Friendly Disputes in Art and Industry between WALTER CRANE and LEWIS DAY." (London: B. T. BATSFORD.) The disputes are not unlike the friendly sparring and wrestling bouts of professional entertainers. They amuse, but victory generally goes by turns and is prearranged. However, the confidence of the supporters suffers no change. Mr. DAY shows how he is quite willing to aid with his skill those manufacturers who employ machinery, believe in the advantages of a division of labour, and are indifferent whether their products are considered art or trade so long as they are purchased at a profitable rate. Mr. WALTER CRANE professes to cater for those who stand aloof from the tradesmen, and believe that everything they buy has a special character which is absent from similar things belonging to their neighbours. Suppose you want to obtain a carpet in Anglo-Persian style with an abundance of lions such as NICK BOTTOM, the weaver, would admire, and which suggest roaring like a sucking dove or a nightingale. Mr. DAY, with charming humility, professes that he does not aspire beyond "ornament." Mr. CRANE is willing to produce them in a style which would satisfy the keeper of a menagerie. The figure of the manufacturer which Mr. CRANE introduces as enjoying the "mill" between the two artists appears to be perfectly amicable; for whatever kind of product is needed, CRANE or DAY, DAY or CRANE, will co-operate with him. The new system is many possibilities. Why should not the makers of medicines, soaps, oatmeals and other things appear to differ the same way? An ordinary trade tract is wearisome reading, but some in the "friendly disputes" style might be more attractive, and who knows whether the public could not purchase both classes of articles? Art and commercialism can still join in the cry, "Quis separabit?" for the two designers have brought them more closely together.

ANYONE who consulted ROBERT ETHERIDGE about questions in connection with building stones will be relieved to learn of his death on Friday last. He was one of the few men of science who never appeared to suggest that matters relating to ordinary business were beneath his notice. It seemed to him to be a pleasure that he could bring his knowledge to bear on questions which to others were obscure. His manner was no doubt due to the fact that at one time he was curator of the Bristol Museum, and at another he lectured on vegetable physiology and botany in the Bristol Medical School. He was therefore early initiated into the practice of answering questions and clearing doubts. The public in general heard more about other geologists who were connected with the Geological Survey, and he never startled the world by colossal theories. But it is doubtful whether he was not equal to the greatest of

his contemporaries in his knowledge of the history of the earth's surface and especially of palæontology. As he was born in 1818 he would generally be considered an old man. But, as commonly happens with students of national science, he was as ardent in the pursuit and application of knowledge as younger men. The Museum of Practical Geology owes much to him. He was assistant keeper, and he not only classified many varieties of the fossils, but he prepared sections and maps which are invaluable to those investigating engineering questions in which geology is concerned. His great ambition was to collect data which could be used by other students, for as to fame, he was indifferent. Hence it is that his most important investigations are only to be found in the Journal of the Geological Society and the Memoirs of the Geological Survey. A slight acquaintance with him was almost enough to reform those ill-taught theorists who were indifferent to anything less than the creation of worlds. He received several medals, but his unobtrusive manner made him unknown to the distributors of other honours; and thus one of the greatest geologists in the world had no higher position than belongs to a Fellow of the Royal and Geological Societies.

ACCORDING to Dr. JOHNSON, a warehouse is "a storehouse of merchandise." Ware he describes as "commonly something to be sold." In other words, a warehouse is only temporarily occupied by its contents. Under the Workmen's Compensation Act the word "factory" includes any dock, quay or warehouse. The question then has been raised, For what length of time must the goods be deposited in order to constitute a warehouse? The Great Western Railway Company have premises in the Minories where the goods may only be a few hours on the platform, and only in special cases are allowed to remain a few nights. Is that extent of use sufficient to constitute a warehouse? The question arose out of an action brought by a labourer whose hand was injured through being struck by the handle of a crane which was accidentally released by the man working it. The case was heard at the Marylebone County Court by Judge STONOR. In his judgment he acknowledged that there was some doubt in his mind on the subject, but he came to the conclusion that the railway premises formed a warehouse, and the applicant was therefore entitled to compensation. The association in the Act with docks, wharves and quays would appear to support His Honour's conclusion. But in the Factory and Workshop Act there is a more restricted meaning given to the word, although there is no precise definition of its signification. Lord Justice COLLINS once said that if a timber yard were roofed over it would become a warehouse, from which it might be inferred that a platform which is unprotected from the rain is not a warehouse.

THE Council of the Upper Norwood Athenæum have lost no time in producing the small volume which is the record of excursions during the past season. The places within convenient distances of the Metropolis which possess historic interest have not been exhausted by the visits of preceding years. This year the subjects are Clandon and Merrow, Warnham Court and Christ's Hospital, Holmbury St Mary, Bexley Heath and Crayford, Christ Church and Oxford Castle, Roydon and Nether Hall, Redbourne and Hemel Hempstead, Alberty, Gatton and Merstham and Selsdon Park. We have printed the papers which were read by the guides, but it is advantageous to have so much information in a more suitable form for the benefit of tourists. Indeed the small volumes will form a series of guide-books of a unique kind. So much gratification has been derived by the members, it is surprising similar societies have not been established not only in other parts of suburban London, but throughout England. The Norwood Society has none of the cumbrousness of the ordinary archaeological bodies, which can only be set in motion for two or three days in the year.

ARCHITECTS AND ANATOMY.

THE necessity of education for architects is so often urged, and there is so much vagueness concerning what should be comprehended in that term, it is excusable if outsiders who are without the least knowledge of construction or design should out of pity come forward with advice about the varieties of knowledge desirable. Among one class of architects, as well as among laymen, there would appear to be an illusion that a man has only to speak on the subject of education and he will be forthwith recognised as an authority who is inspired by personal experience of its advantages. To insinuate that a great many if not the majority of practising architects are unacquainted with the elementary principles of architecture, and are obtaining fees under false pretences, is now becoming an almost exhausted method of advertisement, but it is still persisted in by those who find some strange fascination if not profit in posing as the champions and truest representatives of the art. Architecture alone can claim to have such peculiar advocates. There are differences of opinion in other professions as to the skill of members. Lawyers and physicians are not always unanimous in upholding the superiority of their successful brethren, but they have a manner of expressing their judgments which is unlike that adopted by architects. There is no endeavour to convince the public that they have been wasting their money in paying fees to charlatans. When architects describe architects as incompetent, it is allowable for others to suggest in their innocence the kind of remedy which would serve to overcome the evil and enable people to obtain handsome, substantial, healthy and economical dwellings and other buildings.

It is only by supposing philanthropic motives which were the result of the dismal pictures of the state of their profession drawn by architects that we can understand the "distinguished professor of the Queen's College," Professor SYMINGTON, rising at the annual dinner of the Ulster Society of Architects and gravely informing the company "that a man to be a successful architect should be first of all an anatomist." The reasons given were as follows:—"They found in the human body the application of the principle of the best use of the best materials for the best purpose. There was a maximum of strength with a minimum of material. However high an architect might attain in his profession, however complicated the buildings he undertook, he would never construct anything at all equal in perplexity to the structure of his own body." After-dinner oratory should not usually be rigorously criticised, but in this case the remarks are so unlike a professor's, much less a distinguished one, we are inclined to presume they were incorrectly reported. The absence of censure by the chairman or any of the architects present would support that conclusion. But as young architects are now rather credulous about the extent of the knowledge which should be acquired, there may be no harm in considering the statements.

First, we may say Professor SYMINGTON'S discovery is more venerable than any of the "chestnuts" which will be revived during the present season. The necessity of anatomical knowledge was one of the marvellous pieces of advice through which VITRUVIUS has gained renown. He was unable to point to any instance in his own practice (assuming him to be entrusted with buildings) which was improved by means of anatomy. We doubt whether at any period the wisdom of VITRUVIUS was esteemed as more applicable to ordinary work than Mr. PECKSNIFF'S. But in the nineteen or twenty centuries which have passed since he lived not one architect has been known who testified to the least benefit which anatomical knowledge gained for him. Cases might perhaps be cited of Renaissance architects who studied the human body, but as they were also painters and sculptors, it was for those arts the science was needed rather than for the planning of buildings. It is still possible to hear a study of the figure recommended to students of architecture in order to acquire a canon of proportion. An eye that is familiar with the relations between the parts of a well formed human body or a fine statue and the whole is not likely to be satisfied with details which are larger or smaller than is necessary for effect. As an aid towards knowledge of the exterior of the figure anatomy is unquestionably of use.

But anyone who maintains the human body is to be

likewise taken as a model for building construction cannot have realised fully either the essential character of that body or of a building. The two are so unlike in principle and in purpose, it is ridiculous to enter into a comparison between them. Evidently, however, other men, besides poets, fancy there is some affinity, as if they came under one occult law. EMERSON, for instance, rejoices over the words of VITRUVIUS as if they embodied supreme wisdom.

Is it not sufficient to show the gulf which separates man from building when we say one is organic and the other a combination of things which, if they were organic, ceased to be so before they were utilised by a builder? We cannot discover why the stone or the man exists. But we know that man, when he appears in the world, is an imperfect being, that several years are needed before he attains his full growth, and then after a period of vigour he declines. It does not matter whether like SHAKESPEARE and some of his predecessors we say there are seven ages, or, like some physiologists, determine the periods of life by changes in teeth or bones; the result is the same. With the longest lives it is a succession of variations from the mewling and puking infant to a state of "mere oblivion, sans teeth, sans eyes, sans taste, sans everything." The materials of which so marvellous an organism is composed are adapted to facilitate the succession of changes. All bones were originally so very soft and gelatinous as to be almost in a fluid state. We cannot consider the constituents of the body in the same way as we do building materials, for there are internal forces acting on them which, when the time arrives, are more deteriorating than any to which wood, stone or steel are subjected under ordinary circumstances. The "maximum of strength with a minimum of material," as Professor SYMINGTON describes the body, is not to be taken in the statical or constructive sense the words would have if used by an architect or builder.

We cannot regard the human body rightly unless we accept it as under the influences of dynamic forces. It is a machine rather than a fixed structure. The least vibration in a building is prevented, but that is impossible with animals, for even when we appear quiescent some organs of the body are in action. A labourer would never compare a mortar mill or a steam hoist or trolley with the building which they aid in constructing, and it is no less irrational to identify a building with a being that encloses different kinds of apparatus which only cease from working when life is extinct. A real grasp of one of the truths of animal mechanics was expressed by EDWIN CLARK in his deductions from the experiments in connection with the Britannia Bridge when he said:—"The more special province of the bones appears to be their action as pillars or struts, in forming immovable fulcra for the reaction of the muscles, and since any yielding would involve a great increase of motion in the muscle itself, we find bone among the most incompressible of known substances." As there could be no such reaction in bronze or marble, it was considered almost an impossibility at one time to have a statue which could stand on the feet, and pedestals, smaller figures, drapery or other devices were introduced to give the desired steadiness. But a human being can generally stand in such a position, owing to the exercise of force in some mysterious way. If motion is impending and there is a tendency to fall, it is overcome by motion in a different direction. The act of walking, for instance, consists in successive over-balancing and recovery. Although the same amount of material exists, it would be impossible for a corpse to stand upright, or a skeleton. The forces to which perpendicularity was due no longer existing, we have only matter in a form which must be either held up by exterior props or allowed to lie in such a way that gravity is resisted.

By attempting a comparison between the human body and a building, or indeed with any work of man's hands, a definiteness is given to what is mysterious. The purpose of life is not manifest. We know that a vast number of human beings have not sufficient strength to pass through the few years of infancy. It is also familiar to us that at all ages of human beings there are sudden collapses. In all such cases the purpose of creation is no doubt fulfilled. *Mors janua vite.* But if a house broke down so early or so unexpectedly what would be said of the builder? Buildings

rarely fall, not on account of the superior skill of those who construct them, but because experience has made men acquainted with the various contingencies which may arise and they endeavour to provide against them. As yet physicians have not discovered the remedial measures which will enable them to overcome all the obstacles to length of life, and one of the reasons may be the excessive appreciation of false analogies like the comparison of a body with a building. How little is needed for the demolition of the house of life is universally known. A man can his quietus make with a bare bodkin or one in another hand is no less efficacious; so is "the soft and tender fork of a poor worm" and the sting of an insect. The simplest structure of wood has more power of resistance.

When Professor SYMINGTON said that in the human body they found the principle of the best use of the best materials for the best purpose, he is certainly treating a great many obscurities as if they were known as well as common facts. Humanity has passed through a variety of conditions, and many more will presumably follow. Now numerous observers believe that the rate of speed has exceeded the adaptation of the body to the altered conditions. There are painful weaknesses now suffered which apparently were unknown in a past age. It is sometimes asserted that men are best suited for living in a state nearer to primitive life, and many who have abundant vigour prefer to go to a wild district rather than endure the pains and penalties of modern life and civilisation. Considering what the ordinary highly-educated man has to go through in a profession, can it be said that the best materials are being daily used for the best purposes in a physiological sense?

As respects materials it can be replied, "Beggars have no choice." Man has to employ those alone which he can afford to obtain. Basalt is an enduring material, and it is found in the county of which Belfast is the city. It is not, we believe, used either for walling or for paving. Would anatomical knowledge, if possessed by the Ulster architects, compel them to employ basalt? But is the Professor certain that the best materials are always employed in building men? It was at one time estimated that the mortality after serious operations was more than twice as numerous in French hospitals as in English. The difference was believed to arise from our superior management and sanitary arrangements. M. VELPEAU, whose authority was unquestioned, attributed it to a difference in the flesh of the two races. Would not the English material in such a case be better than the best? The fact is, there are variations in bones, muscles and other materials, and it is erroneous to describe them as if they were alike in quality with men all over the world.

The "minimum of material" principle of course leads to the steel structure or, as we should say out of respect to the Professor, the "skeleton structure." If only utility were considered, the human body would present a different appearance; but material is added to impart beauty. Why should not man be allowed to imitate nature and to employ a little superfluity of material for the sake of conferring a pleasing appearance on his handiwork? Nor is it wise to restrict dimensions to a minimum. According to EDWIN CLARK, "the angler's bamboo-rod is the most perfect of tubular beams," but quantity and strength generally go together, for man cannot imitate the forces which compensate for mass in the human frame. However, where an anatomist cares for his science, we presume he must act on the nothing-like-leather principle and will endeavour to bring all things into subjection to it.

We have referred to the advantage of studying the figure as an aid in cultivating the sense of proportion. A department of anatomy, viz. that relating to races, can also have use for architects. The late CÉSAR DALY, the French architect, declared that architecture varied according to the distinctive character of each race. But a similar theory was upheld at an earlier time by JAMES FERGUSON. He affirmed that if considered apart from ethnography, "architecture is a mere record of bricks and stones," but with the help of that science "not only every tomb and every temple, but even the rude monoliths and mounds of savages acquire a dignity and interest to which they have otherwise no title." Some knowledge of anatomy may be useful in the study of races, but the architect can at least dispense with it in working out the theory and practice of construction.

LONDON ON THAMES.*

IF the poems which the Thames inspired could be brought together they would form a most interesting anthology. We can also say that if the views of the scenery by English artists were collected there could hardly be a more attractive exhibition. The river deserves all the testimonies which the arts can pay, not only to its beauty, but to its importance. If the "factious" Lord Mayor did not inform JAMES I. that His Majesty might remove himself and his Court as soon as he pleased so long as he did not take the river with him, the remark must at least have represented the opinions of many good citizens.

The selection of the site for the earliest settlement of the city now known as London, and which for many reasons may be considered the centre of the earth, showed remarkable wisdom. If a position were chosen nearer the coast there would be a constant danger from pirates. But the 60 miles of waterway not only conferred security against invasion, but added little to the cost of transport. London could not be better placed, and one of the proofs of that fact is to be seen in the aversion of the citizens to extend their boundaries along the sides of the river. Necessity alone must have dictated the use of the supplementary city at Southwark. It would be difficult to decide between the relative merits of the northern and southern settlements, but a number of circumstances into which we need not enter combined to give the greater power to the London which was the nucleus of the existing Metropolis.

The dislike of expansion was disadvantageous. Without exaggeration it can be said that even up to the present time the Thames has not been utilised as a natural feature and as an ornament for the city to the extent it merited. Artists like Mr. WHISTLER may find attractive subjects in the irregularities of the warehouses which line the river. But in any other part of Europe we should see a different class of buildings along the silent but noble highway. At one time a few of the great nobles obtained possession of riparian sites for their palaces and gardens between the City and Westminster. The selection was, however, little more than a fashion which was of brief duration. Trade and commerce usurped the banks, and the river was almost as much neglected by people who professed to have taste as would be a goods railway in our day.

It is well, however, to recall some of the scenes with which the river was connected, and this has been done in an agreeable manner by Mr. G. H. BIRCH. He has been able to use a great many reproductions of old views, but he also endeavours to present what are called "word-pictures." These efforts of the imagination are not unsuitable for such a subject, and only hypercriticism would cavil at any departure from prosaic accuracy. Thus, in speaking of Roman London, he says:—"The broad river then bore on its bosom the triremes and galleys and argosies which, without waiting for a favourable wind, could be borne by the tide to its wharves and quays. . . . London must have contained some fine public buildings: the richness of the tessellated pavements and frequent discoveries of hypocausts show that for a provincial city it was not much behind Imperial Rome itself." We should like to believe all this, but are afraid it is only an architect's vision. The relics, including carved stones, which we see in the Guildhall Museum, are not convincing about the state of art among the settlers. Arrangements for heating and tessellated pavements are to be found wherever the Romans congregated, and during its comparatively brief history Londinium could only be considered as an emporium for the colony. The fact that the head of a bronze statue of HADRIAN was discovered in the river may be evidence that a statue of the Emperor was in some public place. But as one swallow does not make a summer, one or two fragments of statuary are insufficient to convince us that Rome on the Thames resembled Rome on the Tiber.

The Roman engineers constructed a bridge across the river, and no doubt it served as a barrier to some invaders. CANUTE is reported to have found it easier to make a new channel for his fleet than to waste time in attacking it. The river to Northmen would be a more convenient place for fighting than the land, and, as Mr. BIRCH says:—"In

* *London on Thames in Bygone Times.* By G. H. Birch, F.S.A. (London: Seeley & Co., Ltd.)

the long struggles between Roman and Briton, Briton and Saxon, Saxon and Dane, many were the warriors who perished in its waters." WILLIAM THE CONQUEROR made short work of the opposition of London, but once in possession he realised the advantages of its position. He therefore transported an abundance of stone from Caen and erected the White Tower. FITZSTEPHEN, who was credulous, wrote that its walls were "cemento cum sanguine animalium temperato," which Mr. BIRCH dismisses by assuming that the monk probably mistook "the pulverised Roman red brick used in the mortar for blood, from its colour."

Foreigners would naturally regard the river as a highway which led to their own countries, and churches and houses would therefore appear to be erected close to the banks rather than in a northerly direction. DANTE refers to the Thames as if it were London. The Knights Templars, who had to make many journeys, preferred a site near the river to their quarters near Holborn, where Southampton Buildings now stand. There was a royal palace at Westminster, and an Archbishop of Canterbury erected one for himself and his successors at Lambeth. The river consequently forms a bond of connection between different periods. Although there can be no memorial in its waters which will suggest the scenes transacted on it, the old associations still continue, and it only requires the aid of imagination to summon up a series of scenes surpassing those enacted on the Nile or the Tiber.

In the reign of HENRY VIII. Bridewell and Blackfriars became historic in a secular sense. It was in the former place that the king deliberated with some of his representative subjects about the validity of his marriage with CATHARINE OF ARAGON, and it was in Blackfriars the investigations took place. The Bishops of Exeter owned a palace on which Essex Street has been raised. The Earl of ARUNDEL held a fine property with a garden, and several other nobles were able to obtain desirable plots along the river. HENRY VIII. coveted the ground known as York Place, which belonged to the Archbishops of YORK. On WOLSEY'S fall he obtained possession of it, and an Act of Parliament was passed ordering "that all the said ground, mansion and buildings, together with the said park and the entire space between Charing Cross and the Sanctuary at Westminster, from the Thames on the east side to the park wall westward, with all the houses, tenements, lands, &c., and the soil of the ancient palace, shall from henceforth be deemed the king's whole Palace at Westminster, and be called and named the King's Palace at Westminster for ever." Destiny has not respected the enactment, for the ground described now bears other names and is appropriated to other purposes.

It was a remarkable coincidence that when the Elizabethan drama arose some of the theatres were erected close to the river on the northern and southern sides. Whitefriars, Blackfriars and those on Bankside were, in one sense, far more important than the palaces of the nobles. If all the young citizens enjoyed the river like ROBERT HERRICK it must often have presented pleasing spectacles. Addressing his "silver-footed Thamesis" the poet laments his absence in his country vicarage, and says:—

No more shall I reiterate the Strand,
Whereon so many stately structures stand,
Nor in the summer's sweeter evenings go
To bathe in thee, as thousand others do;
No more shall I along thy crystal glide
In barge, with boughs and rushes beautified,
With soft smooth virgins, for our chaste disport,
To Richmond, Kingston and to Hampton Court:
Never again shall I with finny oar
Put from, or draw unto the faithful shore;
And landing here, or safely landing there,
Make way to my beloved Westminster,
Or to the golden Cheapside, where the earth
Of Julia Herrick gave to me my birth.

The lines are probably the most complete account we have of the reasons for the fascination exercised by the Thames in the early part of the seventeenth century.

After the Restoration there was a reaction from Puritanic depression, and according to PEYVS, there must have been 10,000 barges and boats on the river to witness the entry of Queen CATHERINE of Braganza. EVELYN says

the pageant exceeded any he had seen in Venice. At the time of the Great Fire the Thames was covered with floating goods. Then it was proposed to utilise the opportunity offered by the destruction of London, and to construct an embankment. The buildings were to be "no otherwise than fair structures for the ornament of the City, and that no brewers, dyers, or sugar-bakers shall be allowed to carry on their trades, which, by their continual smoke, contribute much to the unhealthfulness of adjacent places in or near this line." It is noteworthy how little seems to have been done at a prior time for the regulation of the Thames. But it cannot be recorded that much advantage arose from the attempt to prevent the river following its own sweet will. It was a favourable time for encroachment, and some interesting papers exist in the Soane Museum which reveal the difficulties attending all projects for improvement.

If the experience of Sir ROGER DE COVERLEY was common it is no wonder the Thames was deserted by people who respected their ears. The old knight, who was in company with the staid Mr. SPECTATOR, endured so much ribaldry that he assumed his magisterial expression and informed his companions "that if he were a Middlesex justice he would make such vagrants know that Her Majesty's subjects were no more to be abused by water than by land." There were official ceremonies, however, in which the Lord Mayor and City companies took part, but there was less romance about the river than at an earlier time. In 1730 GONZALES, or rather DEFOE, thought the pleasantest way of moving from one end of the town to the other was by the water. It was possible to travel two miles for 3d. with one waterman, or for 6d. if two were employed. But as traffic increased and other means of transit were arranged, the employment of small boats within metropolitan boundaries appears to have gradually declined. There was some compensation in the use made of up-river waters.

The construction of the Embankment from the plans of Sir J. W. BAZALGETTE was the grandest of all the attempts to impart that character to the river which is suitable for the chief artery of a great capital. Much should be forgotten about the misdoings of the Metropolitan Board of Works for having accomplished so noble an undertaking within a limited time. But from the arrangement there had to be costly sacrifices of trade interests. On that account the great roadway can only be partially executed, and a long time must elapse before such an improvement as was devised by WREN, EVELYN, JOHN MARTIN and others is accomplished. It must be admitted that the public do not appear to be very anxious as to what happens to the Thames. The failure of the steamboat companies is enough to convince anyone that the slow but pleasant travelling by boats of any kind is not adapted to the requirements of the moment. For a long time the Embankment was not in favour with cab-drivers or the owners of private carriages, and it cannot be asserted that it has been successful as a promenade. And yet every one who remembers the river in the pre-Embankment days will testify that it has been greatly improved, and there is not so much to shock the senses as was common some forty years ago.

Although there may be indifference to the river as it now runs, its old associations should always render it interesting as an historic highway. Many of these are described in Mr. BIRCH'S book, and a large number of illustrations are presented, which are the more remarkable for their size and quality when found in a book published at so cheap a rate and produced with the publishers' usual elegance. It forms a most attractive retrospect, and must excite regret that although so many improvements have been accomplished in or about the Thames, such a pageant as DAVID ROBERTS depicted, *The Lord Mayor's Show at Westminster Bridge*, is no longer among the sights of London.

The Church of St. James, Walthamstow, has been dedicated by the Bishop of Barking, and the Bishop of Colchester preached. This is the third new church built in Walthamstow since the rights of the little parish church were transferred to St. Saviour's. The cost has been 10,000l.

EARLY BRITISH POTTERY.

A PAPER on "Early British Pottery" was read before the Hawick Archaeological Society by Mr. G. Hobden. He said that it had been well remarked that there was no branch of industry, viewed in reference to its history, its theory and its practice, which offered more that was interesting, with regard alike to its economical application and to its scientific aspect, than the ceramic or plastic art, none affording products more simple and varied, more easy of manufacture, and, notwithstanding their fragility, more durable. In describing the various kinds of pottery in this country it was necessary to include in the first place to those primitive wares which, being of pre-Roman age, were generally known as ancient British pottery. Much of this early ware was found under conditions which showed that it was contemporaneous with the use of iron and bronze implements in these islands, but it was probable that similar coarse pottery continued to be made even subsequently to the period of the Roman Conquest. The paste of this pottery consisted of coarse unprepared clay usually mixed with pebbles, and in most cases it had been imperfectly baked. Dealing with Roman pottery in Britain, he remarked that there was a distinctive pottery made and used by the early Romans while they were masters of these islands. It was called Samian pottery, and was always of a red tint. The date of its manufacture probably extended from the first century of our era. It seemed to have been used for domestic purposes, as earthenware and porcelain now are in this country. It was generally considered doubtful whether this red ware was manufactured in the British Islands, though its remains were sufficiently common, especially at Roman stations in the south and east of England. It appeared to have been largely imported during the Roman occupation of these countries, and, judging from the repaired specimens often discovered, seemed to have been of great value at that time, much in the same way that Chinese porcelain was prized before porcelain was made in this country. The influence of the Anglo Saxon seemed to have been detrimental to any kind of art. Possibly the continuous state of war into which they were forced by restive aborigines and threatening invaders prevented any attention being given to the arts of peace. In any case, the work of the potter degenerated rapidly, until during the late years of Saxon power only the rudest kinds of ware were produced. Nor did the Norman Conquest improve matters much. Very little, indeed, was known of the pottery of this period, and it was very remarkable that, after the splendid heritage the Roman potters left, that only one Roman pottery could be traced in these islands, and that solitary pottery was discovered by Mr. Jewitt at Burley Hill. Until the close of the Tudor period, the potters of England maintained a dead level of mediocre work when the dawn of the Renaissance in Europe was reflected over the British Isles. It was generally believed that the porcelain works at Stratford-upon-Avon were established about the year 1730, but the earliest authentic information concerning the factory did not commence until several years later. Bow china and early Crown Derby were very similar in decoration, differing only in the composition of the body. Although the exact date of the establishment of the porcelain works at Chelsea had not been ascertained, it was probably as early as 1745. He also referred to the Staffordshire potteries and to the work of Josiah Wedgwood and his son, who raised the potter's art to the acme of perfection and placed Staffordshire ware as unrivalled in the ceramic productions of the world's potteries.

LEEDS ARCHITECTURAL SOCIETY.

A GENERAL meeting of the Leeds and Yorkshire Architectural Society was held on the 17th inst., when Mr. B. Mitchell Withers gave a lecture on "Sir Christopher Wren: his Time and his Works." After describing the architectural and social condition of London in the years of Wren's youth, Mr. Withers proceeded to speak of the unique opportunity which the Great Fire of London presented to an architect of genius. In Evelyn's "Diary" we learned that the author submitted a plan for the improvement of London within 40 days of the extinction of the fire, but Wren had been before him. The scheme met with the king's approval, but unfortunately, and to the kingdom's loss, it was never adopted. Wren had previously been appointed assistant royal architect to make good the deficiencies of the king's poetical official, and he then had occasion to report upon the old cathedral of St. Paul's, which had recently been repaired by Inigo Jones. The renewal of the fury of the flames, brought about by a big gale, resulted in the demolition of the old cathedral, and thus it was that Wren came to have the designing of the new edifice. Mr. Withers then proceeded to tell of how Sir Christopher Wren, in face of much hindrance and opposition on the part of the Commissioners of St. Paul's, succeeded in the erection of a cathedral, the pride of all

Englishmen, and one of the finest examples of a domed sanctuary in the world. Perhaps the only wise thing the Commissioners did in treating with Wren was when, at the commencement of the undertaking, they told him to submit a design for a cathedral which he thought suitable to the site and worthy of the position, and that they would then have to see about the money. After commenting upon the distinctive style of Wren as revealed in St. Paul's, and touching upon some of the criticisms passed upon the innovations he introduced into the architectural construction of the building, the lecturer went on to describe the way in which Wren suffered at the hands of the Commissioners. One of Wren's foremost ideas was to leave the view of the high altar unobstructed from the western end of the cathedral, but this was prevented from being realised by the building of the organ at the entrance of the choir. It was also his desire to see the interior of the dome decorated with mosaics, and to this end he made elaborate inquiries as to suitable marble and qualified artists and workmen. His labours were, however, set at naught by the Commissioners, who instructed Sir John Thornhill to paint the inside of the dome. A proposal which Wren made, that a low wrought-iron rail should enclose the cathedral, was also strongly opposed and radically altered by his masters, for the building was given the appearance almost of a birdcage by the erection around it of a high cast-iron rail. Perhaps the greatest annoyance which he suffered, however, was in connection with the balustrade. The Commissioners suggested that a balustrade would be necessary, but although Wren was sternly opposed to the idea, the balustrade was designed and erected. The numerous other churches and public buildings in London which Sir Christopher Wren designed were also described by the lecturer, who was aided by numerous old engravings, prints, maps and plans. In conclusion, allusion was made to the way in which Sir Christopher Wren passed away, at the age of ninety-one, after having been deposed from his position as surveyor to George I., and to the deplorable way in which he had been neglected by Court and country.

The lecturer was afterwards accorded a hearty vote of thanks, on the motion of Mr. R. P. Oglesby, seconded by Mr. H. S. Chorley, and supported by the president (Mr. Butler Wilson).

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE first of the monthly meetings of the Society for the current session was held on the 14th inst., Mr. Robert Munro, M.D., LL.D., vice-president, in the chair.

The first paper, on the cairns and tumuli of the island of Bute, was a record of the explorations carried out by Dr. T. H. Bryce during the autumn of this year, by consent of the Marquis of Bute. The prehistoric sepulchral structures which had been examined included three chambered cairns, Michael's grave at the north end of the island, a chamber behind Barmore Hill above Loch Quein, and a cairn at Glecknabae on the west coast. The two first were in all respects essentially similar to the cairns in Arran, having segmented chambers with a portal, but no passage of entrance, and yielding implements and pottery of similar character to those from the cairns of Arran. The Glecknabae cairn presented features of a novel character. It was superposed upon an extensive kitchen midden, which appears to be the earliest remains of man's occupation yet discovered in the islands of the Firth of Clyde. The cairn itself contained two small chambers formed of four large unequal slabs, one of which was much lower than the others and formed the sill of a portal bounded by two upright stones. In one of the chambers a typical Stone Age urn was found, while in the other were fragments of four tall, narrow and flat-bottomed vessels with their lips well recurved, which proved to be somewhat rude examples of the drinking cup or beaker type of urn. As this type has been proved to be of early Bronze Age, the finding of it in this chamber would seem to indicate that the cairn represents a terminal phase of the earlier culture in the islands of the Clyde, after it had come in contact with the new culture. As all the osseous deposits were of burnt bones, no further evidence was obtained of the character of the human remains. Five interments in short cists were also examined. One of these was placed within a tumulus at Scalpsie Bay, and yielded a fine food vessel urn, a bronze pin, a flint scraper and a jet bead associated with an instrument of burnt bones. No relics were recovered from the other four cists, but a skull was found in one, which was brachycephalic in form and proportions. Four mounds were also opened. In three of these nothing was found to indicate what their nature may have been, but the fourth, situated on the hill above Loch Ascog, at Kerrycrusach, contained a core of stones, beneath which was found a deposit of burnt bones, without cist or urn.

The Hon. John Abercromby, secretary, communicated the results of excavations made by him on the estate of Meikleour, Perthshire, in May last, by permission of the Marquis of

Lansdowne. In the east end of the parish of Caputh there is a small isolated hill of somewhat oval contour, with a rounded top called the Black Hill (tumulus) on the Ordnance map. It is about 150 yards in length, and rises to a height of from 30 to 40 feet, and is planted with firs. At the northern end of the rounded top stands a small earthwork, not noted on the map, surrounded by a ditch, and having the remains of a rampart of approximately circular form, at some distance within the ditch, the space enclosed by the rampart measuring about 41 feet by 38 feet. The ditch is only visible now at the south end, where it separates the earthwork from the rest of the hilltop. During the excavation of the interior space some flat slabs occurred, which were suggestive of a destroyed cist, and at different points the following articles were found—a small flint scraper, much chipped at the edges, which may have been used as a strike-light; a small piece of iron, a bit of bluish glass and a small piece of thin transparent glass. As 53 bits of burnt bone were found, it seemed probable that the builders of the earthwork had destroyed a cist containing a burnt interment in the course of their operations. In the ditch there was found a portion of a bronze pin, which may have been the pin of a fibula. The conclusion was that the earthwork belonged to the Iron Age, and may have been a small rath not intended to defend a particular point, but simply the fortified residence, perhaps of a temporary nature, of some petty local chief.

Mr. Abercromby also described the excavation by him of three long cists at Gladhouse Reservoir, by permission of the Chairman of the Water Trust in June last. A cist was discovered by Mr. George Forrest, Linden Cottage, Loanhead, and reported to Dr. Anderson, and on proceeding to investigate the small mound over the south side of the reservoir in which it occurred, Mr. Abercromby found that it contained three long cists with unburnt burials, unaccompanied by any article of use or ornament.

Mr. George Robertson, F.S.A. Scot., Keeper of the Abbey, Dunfermline, described two photographs of the recently discovered Norman door in the abbey church there, which were exhibited and presented to the Society by Mr. W. W. Robertson, F.S.A. Scot., H.M. Principal Architect and Surveyor of Works for Scotland. The doorway is situated at the south-east corner of the ancient abbey church, and had been built up for many years. It is 9 feet 7 inches in height, and being of pure Norman architecture, is considered to be coeval with the original church erected about A.D. 1070. Its arch is ornamented with deeply-cut chevron mouldings, and its attached columns have finely sculptured foliage scrolls on the capitals. A transverse slab inserted in the columns at either end had apparently been placed there as a receptacle for the skeletons of two young persons, which were found underneath it among a mass of rubble and lime. The Board of Works intends to open up and preserve this interesting doorway.

THE LATE MR. WHISTLER.

AT the annual meeting of the International Society of Sculptors, Painters and Gravers held on the 15th inst., Mr. Lavery, the vice-president, being in the chair, the Chairman read a letter from the president, M. Rodin, expressing regret for his unavoidable absence and his appreciation of the honour conferred on him by his election as president. In his tribute to the memory of the late president, Mr. Whistler, the Chairman said:—He was misunderstood and misrepresented, he who was the one artist who fought for the interests of his brother artists and for the dignity of art. In his great fight with Ruskin he demonstrated that painting and writing are separate and independent arts, each with their own means of expression, and time has proved how right Whistler was. In his "Ten o'clock" he has written the gospel of art. Little or no notice has been taken of this great work, which, when it was first read by him, was looked upon as a humorous treatment of the subject, and to this day is mistaken for a mere collection of facetious witticisms. It is difficult to realise the great value of this work, which is the only competent expression of art in existing literature. As a friend, I can speak feelingly, because I knew him intimately for a great many years. His old-world courtesy and kindly consideration were little understood but by those with whom he was in sympathy. In all my dealings with him, both as president and as friend, I always found him full of the kindest thoughtfulness. In losing our own master we have found another in M. Rodin, not less unique in the originality of his genius, whose election to the presidential chair of the Society confirms the international character of our undertaking, and I am sure will give a much-wanted impetus to the sister art of sculpture in this country. Mr. W. Webb, the honorary treasurer, showed in his balance-sheet that the Society was in a flourishing financial condition.

Messrs. Waring & Gillow opened last week additional salons in their premises at the corner of the Boulevard Haussmann and the Rue Gluck, Paris.

LONDON TOPOGRAPHICAL SOCIETY.

THE fifth annual meeting of this Society was held on the 16th inst. in the rooms of the Society of Antiquaries, Burlington House. Mr. Laurence Gomme occupied the chair. The annual report of the Council stated that the steady growth of the Society reported in previous years had received some acceleration during the past year, which the Council attributed chiefly to the stimulus of Lord Rosebery's presidential address in October 1902. Since then twenty-eight new members have joined the Society, and the total membership was now 156. The Council were of opinion that in the reproduction of maps, plans and views of London, and of pictures of streets and houses, there was work for the Society for many years to come. The report was adopted, and Lord Rosebery was re-elected president. The Chairman afterwards delivered an address on topographical changes in London. He insisted strongly upon the beauty of London, notwithstanding the unsatisfactory character of many modern buildings, and mentioned some views of which he had noted the charm. In Poplar really country scenes were to be found at the back of the rather disagreeable façades of the front streets. Referring to changes which were now going on, he pointed out that the squares of London, which were an almost unique feature of city life, were in danger, and regretted that the erection of the national memorial to Queen Victoria involved considerable alterations in St. James's Park. Speaking of the Holborn to Strand improvement, he defended the proposed line of frontage on the north of the Strand. The Law Courts, he observed, were a mere imitation of ancient architecture, and he contrasted with them the beautiful churches of Wren, which would, he contended, be turned to better account under the present arrangement than under that which was suggested as a substitute. Mr. Gomme afterwards gave some account of the Danish settlement at Aldwych, and in conclusion pointed out that London had two exceptional topographical features. It did not contain its place of government, which was at Westminster, nor its place of defence, the Tower of London being without the City. The latter feature was due to the fact that the Tower was more a Norman stronghold for overawing the City than a place of defence for the citizens.

DUNDEE INSTITUTE OF ARCHITECTURE.

TWO interesting lectures were delivered on the 15th inst. at a meeting of the Dundee Institute of Architecture, Science and Art, Mr. A. Symon, of Arbroath, the president, in the chair.

Mr. Charles Ower was the first lecturer, and he had for his subject "The Ordnance Survey." Mr. Ower treated his theme with much detail, and in conclusion offered a few suggestions for making the Ordnance Survey maps better known. He said that at present all kinds of maps were to be found on the bookstalls except the Ordnance maps, and this was good for neither the Department nor the British taxpayer. The Royal Engineers had by the expenditure of large sums of money, combined with scientific knowledge, care, skill and enthusiasm, produced an article which for quality could not be excelled, and what was now wanted was the placing of the finished product on the market in such a way that it could get a fair chance. His experience was that this was not being done. A clever shopman at the head of the sale department was what we needed now.

Mr. Ower's lecture was followed by one from Mr. W. Fleming Wilkie on "Celtic Stones." Mr. Wilkie at the outset referred to the groups which exist in Forfarshire and district, and mentioned that at Meigle there was a very remarkable group. After an allusion to the extensive symbolism of Celtic stones, Mr. Wilkie said no expense was grudged by the authorities nowadays in obtaining sculptured representations of the ancient art of other countries to enrich our museums, while the wealth of unique material which existed in our land and in our immediate neighbourhood was still left scattered, and in many cases unprotected, to decay and perish. The first duty we owed to them was their preservation, as their destruction would mean the disappearance of a series of national records which time and the elements had spared, to be deliberately effaced in an age of the highest and most widely diffused culture. Mr. Wilkie's lecture, which was illustrated, was greatly appreciated.

The Institute has arranged an exhibition of the drawings of the late Mr. H. W. Brewer, of London. The exhibition includes a number of beautiful restorations on paper of Mediæval buildings compiled from existing fragments and old documents.

The new police station erected at Ton for the Upper Rhondda subdivision was opened on the 17th inst. It adjoins the new police court, the aggregate cost of the two buildings being 7,000/.

CATHEDRAL SERIES, NO. 477A.—EXETER: SCREEN IN CHAPEL OF S. GABRIEL.

NOTES AND COMMENTS.

THOSE who can recall the equestrian statue of JOAN OF ARC by M. FREMIET which was set up about twenty years ago in the Place des Pyramides, Paris, do not always agree with admirers of a later time who believe in the altered version now seen in that position. The latter is no doubt more correct in details of armour, and the heroic girl is more suggestive of peasant life and of the vigour which sustained the wear and tear of war in the fifteenth century. But there was greater charm about the first representative, and it suggested that femininity must have had much to do with her success. The second statue did not cost either the city of Paris or the admirers of the MAID OF ORLEANS any expense. The whole work was given to France in return for the opportunity which enabled M. FREMIET to gratify his fastidiousness. He has been also generous in respect of the figure of the warrior maiden which is to be seen in Nancy. A sculptor who thought primarily about his own reputation would have insisted on a site for the statue being found in the principal place of the city. In that position all its advantages would be manifest. But it was considered desirable that the figure should appear to be gazing earnestly towards the lost provinces, as if resolving to win them back. Accordingly, M. FREMIET accepted a site which is a little elevated, but which is in an out-of-the-way part of the city and is likely to be overlooked by the majority of strangers. The original statue, which would, we are sure, have been purchased by Englishmen in order to atone for the calumnies in the historic drama of "Henry VI.," has been sold for an insignificant sum, 950 francs, to the founder. It has been used for the reproduction of the altered figure, and is at Mirecourt in the Vosges.

FIDELITY in portraiture is often difficult to determine. According to Mr. RUSKIN, "recognition is no proof of real and intrinsic resemblance. We recognise our books by their bindings, though the true and essential characteristics lie inside. A man is known to his dog by the smell, to his tailor by the coat, to his friend by the smile." The question, however, is what kind of test is acceptable in a law court. A case which shows the difficulty has been heard in one of the Paris courts. Mr. GANS, an American in Paris, ordered a portrait of his wife from Mr. BENZIGER, a countryman. The portrait was, however, declined on the ground that it did not resemble Madame GANS. Thereupon an action was taken to recover 200*l.*, the value of the portrait. The Court asked M. GABRIEL FERRIER and M. JULES LEFEBVRE, two well known painters, to give a report on the portrait. They stated that the work was conscientiously executed and deserved to be accepted. The resemblance to the subject they considered was sufficient. But they declared that resemblance could be no more than "a personal interpretation of a physiognomy." At each sitting the countenance may change in expression from what it was at the preceding one, although the features would remain the same. If ten artists undertook to make the portrait of a person, there would be differences between the results, for each would give a countenance that would be peculiar. Acting on the report of the experts, the Court came to the conclusion that Mr. GANS should accept the portrait and pay the price demanded. His advocate, however, demurred to the decision, and asked that the judges should themselves compare the portrait with the lady. He quoted what was said a couple of months ago by M. HUMBERT, a member of the Académie des Beaux-Arts, to the effect that he shared in the common opinion that resemblance constituted the most essential quality of a portrait. In the case in question that desirable resemblance could not be recognised. The Court, however, declined the interview

ILLUSTRATIONS.

"VENI, SPONSA MEA."

THE illustration represents one of the mural decorations in the lady chapel of the Roman Catholic Church, Norton Road, Hove. Among the series of paintings are *The Presentation of Our Lord in the Temple*, including the *Nunc Dimittis* and *The Finding of Our Lord Amongst the Doctors*. On the right-hand side of the altar is *The Vision of St. John in Patmos*, and on the north wall *The Corona-*

tion, the subject of the illustration. The text from Canticles, chap. iv. 7 and 8, has inspired the artist's conception. Below this subject are various saints standing on the plains of the heavenly Lebanon. Many of these are patron saints of the family to the memory of one of whom the painting is dedicated. Every moulding and every space of the entire chapel is painted in gold and colour with a separate design, and the whole roof is covered with angels carrying the emblems of the Blessed Virgin. The paintings and the design of the work are by Mr. N. H. J. WESTLAKE, F.S.A. Along the north wall runs the inscription:—"Pray for the soul of KATHERINE ANNE MARY HAMMOND.—R.I.P. The painting of this chapel is an affectionate memorial by her husband, W. A. HAMMOND. 1903."

NEW SCHOOL, ARMADALE.

SHOP PREMISES, HIGH STREET, SWANSEA.

A PORTION of these buildings have been erected, and it is intended to complete them at an early date. The work is carried out with red brick and Bath stone. The architect is Mr. GLENDINNING MOXHAM, of Swansea.

CATHEDRAL SERIES.—EXETER: HIGH ALTAR AND SEDILIA.

THE illustrations in the present number complete those relating to Exeter Cathedral. The building might be said to be in the hands of the masons and other craftsmen for four centuries, and yet the plan can be considered as symmetrical. That there was the church of a Saxon monastery on the site, which was utilised for the cathedral of LEOFRIC, the first bishop of Exeter, seems to be certain, but no part of the early building has been identified with any certainty. The towers are Norman work, but nearly all the remainder, consisting of nave, choir and lady

chapel, belong to the Gothic periods. The cathedral authorities still possess the charter which was granted by EDWARD THE CONFESSOR and Queen EDITH, bestowing the possessions of the monastery of St. Peter on Bishop LEOFRIC and his successors. The reasons assigned for the gift are the fewness and wasted condition of goods and persons in the diocese of Cornwall, the pirates having been able to devastate the churches, and on that account it seemed good to provide a more secure safeguard in the city of Exeter. Among the signatures are those of Earl GODWIN and his son HAROLD, afterwards king, who was slain at the battle of Hastings.

THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday evening last, Mr. Arnold Mitchell, vice-president, in the chair. The following were elected as members:—Messrs. A. W. Ison, C. W. Berry, H. J. West, H. Bromley and A. Welford. Mr. G. P. BANKART read the following paper, entitled

Id Stucco-Duro and Plasterwork with Reference to Modern Use and Application.

Of all the arts associated with that of building, none can perhaps lay claim to more general use than what was once the of the plasterer.

The very commonness of the material, its cheapness and facility of manipulation are at one and the same time its virtue and its misfortune.

It combines extreme ease of manipulation with great durability. To no other material do the associations of our daily lives cling more closely than to the plaster with which the very walls and ceilings of our homesteads are covered. From the humblest cottage to the sumptuous palace it is used as a clothing to the rougher material composing the structure, and it may be this very serviceableness, this very familiarity, which has bred the contempt with which it has for so many years been treated. In my opinion, it is this very serviceableness, this very commonness which may make it worth the while of some of us to pause over, to consider what has been done with it—what is being done with it—what may be done with it—what are its possibilities and limitations as a material. It is an intensely sympathetic medium which has been used by some of the world's greatest artists of all times but the present, and yet of all the materials in the employment of man, few (if any) have been subjected to greater vulgarity of treatment than the plaster of the last century. It can be modelled, it can be cast or incised, coloured, stencilled and stamped with equal freedom, from the size of a cameo to the vastness of a dome. It may be set as a jewel or applied to the facade of a palace. The main purpose of my address is not so much the mapping of a history of the material—although this is necessarily involved—but the notification of some of the methods of working it when it was an art, in order that we may better realise its capabilities and limitations for the present and the future. If in the pursuit of this purpose, if in the examination of works executed in the past, my remarks may appear to your the craftsman more than the architect, or *vice versa*, I say that it may not be mistaken for disrespect toward either; for I myself, belonging to both, would be first to acknowledge the virtues and last to unduly expose the vices of either party.

Assuming the architect to be to the craftsman as the conductor or the composer to a fine orchestra, let us examine one of the parts, one of the instruments, one of the players. The composer or the conductor cannot play all the instruments himself, although he may know much about them, but he can arrange, combine and control them into one body, one harmony, one whole. In like manner, I take it that the instrumentalist may be as good a musician as the conductor or composer, either in combination or soloist, but his work and art it is to well the harmony in the finest manner his skill commands, his inspiration permits and his will imparts.

I see little or no difference between oral harmony and optical harmony or constructive harmony, where all are good. The one of sound, another of form and colour, the last of constructive form.

Research gives us various materials which were applied to all surfaces in ancient times. It will suffice us to know, briefly, that plaster was used in very ancient days, and that it developed into a great art is amply proved. The Egyptians covered their buildings with a slight coating of stucco to conceal the seams of the stones and receive the painted decoration. The pyramids of Memphis were lined with a coat of stucco, the remains of which are still to be seen. The question of the use of stucco among the Greeks opens up a rather extensive subject, and one, so far as I know, about which nothing consecutive or comprehensive has been written. The almost universal use of stucco in Greece is very generally overlooked.

In early times it was usual to use inferior materials for building with—mud bricks or rough kinds of stone—and to cover their surface wherever visible with a thin coating of stucco, which was frequently ornamented with fresco painted decorations or other motives.

This applies to all architectural members of early temples before the use of marble became prevalent, and even after, when marble could not be easily obtained. For houses and other similar buildings it probably remained the custom of all times, as the walls were mostly made of unbaked brick.

The quality of the early Greek stucco is wonderfully fine. In early times, as far as I know, the stucco was always a mere thin coat covering exactly the forms below, but in later Greek times examples of capitals of columns, bulls' heads, &c., are known to have been modelled or cast with it.

This rough stone they used was like the Roman travertine, very porous, and not capable of taking a fine surface, so they stuccoed it over, polished it, and sometimes decorated it with paintings. Traces of this are found in the Doric monuments of Sicily.

The Byzantine Greeks used plaster generally in cornices and enrichments, also in their window framings. Their mosaics were also bedded in a plaster composition. Viollet le Duc tells us "that the Romans used stucco very frequently both for public monuments and private dwellings." It is useless here to quote the numerous examples of the use of stucco in Italy in ancient times. Its use was passed down to the Gauls, and there is not a single Gallo-Roman building in which the remains of stucco coatings, polished and painted, are not found.

Building methods suffered the same fate as the arts. They were lost in the West towards the end of the Roman Empire, and the rare fragments of monuments of the early centuries show us nothing but coarse coatings made of inferior materials, badly dressed and covered with rude paintings.

The Gauls, however, had not lost the custom of covering quarry-stone facings and even rough courses with a coating of lime and sand, as thin as possible, to conceal the defects and joints of the stone and to take on the paint, but these plasters have no longer the beautiful polish that marks the stucco of Grecian antiquity and the best times of the Roman epoch, nor their solidity.

They have consequently been rarely preserved, and their absence is too apt to make us believe that Carolingian buildings, for instance, allowed the rudely-finished courses to be seen both inside and outside. Far from this, however, these buildings, though rude and barbarous, were covered with thin coatings and paintings both in the interior and outside, and these coatings, sometimes decorated with engravings ("sgraffito") and ornaments in slight relief, which are real stuccowork.

A genuine example of such, belonging to the Carolingian period (752-986), was recorded by M. Viollet le Duc as existing in the little church of Germigny des Prés (Loiret), the building of which goes back to the beginning of the ninth century.

A mosaic in the Greco-Byzantine style adorns the vault of the apse—the only mosaic of its kind in France.

Formerly, the walls of churches were adorned with stuccowork, engraved and painted. Art in a barbaric age by no means excludes profusion of ornament. In fact, it is more often quite the contrary. There can be no doubt that Carolingian architecture, though of rude design and habitually carried out by the aid of materials of no value, badly chosen and even more badly used, included ornamentation very rich, but obtained by cheap and rapid means.

Stucco was well adapted for this style of current decoration, and of all the traditions of art handed down from the Romans this was bound to survive by reason of the facilities offered by the use of such processes.

The method most readily followed by the simple architects of the first period of the Middle Ages was evidently to raise walls of quarry stone, and when the work was roughly finished to conceal the irregularities and first attempts by a coating on which chisellers and sculptors cut out ornamental designs taken from Eastern tapestries, furniture and utensils. The process did not require the calculations or foresight of the masters of the twelfth and thirteenth centuries.

Some Carolingian buildings show traces of stuccowork on the vaults, and even on the capitals. The large capitals of the old narther of St. Rémi of Rheims, those of the crypt of St. Laurent of Grenoble, and even of the capitals of the apse of the church of Issoire, are simply baskets of stone covered with figures or ornaments in stucco. At a later period in France stuccowork was nothing but a delicate application of ornaments, trellis and flowered chequerwork on even surfaces to soften the bareness.

The foregoing remarks are sufficient to show that the properties of stucco and plaster were well known in very ancient times, but whereas a full knowledge of the capabilities of stucco was arrived at very early, that of plaster did not reveal itself until comparatively modern times.

Stucco has for its base carbonate of lime—generally the burnt limestone or chalk of the rocks and hills. Vitruvius, writing on architecture about 2,000 years ago, gives very detailed instructions as to its preparation. The stucco of those days was far more carefully compounded than now; the lime was most carefully chosen, burnt with wood and subjected to a very gradual process of slaking for a long time before being used. It was constantly beaten with heavy sticks and chopped up with heavy hammers or axes. It was mixed with fine, sharp and very carefully washed sand, or a white marble dust, which enabled it to be capable of receiving a fine polish. In the old method of preparing it various ingredients were used to toughen and regulate its setting qualities, such as rye dough, juice of figs, hog's lard, curdled milk, blood and other things of which we are now more sparing than economical, viz. time and great care. It was generally applied in three coats, or as many as

the nature of the wall required. The first coat was of rough stuff, with broken marble, and the remainder of finer stuff, whilst the finishing coat was of very fine marble dust, which, when dry, was polished with marble dust and chalk.

The more recent work was stone-coloured from the use of powdered travertine, whitened with lead ground in water. (Mrs. Merrifield.)

With such a medium the modelling was done direct, as it set very slowly and was smooth and hard. It was absolutely impervious to wet or climatic variations. So good and smooth and hard was this preparation that jewellers used it in preference to wax, and modelling of such exquisite delicacy was done with it as to rival gem-engraving. Vitruvius tells that it was capable of receiving so fine a surface that it was sometimes polished and used for mirrors. Its durability was such as to "weather" better than marble. Such was the stucco used for the walls and plain surfaces for painting upon. It is only natural to suppose that the Greeks used this material to model with, knowing as they did its nature and pliability. Unfortunately nothing remains to us of the masterpieces of Greece beyond the skeletons of some of their private and public buildings.

There is a long history connected with this subject that, by your own instructions, must be condensed into a few minutes; so I must abbreviate.

As the Romans carried off the Greek treasures for the adornment of Rome, undoubtedly they carried with them the art of the decorative stucco-worker. A glance at the Roman work shows a strong Greek influence. This is to be seen in the wall and ceiling decoration of a Roman house of the time of Augustus, in the garden of the Villa Farnesina, Rome, presumably belonging to the first half of the first century, A.D. There is also the stucco modelling of a tomb in the Via Latina, the type of which is rougher and more incised, and intended to be seen by torchlight only.

The value of the lesson this early work teaches it is impossible to overrate, combining as it does purity of line and mastery of execution, no matter how simple. Such art as this could not well have been acquired in Rome or attained without prolonged experience.

With the barbarism following the decadence of Rome this work passed into obscurity, to be resurrected again in the sixteenth century through investigations and researches organised by Cardinal Giovanni de Médici in seeking for sculpture of Classic times.

To cut a long story short, Raphael and a number of his fellow-workers succeeded in reviving the art of stuccowork in Italy, doing much work at the Vatican, Raphael's own house, and other notable buildings. It then passed to Mantua, Venice and other Italian cities, and was carried from there to France (Fontainebleau and Versailles, &c.) at the time of François première, and thence to England by Henry VIII in jealousy of the French king. Henry introduced stucco extensively into the palace of Nonesuch, which stood on the hills between Epsom and Cheam, and within reach of Hampton Court.

It is a question for us all to consider how far the elimination of the Gothic element injured the plastic art. So far as the figure was concerned, the time was not ripe for any Italianisation of the human form. The native workmen, unlike the Italians, were not conversant with the delineation of the human figure, nor could they grasp the foreign idea, and this inability resulted, with rare exceptions, in failure to the point of burlesque. However, the introduction of Italian workmanship into England was followed by the raising of a school of English craftsmanship which rapidly spread the art throughout the country. But stucco-duro gradually gave way to the employment of coarser stuff or "pargé" work, which became rather later the medium of the native workmen.

About 1547 we have record of an English stuccoist named Chas. Williams, who had travelled in Italy, and probably was the first to work in England and at Nonesuch.

Time went on, and a cheaper and commoner material brought "degeneration" with it—of a kind. This coarser stuff was modelled and stamped, and was known as "pargetting," and consisted of the ordinary lime, hair, sand, and was applied to any part of the structure, internal and external. To witness Wyvenhoe, Clare and everywhere. Then followed the wave of plasterwork, particularly our own.

1. The arrangement of panelling and radiating ribs based on the fan tracery of stone. 2. A pendentive system superseded and outlived the above, as at Audley End, in the "Fish Room." 3. Modelled foliage sometimes replaced the radial ribs, giving effect of Gothic diaper. 4. Pendentive system superseded by geometric arrangement of ribs—not limited to straight lines, ceilings abounding in interlacing lozenges, quatrefoils, circles, ovals and other forms, spaces between ribs being filled with armorial bearings and personal devices and other emblematical forms; figures very seldom, unless of armorial character.

5. Size of subdivision gradually expanded until (6) Ceiling area became divided into four parts, large or small, quarter bearing the design.

This developed into the Jacobean system of interlacing strapwork and patterns. Earlier ceilings had plain moulded ribs—like groin ribs. As power of execution grew flat surfaces became introduced between two sets of mouldings, with improved decorations done off a revolving stamp. Queen Bess's time had moulded ribs, with sprays or sprigs of flowers or medallions of floral ornament. These ribs or medallions were cast or run *in situ*. Sprays and medallions in early days nearly always modelled by hand. Afterwards stamped; later still, cast in plaster of Paris. Sometimes sprigs were butter-pressed. In later years methods almost exclusively confined to casting in plaster of Paris. This system was productive of a beautiful softness and dulness suitable to the material and was quickly done compared with earlier methods and stuccowork, and less expensive. Against this one has to put the sacrifice of intellectual effort on part of the worker. With "the Restoration" design improved. What do we learn from the old work? The plaster is widely different from ours. Examine a piece of old plaster. It is coarse and rough, and contains little bits of gravel and other inequalities which modern architects would condemn without doubt. Where should we draw the line? The old ceilings were not die-level and polished; they were full of delightful but very slight undulations; the ribs and strapwork were not painfully exact, as ours are. The old work lacks that strain and mental limit naturally associated with office confinement, and the ever continual abuse of drawing as an art instead of a means to an end. Hand and eye judgment rather than exact measurement was evident everywhere. Moulds were carried from one job to another, and frequently made to fit in as they would, or were altered to suit circumstances. The workmen had their moulds, tools and traditions—perhaps some rough plan for guidance, instead of a fussy and pretty drawing of what it would not, and could not, look like—to tempt and deceive a client. All sorts of funny things occurred, quips and cranks and things attributed by some to the genius of the age, and which was very possibly due to accident. Ornament designed and worked for a ceiling will be found combined with another, and used as a frieze elsewhere, or turned into an interlacing pattern in some lunette. All sorts of things done for one, or several places, combined in an overmantel or wall space between dado and ceiling. Much modelling was done with metal tools, and sometimes with the fingers and hand. The lime must have been in a very different condition when used in those days to what it is now, or men's fingers could never have worked it. In many ways their methods of procedure were different from ours—more intellectual, less mechanical.

"In the Eastern counties," says Professor Lethaby, "plasterwork repairs in out-of-the-way cottages still clumsily match the deft patternwork which, after being perfected by the use of hundreds of years, is now done no longer. By careful inquiry you may find an old workman who remembers seeing it done when young, who can describe the tools and knows the names of the patterns—'tortoiseshell,' square-pricking and the rest. He will add that modern plaster is quite unfit for work of this sort. The old material was washed, beaten, stirred and tested so carefully, and for so long at a time, that when laid it was, my informant said, as tough as leather."

Think of the many quaint patterns done on the outsides of buildings (cottages and houses) by the common village plasterer or mason, with the pointed "fan" of sticks, still used by our own plasterers for "pricking-up," as they term it. Think of the quaint patterns done with end of the trowel in various ways. These patterns are confined to the particular district radius in which the man lived and worked. Some of this "pargetting" work is not only clever, but complicated; in the arrangement of symmetrical, flat strapwork patterns; in panels sometimes, at other times over the whole surface of a wall. Some of this work is suggestive of natural form, and it is here interesting to note how the influence of nature affected this art when first introduced into England. At that time the stucco-worker undoubtedly went to nature for inspiration, as is evidenced by the friezes at Hardwick Hall, St Michael's Mount and other places. This may have been because the art was new, and then held no traditions which could be followed.

The plasterers' craft did not share the fate of the other crafts, whose traditions were paralysed and crushed out at the time of the great upheaval in Henry VIII's reign. On the other hand, it was inspired with a new life, a new purpose, and was developed with a vigour and freedom strongly akin at times to the wonderful work at Venice and the early Gothic work.

Take, for instance, one example only—the Long Gallery ceiling at Knowle, Kent, in which are combined the vine, rose, pink, honeysuckle, columbine, marigold, lily, oak, &c. These flowers occupy spaces formed by waving bands of enrichment, and are modelled quite as admirably as such a dull material as plaster can or ought to be modelled. It is very simple, broad, big, straightforward work, free in every way, has little variety

relief; the line curvature is gentle and refined, although vigorous. There are no sharp curves, no under-cuttings or "sparkle" of effect that might be appropriate and desirable in harder material, such as stucco or wood or marble, but it has fulness and a softness quite natural and charming in such a medium. There is no attempt to "copy" nature, but only to express so much of her as would express the vital quality, freshness and vigour of growth, combined with fulness and convenience of arrangement and disposition. "Realism" was admitted beyond the limits of plaster, unnecessary and even undesirable. With such limited means at hand, the plasterer contented himself, and rightly so too, with a mere suggestion of nature, and compromised matters between his material and the suitability of his design to the material. Simplicity, breadth, sincerity were his watchwords, and sincerity of purpose his most faithful companion.

The contrast between the past and the present is sufficiently palpable. We are now chiefly concerned with what is open to us at the present time, and this brings with it various little difficulties. Being myself an architect as well as a craftsman, I am in a position to realise both sides of the question. We cannot, if we would, get away from the employment of plaster as a material. We therefore are confronted with the question what can or should, or what cannot or should not, be done with plasterwork.

What are its capabilities and limitations as a material? "Plastering," says Professor Lethaby, "once the art of the stucco-worker, is now barely represented in the 'three-coat work' of specifications. How should it be otherwise, when we think? Would it not be irony, on the face of it, to put in a bill of quantities 'supply and fix one work of art?' The crafts of the mason, the carpenter, the plasterer are even now being finally destroyed by a system in which design divorced from work, the present system in which the designer has no hands to execute and the worker no head to think. These last remnants of long-gathered traditions are being forgotten because they are no longer required by the paper architect. Indeed, he must crush them out of sight and mind, his ideal being so much mechanical work organised for the 'good of the profession,' a profession which lectures, examines, takes premiums, travels a little, and sometimes sketches—for those who do not think the profession should be artistic do actually sketch. This is the very mission of such an architect to teach the builder and workman his proper place and due ignorance. How else could he show the necessity of building in the material of the North Italy? How else should he get reputation when he forms the Press that his 'designs' are 'Spanish Renaissance,' 'French of the Loire freely treated?'" I have purposely spoken here of the simplest of the building arts—crafts that could be as near to nature as the digging and dressing of the land. If we examined the work of the old joiners, smiths, aziers, stone and wood-carvers, the story would be the more evident, but it is already widely known that these as arts of the workman are destroyed, and that utterly, for the time. Craft gradation has gone so far that what is called "painted decoration" is done by "firms" to the order of numbers of our profession. Were it not that painters have maintained their dependence, architects would certainly provide and fix portraits and landscapes "as specified." It is to be noted that these things have not changed because of a change in man's nature. Wherever handicraft has not been intercepted from material by the intervention of a learned profession, work is still as perfectly beautiful as ever it was, be it in the windmills of the millwright, the fishing smacks of the shipwright or the awnings of the waggon-builder—romantic with quaint chamferings, gay with bright paint.

What we want are housewrights, and let who will play at examination in the art of passing examinations. When the arts of building are all of them killed out finally, and the memory of their doing dead, who shall build them up again? Will being examined in architectural history, practising a mechanical system of drawing and acquiring the completest equipment of all the routine of the profession, give back to us the skill and delight of the craftsman?

Such a sympathetic and sensitive medium as plaster can be used rightly or wrongly, and from its fatal facility of handling the latter course is the more easy, and, from long habit, the more likely to be expected and the more usually demanded. We are all familiar with the modern "sugar" confectionery of the plasterer. At the present day we have the same materials open to us as before, viz. stucco-duro—ordinary lime and sand plaster and plaster-of-Paris—not to mention cements of various kinds. The controlling elements are, first of all, cost, which is naturally a wise and binding consideration. Then clients' idiosyncrasies, architects' ideals and craftsmen's individualities—sometimes all combined.

The employment of "stucco" goes hand-in-hand with freedom of thought and handling, which none can dispute. The idiosyncrasy of clients, where architects are not strong enough to influence them for the better, is hopeless and fatal. Architects' ideals are often possible, with the exercise of

freedom and of individuality on the part of the craftsman, when he is a genuine craftsman.

The craftsman's sympathetic handling is the last, and perhaps most hopeful, means of success, where such individuality is strong, unaffected and reliable. Everything depends on his knowledge of, and sympathy with, architecture; his knowledge of past methods and forms; his knowledge of his material, its capabilities and limitations; his power of imagination, his grasp of the teaching of nature, his gift of selection and of the power of expressing himself, and his constructive instinct. Granted a full share of these qualifications, there is little to fear so far as he is allowed a reasonable amount of freedom. And here lies the hinge of the matter—a subtle hinge, to be opened and closed at will by the architect and by the client.

I believe you wish me to express my opinion as to what should be done.

Putting "stucco-duro" aside as undoubtedly the finest and most permanent, though more expensive, method of expression, let us resort to less expensive ones. We next have a system of modelling in clay and casting in plaster-of-Paris, sulphate of lime, from plaster moulds, as the case may be—either solid or fibrous. Here the craftsman has a fair chance of various nice treatments in the placing of his enrichment and the relief of his enrichment, according to the funds at his disposal and the liberty allowed (either of restraint or otherwise). In such manner beams may be clothed, flat spaces treated as flat spaces, with flat or projecting bands of soft enrichment in endless ways.

Before referring to a still simpler and important treatment open to development, I would desire a few words about deeply undercut enrichment cast in plaster-of-Paris from gelatine moulds. I do not consider this type of work a practice to be encouraged. Beautiful as it is in stucco—which is a very hard material as well as a subtle one, allowing of crispness, thinness, deep-modelling and undercut relief, with beauty of texture and every other possibility—it is not a legitimate one for a soft material that is easily rubbed and broken, and will not take sharpness of treatment without injury. I admit the beauty of this type of work; but it is illegitimate, too easily injured and unsuitable to the material. This work, of course, has to be cast in fibrous plaster, about which there appears to be much difference of opinion.

Fibrous plaster, although a modern process in this country, is by no means a modern process in itself, and many architects and craftsmen are prejudiced against it as being (1) not strictly a solid plaster process, and (2), as some imagine, not a permanent process.

The first objection is a matter open to discussion for and against. The latter objection will hardly hold good, since the process appears to date back to the Egyptian pyramids, when the mummies were wrapped up in canvas dipped in burnt gypsum—so I am informed at least.

The process was introduced in England in 1859-60 from France (again, you see), by a Frenchman named De Sacy. His system was to dip small pieces of canvas, about 4 inches square, into the plaster-of-Paris, and dab them all over the mould and over each other. He employed girls in this work, but was not successful in making much of it then. In 1861 De Sacy sold the patent to Messrs. Geo. Jackson & Sons, with Mr. McDonald as foreman and instructor. But at that time little headway was made with it, and the patent was not renewed. Smaller firms experimented with it from time to time, until it became more constructive and improved.

The French used tow in the loose form, instead of the woven and open-sheet form as at the present time, with wood laths in the form of "strutting." A well-known artist told me that he disliked the system owing to having put up a ceiling thirty years ago which had rotted, and had to be taken down again. This was undoubtedly due to the use of boiled plaster instead of baked or burnt plaster. The difference in the two plasters is great, the former being soft and the latter hard.

Description of Gelly Moulding and Casting, and Piece Moulding and Waste Moulding.

My objection to this system of work, apart from its cost, is:—First, that it is an apology and cheap substitute for the work of another material—that of "stucco-duro," which would be woven into a gossamer of loveliness; second, that in the system of casting from gelatine moulds the work degenerates rapidly from the moment the model leaves the modeller's fingers.

The system is unsatisfactory to begin with. The clay has to be coated with shellac instead of being cast direct from the actual clay surface. In the process of making a plaster case to receive the gelatine a layer of paper has to be laid over the modelling and a thin layer of clay over that, in the process of which the sharp edges and arrises (legitimate in a hard material, which is not afterwards touched) become doubled with the pressure of the clay, and the damage is completed afterwards by putting the gelatine out of the soft plaster

casting, which must perforce suffer where fine edges exist. Apart from this, the gelatine deteriorates with every casting taken, and is greatly affected by the variation of temperature, becomes "woolly," distorted at times, and very difficult to manage, and when done is not, and cannot be, that which it is supposed to "ape," and, in my opinion, can never take the place of stucco and its endless possibilities.

Next comes the method of dealing with the ordinary lime, sand and hair plaster.

Why should we architects allow this beautiful material to be smoother and polished up, as we so commonly know it? Why not demand of the plasterer the surface most natural to it?—its own granular surface.

I know you are thinking of hygienic considerations. Granted this, but it is carried, perhaps, too far, excepting in special instances. However, I am not here to dictate, but to promote discussion. A few words about this ordinary material and what can be done with it in lieu of the cast-work. To begin with, it is capable of being stamped and modelled, and floated in bands, and "run," and stencilled through perforated wooden templates. The stamping process is delicious, so is the modelling when treated with breadth and simplicity. With regard to the "running" of plaster mouldings, we are again to blame in allowing the mechanical, die-level, sharp-arrissed process. It is wrong in principle, whilst we can get interesting work out of simple sections made up of soft, rounded and wave-like forms, flat, undulating, segmental or subtle lines, natural to the "dragging" of a granular material. Again, why the inevitable and hackneyed moulded cornice across the angle of wall and ceiling? One way of avoiding the rigidity of this method of "running" where mouldings are desirable is in the working of a short piece in clay which can be slightly worked on with the fingers and afterwards produced by casting. Of course, it is possible to work the plaster with the fingers if the lime is old enough and sufficiently deadened, but not under present circumstances of "running" lime as it is required. Otherwise, no man's fingers could stand it.

In the old work simplicity and bigness will be found to be the root of much of its success. So, also, it must be with good modern work. I have heard it protested that simplicity is synonymous with "poverty." It may be so in some cases, where reticence and breadth are misunderstood, and texture and quality of material are lost sight of or play a subordinate part. We have good materials at the present day, capable of good treatment; unfortunately, the art of working them has long since been divorced from craftwork—and the plasterers' craft is practically a thing of the past.

Designer and worker are two distinct creatures—the one not knowing the nature of the material, the other not knowing the nature of the man whose work he is supposed to put into material, and tries to do with a mechanical skill truly appalling in the finished result.

In a material such as plaster, designer and worker should properly be one and the same person, and he must be well alive to the possibilities of his material before he can know how to use them to advantage in a decorative sense. The strain, ever constant, of preventing the operator from obliterating the work of the thinker is horrible.

If we can get a certain amount of rhythm or harmony into our work, it will be something at least interesting—possibly mistaken—if even dull, awkward or clumsy. Dulness is, in fact, an acceptable quality for plaster. It shows the process of workmanship, and is the natural effect of adding and pressing a soft material on to a surface of similar nature. This feeling is particularly desirable in the treatment of large, plain surfaces. You will say it will be a long time before we can expect anything different from what we are now getting from the modern journeyman plasterer. Possibly so. Possibly as long as paper architects insist on having something less laboured. I believe the remedy is not beyond us if we will undeceive ourselves, and admit other facts which I will refer to in a few moments. I believe the kernel of the matter lies in the gulf separating designer and operator. The system is at fault, but time seems to produce reaction upon reaction, and gives some hope. This brings us to another point, and not altogether an unimportant one, and a rather delicate one, which reflects to a certain extent on our educational system and schools. Modern architects appear to be divided into two distinct schools of thought and action—the one engaged in the copying and rearrangement of the forms and lines of past styles, the other in the arrangement and development of forms based almost entirely on the simple and natural construction of materials to suit modern purposes, according to modern methods and requirements.

It is a great art to be able to draw well—but it is not "design"—and it is a great gift to possess the art of "design." But before we can design naturally and beautifully in any material, we must be familiar with the capabilities of the same, have served an apprenticeship with the works of the past, have held constant intercourse with them, and gather from them how and why many things were done.

We must also be in touch with living men who practise crafts and learn from them their aims and methods. We must also be in touch with nature, and pick up from her all that which is good and necessary for our refinement, our delight and inspiration. We can only fully grasp the capabilities and limitations of a craft by absolutely personal acquaintance and natural perception, and our knowledge can only come of the actual fingering and handling of our material, and by quiet perseverance in the art of working it. I believe the intensity of our art must be in accordance with the intensity of our interest in the creation around us generally—in construction and in our broad grasp of the whole art of building, past and present. I take it that design is the expression of this delight and interest, conveyed in an harmonious manner according to the limitations of the materials dealt with. But what of the delicate matter we are all of us so apt to overlook (so far as ourselves are concerned) and trip-up over—I mean the gift of selection and discretion dividing man from man or uniting them, which passes under the name of "individuality," if there be such a thing? This is subject enough for a "paper" in itself, and affects the whole educational system from the very elements.

It is not my province to-night to open up the question of design, but I believe much more might be done than is being done in the nice management of straight lines and slight curvature, rather than the orthodox late nineteenth-century "school of art curve" we see so much of, the very curse of the age, born of drawing-paper conceptions and lack of thought in material.

I believe all the crafts must draw blood from the ranks of architects to bring about a thoroughly healthy condition; and I believe also that there will be a time when architects' work will be less minutely detailed in offices than now, and the working-out of things done by sympathetic groups or amalgamations of workers, where architects and craftsmen co-operate and work in a concord and unity, when every man who transfers his attention to craftwork will be regarded as a distinct gain to the art of building and to (what we now call) the "architectural profession."

There is plenty of scope for such men, plenty of demand for such good work as the value of their previous office training can add to technical manipulation. Each individual is as much responsible to himself as to the public for his actions in the encouragement or the discouragement of personal craftsmanship as are the general mass of architects, and on individual effort depends the future of craftsmanship, and, furthermore, the art of building will more nearly approach its long-past state of vitality, will again be endued with a new hope, a new life, a new vigour and a real and living purpose when men of refinement, intellect and discretion draft themselves from the practice of paper architecture into craftsmanship—when architects become craftsmen and craftsmen architects.

At the present day the relationship between the architect and the craftsman is rather curious.

In the present transitional condition of affairs it is not to be surprised at, in the hurry and scurry of getting work done, one is rather apt to forget one's principles in practice. In the anxiety to please one's clients and to increase one's business, we are apt to let some things slide and to do things absolutely against the laws we frame for ourselves and are so determined to renounce. Here it is that little matters crop up which are as disappointing to the craftsman as to the architect.

It is sometimes a matter of extreme delicacy, I know, but perhaps not beyond remedy and further resolve. Personally, I have little cause for complaint, and yet I know the evil exists. The relationship between architect and craftsman, one might say, is a matter of influence and sympathy. Not altogether so. It is gradually becoming so, and I believe will ultimately be so; but there are serious drawbacks, where able men are denied opportunities of doing good individual work. I know many such instances. For example, we hear of men deserting "office architecture" for some craft or another, for the good of architects generally and of the building world. Men who are architects, and who have practised long enough to feel the disappointment of the results of designing on paper only, and the seeming impossibility of extracting refined work from the ordinary British workman, until such times may come that the designer and the operator converge and work together. Men who have strong convictions, which most of us acknowledge to be at least sincere, and which decides them on abandoning the one system for the purpose of carrying into practice these convictions, and yet they are often asked by sympathetic men to do the very thing which, as architects, they have purposely turned their backs upon and as craftsmen they have resolved to strive against. It is sad, but it is true. Time alone will possibly alter this. It is, I take it, due in a great measure to the unequal fermentation in the evolution of art matters. It is even necessary in many cases, one would say. I believe it to be so. There cannot be cause without effect, but sometimes it has a detrimental effect—an effect which stifles the best intentions of a good workman, extinguishing rather than invigorating. If he

healthy and strong enough to refuse and withstand this influence, all well and good; but there are men of weakly-strung fibre who are unable to withstand it, and sink in oblivion through this influence. Their hearts are crushed and they die.

Another controlling influence is the matter of price. I say against it, as I believe it has its good influence in itself, as also its evil influence in other ways. But it is worthy of consideration, if not of discussion. I believe, as an architect, the various causes from which prices arise and how in many cases it might be avoided. Sometimes it arises from the haphazard assessment of prime cost on the part of the architect; sometimes from the unsympathetic, cut-and-dried system of the quantity surveyor, from necessary economy; sometimes, I believe, from a desire to get the utmost possible for the client; at other times from an incomplete knowledge of actual working cost of materials; sometimes by the unreasonable idea that good work can be done at the price of inferior. A very great deal of discontentment to architect, client and craftsman might, I think, be averted by a little consultation and consideration of the matter before the issued bills of quantities.

I think it would also be a great help to both parties, and a needless waste of time and energy, if a maximum sum could be named where it is difficult to provide more than very best means for possible decorative purposes.

With a craft such as I have elected to follow there are numerous ways of doing simple work in a quite nice manner with ordinary materials and methods, properly handled, which would be impossible to indicate on a drawing. You understand me? Matters merely of texture and handling, only to be realised by a man knowing his material, as an artist knows his paper and colours, and what can be done with them.

The architect with much work has not the time, if he would, to acquire all the technical qualities of materials as they present themselves by accident and experience to a craftsman. He looks out, nor has he the same opportunities of rightly knowing the actual working cost of different methods as he who is conversant with them by finger-touch and constant observation.

In conclusion, allow me a few words concerning the actual cost of craftwork and architects' estimates, and prime-cost advances.

I am well aware of the monetary difficulties we, as a rule, have to face in the planning-out of building schemes, and I know, too well, how they often have to be reduced.

We sometimes have to cut the coat according to the cloth, and there is one habit some men have whilst desiring to encourage sympathetic work, which habit seems generally inconsistent—I refer to the matter of under-estimating prime-cost amounts provided for this, that and the other, including decorative work; of imagining that respectable craftwork can be had at the price of "shoddy"; that good work and bad pay are synonymous.

The under-estimating of prime-cost amounts must mean one of three things—that either one's client must be asked to pay more than he at first bargained for, or that the scheme must be reduced, or that the craftsman has to do the work at a personal sacrifice, or at so low a cost as to barely get home from the transaction. Again, one hears the argument that a certain kind of work will not bear more than a certain cost. This is, I believe, an argument based on inexperience or ignorance of process, and of circumstances controlling it.

It is curious that this argument is never applied to the cost of the fabric or shell of a building, but only to various kinds of craftwork where modest skill is concerned. It should, at least, be its own working cost and a living profit in addition, otherwise where is the inducement for the good workman or craftsman to excel in his calling? And yet this method of judgment is frequently brought to bear by men who swear by all that is good and true.

To compare the relative cost of the two kinds of work is most difficult.

Take, for instance, an ordinary enriched plaster cornice.

The moulding can be "run" in the usual way by the non-union plasterer; the enrichment can be bought from the Italian plasterworker and stuck up in the ordinary way. In this way no skilled labour is required in the fixing of the work. The modelling can be turned out by any stone-carver or modeller who knows little of his craft, accustomed to work at starvation wages, and is ignorant of even the right method of handling clay; the casting is done by Italian boys, who work for a mere pittance, and when finished the cornice, to the casual observer, looks what is called "handsome" by some persons and passes muster with the crowd, and then people say, why is our work more expensive?

But to put this work by the side of a cornice in which the enrichment is modelled by a man who regards his craft as something more than a means to supply himself and family with bread and cheese—the casting and fixing done by skilled workmen earning the wage they are worth—is an unfair pro-

ceeding, and, if persisted in, means crushing the heart out of good work and workmen, to the advantage of the inferior in both.

Architects who are accustomed to and only accustomed to the everyday cut-and-dried stuff can only estimate for the work they want done by the average cost of the material they have been in the habit of using, and many find a difficulty in estimating for anything different. They will certainly find themselves very much "at sea" if they persist in prime-costing superior work at the same rate they have been in the habit of allowing for inferior work so much in vogue. This fact seems to be somewhat incomprehensible to many architects who would quickly grasp the fact that good workmanship is worth more than inferior in anything apart from their own "profession."

This system is not likely to encourage "sympathetic" work, and must sooner or later stifle any attempt to elevate craft-workers, no matter what the medium, from unthinking mechanical drudges into intelligent, capable craftsmen, and in the end men who know better, and desire better, will be compelled to revert to old trade methods and systems which are so offensive to their æsthetic susceptibilities.

Boiled down, this all means that the architect must educate, educate, educate his clients, and furthermore must insist upon his own views being carried, even when opposed to those of his client, or otherwise it means grind, grind, grind on every hand as a matter of principle.

Mr. E. GUY DAWBER, who proposed a vote of thanks to the author of the paper, said they must all have felt sorry that Mr. Bankart had not shown slides of his own work, since it could rank with the other beautiful examples the paper had alluded to. The views dealing with the decoration of the outside of houses were most interesting. Nowadays there was a large revival in the finishing in plaster, and when the treatment was quite legitimate much might be done to stucco houses with beautiful effect at a comparatively small cost. It was only within the last 100 years the word plaster had become degraded. In Bavaria and Austria there were whole towns with the house fronts decorated in plaster, and the effect was charming. The methods on the Continent were different to our own. They always treated plaster as a plastic material, whereas we tried to impart to it the nature of stone, and the imitation was wrong. In a plaster front the whole work should be treated as plaster, and the durability of such decoration made it suitable for houses in London. They, as architects, were only too anxious to get hold of the work, but they must remember the uses of the material were all traditional, and the traditional working was dead. They had therefore to instil in the mind of the modern workman a sense of respect for the plaster he had to work.

Mr. J. D. CRACE seconded the vote of thanks.

NORTHAMPTON ARCHITECTURAL SOCIETY.

THE annual meeting of the Architectural and Archæological Society for the Archdeaconries of Northampton and Oakham was held at the Society's rooms, Sheep Street, Northampton, on Monday, the 14th inst. The Rev. A. W. Pulteney presided.

Mr C. A. Markham presented the fifty-eighth annual report of the Society. At the commencement regretful reference was made to the loss the Society sustained by the death of Canon Sidney Lidderdale Smith, one of the original members. He was elected in 1846. Another loss was felt by the departure from the county of the Rev. B. C. Bennett. Nine new members had been elected. The only plans of church buildings submitted to the Society were those of Christ Church, Northampton, by Mr. M. H. Holding. Judging from the plans and elevations it should make a fine building, in the Late Decorated period of architecture. The church will consist of nave, north and south aisles, north and south porches, chancel and south chapel, and spacious vestries and organ chamber, with a lofty western tower. The total accommodation provided would be for 800. Reference was made to some important additions to the library of the Society. The report was adopted.

The Rev. E. L. Tuson said the treasurer's account was not completed, but there was a balance in hand, and the number of members was larger than before.

On the proposition of Mr. Muscott, seconded by Mr. J. W. Fisher, the officers were re-elected *en bloc*.

The Rev. K. E. Barrow, of Brockhall, was elected a member of the Society.

Mr. J. W. Fisher first read an interesting and instructive paper on the tower of Irthlingborough Church. The late Sir Henry Dryden twenty-four years ago stated that the tower urgently needed repair. It was then unsafe and was gradually falling. Six years later careful measurements and drawings were taken, and at the annual meeting of the Society the following year the immediate necessity of the Irthlingborough authorities taking means to secure the safety of both

the church and the tower was emphasised. Eventually in 1887 it was decided to take down the tower, and the work was commenced. It was decided to build to a height of 20 feet. In 1893 the work of rebuilding the tower and octagon was completed, and the old bells, with the addition of two new ones, were hung. The total cost had been 2,500*l*. The tower, as completed, is as nearly as possible an exact copy of the old one, the only addition practically being the restoration of the turrets at the base of the octagon. The total height is 99 feet. In the bottom of the north side of the tower is the following inscription:—

"This Tower, forming part of the College of Irthlingborough, built about 1376 by John Pyel, Alderman and Lord Mayor of London, was taken down in 1887 and the rebuilding commenced. To the glory of God, A.D. 1888."

An inscription for the lantern on the east side is:—

"The Lantern of this Tower was re-erected in memory of the late James John Seymour Spencer Lucas, of Burfield Priory, Westbury-on-Trym, Gloucestershire, by the last act of his Sister, Maria Lucas, also of Burfield Priory. Anno Domini, 1893."

Mr. R. P. Brereton, M.A., read a paper on the building and present condition of Fotheringhay Church. Fotheringhay, said Mr. Brereton, besides its peculiar historical renown, the fame of its castle, its connection with generations of royalty, and its pathetic memoirs of Mary, Queen of Scots, has in its parish church a building of exceptional architectural interest; for by a chance as fortunate as it is rare, the contract for its erection is still in existence; and by an accident even more remarkable, the contract refers to just those portions of the building which remain to the present day, and not (with one trifling exception) to those parts which have perished or have been destroyed. The history of the church dates back to before the fifteenth century, when upon the present site there stood a small church, to which was afterwards built a magnificent choir by Edmund of Langley. After his death his son erected a new nave, with aisles and clerestory, porch, tower and lantern, to harmonise with the choir—in fact the building which exists to-day. The gradual decay and destruction of the choir dates from Edward VI, and parts still remained in the days of Elizabeth. Inside the present building, on the east wall, which was the west wall of Edmund of Langley's choir, above the chancel arch may be seen the weathering which marks the line of the former roof. The east wall, indeed, is the key to the old building. The tower shows great divergencies from the terms of the old agreement. The church is deservedly famous, but it often suffers from the general and indiscriminate praise usually lavished upon it, often arousing expectations which are not realised on a visit. It is, indeed, a very striking and stately building, affording specimens of fine Perpendicular in a district where such are none too common; but in such an extraordinary mixture of good and bad details that the general appearance is late and inartistic. The fabric of the church has remained practically unchanged since its erection. The massive tower, built, as so often, on insufficient foundations, has sunk considerably, and dragged down with it the west walls of the aisles. But the settlement apparently ceased centuries ago. Much greater damage has been caused by the weakness of the west wall, owing to the great size of the west doorway and the abnormal width of the huge eight-light window over it. On the floor of the church are the matrices of four most magnificent brasses, which must have been some of the finest in the kingdom. The fine contemporary font, conspicuously placed in the centre of the nave, is East Anglian rather than Midland fashion. In the space allotted to the sanctuary are, one on either side, the monuments erected by order of Queen Elizabeth to the memory of Edward, Duke of York, slain in 1415, and Richard, Duke of York, slain in 1460. These are also ponderous erections in the taste of the age. The present condition of the church is one of great and imminent peril. Though the foundations of the walls are fairly good, and the masonry stipulated in the contract has, on the whole, stood well, yet owing to long continual neglect disintegration and decay have been going on. Unskilful attempts have been made from time to time to arrest destruction, and in consequence of them the stonework has split and perished in many places. Indeed, it is wonderful that the clerestory has not suffered more than it has done on account of the width of the nave roof. The roof is greatly decayed, and is the chief cause of anxiety, and it has been pronounced to be even dangerous to the people underneath it. Already some of the pendant bosses have fallen, as well as parts of the cornice. The whole roof has, since some years ago, been supported by scaffolding to prevent its entire collapse. The village of Fotheringhay is small, and the sum required for the most necessary repairs is quite beyond the means of the parishioners. It has therefore been decided to issue a public appeal, and it is hoped that the community, in common with the King and the Royal Family, will be ready to contribute for the preservation of this remarkably interesting church. So far as is possible the old work will be redone

in its entirety, and reparation, not restoration, is what is aimed at. In conclusion Mr. Brereton trusted, with the committee, that the Society and its members individually would do their utmost to carry out the work.

The Chairman said it was proposed to carry out the work of the restoration of the tower in eleven sections, at a total cost of 7,000*l*. The raising of such a sum was obviously beyond the powers of a little parish like Fotheringhay. At the present time, however, they had something like 1,500*l*, and with that they proposed to commence with two of the sections. The first would be the restoration of the lantern and tower, built from the top downwards to the ringing floor. The estimated cost of that would be 1,438*l*. The second section was the restoration of the clerestory windows and parapets to the nave roof, and also the restoration of the flying buttresses and pinnacles over the aisle roof, at an estimated cost of 750*l*. The third portion attempted would be the nave roof.

The meeting was adjourned to a future date to consider what help could be accorded in the work of restoration.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

THE annual general meeting of the Royal Institute of Architects of Ireland was held on the 17th inst. Mr. George C. Ashlin presided.

The President referred to the question of the statutory registration of architects, and said that it had entered the realm of practical politics, and they should use whatever little influence they had to force on its speedy solution, especially as no country would derive such benefit from it as their own. The special circumstance which mainly induced them to declare in favour of it was that when they came to consider the adoption of an obligatory examination for their members in the future they felt that there was so little chance of it being generally submitted to unless it was accompanied by State recognition, as in other professions. He might add that at this point, as well as on the general question of the urgency of registration, their views were shared by the Ulster Society of Architects, and that therefore, as far as the profession was represented in Ireland, there was practically no difference of opinion. Having referred to the objections urged against it by the President of the British Institute at the opening meeting in London this year, he said he believed that they would never be able to get their pupils to make the most of their apprenticeship, the most important period of their lives, as long as the voluntary principle prevailed. If a course of professional training and periodical examinations as well as the passing of a final one was made obligatory the candidates would have a definite goal to strive for, and the only individuals to suffer would be those who had not the necessary natural gifts or sufficient energy to attain it, and he need not say that it would be to the benefit of architecture that they should seek some other calling when they had realised this.

The Hon. Secretary then read the annual report of the Council, which stated:—

"The attention of the Council had been directed to several unsatisfactory conditions of competition issued to the profession during the year by public bodies, and has found it necessary to urge their members to refrain from taking part in these. The prize presented by the Institute for competition among members of the Architectural Association of Ireland duly took place, and the assessor, Mr. Batchelor, awarded the prize to Mr. Alfred Livesay, of Kildare. The honorary officers, in accordance with the by-laws, retired in November. The posts had been filled by the election of Mr. R. Caulfeild Orpen as honorary secretary, and of Mr. Charles H. Ashworth as honorary treasurer. The Council would like to place on record their entire appreciation of the splendid services both the outgoing officers, Mr. Kaye Parry and Mr. Owen, had rendered to the interests of the Institute. The roll of membership now reached a total of 103, and their financial state was satisfactory."

Mr. Kaye Parry, in moving the adoption of the report referred to the work done by the Council, not only during the past year, but during the previous three years. During the period under review the Council had helped to form an allied society in the North, viz. the Ulster Society of Architects. In connection with the conditions of contract, he was glad to be able to assure them that the Council would soon be in a position to come to a definite decision on the matter.

Mr. J. Rawson Carroll seconded the motion, which was carried.

On the motion of Mr. A. E. Murray, seconded by Mr. W. Mitchell, the hon. treasurer's report was adopted.

The report stated there was a balance in hand of 67*l* 4*s* 9*d*. and the amount of new 2½ per cent. stock invested was the same as last year—450*l*. 9*s*. 5*d*. In the period 1900 to 1903 the

income of 538*l.* 14*s.* 8*d.* had exceeded the expenditure by 3*d.* The President then read the report of the scrutineers, and read the following nine members elected as members of the Council for the coming year:—
Mr. Thomas Drew, W. M. Mitchell, W. Kaye Parry, A. E. Parry, C. A. Owen, J. P. Sheridan, Frederick Batchelor, Hicks, J. Rawson Carroll.
The annual dinner took place in the evening.

BELGIAN AND GERMAN TRAM RAILS.

THE London County Council recently directed its highways committee to ascertain particulars with regard to hours of work and rates of wages observed by foreign firms in making tram rails not only for the Council's tramways, but for the Government and provincial municipal corporations, and the amount of royalties paid by foreign firms as compared with those in Great Britain. The highways committee reported to the Council on Tuesday to the effect that they had given careful consideration to the question of the manner in which an inquiry indicated in this resolution could be best effected, and they were of opinion that arrangements should be made for an expert to visit the districts in Belgium and Germany to see a large amount of the work in question was carried out, and to report as to the conditions obtaining there as to hours and wages. The required information as to mining royalties could, they thought, be obtained from other sources. They suggested that the clerk of the Council should take all necessary steps in connection with the conduct of the inquiry, and for that purpose it was proposed that he should arrange for the services of an expert surveyor, who would be accompanied by one of his assistants. It would also be necessary to obtain in Belgium and Germany the assistance in the way of interpretation and local knowledge, which could probably be accomplished by means of introductions. Having carefully considered the matter, they came to the conclusion that this was the only way in which a satisfactory and perfectly independent report could be obtained. They did not anticipate that there would be any difficulty in obtaining the names of representative firms whose works could be visited and introductions to residents in the particular localities affected. If their proposal was adopted, they thought it could be carried into effect at a cost of 15*l.*, which amount they recommended the Council to vote. They said that they think that the necessary inquiries should, in the first instance, at any rate, be limited to the districts in Belgium and Germany where the rails in question were made. The question of the purchase of rails again came up at Tuesday's meeting of the Council upon the report of the other tenders sent in for 12,500 tons of rails required in connection with the reconstruction for electrical traction of the Council's trams. For the track rails fourteen tenders were submitted, the lowest being that of a Brussels firm, whilst the lowest for the slot rails, for which sixteen tenders were sent in, was an American firm. The committee recommended the acceptance of the tender for track rails of Messrs. Bolckow, Vaughan & Co., of London, at 43.748*l.* This is the lowest tender for acid steel, the others being for basic steel, that of the lowest tenderer being 40.418*l.* In the same way with regard to the slot rails, they recommend the acceptance of the lowest tender for acid steel, that of the Frodingham Iron and Steel Co., Doncaster, for 34.461*l.* The committee point out that in these cases they require the acid steel in order to make comparison in point of life and durability with the rails already laid, which are made by the basic process.

THE SOCIETY OF ARCHITECTS.

A MEETING of the Society of Architects was held on the 17th inst. at the Society's premises adjoining Old Staple Inn, Holborn, to which they have removed from St. James's Hall, Piccadilly.
Mr. Walter W. Thomas, the president of the Society, was in the chair. In opening the proceedings the President said the Society was increasing in membership and improving in finances, and that it promised in a short time to become second to no similar association in this country. He afterwards presented the gold medal of the Society to Mr. W. G. Jenkins, and then called upon Mr. Ellis Marsland, the hon. secretary, to open a discussion on the Bill introduced in the last session of Parliament to amend the law relating to "Ancient Lights," the outcome of the labours of the joint committee of the Royal Institute of British Architects and the Surveyors' Institution.
Mr. Marsland objected to the Bill *in toto*, contending that a man had no right to acquire an easement of light across his neighbour's premises, that no new rights of the kind should be acquired, and that after a certain term of years existing rights ought to be extinguished. He objected to the peripatetic

character of that tribunal, thinking there ought to be tribunals of appeal in all the large centres of England.

Mr. G. G. Pye, vice-president, considered these proposals rather too drastic as regarded existing rights, but took exception to the Bill on the ground of the expenses it involved, and claimed that the Society of Architects should be represented on the proposed tribunal of appeal.

Mr. W. C. Williams, while condemning the system of easements of light as a thing which existed nowhere on the face of the world except in England, and holding that no future rights should be acquired, did not agree that existing rights should be summarily cancelled, as the introduction of any such provision would wreck the Bill altogether.

Mr. R. B. Tucker, Mr. F. R. Vallance, Mr. C. H. Mead and Mr. R. W. Roques also took part in the discussion.

The President referred to what had been done in Liverpool, as showing that, in the majority of cases, disputes between the dominant and the servient owner might be settled by friendly conference.

On the motion of Mr. Roques, it was resolved that the Society should oppose the Bill, and give notice of opposition to the Royal Institute of British Architects and the Surveyors' Institution—the Society to be represented by counsel.

ROYAL HIBERNIAN ACADEMY.

THE Lord Lieutenant of Ireland has been pleased to approve of the election of the following gentlemen to fill the various offices in the Academy for the year 1903-4:—
President, Sir Thomas Drew; Secretary, S. Catterson Smith; Treasurer and Keeper, P. Vincent Duffy; Visitors to the Life School, H. C. Tisdall, Charles Russell, J. M. Kavanagh, Henry Allan; Visitor, Painting School, S. Catterson Smith; Professor of Painting, Nathaniel Hone; Professor of Sculpture, Oliver Sheppard; Professor of Architecture, Sir Thomas Drew; Professor of Anatomy, Sir Thornley Stoker; Professor of Literature, Edward Dowden; Professor of Antiquities, George Coffey; Professor of Chemistry, Sir C. A. Cameron, C.B.; Trustees, Sir Thomas Drew, S. Catterson Smith, W. M. Mitchell; Auditors, Charles Russell, James Brenan. His Excellency has also been pleased to approve of the election of Mr. Nassau Blair Browne, associate, to be an Academician.

TESSERÆ.

Surveying in Egypt.

IT has been conjectured that Sesostris was the first who divided Egypt by measure amongst his subjects, and thus gave a beginning to the science of geometry. Sir Isaac Newton ascribes the origin of geometry to Moeris, the fifth from Sesostris, confounding Sesostris with Osiris. "Moeris," says he, "for preserving the division of Egypt into equal shares among the soldiery, wrote a book of surveying, which gave a beginning to geometry." But it is plain from Scripture that an exact division of private landed property existed in Egypt before the days of Joseph, whose administration commenced 900 years before the period assigned by Newton. "And Joseph bought all the land for Pharaoh; for the Egyptians sold every man his field, because the famine prevailed over them, so the land became Pharaoh's. And as for the people, he removed them from one end of the border of Egypt even to the other thereof. Only the land of the priests bought he not, for the priests had a portion assigned them of Pharaoh, and did eat their portion which Pharaoh gave them; wherefore they sold not their lands. Then Joseph said unto the people, Behold, I have bought you this day, and your lands, for Pharaoh; lo, here is seed for you, and ye shall sow the land. And it shall come to pass in the increase, that ye shall give the fifth part unto Pharaoh; and four parts shall be your own, for seed of the field, and for your food, and for them of your households, and for food for your little ones. And Joseph made it a law over the land of Egypt unto this day, that Pharaoh should have the fifth part, except the land of the priests only, which became not Pharaoh's." We have here the description of a country very exactly divided out into private property. If property had not at that time been settled with the most minute exactness, Joseph would have had no occasion for employing the troublesome expedient of transplanting the people reciprocally from one end of Egypt to the other. He had recourse to this expedient evidently to secure the monarch in his new property, and prevent the evil effects of that predilection which people naturally possess for an old paternal inheritance. There was, of course, a complete revolution in landed property. The whole of it became the king's, and was henceforth held of the crown by a tenure of a fifth of its produce. The priesthood, however, preserved theirs. The very circumstance of one-fifth to be paid on all landed property supposes that private property had been well and minutely settled. The opinion, therefore, that

the science of geometry originated from the cutting of cross canals by Sesostris, and the dividing the large champaign country of Lower Egypt into square fields, appears to be absurd. The reasons for making these canals were evidently to drain the marshes of this vast level, and render it capable of cultivation, and to connect the branches of the Nile together, so that the whole country might reap the advantages of water communication and of irrigation. But a work of this nature is never projected till private landed property has been well settled, and till an increase of population has increased the demand for the necessities of life. Ground once divided by such canals was in no danger of a change of landmarks, and consequently had no need of future surveys. The most probable cause therefore, of the invention of geometry was the necessity of frequent surveys which existed before these canals were cut, when the annual inundations of the Nile perpetually obliterated all landmarks.

Athens and Rome.

If we turn to republican Athens, in which the Hellenic spirit reached its fullest expansion, we see a people gifted with an intellect supple, mobile, fearless, beyond all precedent; a race unwearied in its pursuit of the ideal, rejoicing in the exercise of abstract reason, withal full of the joy of life; striving after the fullest and the freest development of the individual in body and mind; a radiant people, scattering its light abroad and subduing the world under the sway of its ideas—and yet with no thought of, no aptitude for, material empire over that world; eager, indeed, in the management of its own affairs, but with little genius for managing the affairs of others, having small instincts of national cohesion—a race which, before even it had emerged on the horizon of historic times, had sent forth into the grey twilight of ambiguous days the effulgence of an undying poem; a race from which artists must ever seek supreme examples when striving after the noblest embodiment of the noblest thoughts, and among which the plastic arts leapt to their full stature in fewer years than are wont to divide the cradle from the grave of men. In republican Rome, amongst their next of kin, we find this picture point for point reversed; not here a swift and joyous intellect, but an intellect of tardy growth, grave without spontaneity; a temper not tuned to the ideal, bent on the practical; not seeking the beautiful, grasping at the useful; intent on the joys of life, but on its duties; receiving illumination, not illuminating. We find the individual not expanding freely in unfettered spiritual growth, but sternly merged into the obliterating state; we find the imperial sense supreme, science and letters for centuries non-existent as a native product, the arts not springing from the soil but imported, like letters, first from the north and then from the south.

GENERAL.

Mr. Horace Mountford has been commissioned to proceed with the execution of the bronze statue of Milton, to be placed in front of St. Giles's, Cripplegate. The restoration of the fabric will, it is expected, be completed in the early summer, when the statue will be put in position.

The Society of Engineers have made the following awards for papers read during the past session:—The President's gold medal to Mr. Douglas Mackenzie for his paper on "Motor Transport for Goods;" the Bessemer premium of books to Mr. Robert J. Thomas for his paper on "Road Maintenance and Administration;" and a Society's premium of books to Mr. Albert Gay for his paper on "Mechanical Stokers for Electricity Generating Stations."

King's College, London, have found it necessary to form a separate faculty for engineering and applied sciences, as distinct from the faculty of natural science. A new system of training engineers has been adopted whereby students taking a four-years' course spend six months in each year in the college and six months in engineering works, the engineering course being now divided into a summer and winter session for this purpose.

The Stoke Newington Council have decided to provide public swimming-baths for the district. The site mentioned for the erection of the building is situated in Albion Road, and it is proposed to have first and second-class baths, the former measuring 100 feet by 40 feet and the latter 80 feet by 30 feet.

Lady Ffrench has presented to the Passionist Fathers, Highgate, 1,000*l.* towards the erection of the high altar in the church of St. Joseph, Highgate Hill, but stipulates with the gift that all the materials are to be supplied from Ireland.

The City Corporation have accepted as a gift for the Guildhall Art Gallery an oil-painting entitled *The Quarrymen of Purbeck*, from the brush of the late Mr. H. T. Wells, R.A. The picture is the gift of Mr. Wells's daughters, and has been hung in the centre gallery.

The Council of Birmingham University considered on Friday last the tenders for the erection of the superstructure of the three blocks and the great hall of the new University at Bournbrook. Eighteen tenders were sent in and that of Mr. Thomas Rowbotham, of Birmingham, was accepted. The amount was not stated, but it was understood to be about a quarter of a million.

The New Bridge opened last week in New York connects Manhattan Island with Williamsburg. It is said to be the largest single-span suspension bridge in the world, and has been in course of construction for more than seven years. It exceeds Brooklyn Bridge in length by 1,284 feet. The total cost of the bridge and its approaches to date has been over 10,000,000 dollars. The bridge will have four surface railway tracks, two tracks for elevated trains, two roadways for vehicles, two footways for pedestrians and two bicycle paths.

A Small Norman Church in the parish of Milton Abbey, known as Liscombe Chapel, is being used as a bakehouse and loghouse, and the monastic house adjoining is converted into a labourer's cottage. The matter has been referred to the Society for the Protection of Ancient Buildings.

Committees are to be organised for the purpose of collecting funds for the erection in Geneva of a votive chapel and a monument in memory of the late Empress Elizabeth of Austria. The direction of this enterprise has been entrusted to M. Sigmund Singer, a well-known Austrian. The vice-president and cashier of the central committee is the Rev. J. G. Blanchard, the English-speaking Roman Catholic chaplain in Geneva.

A Collection of Pictures relating to St. James's Park and dating from the reign of Elizabeth to the last century will shortly be exhibited in the Caxton Hall, Westminster.

The Competitive Designs for the new public offices and town hall, and for the County school to be erected in Acton, will be open for inspection at the Central Hall, Acton, from December 28 to January 1 next.

The Post Office Authorities are to purchase the whole of the site of Christ's Hospital. The purchase money, it is understood, will take the form of a yearly annuity. The decision will affect the arrangements for the enlargement of St. Bartholomew's Hospital.

The London County Council on Tuesday agreed to the widening of Hampstead Road, at a cost of 245,500*l.* One-eighth will be contributed by the St. Pancras Council.

A Special Gold Medal has been awarded at the Inventions Exhibition to Messrs. Diespeker, Ltd., for mosaics.

The Will of Mr. Christopher Eales, of Messrs. Christopher Eales & Son, architects and surveyors, 9 Welbeck Street, Cavendish Square, and Worthing, has been announced at 13,227*l.* 17*s.* 9*d.*

A New Pulpit according to the design of Mr. G. F. Bodley, R.A., has been placed in Bristol Cathedral. The body is octagonal and the recessed panels are occupied by carvings representing incidents in the life of Christ. The pulpit is supported by a central shaft surrounded by smaller columns, and is entered by a staircase of stone, the sides of which are decorated by quatrefoil carvings. The cost is estimated at about 1,000*l.*

Three Candidates are regarded as being in the final for the office of town clerk of Leeds, and it is expected that the selection will shortly be made. The three gentlemen referred to are Mr. Beard, town clerk of Coventry; Mr. Robert Eyes Fox, town clerk and clerk of the peace, Blackburn; and Mr. J. H. Ellis, town clerk and clerk of the peace, Plymouth.

A Meeting of the Archaeological Society of Glasgow was held on the 17th inst. in the rooms of the Society, Bath Street, Glasgow, Professor Cooper in the chair. A paper, illustrated by lantern slides, was read by Mr. T. H. Bryce, F.R.S.E., on "Explorations in the Island of Bute."

At a Quarterly Meeting of the Galway Archaeological and Historical Society, the Archbishop of Tuam (the Most Rev. Dr. Healy) was elected president of the Society for the next three years; the Hon. Robert Dillon, Lord Killanin and Richard J. Kelly, vice-presidents. There was a large attendance of members. The hon. secretary is Miss Redington, of Kilcoman; the editor of the journal, W. T. Trench; and the treasurer, T. D. Lawson. The Society embraces over a hundred Galway county members, and publishes an interesting journal.

The First Award made by the Metropolitan Water Board was announced last week. The East London Water Company claimed seven and a quarter million pounds, and the Board, holding that the company's undertaking ought to be valued on the theory that it was liable to contribute to the City Chamberlain's Sinking Fund for the ultimate extinction of its own capital, awarded it 3,900,000*l.*; but if the Appeal Court reversed the decision on the point, the compensation payable would be 4,300,000*l.*

THE

Architect and Contract Reporter.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

ELLESMERE.—Dec. 30.—Plans and estimates are invited for a scheme for the disposal of the sewage of the town of Ellesmere. Mr. R. E. Lloyd, clerk, Urban District Council, Ellesmere.

ERDINGTON.—Feb. 1.—The Urban District Council general purposes committee invite designs for new council house and free library buildings, to be erected at the junction of Mason and Orphanage Roads, Erdington. Premiums of 50*l.*, 30*l.* and 20*l.* will be awarded for the designs placed first, second and third respectively. Mr. Herbert H. Humphries, district engineer and surveyor, Public Hall, Erdington, Birmingham.

ILKLEY.—March 1.—Competitive designs are invited for free library, public offices and assembly hall, intended to be erected in Station Road, Ilkley. Premiums of 100*l.*, 50*l.* and 20*l.* respectively are offered for the three best designs sent in by February 1. Mr. Frank Hall, clerk, Council Offices, Ilkley.

ROCHESTER.—Jan. 31.—Plans are invited, with approximate estimate, for the addition of chancel, organ-chamber and choir vestry to the present church of St. Matthew, Borstal, Rochester. No premium offered. Architects can examine the present building and site at any reasonable hour. Plans must be addressed to Borstal Vicarage.

WINDSOR.—Jan. 15.—Designs are invited for elevations for police and fire-brigade stations. Premium 25 guineas. Full particulars may be obtained upon application to the borough surveyor, who will also provide copies of the plans on receipt of 1*l.* returnable deposit. The Corporation to have the absolute right of erecting the building according to the design chosen, without any further payment to the architect. Designs to be delivered, not later than January 15, to Mr. E. A. Stickland, borough surveyor.

CONTRACTS OPEN.

ASHBURTON.—Dec. 31.—For alterations and additions to Lent Hill, in the parish of Ashburton, Devon. Mr. Fred. Wm. Vanstone, architect, Palace Chambers, Paignton.

BARROW-IN-FURNESS.—Dec. 31.—For the erection of a temporary iron school at Vickerstown on site on Ocean Road. Chairman of the Sites and Buildings Sub-Committee, Town Hall, Barrow-in-Furness.

BEAUMARIS.—Dec. 30.—For the erection of an additional subway and of warehouse and other offices on the pier. Mr. W. O. Griffith, 1 New Street, Beaumaris.

BRADFORD.—Dec. 28.—For the erection of shop and work-rooms in Darley Street and Piccadilly. Mr. C. H. Hargreaves, architect, Exchange Buildings, Bradford.

BRADFORD.—Dec. 29.—For the erection of a bridge and retaining walls at Brownroyd Hill Road. Mr. J. H. Cox, city surveyor, Town Hall, Bradford.

BRADWELL-ON-SEA.—Dec. 28.—For the erection of six workmen's cottages (under the Housing of the Working Classes Act) at Bradwell-on-Sea, Essex. Mr. Horace G. Keywood, surveyor, Maldon.

BRENTWOOD.—Dec. 30.—For repairs to Dunton, Vange, Laindon and Great Burstead Council schools, Essex. Mr. F. W. Bittles, clerk, Town Hall, Brentwood, Essex.

BURY ST. EDMUNDS.—Jan. 11.—For certain alterations at the police station. Mr. A. Ainsworth Hunt, county architect, 51 Abbeygate Street, Bury St. Edmunds.

CAIRO.—Feb. 1.—For the construction of three steel bridges over the Nile at Cairo. Full particulars can be obtained at the Commercial Intelligence Branch of the Board of Trade, 50 Parliament Street, S.W.

CHELTENHAM.—Dec. 30.—For taking-down and rebuilding pigsties at the workhouse. Mr. James Villar, architect, 2 Essex Place, Cheltenham.

NEW CATALOGUE.

A NEATLY got-up catalogue now being issued by the Willesden Paper and Canvas Works Company, Ltd., of Willesden Junction, gives numerous illustrations in detail of the numerous applications and uses to which the various well-known manufactures of the firm can be advantageously applied.

TRADE NOTES.

THE Closeburn red freestone from the Scottish Freestone Quarries, Thornhill, Dumfriesshire, for which Mr. F. H. Brook, of 11 Queen Victoria Street, E.C., is the sole agent, is a high-quality building stone which has a well-established reputation in the north, but is as yet new to the London trade. This stone stands well among chemical works and other trying atmospheric conditions in Lancashire, Glasgow and elsewhere. Its crushing strain is 500 tons per square foot.

MESSRS. MELLOWES & CO, LTD., of Sheffield and London, have in hand the orders for the glazing on their imperishable "Eclipse" system the roofs of the following buildings:—New Midland station, Sheffield; three sub-stations for the Underground Electric Railways, London; erecting shop, Marshall, Sons & Co., Ltd., Gainsboro; Heysham Harbour goods shed, Midland Railway; Covent Garden Foreign Flower Market; Central Station extensions, Glasgow; new fitting shop for Head, Wrightson & Co., Thornaby-on-Tees; new shops, Metropolitan Railway & Carriage Company, Ltd, Birmingham; new shops, Greening & Sons, Warrington; Queen's Road carsheds, Sheffield Corporation; Woodford station, Great Central Railway; extensions, British Westinghouse Company, Ltd, Manchester.

ELECTRIC NOTES.

A BILL has been deposited in the Private Bill Office of the House of Commons for the purpose of obtaining sanction to a scheme for the construction of an electric railway under the Thames between North and South Woolwich. The proposed railway will be just over three-quarters of a mile in length, and will commence in North Woolwich at a point near Francis Street, and will terminate in South Woolwich near Beresford Street.

At a meeting of the Swinton and Pendlebury District Council, held on the 14th inst., the tramways and electricity committee reported that instructions had been given to the clerk to communicate with the Salford Corporation and the Lancashire Tramways Company to ascertain the most favourable terms upon which a supply of electricity in bulk could be obtained by the Council. On the question of the electric supply of the district a deputation from the Swinton and Pendlebury Ratepayers' Association had a private interview with the Council at the close of the ordinary business.

THE waterworks committee of the Manchester Corporation recently went to the city waterworks at Longdendale, and inspected the Bottoms reservoir and the gauge basin through which flows the compensation water before it passes into the river Etherow. The committee have under consideration a scheme for utilising the force of the flow of water so that their workshops in proximity may be driven and lighted by electricity. It is also proposed to work by overhead traction the private railway belonging to the city which runs along by the reservoirs to a large stone quarry on the estate, and thus to develop the quarry.

MR. ARTHUR WRIGHT, electrical expert to the Marylebone Borough Council, has sent a letter to the Mayor expressing his willingness to be remunerated in connection with the local electric-lighting scheme solely by a percentage of the "actual" annual profits made after the Borough Council's own generating station is in full working order. The Bill which the Council are promoting to enable them to borrow in order to comply with the award of 1,212,000*l* in respect of the Metropolitan Electric Supply Company's Marylebone property and goodwill and other claims yet remains to be approved or disapproved by the ratepayers. Meanwhile Mr. Justice Buckley's order against the Council for the payment of 60,000*l*. to the company by the 31st of next month on account of capital expenditure is to be met by an overdraft at the Council's bankers. Negotiations are pending with the company with a view to ascertaining on what terms and conditions they will release the Council from their bargain.

MR. T. F. CHEATLE (chairman) presided at a recent meeting of the Tamworth Rural District Council. The notice was considered of the intention of the Tamworth Corporation to apply to the Board of Trade for a provisional order authorising the supply of electrical energy within certain parts of the rural district, and application for the Rural District

CATHEDRAL SERIES.—EXETER: HIGH ALTAR AND SEDILIA.

Council's consent to the granting of such provisional order, and the waiver of the notice required by the Electric Lighting Act, 1882, to be given to the Council. A resolution of the Bolehall and Glascote Parish Council was read in opposition to the granting of the order. The vice-chairman (Rev. W. MacGregor) moved that the Council assent to the waiver of notice, and pointed out that they did not want to upset the Corporation. In the meantime a committee might consider whether they should oppose the scheme wholly or in part. The reason Bolehall and Glascote Parish Council decided to oppose those powers was because at present they had no proof that the Tamworth Town Council would supply them with electric power and light. As soon as they got an undertaking from the Corporation that they would supply them in a reasonable time they would withdraw their opposition.

THE third sessional meeting of the Insurance Society of Edinburgh was held in the Faculty of Actuaries' Hall, George Street, on the 15th inst., when Mr. Henry R. L. Burn, of the North British and Mercantile Insurance Company, read a paper on "Electric Light Supply and Precautions against Fire." The president of the Society, Mr. David Deuchar, occupied the chair, and there was a good attendance. In the course of an interesting paper Mr. Burn traced in a practical manner an installation from the mains, through the wiring, to the lamps, radiators and motors. Overhead wires, he said, were a source of danger, and with regard to the incandescent lamps, he said care must be exercised in placing them near combustible materials. In warehouses, &c., wire guards should be placed over them. He had seen them placed on the top of goods in shop windows, and it might be advantageous if in fire policies a restriction was made that they should not be put nearer the goods than 3 inches, especially if the goods were cotton. He emphasised the necessity of installations of electricity being carried out by

first-rate firms, for if they were to believe the assessors' reports, "scamping" must be accountable for many of the fires, as they found it reported that the cause of fire in many cases was through defective installation. In conclusion, Mr. Burn gave particulars of losses which had been incurred by fires, many of which had peculiar origins. In one case, he mentioned that owing to the wind swaying a ball lamp the coil became frayed, and damage to the extent of 8% was done. He cited a case in which 1,400% damage had been done to a church, and stated that buildings which were not frequently tenanted should be fitted with some automatic arrangement which would give warning when necessary. Mr. Burn was cordially thanked for his address, which was illustrated by limelight views.

VARIETIES.

ST. PAUL'S CHURCH, Dorking, has just been restored and renovated at a cost of 1,600%.

THE new chapel at Lings, North Wingfield, has been formally opened. It is a Gothic structure 56 feet 6 inches long, 36 feet 6 inches wide, with minister's vestry and choir vestry and a choir gallery. The seating is of pitch pine, the windows are of stained glass, and the accommodation is for 400 persons. The chapel was estimated to cost 1,350%.

A NEW illustrated booklet, issued by the Brighton Railway Company, entitled, "The Riviera and Italy for a 10% Note," describes a series of new tours, including the Mediterranean health resorts from Marseilles to Genoa, the chief Italian cities and Italian lakes, and shows how inexpensively and easily these tours can be made by the improved express services *via* Newhaven, Dieppe and Paris.

A WING which has recently been added to Govan municipal buildings was opened on the 11th inst. The new premises, which have been erected at a cost of between 6,000% and 7,000%, include buffet, smoking-rooms and retiring-rooms for the large and lesser town halls, a large committee-room for the use of the Council, and offices for the Public Health Department, with a bacteriological room.

At the Westminster Roman Catholic Cathedral on the 16th inst., the great crucifix which will hang over the chancel was placed in position. The crucifix, which was blessed by

Patent Interlocking Rubber Tiling.

ARTHUR L. GIBSON & COMPANY

(The B. & S. FOLDING GATE CO.),

19, 20 & 21 TOWER STREET,

UPPER ST. MARTIN'S LANE,

LONDON, W.C.

Provost Johnson on Sunday morning, measures 30 feet by 22 feet. It is gilded and has been built abroad of teak and mahogany. The figure of Christ, painted on canvas by Mr. C. Symons, is stretched on the front of the cross, while the figures of the four evangelists are placed at the corners. On the back is a representation of the Virgin Mary. Over three hours were occupied in raising the cross to the chains and hooks by which it is suspended from the chancel arch.

AN alarming subsidence took place recently at the railway station, Motherwell, Lanarkshire. While one of the railway porters was pushing a barrow along the platform a hole sufficient to bury both suddenly opened up on the platform, causing great alarm and uneasiness on the part of the officials. The alarm is all the greater on account of the subsidence being within two yards of the main Caledonian line between Glasgow and London, over which fast express trains pass at frequent intervals. The railway officials are arranging a series of excavations to ascertain the cause of the subsidence, although it is supposed to be due to a coal mine in the vicinity.

A MEETING of the Edinburgh Architectural Association was held on the 16th inst. at 117 George Street, Mr. A. H. Crawford, F.R.I.B.A., president, in the chair. Mr. W. E. Snell, of the Garden Association, read a paper on "The Objects of the Garden City Association." Mr. Snell, in the course of his remarks, pointed out that migration to new towns would relieve the congestion in the old, and that in the garden city, which would be planned scientifically from the first, there would be cheap sites and space for gardens and farms. The garden city would give opportunities for the revival of agriculture, and would also afford healthy recreation in connection with the problems of drink and gambling. The lecture was beautifully illustrated with lantern slides, and at the close Mr. Snell was awarded the hearty thanks of the meeting.

On the 19th inst. the Rev. Canon Davenport-Kelly preached at Davyholme Church (St. Mary's), when a special service was held for the dedication and unveiling of a new reredos which has just been erected in the church. The Canon's text was from I. Kings, vii. 27, ["But will God indeed dwell on the earth?"] The reredos, which was duly unveiled, has been erected at a cost of over 100*l*., the money being part of a legacy left to the Rev. T. D. Harland (vicar) for church use. The reredos, which stands above a bordering of new Alderley stone, is of solid English oak and weighs about 1½ tons. The carving, which is beautifully executed, is by Mr. Long, of

Manchester. The carved figure in the centre represents Christ, and on His left are the figures of St. Mark and St. John, while St. Matthew and St. Luke are on the right. These carvings are surmounted by the words, in bold letters, "Till He Come." In front of the reredos is a detached cross and small pedestal of black oak, which is beautifully carved.

BUILDING AND BUILDERS.

AN inquest was held on Monday last by Mr. Troutbeck on the body of William Hoad, fifty-nine, of Battersea. A large dome is being built over Harrod's Stores in the Brompton Road, and deceased was working there as a scaffolder. On Friday morning he was sitting astride a girder, 28 feet above the roof, lashing a number of planks together, when he slipped and fell to the roof, striking another girder in his descent. The jury returned a verdict of "Accidental death."

THE Central Railway station, Glasgow, was lately the scene of a terrible accident resulting in the death of three men and the serious injury of another. The accident took place at the extensions at present under construction on the south side of Argyll Street and immediately over Ann Street. Much of the girderwork of the new station has already been put into position and a large number of rivetters are employed in carrying out the operations. A platform erected at a height of 50 feet on the girderwork collapsed and four persons employed on it were precipitated to the level of the platform. One of the men expired shortly after the accident; the other three men were conveyed to the Royal Infirmary.

THE foundation-stone of the new Roman Catholic church which is being erected in Newbigging, Musselburgh, adjoining the present meeting-place of the congregation, was laid on the 11th inst. The plans of the new structure, which will be dedicated to Our Lady of Loretto, were prepared by Mr. Archibald Macpherson, architect, 7 Young Street, Edinburgh. The church will be cruciform, and will embrace, besides nave and chancel, a double porch and baptistery at the conventional west end, which is actually the east end, and nearest to the street. The transepts are shallow and divided from the nave by double arcades. One of the transepts forms the lady chapel. Two sacristies and sacristy hall are placed between the church and the presbytery or priest's house which adjoins it; over the sacristies are the organ loft and choir gallery.

At St. Mary's Hall, Coventry, Mr. W. A. Ducat, Local Government Board inspector, held an inquiry on Friday last on the Coventry Corporation's application to borrow 2,137/6 for the purpose of private street works in an old road known as Brick Kiln Lane, and 2,130/6 for other public improvements. The town clerk said it could hardly be said how old Brick Kiln Lane was, but it appeared to have been made at a time when people built at their own sweet will. Until recently the lane might have been said to lead to nowhere, but a scheme is going through for laying out a number of streets, and Brick Kiln Lane would probably ere long form a through route of some importance. It was proposed to take advantage of the Private Street Works Act for the owners of the property in the road to contribute towards the cost of the work. There was no opposition to the application.

The tender of Mr. A. Cliff, of Evesham, has been accepted for additions and alterations to The Den, Cropthorne, the picturesque residence of Mr. H. H. Avery, from designs by Mr. Drinkwater Butt, F.R.P.S., of Gower Street and Kensington. This pleasant country house, situated on high ground and commanding fine views over the river Avon, was originally a group of half-timber cottages of great age which were made into one house by the late eminent surgeon, Sir Lawson Tait. Since passing into the hands of Mr. Avery further improvements have been made to the property, under the direction of Mr. Edwin Lutyens and Mr. Drinkwater Butt, the former adding a quaint sunk garden and sun-dial, and the latter restoring the leaded lights to the windows, and being now responsible for the new gables, &c. In the whole of the work the greatest care has been taken to preserve the old work and make the new in harmony with it.

The annual supper of the members of the Edinburgh and North Wales Building Trades Employers' Federation was held in the Royal British hotel, Princes Street, on the 18th inst. Mr. D. W. Kemp, J.P., presided over a gathering of about 150. The vice-presidents were Messrs. Donald Macpherson, Thomas M. Tait and John Thomson. The Chairman referred to the great loss which the craft had sustained by the death of Councillor Purves, and expressed the hope that the younger men who were coming up would prove of as sterling worth as the friend whose loss they all mourned. Convener Barton, replying to the toast of "The Plumbing Trade," which was proposed by Mr. Donald Macpherson, also referred to the death of Mr. Purves, and remarked that no more self-denying man sat in the Town

Council than the late Councillor Purves. He was a man who had no axe to grind, and did a deal of good work for the city of Edinburgh. With regard to the plumbing trade, he observed that it, like most of the trades connected with building, had not such a bright spring before it as they had hitherto been accustomed to. They had weathered through such occasions before and he thought they should weather that one also. Other toasts followed.

MASTER BUILDERS' DINNER.

The third annual dinner in connection with the Lancashire, Cheshire and North Wales Building Trades Employers' Federation took place in the civic banqueting-room at the town hall, Bolton, on the 16th inst., the company numbering about seventy, under the chairmanship of Mr. T. H. Ketter, of Preston (president of the Federation), who was supported by Messrs. H. Lever (Liverpool) and J. Hamilton (Altrincham), vice-presidents.

Mr. George Macfarlane (Manchester) submitted "The Town and Trade of Bolton." He remarked that he was an old resident of this town, to which he came in 1860, remaining here three years. In spite of many drawbacks the town of Bolton had made wonderful progress, proof of which was afforded by the magnificent building in which they were then assembled (the town hall) and other palatial structures; besides which, after waiting for so many years, they were going to have a really grand and commodious railway station. Bolton had increased in population from 89,739 in 1861 to 168,215 in 1901. It was ahead of Oldham in this respect, but the latter town was better organised as regarded their Builders' Association, and that was one thing why he wished Bolton would take a leaf out of Oldham's book. In proposing the toast of "The Town and Trade of Bolton," the speaker added, "and may there be plenty of cheap cotton."

Mr. John Dickinson, in responding, said he was very much pleased at hearing Mr. Macfarlane's reference to his old connection with Bolton; but his (Mr. Dickinson's) residence in it began earlier and had continued longer. He came in 1853, and could well remember the fine market hall being built. He thought that they were a successful town and people in Bolton. They spun, he believed, the finest yarns of any place in England; many of their cotton mills had worked full time all through the recent long depression on account of short supplies

of the raw material, and some of the employers had made handsome profits. In the engineering industry, too, the town held a very high position indeed; but he was sorry to say that the only trade which was not successful was the building trade.

"The Lancashire, Cheshire and North Wales Building Trades Employers' Federation" was proposed by Mr. W. Townson, who said he thought it would be found that the wages paid in Bolton in the building trade had been at "the top of the tree" for some years; and it was necessary that the employers should have a very strong organisation. He spoke in complimentary terms of the sacrifices both of time and money made by the officials of the Federation in their work of promoting unity.

The toast was acknowledged by Mr. Samuel Smethurst, of Oldham, who said that the Federation was making great progress. He was glad to hear that such good wages were paid in Bolton; he considered that it was to their mutual interest for good wages to be paid, but it was also important that there should be strong combination among the employers.

Mr. C. Tomkinson (Liverpool) proposed "The Bolton Master Builders' Association," incidentally mentioning that his father erected the Bolton market hall, and he had reason to be proud of the town in that respect.

After the chairman (Mr. Kellet) had remarked that Bolton was one of the pioneers of the federation of the building trades, and he hoped increased efforts would be put forth to extend the local organisation,

Mr. B. Talbot, in responding, said that they had heard some candid critics of the Bolton Master Builders' Association that evening, but they were doing their best to support the Federation in every possible way. They were soldiers, not statesmen, but he did not think they were treated with sufficient consideration by the local authorities. On one occasion a deputation from their Association were snubbed by a sub-committee of the Corporation, and he advocated additional representation of the building trade on public bodies. They employed between 4,000 and 5,000 workmen, and paid from 6,000*l.* to 7,000*l.* per week in wages, so he considered their Association was entitled to some consideration.

The last toast was "The President and Officers of the Federation," which was proposed by Mr. J. E. Tinline (Bury), and responded to by Mr. A. Matthews (Manchester), a member of the Executive.

Considerable enjoyment was infused in the reunion by a

well-arranged and choice musical programme. Solos, duets and quartettes were ably rendered by Mr. Marsh's male voice quartette party; Mr. Stanley Jackson contributed sundry humorous sketches in his usual racy style; and Mr. W. Townson sang "The Longshoreman." Mr. Herbert M. Shorrocks presided at the pianoforte efficiently. "Auld lang syne" and the National Anthem were joined in at the close.

DRAINAGE WORKS AT OPORTO.

A CORRESPONDENT of the *Times* writes from Oporto:—A contract for works which should exercise great influence for good on the future of this town has just been concluded between the municipality and Messrs. Hughes & Lancaster, of Westminster. These works comprise the complete drainage of Oporto on the separate system. The town is beautifully situated on the steep northern bank of the Douro, which allows of its being drained mostly by gravitation. The decree of the Portuguese Minister for the Home Office lays proper stress upon the necessity of having all properties in the town properly connected with the new drainage system as soon as it is carried out. This constitutes an important feature, and affords good evidence that, although the municipality and the Government authorities took a long time (about seven years), their determination to have it carried out is coupled with an intention to make it practically effective. It will take the contractors some years to complete the entire works, but they have undertaken to complete the main works in the town within four years from the date of the signature of the contract.

THE Kirkintilloch Town Council have resolved upon the site to be acquired for the proposed town hall and municipal buildings, for which they have in hand a sum of 4,000*l.*, collected by public subscription. The site to be purchased is in the centre of the business part of the town, with a frontage to Cowgate and Union Street. It is proposed to erect municipal buildings facing Cowgate, having departmental offices on the ground floor and a council chamber above. Behind this building will be the halls, having access both from Cowgate and Union Street.

SAM DEARDS'S PATENT NEW GLAZING BAR."

S Deards's lead-covered steel glazing bars are now being extensively used, the following facts should claim the attention of architects, surveyors and engineers, as the steel bar is very light and strong, being constructed to carry a length of glass up to 11 feet without support, and in covering this bar with lead the process used is such as to ensure a uniform thickness. Some glazing bars that are now in the market are very irregular,

to the Cape of Good Hope, Mexico and Brazil, and these have been fixed by local men or natives. The simplicity of fixing also calls for commendation. There are no nuts, bolts, screws or packing of any kind, and after the steel bar is fixed in its place the squares of glass are dropped in, the lead cap is then fixed on to the bar and with a pair of special nippers the lead is closed into the counter-sunk holes, and all is fast and secure. By the use of the self-locking bar all drilling of holes in purlins, plates and ridge is avoided, as a slot is made in the top and bottom of the web of the bar, which is on the underside (see illustration), and this allows of all glass and bars being slid in and firmly held, allowing for expansion; the slot being some 1 inch or 1 1/4 inch deep allows plenty of room for any irregularity. The patentee has, we are informed, made and supplied many thousands of feet of this bar to the Admiralty, War Office, and the Governments. The bars can be enamelled any colour, galvanised or lead covered.

THE new police buildings, which have been erected at Kirkcaldy, N.B., at a cost of between 20,000l. and 25,000l., are now completed and taken over by the police authorities. They face St. Brycedale Avenue, and form one side of the new street between St. Brycedale Avenue and Hunter Street. The main entrance is from St. Brycedale Avenue, and passing through a vestibule lined and floored with marble a wide corridor is reached, with Barrhead stone pillars supporting the roof. From this corridor entrance is gained to the rooms occupied by the various officials. A wide stairway, with solid walnut banisters, leads to the court-room, which is a large hall, panelled to a height of 8 feet, the roof being of fibrous plaster of very fine design. On the same flat is a fully-equipped gymnasium for the policemen, also a fine reading-room and library. The prison quarters are behind the main building. In one wing there are 18 cells for male prisoners, the cells being on two flats, the upper part being reached by an iron stairway and overhead iron passage. In the female section there are 9 cells. Each of the cells is fitted with an electric bell, which rings in the charge-room, a semaphore falling to show the officer which of the prisoners requires his attention. At the rear of the buildings are exercise-yards for both male and female prisoners. The buildings are lighted throughout with electricity. Mr. William Williamson, Kirkcaldy, was architect for the works.

and, if examined, it is easy to see that parts of the steel bars are barely covered with the lead, but in the bar in question it is claimed that there is complete uniformity, and in addition to this an improvement is made, i.e. all lead-covered bars which have the wings cast on them are liable to damage by their being torn off, and in cases of repair broken away from the bar, it being difficult to make them good again; while in Sam Deards's bar the lead cap forms a separate part, and can be easily renewed by any handy-man. This improvement is valuable, especially when the bars are exported. Some thousands of feet have been sent

FINE CRUSHING ROLLS.

WE illustrate in this issue a new type of fine crusher, which is being made and put on the market by Goodwin, Barsby & Co., of St. Margaret's Ironworks, Leicester. The machine is styled by the firm as their "patent high-speed fine crushing rolls," and is illustrated, described, and priced on their new list F, which now forms part of their complete catalogue. This machine is now being inquired for, and sold freely to corporations and other public bodies and contractors for the fine crushing of slag or limestone chippings used in the manufacture of tar macadam; also for crushing granite chippings and destructor clinker for concrete slab-making; and, further, for crushing sandstone to sand for building and filtering purposes, and for crushing flints and gravel to pass finer meshes for sanding streets or for racking in paving

and setts. These fine crushing rolls having only one pair of rolls, are, of course, intended mainly for working in conjunction with the patent "Acme" or any other stone breaker, when these latter machines have previously broken the material down to pass about $1\frac{1}{2}$ -inch riddle. The rolls are then used to make a further reduction to $\frac{1}{2}$ -inch and less. Screens and elevators can be used to automatically deal with the material after leaving the rolls. The design and construction of the machine are of the greatest simplicity. The frame is sectional, and is composed of steel tie-bars, and is so built that it is perfectly rigid, and capable of working continually under the greatest strain.

Each roller is direct driven by belt running on a pulley heavy enough to give adequate momentum; in driving by this means tooth-gearing is dispensed with, and much risk as well as wear and tear is saved. Springs of sufficient strength are

itted behind the movable roller to relieve the frame bars of undue strain in case of accident; in fact, pieces of iron may be put through the machine in course of testing in order to illustrate the working of the relief springs. The adjustment to take up the wear on the rollers is also made through these springs. Each bearing is accurately machined and fitted with gun-metal or phosphor-bronze brasses, the protection of which is made a very special point of, being cased at each end with dust-proof caps. The roller shells are deeply chilled and are made of a special mixture of high-grade iron. The shells are secured to the shafts by an improved and approved method, which prevents them slipping or getting loose. Patent automatic feed is provided to give a steady and continuous stream of the material to be crushed across the whole face of the rolls. Another important machine is the improved geared stone-breaker or cubing-mill. This machine is intended to deal with granite for macadam, where the material is of such a nature that it will not break cubically in a breaker on the jaw principle.

THE INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting on Tuesday, December 15, Sir William H. White, K.C.B., president, in the chair, two papers were read, namely, "Deposits in Pipes and other Channels conveying Potable Water," by Professor J. Campbell Brown, D.Sc.; and "The Purification of Water highly charged with Vegetable Matter, with special reference to the effect of Aeration," by Osbert Chadwick, C.M.G., M.Inst.C.E., and Bertram Blount, Assoc.Inst.C.E.

The first paper dealt with three classes of deposits:—(1) Incrustations on iron pipes; their source, causes and remedy. (2) Growths, more or less slimy, on inner surfaces of pipes and culverts and tunnels; their varieties, nature, composition and causes; also the composition of waters which produce different kinds of growths. (3) Loose deposits.

Analyses were given of incrustations on iron pipes and analyses of different kinds of waters were quoted, showing that these incrustations were due to oxidation of the iron of the pipes, whether widespread or in nodules, and that they were not limited to acid waters, but were common to acid, alkaline

and neutral waters. The remedy was briefly discussed, in the light of recent experiments as well as earlier observations.

Growths or deposits on the inner surface of pipes were of two kinds:—(a) Deposits of carbonates of alkaline earths from calcareous waters; (b) black slimy deposits from the top, bottom and sides of pipes and other channels conveying certain waters, chiefly from Welsh sources. Investigations were recorded and detailed evidence was adduced showing that these slimy deposits were produced by gelatinous and filamentous iron organisms which grew and extracted iron from the water and died at one end while they grew at the other. Solid rock particles were entangled in this slime, and binoxide of manganese was deposited by chemical action, and this also was entangled in the mass of the gelatinous iron-organisms. Analyses were given of waters which did, and a variety of waters which did not, support the growth of this slime, and deductions were drawn as to the constituents of the waters on which these growths depended. Experiments were described, undertaken with the view of ascertaining the conditions favourable to the growth and the conditions which would prevent the multiplication of these organisms and the growth of the slime. Microphotographs were given of these growths at different stages, and the results of the experiments were described and discussed in order to arrive at a correct theory and so at a practical result.

The second paper treated of the nature of tropical waters collected in regions free from ordinary sources of contamination, but containing large quantities of dissolved vegetable matter. These waters, wherever their place of origin, presented a great similarity of composition, samples from Mauritius, the West Coast of Africa, Uganda and the West Indies having the same characteristics. In all cases contamination was caused by the water remaining stagnant or flowing slowly through regions rich in vegetation, which by its decay produced a large quantity of vegetable debris absorbable by the water. Pure tropical waters might be obtained even from a district densely covered with vegetation, provided that the flow was sufficiently rapid.

The purification of waters of this class was very difficult. The authors had found by experiment that treatment with iron was generally efficacious, but the treatment must be more thorough than was necessary with ordinary water supplies. The peculiar character of these waters charged with vegetable matters rendered the removal of the iron difficult; casual aeration by fountains or cascades was insufficient. Systematic

aeration, so as to insure an abundant supply of oxygen, was requisite.

Various methods had been tried, and finally an apparatus had been devised in which the water was caused to flow through perforated plates, emerging in streams of small diameter and exposing so large a surface per unit volume of liquid that rapid absorption of oxygen from the air was made certain. It was found that, if the water was delivered at or above a certain critical head, the streams of liquid remain distinct, and if they were caused to coalesce by some temporary disturbing influence, such as a gust of wind, they resumed their position and individuality as soon as the disturbing influence had subsided. The use of this critical head was essential for the proper working of the apparatus and for the satisfactory aeration of the water.

Plant designed on this principle had been erected to purify the water-supply at Mauritius and in Uganda; the method had sufficed to change water so loaded with vegetable matter as to be almost unpotable into a drinking-water of excellent quality. An account was given of the waterworks at Mare aux Vacoas in Mauritius, and of the various improvements in the mode of purification which had been effected from time to time. The principle of aeration had also been usefully applied at Singapore by means of intermittent filtration, but the authors held that the systematic process described above was preferable on account of its certainty and compactness. They considered that by this means it was practicable to purify difficult tropical waters so as to obtain a satisfactory supply without excessive cost or difficulty of working.

SOCIETY OF ENGINEERS.

THE forty-ninth annual general meeting of the Society of Engineers was held on Monday, December 14, at the offices of the Society, 17 Victoria Street, Westminster.

The chair was occupied by Mr. J. Patten Barber, president. The following gentlemen were duly elected by ballot as the Council and officers for 1904, viz.:—As president, Mr. David Butler Butler; as vice-presidents, Messrs. Nicholas James West, Maurice Wilson and Richard St. George Moore; as ordinary members of Council, Messrs. Joseph Bernays, George Austin Pryce Cuxson, George Abraham Goodwin, William Henry Holtum, Henry Sherley-Price, Edward John Silcock,

Joseph William Wilson and George Green; as honorary secretary and treasurer, Mr. George Burt; as honorary auditor, Mr. Samuel Wood, F.C.A.

The President announced that the following premiums had been awarded by the Council for papers read during the past session, viz.:—The President's gold medal to Mr. Douglas Mackenzie for his paper on "Motor Transport for Goods;" the Bessemer premium of books to Mr. Robert J. Thomas for his paper on "Road Maintenance and Administration;" and a Society's premium of books to Mr. Albert Gay for his paper on "Mechanical Stokers for Electricity Generating Stations."

A vote of thanks was accorded to the scrutineers, and the proceedings terminated by a vote of thanks to the President, Council and officers for 1903, which was duly acknowledged.

The forty-ninth annual dinner of the Society was held at the Hôtel Cecil on the 16th inst., Mr. J. Patten Barber, president, occupying the chair. Among those present were:—Mr. D. B. Butler (president elect), Mr. W. H. M. Christie (Astronomer Royal), Colonel Yorke, R.E., Captain Walter Wood, Mr. A. T. Walmisley (Mayor of Dover), Mr. G. Burt (hon. secretary and treasurer), Mr. C. Crole-Rees, Mr. J. H. Wicksteed (President of the Institution of Mechanical Engineers), Mr. R. K. Gray (President of the Institution of Electrical Engineers), Mr. A. Siemens, Mr. W. F. Dewey, Mr. A. Towers, Dr. A. E. Harris, Mr. J. R. Leggatt, Mr. W. Galton, Mr. D. McMonnies, Mr. Ambrose Jones, Mr. A. S. E. Ackerman and Mr. Perry Nursey (secretary), &c. The loyal toasts having been cordially honoured,

The President proposed "The Imperial Forces of the Crown," Captain W. Wood responding.

Mr. W. H. M. Christie, in giving "The Society of Engineers," said he thought every astronomer should be an engineer. Speaking as an astronomer, he could say they felt very grateful to the engineers for all they had done for the advancement of astronomy. Many astronomers, and most of the able ones, had been engineers. As regarded astronomy, they were struck by the great advance made in America, where the whole science seemed to be monopolised. That was very largely due to the way in which the Americans utilised the engineers; their modern astronomical instruments were really engineering manufactures. The Americans had rather gone ahead, he was sorry to say, of English astronomers, the reason being that they had been able to get large funds. Unfor-

inately in this country it was difficult to get money for science efficient to deal with those costly engineering works necessary for the advancement of the present day. Everybody in the country was indebted to the Society of Engineers, which was looked upon as the nursery of engineers essentially.

The President, in replying, said that the highest compliment that could be paid to them was that they had been useful to other scientific men, and particularly to a body of such magnitude and importance as astronomers. One great advantage of the Society was that those who were young in the profession might meet with those who were older and had had greater experience. The Society's meetings offered an opportunity for such men to become acquainted, and to get advice and information with respect to the various subjects with which they had, as engineers, to deal. It was part of their duty as engineers to see that our cities and places where there were large populations were supplied with an ample amount of the purest water. They also had before them the problem of obtaining cheap and rapid means of transit from the centres of population to the less thickly populated districts outside. Another matter they had to deal with was the efficient purification of sewage; also the question of the more economical consumption of fuel, and getting from the fuel a greater amount of heat, and utilising it more than they could at the present time. There was also to be considered by them the problem of getting greater efficiency from engines. With regard to all these problems they hoped, if not to solve them entirely, at any rate to get nearer the truth by constant study and observation, and contributing the facts and truths which they had learnt by study and observation to the general fund of knowledge, so that others might carry on the investigations further than they had done. In conclusion, he said their society was in a condition of very great prosperity.

Mr. D. B. Butler submitted the toast of "Kindred Institutions," Mr. J. H. Wicksteed and Mr. R. K. Gray replying.

The final toast, "Our Guests," given by the vice-president Mr. Maurice Wilson), was acknowledged by Mr. W. F. Dewey.

THE PLUMBERS' REGISTRATION BILL.

THE Plumbers' Registration Bill that passed the House of Lords in 1902 but failed, in the hands of a private member, to pass the House of Commons, has the full approval of the Local Government Board. It provides for the constitution of

a Council composed of fourteen members nominated by the following bodies:—Three by the Local Government Board, two by the Association of County Councils, two by the Association of Municipal Corporations, two by the National Association of Master Plumbers, two by the National Association of Operative Plumbers, one by the Royal Institute of British Architects, one by the City and Guilds of London Institute, one by the Worshipful Company of Plumbers, to frame a scheme for the registration of plumbers, such scheme to be approved by the Local Government Board and confirmed by Parliament. The chief object of the Bill is to afford additional safeguards to the public health by encouraging the better training of plumbers, and by enabling persons employing plumbers to select, if they wish to do so, workmen who have given evidence of their qualification to carry out satisfactorily work in connection with sanitation and the public water-supply. The Bill does not contemplate any monopoly, and does not in any way interfere with the rights of non-registered plumbers. It does, however, prohibit such plumbers from representing themselves to be registered. It is to be particularly noticed that any scheme framed by the Council is subject to the approval of the Local Government Board and confirmation by Parliament. Therefore, any scheme to receive such approval and confirmation must necessarily insure that all trade interests, as well as all public interests, must be fully and fairly safeguarded.

LEEDS NEW PUBLIC LIBRARY.

THE new branch library at Holbeck was recently opened by the Lord Mayor of Leeds. The building, which occupies a site at the corner of Nineveh Road and Marshall Street, has been erected under the superintendence of the architect, Mr. William Bakewell, of Leeds, whose design was selected by the assessor, Mr. Leonard Stokes, from those submitted in competition. The perspective view was exhibited at the Royal Academy Exhibition of 1902.

The exterior is faced with Accrington bricks and dressings of terra-cotta; the roofs are slated with green Westmoreland slates, and the building generally is of fireproof construction. The whole of the floors are laid in wood-blocks and marble mosaic, and the walls of the public rooms are lined with a dado of glazed tiles.

The accommodation provided consists on the ground floor

HIGHEST AWARDS AT EVERY EXHIBITION.

The simplicity, freedom from complication, and efficiency has caused this system to be universally adopted, while its cleanliness and saving of time, effected by the instantaneous discharge, is greatly appreciated. The deposit left round the plug hole basins is not only objectionable, but is considered by medical men to be too often the means of communicating disease.

This system has been adopted in Buckingham Palace, Windsor Castle, Marlborough House, and in the Residences of Royalty, the Nobility and Gentry, the principal Clubs, Hotels, Schools, &c, throughout the world, and as a guarantee of efficiency bears the name and address of the Patentee.

PARTICULARS ON APPLICATION.

of large reading-room, lending library, ladies' room and librarian's room. The juveniles' room is situate on the lower ground floor, together with the usual offices, &c. The irregular lines of the site on the north and east sides presented some difficulty in obtaining regular shaped rooms; this has been overcome in the large reading-room by an arrangement of piers, which also enables the adoption of cross-lighting and ventilation by means of clerestory windows. At the east end a street improvement has been effected by the semicircular ladies' room, and thereby widening the somewhat congested approach to Marshall Street. The principal reading-room is a lofty apartment, being 26 feet 6 inches from the floor to the crown of the waggon roof, with a view to securing an ample volume of air, and preventing the vitiated condition of the atmosphere that generally exists in a public reading-room. The turret is utilised for a ventilating fan, connected by means of trunks and tubes with the various rooms. The fittings generally have been arranged on lines laid down by the chief librarian for the purpose of effective supervision, and are executed in teak and oak. The building has been erected by Messrs. Armitage & Hodgson, contractors, Leeds, whose tender for the whole of the trades was accepted by the City Council.

AMERICAN TRADE DISPUTES.

A LAW has been passed in Alabama against boycotting, which exceeds in stringency that of any other State, and its favourable working may lead to similar enactments in other industrial States.

The measure has been signed by Governor Jelks. It was drawn and championed by the Citizens' Alliance of Birmingham, Alabama's chief manufacturing centre, and the seat of most of its strikes and labour disturbances. The aim avowed by its authors was "to promote the stability of business and the steady employment of labour, whether organised or unorganised." The new law forbids two or more persons to conspire together for the purpose of preventing any person, persons, firm or corporation from carrying on any lawful business within the State of Alabama. It prohibits "picketing" the place of business of any person, firm or corporation, or loitering about any such place of business "for the purpose of influencing or inducing others not to trade with, buy from, sell to or have business dealings with such person, firm

or corporation." The new law makes illegal the printing or circulating of boycott notices, cards, stickers or dodgers, or of black lists putting a ban on any persons engaged in lawful business or on any judicial officer or other public official because of his lawful official acts. It proscribes the publication or maintenance by any employer of a labour black list, or the use of such a black list to prevent any person or persons from obtaining employment. Offences against the anti-boycott law are to be punishable by fines of from 50 to 500 dollars, or by imprisonment at hard labour for sixty days.

Such legislation as this would do much to clip the wings of labour agitators and prevent the disturbances everywhere attendant on labour struggles.

LONDON COUNTY COUNCIL WORKS DEPARTMENT.

THE half-yearly report of works completed during the six months ended September 30 last has been prepared by the works committee of the London County Council. It is stated that the first table contains the accounts for twenty works completed in the half-year in respect of which complete specifications and bills of quantities had been prepared. The total cost of the works included in the statement does not represent the turnover of the department, because much of the expenditure on these works occurred before the half-year in question, while, on the other hand, much of the expenditure during the six months was upon works still unfinished. The approximate expenditure on works executed by the department during the half-year was 187,000/. They are glad to be in a position to state that the net result of the execution of the works included in the statement is a balance of cost below final certificate of 25,853/, or about 11.114 per cent. on the total of the final certificates, and that 19 out of the 20 works have been carried out at a cost below final estimate. They are, moreover, of opinion that in the case of two of the works the balance of cost below final certificate would have been greater but for circumstances quite beyond their control. They desire to direct attention to the fact that while the total of the accepted estimates for seventeen of the works was 219,873/, the total of the final certificates for these works was 185,823/. The only excess of cost over final certificate was in respect of the construction of a band-stand at

Horniman Gardens, the amount of such excess being 31%. The number of works in respect of which full specifications, bills of quantity, &c., have been prepared, and which have been referred to the committee for execution and not yet included in the half-yearly statements of completed works submitted to the Council is thirty-six, representing an estimated expenditure of approximately 941,000/. In the case of the construction of the relief sewer from the southern high-level sewer extension at Balham High Road the sum of 5,940/. voted for the work may be exceeded, but that was the only work on which at present they anticipate an excess. Included in one of the statements is the account for the erection of the first portion of the Clapham car-sheds, which was referred to them for execution without any estimates being prepared by the architect for purposes of comparison, the tramways account being debited with the actual cost of the work. It is to be remembered, they state, that this work was referred to the department for execution under peculiar and special circumstances, the highways committee reporting that it was essential that the car-sheds should be put in hand without the delay which the preparation beforehand of specifications and bills of quantities would entail. They would draw the attention of the Council to the expression of opinion contained in the report of the highways committee that one of the advantages of the works department was that the Council could make use of it on occasions of great emergency such as that in question. The car-sheds were completed to the entire satisfaction of the highways committee and the cars were able to be housed as soon as they were delivered. The execution of jobbing works during the year 1902-03 and part of 1903-04 has resulted in balances of cost below schedule value of 1,883/. and 393/. respectively. The Fire Brigade committee, in a brief report upon the statement of the works committee, point out that the return includes four accounts in respect of the erection of fire-stations, and they observe with considerable satisfaction that in every case the actual cost of the work has been substantially below the architect's final certificate. The highways committee express pleasure at noting that in regard to the erection of three tramway substations in each case the cost was below the amount of the final certificate, the total balance of cost below that certificate being 2,153/., equal to nearly 10 per cent. The main drainage committee state that in regard to the three estimated works carried out for them by the works committee, they were pleased to observe that the cost of the works was below the total amount of the final estimates by no less than 15,687/. That difference

represented a total saving of over 11½ per cent. on the final estimate. It may be pointed out, they state, that two of the works consisted of the construction of new sewers which formed part of the enlargement of the main drainage system, and when it is remembered that other large works of a similar character are being undertaken by the Council, it is satisfactory to note that by the direct employment of labour on these particular works the saving on the final estimate has been about 16 per cent.

ABERDEEN GRANITE TRADE.

A GENERAL view of the quarrying, building and monumental branches of the granite industry, which has its headquarters in the city of Aberdeen, shows that during the year 1903 a substantial measure of prosperity has been enjoyed. If anything, says the *Scotsman*, the comparison all over reveals an improvement rather than a decline on the previous year. The score or so of quarries scattered throughout the country, employing upwards of 2,000 hands, have had constant work. Mr. Fyfe's great Kemnay establishment, which has now on hand contracts for the extension of the University, the new post office and Regent Bridge, has kept its 800 men busily employed. But it is perhaps orders for paving setts for various places throughout the kingdom that, generally speaking, have created the briskness in most of the quarries this year. The building branch, however, has, as the statistics of the municipality disclose, had a steady run. The value of the erections sanctioned during the year ending October is 413,650/., as compared with 330,000/. in the corresponding period of 1902, or an increase of 80,000/. Of this total, 107,000/. is put down as the estimated value of public buildings—such as the University, the addition to the Art Gallery, the extension of the United Free Church Training College, &c.; while last year the public buildings in course of construction were estimated at only 63,000/.. There has been less demand recently for tenement houses—the general opinion being that the city is for the time sufficiently well supplied with that class of erections, and now the tendency is towards two-storey buildings of the cottage description. As to the monumental branch, all the yards have had a busy time, though orders have now become less numerous and a good many of the hands are idle. To supplement the supplies of local stones, merchants have had to purchase foreign material, and this year the quantity of the

granite imported for ornamental use, chiefly from Norway and Sweden, amounts to 18,820 tons, as against 16,280 tons last year—an increase of 2,540 tons. It is disappointing to learn that in none of the three departments under review are the prospects of a very cheering character, and the quarry-masters whose stones are used for decorative purposes contemplate with some concern the proposed introduction of the foreign manufactured article.

GLASGOW HOUSING PROBLEM.

A MEETING of the Civic Society of Glasgow has been held. Sir Samuel Chisholm gave an address on the housing problem in Glasgow. He said that when many months ago he consented to speak on the subject he was sanguine enough to believe that the report of the Municipal Housing Commission would long before his address have been completed and issued. The report, however, and its recommendations were still in preparation; therefore, it would be in bad form if he ventured to allude to them. Sir Samuel spoke of the great amount of poverty which existed in the city, and the question whether there was anything in the housing problem apart from the housing of the poor. He referred to the visit which members of the Commission had made to the congested areas of the city. He mentioned how the model lodging-houses of the Corporation had supplanted others of a bad type, and also how the family home in St. Andrew's Square had been a means of improving the condition of persons with families who had not other means of finding suitable accommodation. A discussion followed.

CORRESPONDENCE.

Brilliant Signs.

SIR,—Our directors' attention has just been called to a letter from a correspondent, appearing in your issue of November 6, signed "W. G. Pether," and we find it necessary to state a few facts in connection with "Brilliant Letters":—

1. Contrary to your correspondent's information, the original brilliant letter is manufactured from start to finish at our steam power works, 35-37 Verulam Street, London, E.C.

2. Our brilliant letters are made in over 100 different shapes and every design, in sizes 1 inch to 36 inches.

3. We are the original patentees in all countries.
4. We own over 3,000 l. worth of the latest machinery, solely for the manufacture of brilliant letters.

5. We invite comparison of our original brilliant letters with all other brilliant letters as regards—(a) Stoutness of copper; (b) sharpness of stamping; (c) brilliancy of gilding; (d) correctness of design; (e) neatness of fixing.

6. We guarantee to sell to the trade only our brilliant letters at lower prices than any other brilliant letter on the market.

7. We cater solely for the trade, and cordially invite architects, shop-fitters, builders, sign-writers, decorators, &c., to inspect our works and manufactures in order to verify the foregoing.

8. Our original brilliant letters, being made from steel dies, are prepared from stout copper, and consequently can be fixed without fear of damage by inexperienced workmen.

9. We control patents of the original brilliant letters in many countries, and your correspondent is again in error in stating that we abandoned ourselves for any such reason as he suggests.

We are sorry to have to encroach on your valuable columns to such an extent, but we feel that your readers will appreciate a little correct information regarding brilliant letters and signs, although we have but little doubt that the majority of them are already in possession of the main facts.—Yours very faithfully,

THE BRILLIANT SIGN CO., LTD.

F. G. LUCAS,

Proprietor and Managing Director.

Of London, Manchester, Leeds, Birmingham,
Auckland, N.Z., and Sydney, N.S.W.

THE competitive designs submitted by Messrs. G. & R. P. Baices, 5 Clement's Inn, Strand, W.C., have been adopted for the United Methodist Free church and schools, Seven Kings, E., and the first portion of the building, which embraces the nave of the church, including tower and temporary apse, &c., is to be proceeded with at once; the schoolroom and two classrooms also form a portion of the scheme. The estimated cost of this first portion is 3,641 l. The materials are to be facings in red brick, dressings in Bath stone. The tower, which is a square one surmounted by open traceried parapet and spire, forms a prominent feature of the design.
